Medicine.

1

Glandular Fever

C C GUTHRIE and J F PESSEL (*Am. Journ. Dis. Child.*, April, 1925, p. 492) record an epidemic of glandular fever in a school for boys ranging in age from 13 to 18. The younger boys were chiefly affected, and of a total of 500 boys it was estimated that over 300 cases occurred between the latter part of September and the third week in November, 1922. Onset was usually abrupt after a short prodromal stage of malaise, sore throat, and slight headache, and, in a few cases, unilateral conjunctivitis. The febrile period usually lasted three days, and just before the temperature started to fall the patients became drowsy and often slept for twenty-four hours. Swelling of the pharyngeal lymphatic glands gave the throat a dry and coarsely granular appearance without exudate or membrane, the eyes were usually congested, and in about 9 per cent of the patients there was a dry granular palpebral and bulbar conjunctivitis, usually unilateral. Both the spleen and liver were enlarged and slightly tender on palpation during the febrile stage, at the end of which all the superficial glands, including the epitrochlears, became swollen and tender, the posterior cervical glands being the most markedly affected. During the febrile period a polymorpho-nuclear neutrophil leucocytosis was present, followed by a relative and absolute increase of lymphocytic cells accompanying the lymphadenitis. No specific organisms were recovered from the blood, eye, or throat in any case, and there was no skin rash. No complications occurred and recovery was rapid.

2.

Sudden Onset in Pulmonary Tuberculosis

A DUDAN (*Ann. de méd.*, April, 1925, p. 363) reviews the literature dealing with the character of the onset in pulmonary tuberculosis, and records his observations on 100 cases of chronic pulmonary tuberculosis at the Hôpital Laënnec, Paris, in patients aged from 17 to 50, consisting of 50 men and 50 women in whom tubercle bacilli had been found in the sputum. His conclusions are as follows: (1) An insidious onset is by no means the most frequent mode of commencement in pulmonary tuberculosis, as is generally supposed. It was found in only 34 per cent of the present series (14 men and 20 women). (2) An onset with haemoptysis is infrequent, it was noted in only 6 per cent (4 men and 2 women). (3) An acute onset preceded by slight prodromes occurred in 12 per cent (4 men and 8 women). This mode of onset was regarded as transitional between an insidious and a sudden onset. (4) An acute onset without any prodromes or in which the prodromal period did not exceed forty-eight hours was most frequent, being found in 48 per cent (28 men and 20 women). The frequency of a sudden onset and of the transitional form of onset should make the practitioner regard any broncho-pulmonary affection with suspicion and take all available means for excluding tuberculosis from the diagnosis.

3

The Antirachitic Action of Light.

C E BLOCH and F FABER (*Ugeskrift for Læger*, April 16th, 1925, p. 392) give an account of investigations carried out during the autumn and winter into the action of ultra violet light on fifty infants suffering from rickets or tetany or both these diseases. They were kept on the same diet of milk and carbohydrates as that on which they had developed these diseases, and they were not given cod liver oil or any other drug or food calculated to influence the diseases treated. The experiments with light treatment by a mercury quartz lamp were thus uncomplicated by extraneous factors. The phosphorus and calcium content of the blood was determined from time to time, and it was found that in rickets the phosphorus content, and in tetany the calcium content, of the blood rose to the normal level within a few weeks of the commencement of the light baths. In the case of rickets the phosphorus content of the blood rose to the normal level within four weeks of the commencement of the treatment, and after a total exposure of about one hundred minutes. In two cases of diabetes in children ultra violet light treatment was given, with the result that the concentration of sugar in the blood fell, the fall being equivalent to that following the injection of 3 or 4 insulin units. As the excretion of sugar in the urine was not increased, and there was no evidence to show that the blood sugar had been deposited in the tissues, the authors conclude that the light baths had stimulated the pancreas to turn out more insulin.

They argue that light, ultra violet light in particular, is an activating factor on those functions of the body which are below normal, and that this activating action is accompanied with vitamins. Treatment of rickets with ultra violet light not only raises the phosphorus content of the blood to the normal level, but also keeps it at the normal level after the light baths have been discontinued. It cannot therefore be ascertained that these light baths have provided or liberated a substance such as phosphorus or a vitamin which was previously wanting, for these substances are always being consumed, and must therefore always be replaced. The authors also argue that the antirachitic action of cod liver oil is not due to the vitamin A it contains, but to the same, or a similar, activating factor as that provided by ultra violet light.

4

Antityphoid Inoculation in the Italian Army during the War

G ROVIDA (*Rev. Sud Amer. de Endocrinol.*, March 15th, 1925, p. 137) states that Gini and De Beradinis, as the result of their studies on antityphoid inoculation in the Italian army during the war, have come to the following conclusions: (1) Antityphoid inoculation, whether complete (three injections within a month) or incomplete (two injections), considerably reduces the mortality from typhoid fever. (2) Complete antityphoid vaccination shortens the duration of the disease in patients who recover as compared with those who have not been vaccinated at all, or only incompletely, it prolongs the duration of the disease in fatal cases as compared with patients who have not been vaccinated, and makes the disease shorter than in those who have been incompletely vaccinated. (3) The favourable effect of complete antityphoid vaccination is somewhat greater if it is performed 60 to 120 days before the disease than if it is delayed to within 60 days. (4) Complete antityphoid vaccination, if performed within less than 30 days of the onset, prolongs the disease, but if the interval is longer it shortens the duration of the disease, and its influence increases until its maximum effect is reached when inoculation is performed from 120 to 180 days before the onset. (5) Incomplete antityphoid inoculation prolongs the duration of the disease, both in cases which recover and in cases which terminate fatally. (6) The favourable effect of incomplete antityphoid vaccination is greatest when the vaccination has been performed recently, and diminishes as the interval increases.

Surgery.

5

Indications for Splenectomy

E M HARRAHAN (*Annals of Surgery*, May, 1925, p. 906) remarks that our lack of knowledge about the functions of the spleen and its place in the blood system leads to there being no clearly defined indications for its removal. Since an etiological classification is at present impossible he suggests a classification based on surgical results. He divides splenic disorders into three groups. Splenectomy is definitely indicated in purpura haemorrhagica, the slow chronic forms of familial haemolytic jaundice, and the early forms of splenic anaemia, including the Banti syndrome. He thinks that splenectomy should be considered in the more progressive forms of haemolytic jaundice—particularly the acquired forms—splenic anaemia, and rarely in cases of pernicious anaemia. In cases of haemolytic jaundice or splenic anaemia showing signs suggesting pernicious anaemia the results of splenectomy are usually unsatisfactory. Splenectomy, he considers, is contraindicated in lymphoid and myeloid leukaemias, polycythaemia, and the rapidly progressive fulminating forms of haemolytic jaundice, splenic anaemia, and pernicious anaemia.

6

Treatment of Megacolon

J HERTZ (*Bull. et Mém. Soc. Nat. de Chir.*, May 9th, 1925, p. 494) reports the treatment by resection of three cases of megacolon by the Milneuz method. The loop of gut was brought outside the abdomen and excised, an enterostomy was then placed in the space between the two loops, and the fistula finally closed at a second operation. The author considers that the ease and simplicity of the procedure, together with the absence of risk, are sufficient to recommend it. These cases are usually easy to deal with, the gut is freely mobile and the intra-abdominal manipulations are reduced to a minimum. There

is no need to free the bowel as in cases of growth, and there is usually a complete absence of adhesions. He adds that it is always safer, however, to complete the operation in two stages. The bowel is usually distended with faeces, and is in a more or less septic condition, which endangers the suture line for these reasons primary resection and anastomosis should be rejected. In one patient the megacolon was associated with a condition of megacaecum, the H. R. and was dealt with in two stages, while the caecum was simply plicated. The patient was cured, and the H. R. demonstrated the success of the method and the diminution in the calibre of the intestine. Similarly, if megacolon is associated with volvulus the above procedure is said to be safe and to be recommended.

7 Prevention of Post operative Peritoneal Adhesions

C. PRIMA (*Zentralbl. f. Chir.*, April 25th, 1925, p. 930) states that apart from physico-chemical processes the chief cause of the formation of peritoneal adhesions after laparotomy is to be found in circulatory disturbance and diminution of absorption or of intestinal activity. The best plan, therefore, for preventing the formation of adhesions is regulation of the circulation and stimulation of the intestinal activity and power of absorption. This result can be effected by three measures—namely, (1) suitable pre-operative treatment, (2) gentle and rapid operative technique, (3) suitable after treatment. As regards pre-operative treatment, Prima emphasizes the importance of regulating or increasing cardiac activity by administration of cardiac tonics of the digitalis group for two or three days before the operation. Treatment by suggestion should also not be neglected, and the patient should be assured that the operation will be successful. During the operation itself the peritoneum, omentum, in testine, and mesentery should be handled with the utmost gentleness. Prima regards Paquelin's cautery as a useless and even dangerous instrument in abdominal surgery. The appendix should always be removed with a knife, and the stump treated with sodium chloride or sublimate. The use of plugging should be forbidden, as it favours the formation of adhesions. Drainage should also be avoided when possible for the same reason. Lastly, as regards after treatment, more movement is required. The patient should be allowed up as soon as possible, and should not be starved, since such treatment causes diminution of function, weakness, and the formation of adhesions. Moreover, early rising considerably reduces the risk of pneumonia.

8 Movable Kidney

C. P. MATHÉ (*Surg., Gynecol. and Obstet.*, May, 1925, p. 605) points out that the great majority of cases of movable kidney require no treatment. In a certain percentage of cases, however, the condition causes definite symptoms which necessitate fixation by abdominal support or surgical operation. The condition is common in females owing to the shape of the renal fossa, it is more often found on the right side owing to the presence of the liver and the weaker support afforded by the perirenal fascia here. It may give rise to various symptoms both from kinking of the ureter and by producing traction on the stomach, duodenum, and gall bladder. The diagnosis is best made by palpation, while radiograms and pyelography are often useful. The majority of patients can be relieved by the use of proper abdominal support. Nephropexy is, Mathé thinks, a justifiable operation, it relieves the symptoms, and is indicated when belts fail and in cases of kinking of the ureter, in 29 out of 30 cases so treated by him the operation was successful. He believes that surgical suspension has fallen into disrepute because it has been performed when it has not been indicated or the technique has been faulty. The kidney should be suspended by three silk sutures, the uppermost over the twelfth rib. Also the upper part of the ureter should be exposed and any fibrous bands or aberrant vessels dealt with. The article concludes with a full list of bibliographical references.

9 Treatment of Ventral Hernia

C. DANIEL (*Bull. et Mem. Soc. Nat. de Chir.*, May 2nd, 1925, p. 468) describes a method of treating ventral hernia. He has adopted with success. The hernia occurred through the right rectus abdominis muscle below the umbilicus following a transverse abdominal wound. There was considerable retraction of the divided muscular ends, leaving a gap of several centimetres. In such cases the resulting scar tissue leaves a weakened spot in the abdominal wall which is conducive to the occurrence of hernia. The abdominal wall at the site of the scar is filled by a mass of fibrous tissue in front and the posterior sheath of the rectus muscle behind to

which the peritoneum is adherent. The omentum and in testines become adherent at this spot, and the true extent of the hernia can only be discovered after their reduction. In many cases the re-forming of the layers of the abdominal wall is not possible, and the gap can only be filled in by a plastic operation. Daniel accomplishes this by cutting flaps from the rectus muscle above and below the hernial site, and turning them towards each other, these are superimposed and sutured together over the weak spot. A flap of aponeurosis is then cut from the opposite side, turned over, and fixed in front of the sutured muscle, by this means the gap is satisfactorily covered in. The result of this operation was good, and the patient was left with a strong abdominal wall. The technique of the operation is made clear by a series of diagrams.

Therapeutics.

10 Diathermy in the Orchitis of Mumps

H. L. FOUGEROSSE (*Journal Amer. Med. Assoc.*, April 11th, 1925, p. 1117), during a recent outbreak of mumps among recruits for the United States navy, tested the efficacy of diathermy for metastatic orchitis. Out of 100 of these patients admitted to hospital twenty developed orchitis and were immediately treated by diathermy according to the method employed in gonococcal epididymitis and allied disorders. A Corbus clamp was used with the diathermy machine. Treatment lasted half an hour each day, and the results were invariably satisfactory. Practically all pain subsided during the first treatment, and resolution was much hastened in all cases. Fougerosse thinks that with suitable apparatus treatment of the parotitis or primary focus should cut short the disease before metastases can occur.

11 Rickets treated with Ultra violet Rays

P. PORCELLI (*Raggi Ultravioletti*, March, 1925, p. 79) reports in detail three severe cases of rickets successfully treated with ultra violet rays. The children were aged 8, 6, and 5 years, and were members of one family. Twenty-four applications were made at intervals of five to eight days. One child, who had not walked at 5 years, was able to walk after six irradiations. The radiograms showed increased centres of ossification in the carpus after two months' treatment. The general condition of the children improved most markedly, they were more lively, their colour improved, and the bone tenderness disappeared. The quartz lamp was used at distances beginning at 17 metres to 0.8, and the sittings lasted from ten to thirty minutes. Photographs of the children, and radiograms before and after treatment, are given.

12 Dehydrochol Acid in Pyrexial Affections of the Biliary Passages

D. ADLERSBERG and E. NEUBAUER (*Wien Arch. f. inn. Med.*, April, 1925, p. 59) point out that in recent years it has been definitely shown that bile acids and sodium sulphate increase the bile secretion. One of the most powerful and harmless of the bile acid products is dehydrochol acid. Neubauer has shown by observations on a patient, with choledochus drainage after cholecystectomy, that dehydrochol acid increases the bile secretion enormously, and Specht has recorded similar observations in dogs and men with biliary fistulae after cholecystectomy. From these facts it may be expected that the drug will produce an "internal drainage" which will be especially advantageous in cases of cholangitis without gall stones. In such cases the authors consider that the drug will act primarily by mechanical flushing of the biliary passages. During the last two years they have employed the drug in thirty cases of diseases of the liver and biliary passages, seven of these being affections of the biliary passages causing febrile symptoms. These cases were specially suitable for observations respecting the action of the drug (1) because the fever was not of too short duration and the fever curve was fairly regular, (2) the cases had remained uninfluenced by the usual internal treatment. The sodium salt of dehydrochol acid was employed in a 20 per cent concentration in physiological sodium chloride solution. The drug was injected intravenously—2 grams daily—usually for several days. Seven cases are described in detail in which febrile symptoms were produced by disease of the biliary passages, and the authors consider they are justified in concluding that in such the affection was favourably influenced by the drug. The seventh case was not in fact cured, but a subsequent necropsy revealed malignant disease.

Ophthalmology.

13 Optic Atrophy

G KLEEFELD (*The Scalpel*, May 2nd, 1925, p 409) classifies the varieties of optic atrophy in three groups, according as they are due to intraocular, extraocular, or extracranial diseases. Intraocular atrophy may be due to glaucoma owing to increase in intraocular tension, syphilitic choroiditis, retinitis pigmentosa, and amaurotic family idiocy. Extraocular atrophy is the result of neuritis or ischaemia due to severe anaemia or toxic angiospasm. In neuritis there is an oedematous stage, or "choked disc," and the resulting atrophy is characterized for a long period by the presence of sinusoidal vessels. In some cases which are due to tobacco, alcohol, and various vegetable poisons the atrophy is not preceded by a neuritis visible to the ophthalmoscope. Extraocular atrophy is due to tubes, fracture of the optic foramen, or the presence of a tumour in the neighbourhood of this foramen. Optic atrophy, when complete, is usually accompanied by mydriasis. If the pupil is contracted the diagnosis of tubes may be made with almost complete certainty. In exceptional cases, however, morbid processes in the upper part of the spinal cord may give rise to myosis.

14 Ocular Injury caused by Liquid Ammonia

I ABRAMOVICZ (*Brit Journ Ophthalmol*, May, 1925, p 241) describes a case of severe injury caused by the eyes being flooded accidentally with a 10 per cent solution of liquid ammonia. As a result one eye had to be eviscerated and the other, less severely injured, eye was many months before recovering. Abramovicz remarks that ammonia burns of the eye are always serious. The immediate damage is often not very severe apparently, but sooner or later the cornea suffers. Ammonia, in a 10 per cent solution, absorbs water and dissolves albumin, this tends to destroy the corneal epithelium and Bowman's membrane. The apparent delayed action, so often seen, is probably partly due to secondary infection of the damaged cornea, and partly to a continuous destructive action on the deeper corneal layers as a result of the production of all albumin by the ammonia. Abramovicz insists that prognosis in ammonia burns should be very guarded.

15 Embolism of the Central Artery of the Retina

T DE LAPERSONNE (*Journ de Méd et de Chir Prat*, April 10th, 1925, p 229) describes the classical symptoms of this serious affection and refers to the case of a patient with heart disease seen ten minutes after the arrival of an embolus in the central artery of the retina. There was no arterial pulsation, no retinal oedema, and fingers could be counted. By massage of the globe of the eye the embolus was displaced, and next day the vision was nearly normal. Other cases have been recorded, but unfortunately the improvement in sight is often only temporary. It is possible that the central artery may be obliterated by spasm, due to hyperexcitability of the sympathetic and a few cases of this kind have been recorded where the artery looked like a white strand. In chronic glaucoma spasm of the retinal vessels is not infrequent, lasting from a few minutes to several hours.

16 Cilia in the Anterior Chamber

O A SHAPPE (*Amer Journ Ophthalmol*, April, 1925, p 301) describes a case in which four cilia were found in the anterior chamber of an eye, they had been in this situation, apparently, for thirty three years. The affected eye had had what must have been a penetrating injury caused by the peg of a top. This occurred thirty three years ago. The eye had remained quite quiet until three years ago, when it had become at times somewhat painful and red. Slight ciliary injection with infection of the bulbar conjunctival vessels was present. The cornea was uneven and coarsely stippled, and on the upper part of the cornea there was a large opaque scar. The pupil reacted well, but the fundus was indistinctly seen. The eye seemed to be suffering from a low grade endothelial, by slit-lamp examination cilia were seen lying upon the iris. These were removed, after which the eye healed. There appears to be a considerable literature upon this subject, so that the accident cannot be considered to be so very uncommon. The cilia are introduced into the eye by a penetrating injury and nearly always cause some irritation eventually though they may be tolerated for long periods. In only two cases has sympathetic ophthalmitis arisen, and paracentric ophthalmitis is a very rare sequel. Cataract is occasionally produced if the cilia are in contact with the lens. Epithelial cysts in the anterior chamber may be produced by the implantation of cilia in this manner.

Obstetrics and Gynaecology.

17 Tuberculosis and Pregnancy

C MONCKEBERG and J M VERGARAK (*Gynecol et Obstet*, 1925, vi, 4, p 241) state the conclusions regarding the influence of pregnancy on pulmonary tuberculosis that have been drawn from nine years' experience in Chili. Of tuberculous patients 7 per cent were found to die before the third month post partum, 21 per cent of patients with latent lesions showed clear clinical signs of active disease during pregnancy, 53 per cent of those with active lesions became worse during pregnancy, with a marked tendency to generalization. In about 6 per cent, including a number of cases without tubercle bacilli in the sputum, laryngeal tuberculosis became manifest. Extension of the disease was more noticeable in multiparae and in the later months of pregnancy. According to the authors this is due partly to the withdrawal of calcium from the system by the foetal demands, but more especially to a diminished resistance to the tubercle bacillus. Chomé reported that pregnant rabbits succumbed to injections of streptococci which were non virulent for non gravid animals. The present authors found that anaphylactic shock was much less in pregnant than in other guinea pigs, that the intradermal reaction to tuberculin was feebly positive or frankly negative in 76 per cent of tuberculous women at term, and that the Wassermann test was negative in two thirds of patients with active syphilis who were nine months pregnant. Diminished resistance to bacterial invasion is correlated by the authors with impaired liver function, which they report having noted by use of many different tests in 200 pregnant tuberculous women. Therapeutic abortion is only advocated in a certain number of pregnancies in multiparae earlier than the fourth month provided that the tuberculous process, although still early, is proved to be extending, and that the Besicoff and intradermal tuberculin reactions are negative or feebly positive.

18 I CLIVIO (*Riv d Ostet e Ginecol Prat*, March, 1925, p 113) agrees with those Italian and French writers who have recently advocated the restriction of induction of abortion in pregnant tuberculous patients to cases in which there is a good prospect of the pulmonary affection being brought to a standstill, and in which the gestation has not advanced beyond the third or fourth month. He thinks, however, that by an extended recourse to artificial pneumothorax the indications for premature termination of pregnancy may be still further limited. The cases are quoted of three women seen during the early months of pregnancy with unilateral apical lesions which had recently begun to extend more rapidly. In each case pregnancy went to term after artificial pneumothorax had been induced, and a cure of the pulmonary tuberculosis was effected. Equally good results occurred in two other patients who came for treatment with pyrexia and asthenia in the fifth and seventh months respectively, and in a sixth woman with unilateral irritation and early disease of the other lung. Clivio adds that the fears of producing anaemia by performing pneumothorax in pregnant subjects appear to be ill grounded.

19 Intracranial Haemorrhage in the Newborn

W SHARPE and A S MACLAIRE (*Journ Obstet and Gynaecol of the British Empire*, Spring 1925, p 79) emphasize the importance of clinical diagnosis of the less severe cases of intracranial haemorrhage in the newborn. The signs which should arouse suspicion of such haemorrhage are meagre and far from conclusive. They are drowsiness, refusal to suck, and slight muscular twitchings of fingers, limbs, face, or orbital muscles but they may be almost or entirely absent. As an illustration the case is described of a 3 days old baby in whom the only suspicious symptom was spasmodic twitching of the left orbital muscles occurring two or three times each hour. Two hours later the child suddenly died, and the autopsy showed bilateral supratentorial haemorrhage over one inch in thickness, the longitudinal sinus having been torn at the posterior margin of the anterior fontanelle. The tension of the posterior fontanelle has little diagnostic significance. According to the authors lumbar puncture affords the only accurate means of diagnosis in the mild cases of intracranial haemorrhage; this procedure repeated until the fluid is free from blood, is of great therapeutic use. To ascertain the frequency of intracranial haemorrhage Sharpe and MacLaire performed lumbar puncture as a routine in 400 newborn babies, of whom about one half were first born and 10 per cent were delivered by forceps. Bloody or blood tinged cerebrospinal fluid was found in no fewer than 39. The puncture was repeated therapeutically as often as six times. Three of the babies died, and autopsies confirmed the diagnosis. Even in the presence of signs of intracranial haemorrhage babies of low

vitality, especially if premature, and those in a state of shock, should not be submitted to lumbar puncture, which should be deferred until the general condition improves. The early use of forceps, correctly applied, does not seem to increase the risk of intracranial haemorrhage, which is more likely to occur after prolonged labour in which forceps application has been too long deferred. The authors conclude that by extended employment of early lumbar puncture it may be possible to diminish considerably the numbers of children with chronic spastic paralysis with various degrees of mental retardation.

20 Abortion through the Posterior Wall of the Cervix

Z. BUBLITSCHENKO (*Zentralbl. f. Gynak.*, April 11th, 1925, p. 827) believes that a cervico-vaginal fistula following abortion is not usually the sequel of criminal or unskilful attempts to induce abortion, the communication between the cervix and vagina is as a rule the result of spontaneous passage of the foetus through the posterior part of the cervical wall. The accident occurs in primiparae (25 out of 31 cases) with hypoplastic genital organs and marked uterine retroflexion, with a small rigid os, it is to be attributed to yielding of the muscular wall in the neighbourhood of the internal os, in consequence of the pressure of strong contractions in the corpus uteri. The site of rupture and passage of the foetus, and of the fistula which develops later, is the posterior wall of the cervix. Anterior cervico-vaginal fistulae are due to pressure by the foetal parts during their passage into the vagina by the normal route. Hies has recorded a case of some forensic interest in which abortion through a cervico-vaginal tear occurred after the external os had been dilated *secundum artem* up to Hegar No. 10. Bublitschenko describes a case of premature labour with septic infection at five and a half months in a 3 para, in spite of previous artificial dilatation of the cervix and insertion of a metreuryter. The 950 gram foetus was born through a large cervico-vaginal tear.

Pathology.

21 The Antagonistic Action of Posterior Pituitary Extract and Insulin

P. C. MORHLIG and HARRIET B. AINSLEE (*Journ. Amer. Med. Assoc.*, May 9th, 1925, p. 1399) point out that previous observers have shown that injections of posterior pituitary extract produced glycosuria that it has a powerful antagonistic effect on the lowering of blood sugar produced by insulin, and that it removes the symptoms of hypoglycemic convulsions, causing rapid elevation of blood sugar. The present authors record the results of experiments on rabbits and come to the following conclusions: (1) Posterior pituitary extract injected into normal rabbits usually produces a slight rise in the blood sugar. (2) Posterior pituitary extract, when injected simultaneously with insulin, prevents the fall produced by the latter. (3) Posterior pituitary extract, injected during insulin hypoglycemic convulsions, produces a rapid rise in the blood sugar, and the rabbits subsequently recover. (4) The site of action of the pituitary extract seems to be in the skeletal muscle metabolism.

22 The Bactericidal Power of the Human Blood

C. PRÄUSNITZ and GERTRUD MEISSNER (*Zentralbl. f. Bakt.*, April 8th, 1925, p. 376) have tried to determine the variations occurring in the bactericidal power of the human blood after injections of specific and non-specific agents. Their technique was modelled on that of Wright, and consisted in incubating the debarbured blood in capillary tubes with staphylococci killed by heat at one hour 50 cmm of the mixture were withdrawn, mixed with 2.5 cmm of a living staphylococci suspension, transferred to special slide chambers, and incubated for twenty-four hours at 37° C., the number of colonies which had developed were then counted. At the same time the opsonic index, the leucocytic index, and the phagocytic index were determined. It was found that normal human blood had a pronounced bactericidal effect on staphylococci by preliminary vaccination of the blood *in vitro* with dead organisms it was possible to raise it appreciably. The results obtained by the bactericidal and the opsonic estimations agreed fairly closely. Thus it was found that the optimum dose of dead staphylococci for raising the bactericidal power was 24,000 per cmm of blood and 12,000 for raising the opsonic power. With these doses the bactericidal index was raised about 4 times, the opsonic index 1.5 times. Experiments *in vivo* were then made. 500,000 dead staphylococci were injected intravenously. The blood withdrawn after thirty minutes and the bactericidal and opsonic powers compared with those of specimens of blood withdrawn prior to the injection of the vaccine. In one experiment of this nature the bactericidal index was increased 2.8 times and the opsonic index 1.2 times. There

was, however, considerable variation in the reaction of the blood of different persons, some reacted to the vaccine more than others. The effect of the intravenous injection of non-specific substances was likewise tried, the two substances used were y-tin and adlan. The injection of 0.0125 ccm of y-tin raised the bactericidal power 2.6 times in half an hour, the effect of adlan was less marked. When a second injection of adlan was given six days later, and the blood withdrawn an hour, a distinct rise in both the bactericidal and the opsonic power was noticed. Again, there were differences in the reactions of different persons. From the experiments they conclude that it is possible, both by specific and by non-specific agents, to raise the bactericidal power of the blood to staphylococci.

23 Rapid Method of Complement Fixation Test in Tuberculosis

J. VALTIS (*Ann. de l'Inst. Pasteur*, April, 1925, p. 365) describes a rapid method of performing the complement fixation reaction in tuberculosis closely similar to that employed by Nuttmann in the diagnosis of syphilis. It consists essentially in making use of the complement and haemolytic immunity body naturally present in human serum for sheep's red cells, and diminishing the number of tubes to two sets of three. In one set the haemolytic index is titrated, the patient's serum being incubated with varying quantities of red cells, from the amount of lysis which occurs in an hour and a half at 37° C. the quantity of red cells to be added to the first series is calculated. When the serum has no haemolytic power the Valtis method cannot be used. In this first set of tubes the actual test is performed. The first tube receives 0.5 ccm of antigen—Boquet and Negre's methylic antigen, the second tube 1 ccm, the third tube, which acts as a control, receives 1 ccm of saline. To each tube is added 0.1 ccm of unheated serum. According to the haemolytic titre of the serum, which has already been worked out, from 0.1 to 0.9 ccm of sheep's red cells is added to each tube, incubation is performed for thirty minutes. If there is haemolysis in the control tube and not in the first two tubes the reaction is said to be strongly positive, if there is haemolysis in the first and third the reaction is positive, and if there is haemolysis in all three the reaction is negative. The author has compared the results with those obtained by Calmette and Massol's technique, and finds that there is a fairly close correspondence between the two methods, with 38 known tuberculous serums positive results were obtained by Calmette and Massol's technique in 30 cases, and with his own method in 32 cases.

24 Prognostic Significance of Tubercle Bacilli in Sputum

T. STEPHANI and J. STEPHANI (*Schweiz. med. Woch.*, April 23rd, 1925, p. 365) have compared the clinical with the bacteriological findings in the 781 sputum positive cases of tuberculosis treated at their sanatorium in Montana in the period 1898 to 1923. The sputum findings were classified, not only according to the tubercle bacilli were numerous or scanty, but also according to whether they were long or short, homogeneous, granular, or moniform. In 70 per cent of all the sputum positive cases it was found that slight disease was associated with few tubercle bacilli, severe disease with many tubercle bacilli, clinical improvement with a diminution, and aggravation of the disease with an increase in the number of the tubercle bacilli in the sputum. In 8 per cent the number of the bacilli in the sputum was at variance with the clinical signs, and in the remaining 22 per cent there was no uniform relationship between the clinical signs and the number of the bacilli in the sputum. With regard to the appearance of the bacilli, it was found that in 60 per cent of all the sputum positive cases clinically slight disease was associated with bacilli which were mostly granular, whereas severe disease was associated with homogeneous and short bacilli. Clinical improvement was associated with a change from homogeneous to granular bacilli, and the reverse process was observed when the patient was getting worse. In 18 per cent the clinical signs were contradictory of the bacteriological signs as indicated by the appearance of the bacilli, and in the remaining 22 per cent no uniform relationship could be established between the clinical signs and the appearance of the tubercle bacilli.

25 The Blood Platelets in Infections

BECK (*Moritzsch. f. Kinderheilk.*, March, 1925, p. 673) examined the blood platelets in various acute infections—namely, ten cases of vaccinia, three of varicella, and two of measles—with the following results: (1) There was a rapid increase in their number during the incubation stage. (2) During the height of the disease there was a steep fall in their number as had previously been noted by Tschistowitz, Schiff and others. (3) In convalescence there was another increase in their number with a gradual return to the normal

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

25 Familial Lupoid Syphilis

A SCHOGG (*Dermatol Week*, May 16th, 1925, p 711) refers to Jadassohn's account (1907) of two sisters who suffered from congenital syphilis, with precisely similar local lesions. Such cases are rare but important, as they raise questions like that of the possibility of a peculiar familial "terrain." Schogg describes the cases of a mother and son who exhibited the lesions of lupoid syphilis with similar localization, in the son's case lupoid syphilis was associated with squamous celled epithelioma. When the boy was 15 the first skin lesion appeared behind the left ear as a small painless nodule. During twenty years little change occurred, but at the age of 39 the skin lesions rapidly increased in size and formed a crescent of soft nodules covered by yellowish brown or reddish brown crusts and slight bran-like desquamation. A second lesion was found in front of the left ear, with the same spreading crescentic form and atrophic scarring. The third focus was situated immediately below the left ear; this was a sessile tumour as large as a plum. The surface was covered by a greasy crust, on removing which slight bleeding occurred, at its anterior border there were two typical papules undergoing retrogressive changes. The regional lymph nodes were palpably enlarged and painless. Sections of the skin lesions showed typical tuberculous proliferation, no tubercle bacilli were demonstrated, and injection of the tissue into a guinea pig was negative. The tumours proved to be squamous celled epithelioma. The patient gave a plainly positive reaction to tuberculin, and the Wassermann reaction was positive. The lupoid skin lesions healed rapidly and soundly in four to five weeks from the commencement of treatment with neosalvarsan and potassium iodide, the tumour was excised and its site irradiated. The mother of this patient had been treated more than twenty years previously in Jadassohn's clinic. For seven years she had had a painless nodule in front of her left ear, two years later she diseased at the bridge of the nose, and subsequently larger painful nodules developed on the forehead and in the neighborhood of the right eye. She had typical lupus of the nose and both cheeks, spreading in some directions and healing in others with characteristic thin atrophic scarring. There was a tumour the size of a walnut on the forehead. She received tuberculin injections for two weeks, the tumour was excised, and potassium iodide prescribed. Sections showed that the growth was a typical tuberculoma, but injection of a laboratory animal proved negative. The patient's husband, who denied any syphilitic infection, had on his left cheek a stellate scar which was very suggestive of a former syphilide.

27 Leucocytosis following Typhoid Perforation

E. W. LIVINGSTON and W. H. SQUIRES (*Journ Amer Med Assoc*, April 4th, 1925, p 1020), after a review of the literature in which they show that there is no uniformity concerning typhoid perforation, record their observations at the Bellevue Hospital, New York, where among 2,215 typhoid cases admitted from 1905 to 1924 69, or 3.11 per cent developed intestinal perforation, confirmed by operation or necropsy. Blood counts were made on 55 of the 69 cases, with the following results: 8 or 15 per cent, showed leucocytosis of 12,000 or more, 8 or 15 per cent, a slight rise—that is, an increase of more than 3,000 cells in the total 29, or 52 per cent, remained constant, while in 10, or 18 per cent, there was a definite fall in the leucocyte count. Thus in 85 per cent there was no leucocytosis, and in 70 per cent no rise of any degree. On the other hand, in cases of typhoid fever without perforation leucocytosis was very common in association with acute infectious diseases such as acute cholecystitis, pneumonia, phlebitis, wound infections, and local abscesses. The authors conclude that leucocytosis occurring during typhoid fever points to complications other than perforation of the intestine, and emphasize the unreliability of these variable counts for diagnosis.

28 Vaccination and Small pox

F. W. SLARS (*New York State Journ of Med*, April 24th, 1925, p 681) states that in 1923 the United States ranked third among the civilized nations in the number of small pox cases reported, being only exceeded by India and Russia. From incomplete reports received for the year 1924 which gave the total number of reported cases in the United States as 49,819 the indications were that that country would stand second. From January 1st to July 1st 1924, 3,999 cases were reported in the State of Michigan. Detroit alone reported

1,592 cases, with 164 deaths. From January 1st to August 1st, 1924, Minnesota, where compulsory vaccination had been abandoned since 1903, reported 1,613 cases, 193 of which were of the malignant type, with 40 deaths. The case mortality for small pox in 1922 was 28.6 per cent in Arizona and 24.9 per cent in Colorado. At the beginning of the outbreak in Detroit in 1924, 26 per cent of its population were unvaccinated and 44 per cent were in need of revaccination. During 1924 New York State had the largest number of cases recorded for many years—namely, 488, of which 451 had never been vaccinated, some were of the malignant type. In the presence of an epidemic States does not recognize any contraindication to vaccination. In the recent Detroit epidemic 3,346 hospital patients were vaccinated, of these 50 were cases of erysipelas, 773 were obstetric cases, 676 were newborn babies, and 21 were venereal cases. Numerous patients with diphtheria, scarlet fever, measles, and tuberculosis were also vaccinated, and no untoward results occurred in any case. During the recent epidemic in Detroit 817,000 vaccinations were performed, 500,000 of which were done in May and the early part of June without any serious ill effects. The epidemic terminated at the end of June. (See also *JOURNAL*, May 23rd, 1925, p 976.)

29 Joint Manifestations in Late Syphilis

M. P. WEIL and P. BOURGEOIS (*Presse Med*, April 25th, 1925, p 538) draw attention to three syphilitic affections of the joints which they say are not sufficiently known. Unilateral hydrarthrosis, which is less common than the bilateral form, is usually painless and affects the knee, it may disappear spontaneously on resting, and immobilization does not cause stiffness or ankylosis. Sometimes there are signs of thrombosis or there may be glycosuria with high blood pressure. The results of cytological examination of the fluid vary so much that nothing very definite can be concluded. Radiography, unless there are bone changes of a tubercular kind, does not show anything definite. The second affection is flying pains in various joints, and the third, chronic rheumatic pains due to syphilitic affection of some of the endocrine glands.

Surgery.

30 Simple and Complicated Dislocations of the Astragalus

WEITZEL (*Rev de Chir*, No 4, 1925, p 306) states that simple or complete dislocation of the astragalus, with or without injury to the malleoli, is unusual. He describes three cases. In the first an obese unhealthy man dislocated his astragalus outwards, the superior articular surface being directed outwards with the apex of the internal malleolus detached from the fibula and following the astragalus in its displacement. All efforts to reduce the dislocation under a general anesthetic failed. Astraglectomy was then performed easily, on account of the rupture of the ligaments, the apex of the internal malleolus was also removed. The foot was immobilized for eight days, the patient was then allowed to walk wearing Deltet apparatus. In the second case a subletian's horse fell on its rider's ankle, the astragalus was dislocated inwards and downwards so that its head was lodged below and internal to the os calcis. The malleoli were intact. Attempts at manipulative reduction having failed, a curved incision was made over the bony prominence from the internal malleolus downwards, the astragalus was then levered into its normal position with chisels. The torn ligaments, partially divided in the tendons, and tendon sheaths were restored and the joint closed without drainage. The ankle was immobilized in plaster for fifteen days, and then active and passive movements were ordered. The patient could walk without pain and with the aid of a stick in twenty days and in two months he was able to dance. In the third case the patient fell 50 metres from an aeroplane and not only dislocated the astragalus backwards and inwards, but that bone and also the internal malleolus were fractured. Skiagrams showed that the anterior fragment of the astragalus was in normal position and that the astragalo-sephoid joint was intact. Under a general anesthetic, a curved incision was carried from the internal malleolus downwards and forwards over the bony prominence. The posterior fragment of the astragalus, which lay transversely on the os calcis, was removed. The separated internal malleolus was sutured to the fibula, the torn ligaments restored, and the joint closed, horseshoe drains were left *in situ* for two days. The joint was immobilized for ten days when the patient was allowed to walk with crutches, which he was able to discard two months after the accident. A skiagram showed

callus formation at the site of the fracture of the internal malleolus. The ankle movements were complete and the patient was able to return to duty as a pilot. Weitzel concludes by remarking that his decision to preserve the head of the astragalus and to replace the internal malleolus was due to his having seen a patient a few days previously who had had a fracture of the astragalus (three fragments) and of the internal malleolus. Astragalectomy had been performed and the internal malleolus had not been replaced, the result was that the patient had severe pes valgus with projection of the base of the internal malleolus and ulceration of the skin at this point. The patient could only walk with severe pain on the heads of the metatarsals. There was extensive oedema of the dorsum of the foot and the patient asked that the foot might be amputated. This disastrous result led Weitzel to adopt a conservative procedure in the aviator's case, which produced an excellent functional result, with only a minimal degree of shortening of the limb, due to the loss of the posterior portion of the astragalus.

31 Suprarenal Transplantation in Addison's Disease.

DMITRIJEV (*Zentralbl. f. Chir.*, May 16th, 1925, p. 1082) records a case of Addison's disease in which considerable improvement followed subcutaneous suprarenal transplantation. The patient was a man, aged 26, who was in good health until 1920, when he developed general bronzing of the skin and pronounced asthenia. In March, 1923, a dog's suprarenal was transplanted under local anaesthesia. General improvement took place, and a month later the patient felt quite well. Dmitrijev has been unable to find any records of improvement after suprarenal transplantation in Addison's disease. Biedl in his textbook quotes three cases in which the operation had a bad effect. In two cases death followed twenty-four hours after transplantation of a dog's suprarenals (Jiboulay), and in a third case reported by Basch and Wihl, in which a pig's suprarenals were transplanted, the patient died after a fortnight's improvement. In the present case, as well as in seven others in which he performed suprarenal transplantation for spontaneous gangrene, Dmitrijev found that the transplanted suprarenal had undergone atrophy within ten days. While admitting that the case was not conclusive, especially as it had not been kept under observation for long, he considers that the result was sufficiently encouraging to justify further operations of the kind in Addison's disease.

32 Remote Results of Heart Suture

L. HESSE (*Deut. Zeit. f. Chir.*, May, 1925, p. 239) has collated 107 cases of operative treatment of wounds of the heart, and gives particulars of 48 cases admitted from 1903 to 1921 to the Obukhov hospital, Leningrad. Of these 48 patients 33 died and 15 survived, three of these survivors could not be traced after discharge from hospital, but the remaining 12 patients were under observation for periods varying from seven months to fifteen and a half years. Hesse arrives at the following conclusions. Among the patients who survived, suture of all types of heart wounds is successful in 77.3 per cent of cases, in 22.7 per cent the result is moderately good, and only in 1.7 per cent were the results unsatisfactory. In only 1 case (0.8 per cent) was the operation, after an interval, followed by death. In general the ultimate results of heart suture are excellent, in spite of the fact that in the majority of cases pericardial adhesions occur. Exercise tests showed that 80.1 per cent of these patients were able to do full work, while 8.4 per cent were able to work moderately hard, the general condition was good in 89 per cent of patients. A number of these patients suffered subsequently from serious illness, or lived under conditions which formed a severe test of functional soundness—such as lobar pneumonia, epidemic influenza, typhus fever, recurrent fever, pruritus, severe fatigue, watery service, pediculosis and chronic alcoholism. Moderately good results followed suture in 21.3 per cent of punctured wounds and in 29.6 per cent of gunshot wounds of the heart, in the latter class the characteristic explosive effects were obvious and retarded recovery. Similarly, the results in through and through punctured wounds were less favourable than in single stab wounds of the myocardium, in the former case fair success was obtained in 22.6 per cent, while among cases of single wounds the proportion of recovery was 37.5 per cent. Wounds of the auricles were more serious than those of the ventricles, in auricular wounds moderately good results were obtained in 21.8 per cent of cases while in those of the ventricle the percentage was 25.8. In 10 instances the trunk or branches of one of the coronary arteries were ligatured, no evil effects followed. In the early days of heart surgery a number of cases of dry pericarditis occurred after operation occasionally this was severe and chronic. Suppurative pericarditis is a very serious but not necessarily fatal complication, among a recent series of cases Hesse found 9 patients suffering from this. Plastic pericarditis and mediastino-pericarditis followed

operation in 27 per cent of all cases, the resultant adhesions bound down the heart and impeded its action, myocardial hypertrophy followed, and in some cases the adhesions were stretched. In other cases the pericardial sac was completely obliterated, resulting in severe dilatation, myocardial failure, and finally death. One of these patients exhibited the classic symptoms of Pick's syndrome. Hesse thinks that it is possible that operation on the lines of Brauer's pericardial thoracotomy may prolong life in some of these cases, when there is no evidence of stretching of adhesions as the result of cardiac and respiratory movements. In numerous cases the pleura and lung were wounded and inflammatory effusion followed, this complication was neither so frequent nor so serious as pericarditis. In 2 cases aneurysm developed in the pericardial scar, possibly due to local necrosis following infarct. In the great majority of cases there was no change in the character of the heart sounds, but in 13.5 per cent there was persistent tachycardia. Occasionally necrosis of one or more costal cartilages in the thoracoplastic flap occurred. Skiagrams and screening showed that in spite of the fibrous scars in the myocardium the heart outline and contractions were absolutely normal, while electrocardiograms indicated that in the majority of cases the function of the auriculo-ventricular bundle was completely restored.

Therapeutics.

33 Diathermy in Gonococcal Infection

I. P. CUMBERBATCH and C. A. ROBINSON (*Brit. Journ. Venereal Dis.*, April, 1925, p. 36) record their experience of the treatment of gonococcal infection by diathermy. Its application to the prostate and seminal vesicles alone caused subsidence of symptoms, even when the testis, epididymis, and vas were affected, and metastatic arthritis was present. In this last condition application to the joints was not found necessary. The contents of the serotum were included in the treatment because pain was thus relieved more quickly. With the patient lying on his back one electrode eight inches long is passed four inches into the rectum, the outer end being depressed on to the couch while the other electrode of thin sheet lead encircles the pelvis or waist. The current is increased until pain is felt, when it is reduced until the pain disappears, at which strength it is continued for twenty minutes. This treatment is repeated twice weekly. For application to the testis, epididymis and vas, strips of lint soaked in salt solution are applied to the scrotum and covered with thin sheet lead to form one electrode, the circuit being completed by the rectal electrode. The authors contend that the application of diathermy to the disseminating foci will cure or arrest gonococcal arthritis, they found the subsidence of inflammation, pain, and tenderness after three treatments spread over a period of ten days in epididymitis was strikingly rapid. In chronic cases three or four weeks' treatment may be necessary. In prostatitis and vesiculitis diathermy caused cessation of discharge, and disappearance of the gonococci and of the metastases in the joints and epididymis. In urethritis in the female and in endometritis five applications appear to be sufficient if recrudescence does not occur, and in salpingitis subsidence of pain, tenderness, and swelling usually result by the fourth application.

34 Tryparsamide in Neurosyphilis

J. H. STOKES and L. F. A. WILHELM (*Arch. Derm. and Syph.*, May, 1925, p. 579) treated 152 cases of neurosyphilis by weekly injections of tryparsamide in 3 gram doses for from eight to ten weeks, accompanied by intramuscular injections of mercuric salicylate in 1 gram doses. They consider the method superior to others in resistant cases. Since there is, however, a definite risk from eye complications, treatment should be preceded and regulated by careful examination of the eyes, especially with reference to visual activity and perimetric fields. Such symptoms as blurring of vision, flashes of light, and difficulty in seeing objects near the feet should lead to examination for organic injuries, which, if present in the slightest degree necessitate discontinuance of treatment. In mental cases a flare up of symptoms may occur requiring special nursing and precautions against violence. Tryparsamide appears to be beneficial in resistant tabes, and in early paresis its use is recommended in conjunction with other forms of treatment. In certain cases sexual activity is increased, and with the possibility of converting an unobjectionable and harmless patient into an objectionable and dangerous one each case must be considered from the social aspect. In other types of syphilis its use is contraindicated on account of its lack of spirillocidal power. Owing to the possibility of eye complications the authors consider that the drug should be used as a last rather than as a first therapeutic resort in asymptomatic neurosyphilis.

Diseases of Children.

33 Pneumonia in Anaemic Infants

M. H. BASS (*Inner Journ Dis Child*, March, 1925, p. 318) records the favourable results he has had with blood transfusion in 10 cases of pneumonia in anaemic infants, all under 3 years of age. In 3 cases citrated blood was employed, in the others whole blood by the Unger method, the amount transfused varying from 150 to 400 c.c.m. In only one case was there a severe reaction, the temperature rising to 105.8°, with chill, within an hour of the transfusion of citrated blood, but after this there was an immediate drop to 99.2°, followed by continued normal temperature and rapid recovery. In every case there was not only improvement in the anaemia but cure of the infection, 9 patients recovered, 1 patient suffering from coeliac disease improved for a time, but finally died of purulent meningitis. The author offers no definite explanation of the success of the treatment, and points out that there is a difference in the circulatory efficiency in infants and children as compared with adults, which possibly accounts for the lack of circulatory embarrassment during and after the blood transfusions.

35. Rickets

R. POLLITZER (*Il Policlinico*, May 11th, 1925, p. 659) refuses to think of rickets as limited to the skeletal system, and states that it is an anomaly of tissue change of which the bony changes are only one of the consequences. In rickets there is an inability to fix the calcium and a diminution of the phosphorus in the blood serum, which slows the processes of tissue change and induces a state of acidosis. This anomaly of tissue change is, he thinks, determined by a deficiency in the hormone, physiological, and vitaminic stimuli. This deficiency may be primary and dependent on constitutional, alimentary, or environmental causes, or secondary to digestive or toxic infective causes. Calcium is seldom much below the normal content (10 mg. per 100 c.c.m.) in the blood serum. Syphilis causes a special type of early rickets (before 3 months), characterized by cranial lesions, anaemia, enlarged spleen, and marked deformities. It is doubtful whether endocrine changes act as a primary cause of rickets. The ultra violet rays seem to act by increasing the phosphorus content in the serum.

37 Infantile Lupus

L. CHATELIER (*Ann de Derm. et de Syph.*, April, 1925, p. 265) states that lupus in early childhood is more common than is usually thought, and occurs as a secondary infection usually, the primary type being very rare. He describes a case in a child in whom, when 7 months old, a small chronic indolent lesion appeared on the left forearm. Two months later a similar lesion appeared on the right cheek, spreading in a few weeks to the nostril and inner part of the lower eyelid. When first seen there was induration of the surrounding parts, but later, progressive softening occurred. On the left forearm there was a patch of lupus as large as two lentils on the cheek the lesion was rather smaller than a threepenny piece. The nose was swollen, the centre of the lymphangitic ridge was softened and fluctuating, at this point the skin was unaltered. Until the age of 6 months the child was healthy and of normal development. There was a family history of tuberculosis. Both lesions were excised. Histologically they were typical, and two months later the child was quite well. Hutinel and Jeanselme (1909) published the case of a child, aged 5 months, in whom lupus followed chronic facial eczema. Jungmann collected 838 cases of lupus among these 7 occurred in the first year of life, 10 before the second year. In nearly all the cases there was a family history of tuberculosis. Chatelier adds that lupus in children almost always attacks exposed parts—the cheeks, hands, forearms, or thighs. The lesions are seldom numerous or extensive, and, as in adults, spread very slowly. Prognosis must be guarded when, as in the present case, lymphangitis occurs, indicating active tuberculous extension. Excision, he thinks, remains the most satisfactory method of treatment, although the Finsen lamp gives equally good results in suitable cases.

Obstetrics and Gynaecology.

38 Anterior Crural Nerve Paralysis after Childbirth

N. A. CARR (*Journ Bone and Joint Surg.*, April, 1925, p. 451) records a case of complete paralysis of the anterior crural nerve occurring in a woman, aged 26, after the normal birth of her second child. Her first pregnancy had been normal until the eighth month, when she developed a dull aching in the symphysis and lower part of the back, this gradually

increased until delivery, when the symphysis symptom disappeared in a few days, but the back aching persisted for a further four months. With the second pregnancy the symptoms returned at the seventh month with tenderness over the symphysis extending to the left along Poupait's ligament. Delivery was not followed by relief, and extreme tenderness and swelling were present over the articulation and extended to the centre of Poupait's ligament on both sides. Complete paralysis of the left anterior crural nerve developed from the fifth day but gradually improved until six months after delivery, when normal function and strength in the limb had returned. The paralysis appeared to be due to pressure upon the nerve before its division into the anterior and posterior branches, causing complete motor paralysis without disturbance in sensation. Cary believes that this was probably due to an abnormal position of the nerve in the pelvis; and that the severe symphysis pain was caused by an early separation of the articulation and inflammation of the synovium, together with irritation of the sensory portion of the genito-crural nerve from pressure.

39 Primary Mortality of Radium Treatment of Cervical Carcinoma

G. DODERLEIN (*Zentralbl. f. Gynak.*, April 18th, 1925, p. 852) states that in a series of 2,200 cases of radium application for cancer of the cervix death occurred within a few days in 13, or 0.6 per cent. In 3 patients causes of death other than the treatment were found, but in 10 septicæmic processes following treatment led to death within seven to eighteen days. In 5 of these cases there had been some surgical treatment of the tumour prior to the radium insertion. A recent communication of Baum is quoted in which 5 deaths are reported to have occurred after radium applications in 25 patients who had been previously shown to harbour locally virulent staphylococci, and one death in 50 patients without such organisms. Doderlein recommends that before radiotherapy each carcinomatous patient should be examined for the presence of virulent staphylococci near the growth, in those harbouring such germs only a ray treatment (or possibly vaginal rather than intracervical radium application) should be performed, in the first instance at any rate, all instrumental procedures being avoided. In this way, he remarks, the primary mortality of radium treatment, already very small, may be made negligible.

40 Pelvic Haematocoele in Sarcoma of the Uterus

F. PATRI (*Rivista d'Obstet. e Ginecol. Prat.*, April, 1925, p. 161) records the case of a 3 para, aged 36, who for eight years had had menorrhagia but appeared to be in good health until, shortly after two painful menstruations, she was seized with violent hypogastric pain followed by temporary loss of consciousness. Examination led to diagnosis of uterine myoma. The morning before her admission to hospital a second attack of pain occurred, with increased vaginal bleeding. Two days later the pouch of Douglas was found to be filled by a semi-liquid mass, shown at the operation to be a haematocoele. The uterus, the size of a three months pregnancy, was softened, and just above the isthmus there was a perforation 2 cm. in width. The neoplasm was found to be a spindle cell sarcoma, and there was no trace of a pre-existing myoma. The patient died three weeks later. Erosion of the uterus by a sarcoma appears rarely to have caused such acute symptoms as in this patient, and in most cases reported the sarcoma before perforating has been present for a considerable number of years.

41 Bilirubinaemia in Pregnancy

L. PUCCIONI (*Società Toscana d'Obstet. e Ginecol. and Riv. d'Obstet. e Ginecol. Prat.*, March, 1925, p. 1) has estimated the bilirubin in the serum of 65 pregnant, parturient, and puerperal patients. During the first eight months of gestation the bilirubin varies from a trace to an average of 0.9 van den Bergh unit, during the ninth month towards term and during labour, it is notably increased. Very high values were found in two eclamptic patients in premature labour and in two other eclamptics during the puerperium. The bilirubin was also increased in certain patients who manifested no sign of toxæmia other than slight albuminuria. In all patients the bilirubin progressively diminished during the puerperium to a small trace. The author refrains from drawing conclusions, in these preliminary observations as to hepatic function in pregnancy and its toxæmia.

42 Pelvic Measurements

ACCORDING to L. LITZEN (*Zentralbl. f. Gynak.*, April 11th, 1925, p. 817), the average measurement of the true conjugate of the pelvic brim in the presence of the soft parts is 10.4 cm., and variation between 9.5 to 11.5 cm. is found in normal pelvis. The average internal diameter is 23.5 cm., variation from 28.5 to 32 cm. occurring in normal pelvis.

The transverse diameter of the brim varies between 13 and 15 cm. The intercrystal diameter may show wide variations in comparison with the conjugate—from 26.5 to 34.5 cm, with a conjugate of 11 cm, and similar divergences are shown in comparison of the transverse and conjugate brim diameters. Clinical measurement of the intercrystal diameter enables no very certain inference to be drawn concerning the transverse diameter, intercrystal diameters of 28, 29, 30, 31, and 32 cm correspond to mean transverse diameters of the brim of 13.6, 13.8, 14.1, 14.3, and 14.6 cm respectively, but the transverse diameter thus calculated may be about 1.6 cm larger or smaller than is actually the case in a particular pelvis. The figures are derived from necropsy measurements of the pelvis still clothed with soft parts.

43 Hydatidiform Mole at the Age of Fifty-two

MARZETTI (*La Clin. Ostet.*, February, 1925, p. 66) describes the case of a woman, aged 52, who suffered from menorrhagia and was thought to have a myoma. A myomatous nodule in the fundus uteri was found at the operation and also a hydatidiform mole which had partially eroded the uterine wall. Marzetti adds that apart from the indication of this erosion, hysterectomy was justified by reason of the large percentage (38 to 53 in various statistics) of cases in which chorion epithelioma is preceded by a vesicular mole.

44 The Disinfectant Value of Chloramine

G. FROMMOLT (*Zentralbl. f. Gynäkol.*, May 16th, 1925, p. 1075) states that Linzenmeier and Engelhorn recommend midwives to use chloramine instead of mercuric chloride as a disinfectant of the hands. Frommolt has carried out exhaustive experiments for the purpose of determining the disinfectant power of chloramine as compared with that of (1) 5 per cent lysol in (70 per cent) alcohol, and (2) 0.05 per cent and 0.1 per cent mercuric chloride for disinfection of the hands. Subsequently he used it in a large number of intravaginal gynaecological operations. In 163 cases chloramine was employed, while mercuric chloride was used in 159 cases as a preliminary the hands are thoroughly scrubbed with nailbrush, soap, and hot water for ten minutes, they are then rinsed in hot water and immersed for from three to ten seconds in the antiseptic solution, this is removed by a careful rinsing of the hands in hot water for thirty seconds. The hands are then thoroughly dried with a sterile towel and a toothpick is used for scraping beneath the edges of the nails. Cultures were then made from the scrapings. Frommolt reports that chloramine is inferior to mercuric chloride and to a 5 per cent alcoholic solution of lysol. In alcoholic solution its action is similar to that of lysol, but stronger concentrations and the daily use of chloramine cause dermatitis of the hands. He found chloramine solutions in 0.05 to 0.1 per cent concentration useful for douching the vagina, either as a preliminary to operation or for the disinfection of offensive discharges during pregnancy.

Pathology

45 Pathogenesis of Internal or Spontaneous Anthrax

G. SANARELLI (*Ann. de l'Inst. Pasteur*, March, 1925, p. 209) dissents from the view that cases of internal anthrax are due to the ingestion of anthrax spores with the food, the pathological lesions found in the intestine being the result of the direct attack of the anthrax bacilli on the gut wall they are in short internal malignant pustules. He has found it impossible to reproduce anthrax in rabbits or guinea pigs—adult or newly born—by the administration of the bacilli by the mouth. Experiments made *in vitro* by inoculating 1 cm of the gastric juice of a newborn guinea pig with a loopful of blood containing anthrax bacilli, and subculturing on to agar after varying intervals, showed that the bacilli were all killed in between two and forty minutes, depending apparently on the acidity of the fluid. When anthrax spores were given by the mouth to guinea pigs and rabbits, even in enormous doses, the results again were negative in all but a few instances, the spores being incapable of proliferating either in the stomach or the intestine. Experiments *in vitro* showed that the intestinal juice prevented the spores from multiplying though it had no such action on the ordinary intestinal bacteria. It therefore appears that the spores taken in by the mouth are partly aspirated or taken in other ways to the lungs. Thus, in rabbits infected with spores by the mouth, the organisms were demonstrated a few hours later in the lungs and twenty-four hours later in the spleen and other viscera. To determine the effect of introducing anthrax spores into the respiratory passages Sanarelli injected given numbers

into one nostril in such a way as to ensure their being aspirated into the lungs. If about 100,000 spores were injected, death occurred from anthrax, if fewer were given, the animals did not die, but the organisms were ingested by the phagocytes and carried to the various internal organs, where they could be demonstrated even after several days. Here they remained in a latent condition, till finally they were destroyed. But while they remained alive, it was found possible to stimulate them to activity by the simple device of injecting some substance, such as arsenic, lactic acid, sodium hyposulphite, or even distilled water, into the spleen, liver or kidney, which produced a necrotic area, this enabled the spores to germinate, to invade the blood, and to set up fatal septicaemia. The same effect was produced by incubating the rabbits at 37°C, or by feeding them on a diet poor in water. Finally Sanarelli shows that the intestinal lesions present in anthrax are due not to enteric but to haemotogenous infection. They occur after subcutaneous injection of the organisms, and are most marked in young dogs, less so in the omnivora, and least of all in the herbivora. By this method it is possible to produce in guinea pigs swelling and ulceration of Peyer's patches, passing on to haemorrhagic necrosis, and accompanied sometimes by ulceration and necrosis of the intestinal mucosa.

46 The Physiology of the Lung

G. H. ROGER and L. BRUNET (*Rev. de Med.*, No. 1, 1925, p. 1), as the result of some years' study of the lung, state that it is something more than a mere filter with respiratory functions, and they consider it a glandular organ comparable to the liver and playing an important part in metabolism. As the liver acts on the albumins and sugars, so the lung acts on the fats brought to it by the thoracic duct and veins. They add that the fats are arrested in the fine capillaries of the lung, and are oxidized by a kind of intravascular digestion, started by a ferment in this process of combustion on the fats a certain amount of heat is generated. These pulmonary fat contain antirheumatic and growth vitamins. Moreover, the authors believe that the lung also exercises a certain influence on the alkaloids and different toxic substances brought to it.

47 Diphtheroid Organisms in the Blood in Obscure Fever

E. GUNDERSEN (*Norsk Mag. f. Lægevid.*, May, 1925, p. 477) records three cases of remittent fever in female patients, aged 20, 57, and 10, without any obvious lesions. The serum test for typhoid fever was negative in each case. In the first case the disease began with rhinitis and lasted for two months, but the patient gradually recovered. In the second case the disease developed after an injury to the nose and lasted two months, when death supervened from exhaustion. There were no signs of a malignant growth or tuberculosis. In the third case the illness lasted two and a half weeks, death being due to septicaemia with signs of endocarditis. In each case a growth of *Bacillus aeris* was obtained from the blood. Gundersen thinks it probable that this organism had invaded the blood from the nasal mucous membrane, though he would not assert that the organism isolated was the cause of the disease.

48 Urea Tolerance in Health and Disease

H. E. ARCHER and G. D. ROBB (*Quart. Journ. Med.*, April, 1925, p. 274) describe an attempt made to devise a urea tolerance test on the lines of the glucose tolerance test in diabetes. A solution of 15 grams of urea, in 3 ounces of water was administered, and blood urea determinations were made 30, 60, 120, and 240 minutes subsequently, the urea in the urine being estimated at intervals of 60, 120, and 180 minutes after the urea had been given. Investigations were made in twenty-eight cases, four healthy persons being used as controls, and curves were plotted. The authors found that, in normal individuals, after urea had been administered the return to the normal concentration was complete in 120 minutes. In patients with pronounced renal disease the examination of the resting level of blood urea, taken in conjunction with the concentration, was found quite adequate for the diagnosis of renal insufficiency, the tolerance test being therefore unnecessary. In sixteen cases the presence of renal insufficiency was less apparent, and in twelve of these there was known to have been some interference with renal function, very valuable help being obtained by the tolerance test. Though the resting blood urea levels and the concentration test results were normal, the tolerance test showed the presence of renal deficiency in all cases except one. The authors dissent the value of the tolerance test in detail, and believe it to be more trustworthy than the other two tests in detecting renal insufficiency of slight degree. They add that the chief disadvantage of the test is the rather long period during which specimens must be collected.

CABANES and MONTOUX (*Gaz hebdomadaire des Sciences Médicales de Bordeaux*, April 19th, 1925, p 243) state that ocular disturbances at the onset of epidemic encephalitis or in the course of its prolonged forms have been noted by Aebard and Netter in 75 per cent of all cases. The present authors, however, like de Lapersonne, think that they are really much more frequent. Although involvement of the optic nerve is perhaps much commoner than is supposed, ocnomotor disturbances are much more often encountered. Paralysis or paresis of one or more muscles of one or both eyes is chiefly found at the onset of the disease. The principal features of these palsies are that they are incomplete, partial, and dissociated, showing a tendency to shift from one muscle to another and to extend. The symptoms may be described as follows: (1) Ptosis, which is very frequent on one or both sides, is complete or incomplete, generally transient, and sometimes so slight as to escape notice altogether. (2) Diplopia, which appears to be constant but is often atypical. It is sometimes the first sign of the disease and is frequently found, as de Lapersonne has shown, in ambulatory cases. (3) Paralytic or paretic strabismus, which is more or less pronounced. The third, fourth, and sixth nerves are most frequently affected, but chiefly the third. The various ocular palsies may be isolated or combined. The most frequent combination is paralysis of the vertical movements and those of convergence. The authors think that the so-called palsies of divergence are really spasms of convergence. The internal muscles of the eye are often involved. English authors have emphasized the frequency of unilateral or bilateral paralysis of accommodation and of botulism. Most writers have, which is usually associated with, reflex to light. Often the reflex to accommodation is diminished while the reflex to light is preserved—the converse of the Argyll Robertson pupil.

ROUSSEAU SAINT PHILIPPE (*Bull de l'Académie de Médecine*, April 28th, 1925, p 470) emphasizes the fact that whooping cough is variable in its form, appearance, and course. Side by side with moderate and well marked cases are incomplete and abortive forms which escape recognition and are often the most dangerous. Pertussis is not always accompanied by a whoop, but should be suspected in the presence of an obstructive cough, most pronounced at night and followed by vomiting or expectoration. The cough may be rendered characteristic by pressure with the thumb on the cricothyroid region or trachea or by tickling the windpipe. Lastly, all doubt can be removed by bacteriological examination of the sputum. Whooping cough patients should be kept under close observation and should be antenatalized periodically, as many of the complications are insidious and latent. They are chiefly found in the prolonged relapsing forms. In view of the fact that whooping cough predisposes to tuberculosis, prolonged contact between a case of whooping cough and one of active tuberculosis should be carefully avoided. The patients should be protected against chills and secondary infections. The author does not agree with those pediatricians who recommend that the period of staying away from school should be shortened on the ground that the causal organisms are hardly ever found in the sputum, as they may be lurking in the recesses of the larynx.

LOUIS BORY (*Bull Soc Française de Dermatologie et de Syphilis*, April 1925, p 171) suggests the possibility of the existence in women of cases of unrecognized but contagious syphilis evading the strictest clinical observation—a matter of considerable importance in the examination of prostitutes. He asks whether such atypical cases have a special origin with an abnormal onset, and whether it is possible for an apparently non-syphilitic woman to convey infection to a man. Bory cites the analogous examples of carriers of tuberculosis, diphtheria, cerebrospinal meningitis, and enteric fever and quotes Milian's remarks. The untreated syphilitic exudes spirochaetes from every pore and in all his secretions. Bory condemns the official method of inspection of prostitutes, and thinks that the Bordet-Wassermann test should be compulsory in every case. He holds that in the absence of any lesion of skin or of mucous

membrane, spirochaetes may travel as far as the ovaries, or even the peritoneum, where they may remain dormant for an unknown period, or possibly, in the absence of favorable conditions, they may die. Such spirochaetes, latent in the ostium of the Fallopian tube, might attack the ovum at the moment of fertilization, so explaining Colles's and Protos's laws. Moreover this suggestion would account for the varying degrees of immunization of women in regard to syphilis, even to the extent of complete immunity. Bory believes that a woman may be infected either by local infection, producing, as in man, a chancre followed by secondary generalization or by direct inoculation of the menstruating uterine or of the peritoneum, in the latter case the local lesion does not occur, and in the majority of cases the disease remains latent.

J. SABRAZES, D. POUZAT, and P. LARAUD (*Journ de med de Bordeaux*, May 10th, 1925, p 371) state that two groups of combined meningococcus and pneumococcus infection can be distinguished. In the first group pneumococci are found at the onset of the disease in smears and cultures among the meningococci which predominate. Netter has seen cases of this kind in which recovery took place under combined anti-meningococcus and anti-pneumococcus serum therapy. In the second group, as the meningococcus infection appears to be subsidiary, pneumococcal infection supervenes, and the disease assumes a most malignant form, against which the most energetic anti-pneumococcus serum therapy proves ineffective. The present case was that of a man, aged 23, who developed a severe attack of meningococcus. A meningitis accompanied by extensive labial herpes. During the course of treatment pneumococcus meningitis developed. The symptoms consisted of hyperpyrexia with dissociation of pulse (76) and temperature (105.4°), and towards the end intense polyuria and glycosuria.

J. M. T. FINNEY, sen and jun (*Surg, Gynecol and Obstet*, June, 1925, p 743), report a series of fifteen cases of tuberculosis of the tongue. The condition is not common and occurs chiefly in cases of advanced pulmonary tuberculosis. It may be associated with a laryngeal manifestation also. The authors remark that primary tuberculosis of the tongue is very rare and the disease may manifest itself in several forms. Lupus may occur as an extension from the cheek. Tuberculosis is usually found as a single nodule deep in the muscles of the tongue and simulating a gumma. It tends to soften, form an abscess and ulcerate. The most frequent lesion is a shallow ulcer with irregular edges. It may be single or multiple and show a tendency to heal and break down again. The tip, margin or dorsum of the tongue may be attacked. Pain does not seem to be a striking feature, and when present is usually a late stage of the disease. There is a marked preponderance of cases in males as occurs also in carcinoma. Most cases occur between 30 and 60 years of age. The lymph glands may or may not be enlarged. The diagnosis may be difficult and is made by eliminating other conditions. The usual tests may be useful but it is often difficult to find tubercle bacilli present. The authors think that no special form of treatment is indicated, but recommend wide excision much as if it were carcinoma. The prognosis appears uniformly bad, especially in the presence of a general infection. Direct trauma appeared to be a causative factor in some of the cases.

E. WEGNER (*Zentralblatt für Chirurgie*, May 2nd, 1925, p 971) records the case of a woman aged 65, who was admitted to hospital for intestinal obstruction of two days duration. On laparotomy the distal end of the appendix was found to have undergone a cystic change and to be lying between two haustra of the ascending colon, no adhesions had been formed. The appendix was removed in the ordinary way, and the subsequent recovery was uneventful. The case was an example of a mucous cyst of the appendix, sometimes known as pseudo-myoma. In the previous cases on record this condition has merely been an autopsy finding, or has been discovered on laparotomy owing to rupture of the cyst.

necessitating operation Wegener has been unable to find any record of a similar case in which intestinal obstruction was due to a mucous cyst of the appendix. Although there was no previous history of such an occurrence, it is probable that inflammation of the proximal part of the appendix had occurred some years previously and had caused occlusion of the lumen. On microscopic examination the cyst showed all the layers of the appendix, especially the epithelium, in a good state of preservation. It was particularly remarkable that the goblet cells of the mucous membrane were still actively engaged in the production of mucus in spite of the internal pressure.

55 Cancer Mortality in Copenhagen.

P. HEIBERG (*Ugeskrift for Læger*, May 7th, 1925, p. 460) thinks the cancer mortality in Copenhagen has remained unchanged as far as a certain age class is concerned. He selected this age class (55 to 64) for this reason, among others—that the recent epidemics of influenza had comparatively little influence on persons in this decade of life. The twenty-year period studied was from 1904 to 1923, and the deaths from cancer in each of the five-year periods between 1904 and 1923 were as follows: Men, 354, 440, 488, 528, women, 421, 483, 561, 644. It will thus be seen that, in the period under review, there was a rise in the number of deaths from cancer by 50 per cent, and that the deaths among women were greatly in excess of those among men. But when these figures were corrected so as to show the number of deaths from cancer among 10,000 living persons in the same age group, the following figures were obtained: Men, 60, 63, 61, 60, women, 50, 51, 50, 52. In other words, there has been no change in this twenty-year period in the death rate from cancer in men and women between the ages 55 and 64, and the cancer mortality is actually about 20 per cent higher for men than for women.

56 Pseudo myxoma Peritonei

T. S. KLOTS (*Nederl Tijdschr v Geneesk*, May 9th, 1925, p. 2112), who records an illustrative case in a woman aged 50, states that pseudo myxoma peritonei was first described under this name in 1884 by Weith, who found it arising from an ovarian cyst. The first case in a man was reported by E. Fraenkel in 1901, in which it arose from the appendix. Subsequently several cases were described both in men and women in which the appendix was the only cause. Examples were also recorded of unilateral or bilateral ruptured ovarian cysts with a similar condition in the appendix. The prognosis is much less grave than is generally supposed if the primary and secondary pseudo myxomatous tumours are carefully removed. The appendix should be excised in all cases, even when it is apparently healthy. Pseudo myxomatous tumours adherent to the peritoneum should be left in situ if they cannot be removed easily, and the abdomen should be closed without drainage. When there is recurrence an operation should be performed as soon as possible and a careful search made for pseudo myxomatous growths. The operative mortality is fairly low. Of six patients operated on by Briggs, of whom only two had recurrences, after twenty-six months and seven years respectively, one died nine years after the first operation after having had twelve operations for recurrences, while the other four had had no recurrences two years after their operation. Of six patients operated on by T. Wilson one died nine days after the operation from intestinal obstruction and another two years after the operation from psoas abscess, while the others had had no recurrences nine months, two years, seven years, and eight years respectively after the operation. In Klots's cases, in which the condition originated from a cyst of the right ovary, a diagnosis of colloid cancer of the ovary was made at the first operation, but at the second operation a week later the true condition was recognized, and complete recovery followed.

57 Treatment of Perforated Gastro duodenal Ulcers

S. RADOJEVITCH (*Rev de Chir*, No 3, 1925, p. 161) deals with the treatment of perforated gastric and duodenal ulcers in a large series of cases. When the perforation had occurred less than twelve hours previously the mortality was 23.5 per cent in 119 cases treated by simple suture, whereas in 134 cases treated by gastro-enterostomy the mortality was 19 per cent. The prognosis, therefore, in early cases appears to be improved by the addition of a complementary gastro-enterostomy, and this was even more noticeable in cases of indurated and callous ulcer. Simple excision was employed in 18 cases with 2 deaths, a mortality of 11 per cent; the thermo-cautery used in 9 cases had a death rate of 22 per cent; gastro-pylorotomy in 124 early cases was followed by 14 deaths. Radojevitch considers that in early cases direct methods of treatment give better results and a lower mortality than indirect methods. In cases in which perforation had occurred more than twelve hours previously direct methods

such as excision and the use of the cautery, were found to have a distinctly higher mortality than suture combined with gastro-enterostomy. With regard to ultimate results simple suture appeared the least satisfactory, the author believes that where the ulcer is not dealt with directly there is probably a definite risk of malignant disease later. He concludes that in all cases, speaking generally, excision of the ulcer-bearing area or local treatment of the ulcer combined with gastro-enterostomy give the best results in the treatment of perforated gastric and duodenal ulcer.

Therapeutics.

58 Ulcers of the Leg treated with Insulin

M. FAURE BEAULIEU and M. DAVID (*Bull Soc Med de Paris*, June 12th, 1925, p. 892) report favourable results in ten cases of ulcers of the leg treated by insulin injections. In these cases, although the urine showed no trace of sugar, it was found unexpectedly that there was a slight excess of sugar in the blood, 1.67 to 2.77 per 1,000. The authors, however, do not consider that they were cases of latent diabetes. The insulin was given hypodermically and not used as a local dressing, and, except for the occurrence of urticaria in one case, no bad effects were noted. Most of the ulcers were large and chronic, they responded remarkably well to the treatment, and the authors suggest that insulin possesses a trophic action. In one case an ulcer $4\frac{1}{2}$ by $2\frac{1}{2}$ in was cured in two months, whereas a year previously it had taken seven months to heal.

59 Vaccine Treatment of Whooping cough

J. M. WIGGELENDAM (*Nederl Tijdschr v Geneesk*, May 23rd, 1925, p. 2326) states that in the last six months of 1924 he treated by pertussis vaccine 34 cases of whooping cough, 3 of which were in adults and 31 in children aged from 3 months to 8 years. The vaccine, which had been prepared at the Utrecht Serological Institute, had been put up in bottles of 10 c.c. containing 2,000 million bacilli per cubic centimetre. Increasing doses of 1,000, 2,000, 3,000, and 4,000 million were injected subcutaneously over four or five days. Half this dosage was employed for children under the second year of life, while patients more than 10 years old were given as much as 5,000 million. With two exceptions, in which no result was obtained even after six injections, remarkable success was attained after two to five injections, only one child, which developed very severe urticaria, showed any bad effects from the injections.

60 Adjuvants in the Treatment of Glaucoma

F. FERRIER (*Brussels Medical*, April 19th, 1925, p. 830) observes that at present the treatment of glaucoma, especially when acute, is essentially surgical. In acute glaucoma iridectomy is essential, but it cannot always be performed immediately, in all but the most acute attacks, it is possible that the use of suitable myotics will reduce the tension and thus improve the intraocular conditions, so rendering the subsequent operation safer and more effectual. The use of pilocarpine nitrate (2 per cent aqueous solution) or preferably a 1 per cent oily solution of eserine, instilled every six or eight hours, is very general. Their action is not yet fully understood, neither is the mechanism of glaucoma, but it would appear that the latter is a result of oedema of the vitreous which may be regarded as analogous to the anaphylactic or protein "shock" such as the angio-neurotic oedema of Quinke, or serum disease. Alteration of the chemical constitution of the intraocular fluids probably occurs very early, preceding by a long period the actual attack. Endocrine changes may be a contributory cause, since statistics show that glaucoma occurs rarely before the age of 50, and is rather more common in women than in men. Another probable contributory cause may be found in senile changes in the sclerotic lens and iris. Nervous factors have also been suspected, but if glaucoma is a vagotome phenomenon it is difficult to account for the mydriasis which is always so marked. Although adrenaline raises the general blood pressure, yet it has been found to diminish the intraocular tension, and it is therefore a valuable adjuvant in glaucoma. Rollet and Curtius succeeded in reducing abnormally high tension in a case of irido-cyclitis by subconjunctival injection of a few drops of 0.01 per cent adrenaline solution, thus rendering the use of atropine safe. Instillation of a similar adrenaline solution may dilate the pupil when intraocular hypertension exists, thus furnishing a means of diagnosing glaucoma. Fromaget by injecting into the retro ocular cone 3 c.c. of a 2 per cent novocain solution containing 10 per cent of a 0.01 adrenaline solution, succeeded in preventing a threatened attack of glaucoma in twenty minutes. Later he obtained similar results by the injection of adrenaline alone.

These observations have been repeatedly confirmed, but Terrien finds that this reduction of tension is always temporary, the lowest point being reached on the first or second day, after which the tension gradually rises, reaching its original height at the end of five or six days. In a case of acute glaucoma in which Terrien had performed iridectomy on the other eye four years earlier, the tension was very high (70 mm), with severe pain and vomiting. The patient could distinguish hand movements only at a few inches. Retrobulbar injection of 2 c.c. of novocain-adrenaline solution produced an obvious improvement, and by the evening the tension had fallen to 55 mm. Next day it rose to 60 mm, and, the pain having returned, iridectomy was successfully performed. The author adds that this procedure is valuable as it may assist the action of myotics in all cases, if it can not replace iridectomy it may enable the operation to be performed under better conditions, or at least delay operation until a specialist's arrival. The injection may be repeated several times, moreover, if hypertonia supervenes after iridectomy, it will assist the action of myotics. The mode of action of adrenaline in these cases is obscure. Dionne (in 5 or 10 per cent solutions) dropped into the conjunctival sac, or even the pure powder, which has a definite lymphagogue action, will give great relief to the symptoms and will reduce tension considerably. Some authors, regarding glaucoma as the result of vitreous oedema, have used subconjunctival injections of 1 per cent sodium citrate solution, these are always painful and may be replaced by a solution of sodium bicarbonate.

Anaesthetics.

61. Apothesine Anaesthesia

S. G. CHAVAN and J. P. ARLAND (*Indian Med. Gaz.*, June, 1925, p. 272) report the successful use of apothesine as a local anaesthetic in operating upon a patient with an irreducible scrotal hernia, enlarged heart, emphysematous lungs, and rigid arteries. An intradermal wheal was made one inch internal to the anterior superior spine and half an inch below it. The needle of the hypodermic syringe was then inserted vertically until the resistance of the external oblique muscle was felt, and 4 drachms of a 0.5 per cent solution of apothesine was introduced. The needle was then thrust horizontally in a direction midway between the anterior superior spine and the spine of the pubis, and 1 oz. of solution injected. An intracutaneous infiltration was made in the line of the proposed incision, and, after exposure of the hernial sac, its neck was infiltrated with about 2 drachms. The anaesthesia was found to be perfect in all respects, no shock was caused, and, although as much as 15 grains of apothesine was employed, no toxic effects followed.

62. The Fall of Blood Pressure in Splanchnic Anaesthesia

W. HARKE (*Zentralbl. f. Chir.*, March 14th, 1925, p. 565) states that Cyon and Ludwig in 1866 showed that section of the splanchnic nerves in the animal caused a considerable fall of blood pressure, which was explained by paralysis of the vasoconstrictors of the intestinal vessels and the resulting accumulation of a considerable quantity of blood in these vessels. This form of vascular paralysis is generally supposed to account for the fall of blood pressure after splanchnic anaesthesia, which forms a considerable drawback to this method. Hitherto all attempts to prevent it have been unsuccessful. Digitalis, strychnine, caffeine, and adrenaline have no permanent effect. Harke has recently employed "pituglandol," which is a 10 per cent extract of the fundibular portion of the hypophysis, in 28 cases of fall of blood pressure following splanchnic anaesthesia. In 24 cases the fall of blood pressure was avoided by giving 1 c.c. of pituglandol ten minutes before the injection of the anaesthetic, and the action of the drug lasted one to one and a half hours. The hypertensive action of pituglandol was all the more marked when there was a low arterial blood pressure from the first, or when a considerable fall of blood pressure had been caused by any therapeutic procedure, such as bleeding or eversion of the intestine. In four cases two injections of pituglandol were given, in one of which the second injection was followed by a fresh rise of blood pressure, and in the other three by no change. All four patients were very anaemic as the result of haemorrhage from gastric ulcers. Apparently, therefore, the action of pituglandol is not so marked in anaemic patients as in those with normal haemoglobin values. In cases of high blood pressure (175 mm Hg) 1/2 c.c. of pituglandol instead of 1 c.c. was given. The blood pressure after the injection rose to 250 mm, and then gradually sank to 150 mm, but no lower. No bad effects of any kind could be attributed

to the use of pituglandol in any of the 28 cases. According to Biedl the action of pituitary extract consists in producing a rise of the arterial blood pressure, partly by vascular contraction and partly by slowing and strengthening the cardiac action.

63. Sacral Anaesthesia

N. MURVEY and D. C. ELLIOTT (*Amer. Journ. Surg.*, Anaesth. Suppl., April, 1925, p. 39) describe the technique for producing anaesthesia by the injection of novocain into the sacral canal between the dura and the bony covering of the spinal cord. With a hypodermic syringe containing 2 per cent novocain solution an intradermal wheal is made over the sacral hiatus, the point over the tip of the sacrum which is situated at the apex of an equilateral triangle, of which the base lies between the posterior superior iliac spines. A spinal puncture needle is then inserted into the sacral hiatus at an angle of 45 degrees, and as soon as this impinges upon bone it is slightly withdrawn and lowered so that its shaft is parallel to the sacral canal, into which it can be introduced to a depth of 4 or 5 cm. With a 10 or 20 c.c. syringe partially filled with novocain solution aspiration is attempted, and if blood or spinal fluid appears the needle must be slightly withdrawn before an injection is made, as the solution must not be injected into either the blood or the spinal fluid. By dissolving a powder containing 1 gram of dry novocain and 0.2 gram of quinine and urea hydrochloride in 55 c.c. of normal saline and boiling for two and a half minutes a solution for injection is obtained which is never over 2 per cent novocain and 0.4 per cent quinine and urea hydrochloride, and at least 45 c.c. may be injected in normal adults. The authors consider that the method is suitable for operation upon the anus, lower rectum, perineum, and bladder, and occasionally the prostate, and in women for local operations upon the external genitals and for dilatation and curettage. In cystoscopies upon painful or irritable bladders the method is of great value.

Obstetrics and Gynaecology.

64. Ante natal Death due to Abnormalities of the Umbilical Cord

ACCORDING TO F. J. BROWNE (*Journ. Obstet. and Gynaecol. of the British Empire*, Spring, 1925, p. 17), true knots on the umbilical cord, which have been described as present in from 1 in 1,000 to 1 in 200 cases, may exist during intrauterine life without endangering the life of the foetus. In two of the author's cases, however, and in 24 cases collected from the literature, it appears that such knots may lead to foetal death, usually during the later months of pregnancy. In such cases the cord is not necessarily long and may even be unduly short. Knots existing before labour may, it is stated, be distinguished from recent ones by persistent flexion after the knot has been undone, by permanent grooving at the site, and by the local disappearance of Wharton's jelly. A few cases have been recorded of ante natal death due to encirclement of the child's neck (before delivery) by a loop of the cord, and sometimes the pressure is so great as almost to amputate the head. Excessive torsion of cord rarely causes the foetus to perish, the twists may be as numerous as 95, and insufficiency of the Wharton's jelly is probably an important predisposing cause. Localized constriction is frequently associated with pathological torsion; it is commonest at the foetal end, and is probably due to obliterating vascular changes. Haematomata and solid tumours of the umbilical cord are of great rarity.

65. Post climacteric Haemorrhages

M. HENKEL (*Deut. med. Woch.*, March 27th, 1925, p. 507) gives statistical evidence in support of his criticism of a textbook of gynaecology published in 1924, in which one of the writers, Stockel, suggested that a post climacteric haemorrhage should be an indication for immediate hysterectomy. Against the practice of first performing an exploratory curettage and carrying out a hysterectomy at a later date in the event of the microscopic examination revealing malignant disease, Stockel argued that the curettage might favour spread of the disease, and that this procedure entailed two operations instead of one. Henkel admits that the post climacteric uterus has finished serving its purpose, but he considers the risks entailed by the wholesale removal of every uterus convicted of post climacteric haemorrhage to be too great, particularly when the patient is old and likely to tolerate a general anaesthetic badly. In support of his contention that post climacteric haemorrhages from the body of the uterus are generally not malignant, he gives the following statistics from the University Maternity Hospital of Jena in the six year period 1919-24. Of 240 cases only 27 showed

malignant disease as indicated by the result of a microscope examination, in the remaining 213 cases the haemorrhages were from a benign lesion of the lining of the body of the uterus. In his private practice in the same period he had 72 cases of post climacteric haemorrhage from the body of the uterus, and only in 9 of these cases was carcinoma diagnosed. Adding his hospital to his private cases, he shows that only in 11.85 per cent. was the cause of the haemorrhage from the body of the uterus a malignant growth. In no case did the exploratory curetting do any harm, and his opinion of the harmlessness of curetting was confirmed by the examination of the uterus in these cases in which it was subsequently removed. The usual interval between the two operations in cases of malignant disease was a week. Hysterectomy was performed by the vaginal or abdominal route, according to the nature of the case, when pyometra exists—and this was so in two of the author's cases—hysterectomy by the vaginal route is apt to be dangerous.

63 Treatment of Menorrhagia in Virgins

A SIREDI Y (*La Gynecol.*, April, 1925, p. 193) remarks that the treatment of menorrhagia about the age of puberty is hindered by the difficulty of making a complete local examination, but the great majority of patients recover under general treatment. A careful examination must be made of the patient's health and the personal and family antecedents. Certain cases of menorrhagia occur in the subjects of cardiac, renal, or hepatic disease, here, in addition to treatment of the organic disease, absolute rest in bed is necessary during the menses. "Essential haemorrhages" in young girls, otherwise healthy, yield in the majority of cases to absolute repose during two or three consecutive menstrual periods. Very grave haemorrhages require, in addition, the raising of the foot of the bed and hypogastric application of an ice bag, renewed every three hours. Hot vaginal douches in grave cases are given with difficulty if the hymen is intact, they should consist of four or five litres of water at 122°F, be repeated at intervals of four hours, and if effective are usually so within forty-eight hours. Siredy adds that it is most unwise to advise a very liberal diet aided by tonic exhibition of iron, arsenic, and phosphorus, the diet should not be restricted, however, except, perhaps, in endocrine dyscrasia with tendency to obesity—here a milk and vegetable dietary is often useful. Search should be made for signs of thyroid inadequacy—coldness of the extremities, dryness of the skin, loss of hair, migraine, somnolence, and obesity. If these are found 25 mg. of thyroid extract with 1 to 2 cg. of hypophysis and 5 to 10 cg. of suprarenal extract may be given once or twice weekly for two or three weeks, the doses being increased if necessary. If these measures fail local examination is indicated, especially if the periods are followed by a scrous or mucous discharge tinged with blood, the detection of a mucous polyp or even of a dilated os calls for curetting under general anaesthesia, which usually brings about cure. Certain cases resist repeated curettings, and radiotherapy is therefore justified exceptionally. Siredy prefers intrauterine radium to x-ray treatment, chiefly because the antecedent curetting affords useful diagnostic data, he has used small doses of radium in eight cases of severe haemorrhage (resistant to curetting) in which the endometrium was polypoid and adenomatous. All these patients were cured, with conservation of the menses, one subsequently gave birth to healthy offspring. Cases of myoma and ovarian disease require the appropriate treatment. Siredy thinks that many cases of otherwise inexplicable menorrhagia in young virgins are due to an hereditary syphilitic taint, of which the patients may or may not show stigmata. In these cases he is of the opinion that the older treatment by mercury and small doses of iodides is more effective than administration of arsenic, benzol derivatives or of bismuth.

Pathology.

67 Viability of Typhoid Bacilli in Shell Oysters

H. O. JORDAN (*Journal Amer. Med. Assoc.*, May 9th 1925 p. 1402), as the result of his experiments, found that shell oysters infected with typhoid bacilli by floating for an hour in sea water to which typhoid bacilli had been added and then placed at ice box temperature (from 5° to 8°C) continued living typhoid bacilli after as long as twenty-four days. There was no evidence of multiplication, but rather a diminution, with the passing of time. F. O. FONVEX and J. L. WHITE (*ibid.*, p. 1403) carried out the following experiments. Shucked oysters were inoculated with typhoid bacilli and stored at 98°, 70° and 45°F. *B. typhosus* survived in the oyster fluid in considerable numbers for one, four, and twenty-two days respectively. Living shell oysters were inoculated with large numbers of typhoid bacilli and stored

at 70° and 45°F. At the former temperature *B. typhosus* survived in the fluid within the shells for eight days, while in the latter temperature, which is the ordinary icebox temperature of the trade, the organism survived for sixty days. C. KINLOUGH (*Public Health Rep.*, April 24th, 1925, p. 819) has also found that the typhoid organism may be recovered as long as fifteen days after it has been given to oysters at temperatures of both—2.8°C and 14.4°C. These experiments conclusively prove the importance of preventing contamination of the oyster at any time from the beginning of its growth to its ultimate consumption.

68 The False Dick Reaction

G. ZOFFLER and MANOUSSAKIS (*C. R. Soc. de Biologie*, April 10th, 1925, p. 1046) state that one of the chief difficulties in the performance and interpretation of the Dick test is the occurrence of the so-called "false Dick reaction" which Zingher has attributed to protein substances of streptococcal origin dissolved in the broth culture. When a streptococcal toxin is heated in the water bath to 100°C for an hour the toxin disappears and the protein elements persist. The heated toxin therefore remains capable of producing a pseudo reaction, and the true reaction can be distinguished from the false by giving a control injection of heated toxin. The true reaction is effaced or neutralized by the serum of a scarlet fever convalescent, whereas the pseudo reaction persists. The authors describe their technique for purifying streptococcal toxin and freeing it from the protein substances responsible for the pseudo reaction. The technique is based on the fact that the precipitation of albuminoid substances may occur without much affecting the streptococcal toxin. The best method of precipitating the protein substances is the employment of nitric acid or acetic acid in the presence of a 20 per cent. solution of sodium chloride. 2 grams of sodium chloride are dissolved in 10 c.c.m. of streptococcal toxin, and acetic acid is added drop by drop until its concentration is about 1 per cent., or 0.1 c.c.m. of acetic acid for 10 c.c.m. of toxin. The solution is then carefully shaken so as not to redissolve the precipitate formed, and rapidly filtered. The filtrate is neutralized by a decinormal solution of soda, and its sterility tested. The pseudo reaction is now abolished, or much attenuated, and no longer constitutes a source of error.

69 Persistence of Antitoxin in the Blood after Inoculation of Anatoxin

H. DAVREL, G. LOISEAU, and A. LATFAILLE (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, April 9th, 1925, p. 565) report three cases to show that the increase in the antitoxic power of the serum in persons vaccinated by anatoxin persists for some time. Eleven months, one year, and thirteen months respectively after inoculation the antitoxin content of the serum, though diminished, was still pronounced and considerably in excess of the quantity needed to render the Schick reaction negative. The authors find that the duration and intensity of the immunity conferred by anatoxin thus greatly exceeded those conferred by other methods of vaccination. LÉRENOUËT (*ibid.*, p. 567) also emphasizes the superiority of preventive inoculation against diphtheria by anatoxin over injection of antitoxin, which conferred only a temporary protection. In most cases 1/4 or 1/2 c.c.m. of anatoxin was given and repeated three weeks later.

70 Fibrinogen in the Cerebro Spinal Fluid

LET, and P. BRUNER (*C. R. Soc. de Biologie*, p. 1201) describe a method to distinguish the mechanical and the inflammatory types of the cerebro spinal fluid, based on the estimation of the proportion of fibrinogen to total albumin. In normal blood plasma this proportion is a little above 1 in 20, in the mechanical type of hyperalbuminuria the proportion in the cerebro spinal fluid is much the same, but in the inflammatory type it is greatly increased. To estimate the amount of fibrinogen the spinal fluid is mixed with an equal quantity of a saturated solution of sodium chloride, and left for twelve hours. At the end of this time the fibrinogen will be found precipitated in the form of a magma. Unfortunately it is impossible to estimate it directly, as it is impregnated with the sodium chloride. The total amount of albumin in the original fluid and in the dechlorinated fluid are estimated, the difference gives the amount of fibrinogen precipitated. For practical purposes it is not the total quantity of fibrinogen which is of importance, this may be high in a compression fluid and low in an inflammatory fluid. The important figure is the proportion of fibrinogen to total albumin. In compression of the medulla or cerebrum the figure is between 1 in 10 and 1 in 15. In inflammatory lesions, particularly those which are accompanied by an increased cell content (in syphilis, for example), it rises to 1 in 3 or 1 in 2.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

71 Anaphylaxis due to Insulin

M. RINAUD and A. LACROIX (*Bull et Mem Soc Med des Hop de Paris*, June 4th, 1925, p. 831) publish the case of a diabetic woman, aged 64, who, after injection of insulin, developed on several occasions signs of severe anaphylaxis. These consisted of marked oedema of the face and pharynx, vomiting, redness, giant urticaria on hands and feet, generalized pruritus, troublesome cough with abundant frothy mucus, headache and dyspnoea. The symptoms lasted about two hours. The authors tried to determine how far the condition was due to insulin and to other protein substances, they came to the conclusion that the insulin was responsible, causing haemolysis. This, they point out, would explain certain alterations in the coagulation time and in blood pressure which were noted.

72 The Heart in Faucial Diphtheria

H. M. MARVIN (*Amer Journ Dis Child*, April, 1925, p. 433) records his clinical and electrocardiographic observations on ninety patients with faucial diphtheria and three additional cases which were not studied with the electrocardiograph, but were subjected to necropsy. The only important abnormalities in the electrocardiogram were disturbances in ventricular or intraventricular conduction. Sinus arrhythmia occurred invariably in young patients with heart rates below 95 a minute. Auricular and ventricular premature beats, sino-auricular block, and variations in the form of the P wave were seldom noted and appeared to have no significance. There was no evidence that in some patients the heart was primarily injured, and in others the peripheral circulation suffered the first and greatest damage. In Marvin's patients who showed circulatory impairment the clinical picture seemed to be that of myocardial failure. The most important signs of myocardial involvement were vomiting, hepatic engorgement, and change in the character of the first heart sound. Syncope occurred only once in the series and gallop rhythm was noted only three times. Abdominal pain was complained of in five of the thirteen fatal cases. Necropsies in five cases revealed widespread myocarditis. The vagus nerves were found normal in the only case in which they were examined. Electrocardiograms proved of considerable value in the diagnosis and prognosis.

73 Geilher's Disease

K. REHSTEINER (*Schweiz med Woch*, May 7th, 1925, p. 410) gives an account of a small epidemic of Geilher's disease, which seems to have been unknown in Europe since 1900, although it has been more or less endemic in the north of Japan. In one house, in which a family of four persons lived, all showed signs of this disease, and in another family of four persons three were ill. All seven patients suffered from transitory attacks of ptosis of the upper eyelids, disturbances of vision, giddiness and weakness of the muscles of the nape of the neck. In one case there was also spasm of the orbicularis oculi—a phenomenon not commonly associated with Geilher's disease. The triad of phenomena which Geilher considered most characteristic are: (1) pareses of certain muscles, notably the levator palpebrae superioris, the muscles of the nape of the neck, and, in some cases, the extensors of the arms and legs; (2) disturbances of vision and giddiness; (3) pain in the nape of the neck and back. The disease, which is never fatal, usually begins in the summer and ceases when the weather becomes cold. Each attack of ptosis, giddiness, and pain lasts only a few minutes, but there may be as many as a score of such attacks during the day, and they are, therefore, liable to interfere greatly with the patient's work. Discussing the differential diagnosis, the author points out that the transitory character of the attacks distinguished his cases from typical cases of myasthenia pseudo-paralytica and lethargic encephalitis. In his summary of studies of this disease in Japan he points out that this is often a disease of stables, persons employed therein being subject to it, while others, even though they live in intimate contact with stablemen, remain immune. It would therefore seem that the disease is not contagious, though it has been known to be transmitted through the milk from mother to infant. The work of Couchoud in 1914 suggests that the disease is caused by small Gram-negative cocci, entities of which when injected subcutaneously into rats, may provoke signs identical with those observed in man.

74 Vaccine Prophylaxis of Scarlet Fever

L. PICCHEZZI (*Riv Polichinico*, Sez. Prat., April 27th, 1925, p. 594) states that on the occasion of an outbreak of scarlet fever near Rome in August-December, 1924, 150 children were given prophylactic intramuscular injections of Caron's vaccine on alternate days, while 100 other children served as controls. Of the 150 vaccinated children 34 developed scarlet fever at various periods after vaccination, and were classified in the following groups: (1) Five patients who contracted the disease one month after the last injection of vaccine, the symptoms were very slight and no complications occurred. (2) Nine patients who developed scarlet fever two months after the last injection. The symptoms in this group were more severe and five patients had complications, but all recovered. (3) Twenty patients who fell ill three months after vaccination and had a still more severe attack which was almost identical with that in the non-vaccinated. One died after presenting necrotic angina, effusions into the joints, and deep abscesses in the right hip, all the rest recovered, though four had nephritis, one otitis, and one pleurisy. On the other hand, all the non-vaccinated children contracted scarlet fever and mostly in a fairly severe form. 11 died—4 from a septic attack, 3 from toxæmia, 1 with meningitis, 1 of empyema, and 2 of nephritis. Moreover, a large number had renal complications and abscesses of various kinds. Picchezzi concludes that the vaccine prepared from the organisms isolated by Dr. Cristina, Caronia, and Sindoni is of undoubted efficacy in the prophylaxis of scarlet fever. T. LAZZARINI (*ibid.*, p. 595), during an epidemic of scarlet fever in Istria in October, 1924, vaccinated 70 children under 18 years of age with Caron's vaccine, 50 of these were brothers and sisters of the scarlet fever patients and had never had scarlet fever, but had been in close contact and in some instances in the same bed with the scarlet fever patients. The remaining 20 had not been in direct contact with scarlet fever patients, but were mostly the relations of the doctors and dispensers who had been exposed to infection. None of those vaccinated contracted the disease and no bad effects resulted from the vaccination.

Surgery.

75 Operative Treatment of Gastric Ulcer

K. A. MEYER, W. A. BRAMS, and W. N. GRAVES (*Annals of Surgery*, June, 1925, p. 1102) report a series of 22 cases of gastric ulcer in which the Polya operation of pyloric resection with gastro-enterostomy was performed after medical treatment had failed to give permanent relief, and there was evidence of the presence of a chronic ulcer of considerable severity. Eighteen of these patients, subsequently examined, showed an absence of free hydrochloric acid in the stomach contents. The rate of emptying of the stomach was estimated radiologically in 15 cases and found to be rapid in 10. Diarrhoea was found in only one case, and as a whole the patients were much improved after the operation, they were free from gastric symptoms, had gained in weight, and were able to return to their occupations. The authors believe that in such cases of chronic gastric ulcer it is wise to resect the pyloric antrum, so removing the ulcer and the ulcer-bearing area. Moreover, the eradication of the factors in ulcer formation—namely, the gastric juice and the retention of stomach contents—is also achieved. With the exception of one death and of one patient who was limited to light work, all the patients so treated have recovered completely and returned to their regular occupations.

76 Intestinal Obstruction due to Lane's Band

GIVESTI (*Bull et Mem Soc Nat de Chir*, May 30th, 1925, p. 593) reports the following case. A man, aged 30, was admitted with symptoms of acute obstruction of twenty-three hours' duration. There had been a sudden attack of generalized abdominal pain, and after that the patient passed neither faeces nor flatus, the vomiting being bilious. The abdomen was slightly distended and generally painful on palpation, especially in the umbilical and right iliac regions. There was a previous history of slight dyspepsia with pyrosis and slight constipation, but none of appendicitis or of lithiasis. A provisional diagnosis of perforated gastric ulcer was made, and an immediate suprapubic laparotomy was performed. The stomach and gall bladder were normal, but at the lower end of the incision congested and distended coils of intestine could be seen. The incision was closed and

the abdomen was reopened by a median subumbilical incision. A Meckel's diverticulum was found adherent to the anterior abdominal wall, and, although not the cause of the obstruction, it was divided and excised. The coils of small intestine were greatly distended, the colon was empty, the appendix was normal and non-adherent, the terminal portion of the ileum was completely flattened and compressed against the posterior wall for about 10 cm by a thick, smooth, fleshy band. This had produced a V shaped notch in the intestine with which its upper extremity was fused, while below it was attached firm to Douglas's pouch. The band was divided along the free border of the ileum and the abdomen closed. There was severe shock, the patient dying fifteen hours later. Ginestry states that only one previous case of obstruction by Lane's band has been reported (Hillingworth's). In that case the operation was performed eight hours after the onset and the patient recovered, in Ginestry's case there was a delay of thirty three hours. Manœuvre states that in the course of every appendectomy which he has performed in the last twelve years he has found Lane's band fifteen times—some times alone, at others associated with Jackson's membranes situated on the caecum and ascending colon.

77 Congenital Dislocation of Hip

L. W. LEE (*Journal Amer Med Assoc*, May 30th, 1925, p 1627) gives the results of a clinical study of 29 cases of congenital dislocation of the hip, of which 27 were females. The dislocation was right sided in 6, left sided in 6, and double in 17 cases. Treatment consisted in manipulation without incision, extreme abduction in plaster for three or four months and modified abduction for a further period. If this failed an open operation was performed through an anterior incision between the tensor fasciae latae and the sartorius, the capsule being opened, and adhesions and any constriction divided in order to remove all obstruction to the return of the femoral head into the acetabulum. When capsular constriction alone had been the cause of failure the thigh was put up in moderate abduction and slight flexion with plaster reaching only to the knee. In cases complicated by an anterior twist of the neck the femur was held in internal rotation with plaster extending down the leg with the knee in flexion in order to prevent the possibility of the head coming out of the socket. When, at the end of a month or two, the plaster is removed Sprengel suggested driving a steel nail into the great trochanter while an assistant maintains internal rotation. Through a small lateral incision the bone is divided and, while the proximal fragment is held in position by means of the nail, the distal fragment is rotated outward to lie in the plane of the body. On removal of the plaster there is then no reason for the patient to rotate the femur outward, but rather to rotate inward in order to walk properly, thereby making the reposition more secure. The development of the head affords a guide to prognosis since if this is approximately normal a good result may be expected.

78 Hydatid Pneumo cyst of the Lung

F. DAVIL (*Rev de Chir*, No 4, 1925, p 245) terms a partially evacuated hydatid cyst containing air or gas as well as fluid a "hydatid pneumo cyst". He maintains that hydatid cysts of the lung are much less rare than is commonly supposed, and that actually there are more recorded cases of hydatid cysts than of hydatid cysts of the liver. Dérivé has collected 71 cases of hydatid cysts of the pleura. Deves has collected 15 cases of hydatid pneumo cysts which simulated pyopneumothorax. He is convinced that the actual number is far greater, but he has found records of 31 or 32 cases of hydatid pneumothorax. In many cases the persistent cough, occasional haemoptysis, and progressive emaciation of the patient led to a diagnosis of tuberculosis, and in some cases it was evident that a secondary tuberculous infection had occurred. Hydatid cysts occur rather more frequently in the right lung (in ratio of 5 to 4). In almost every case the cyst spreads widely beneath the visceral pleura, reducing the layer of lung parenchyma to a thin fibrous or pyramaceous layer adherent to the costal pleura and without any trace of lung tissue. For this reason, at the time of operation, these cysts have frequently been described as "pleural". They are frequently very large, sometimes occupying two thirds of the lung. In those cases in which secondary infection by anaerobes has not occurred the cyst may rupture into a bronchus during an attack of violent coughing, with the evacuation of a considerable quantity of clear fluid. In other cases the fluid is frothy and contains white fragments of cyst wall and daughter cysts, if secondary infection has occurred the gas is horribly fetid and the fluid contents purulent. In numerous instances the diagnosis of serous pleurisy has been made and aspiration has yielded the characteristic limp fluid. Dérivé insists that, in spite of the fact that a certain number of these cases undergo spontaneous cure, every hydatid pneumo cyst of the lung should be operated upon as early as possible, since, while the cases submitted to opera-

tion show 65 per cent of recoveries, those on whom operation is not performed show 65 per cent of deaths. The ultimate prognosis is much more favourable than that of hydatid pneumothorax, as in the latter case a secondary pleural echinococcosis is almost certain to occur, in hydatid pneumo-cyst such a secondary infection is unknown.

Therapeutics.

79 Sanocrysin in Chronic Pulmonary Tuberculosis

L. NICOLAISEN (*Udvalgt for den Norske Laegeforening*, June 1st, 1925, p 553) has treated, at his hospital in Oslo, 20 cases of pulmonary tuberculosis, the course of injections of sanocrysin having been completed or prematurely discontinued in 12 cases. In the remaining 8 cases the treatment was not yet completed, but in some of these cases good results appeared likely. Of the 12 in the former class 4 discontinued the treatment early, either because their general condition was becoming worse or for other reasons. There were 2 deaths, one of which ensued within three days of the third injection, which was followed by severe vomiting and diarrhoea. The second death was that of a young man whose general condition was at first good. He tolerated the first injections well, but later he developed septicaemia, faecum with gangrene of a tonsil and high fever, which terminated in death three days later. This death was probably not due to the sanocrysin treatment. In the remaining 6 cases, in which the treatment was completed, no definite change in the physical signs was demonstrable except in one case in which the disease was of the pneumonic type and had lasted only five weeks. Four months later the sputum no longer contained tubercle bacilli, he had gained 17½ lb in weight the x-rays showed considerable diminution of the consolidation and his general condition was strikingly improved. The author considers that by giving smaller doses and allowing longer intervals between the intravenous injections than those originally recommended the treatment can be robbed of most of the dangers and discomforts described by its pioneers, and that many of the failures in the past were due to the selection of unsuitable cases. He prefers to reserve sanocrysin treatment for patients whose general condition is already good, and who show signs of disease which is only moderately progressive or is stationary. His initial dose is 0.1 gram, and this he increases gradually, allowing the reactions to determine the length of the intervals and the rate at which he increases the dosage. Having reached a dosage of 1 gram he repeats this dose as long as it gives rise to a reaction or a little longer. He is sufficiently impressed by the results he has hitherto achieved to want to continue this treatment, but he does not think it will be possible to gauge its value till at least five more years have passed.

80 A Rapid Method of Antirabic Treatment

A. HEMPT (*Ann de l'Inst Pasteur*, July, 1925, p 632) reports some favourable results which he has obtained in rabies by a new and more rapid method of treatment. Of recent years the method used in many cases of treatment has been the inoculation of "fixed virus", though satisfactory in most cases, it occasionally is followed by grave accidents. Alvisatos published his first experiments on the protective effect of etherized vaccine, which depended on the fact, first determined by Roux, that ether exerts an attenuating action on the rabie virus. By submitting the infected central nervous system of a rabbit to ether for a period of between seven and two and eighty four hours Alvisatos succeeded in producing a vaccine which protected patients who had been bitten seriously by rabie dogs or wolves—patients who would almost certainly have died. Stimulated by this work the author has made numerous experiments on the etherized vaccine, and has found that it is possible, by a short course of treatment, to confer on animals a degree of immunity such as could only be obtained by a much longer course with non-etherized vaccine, he then proceeded to adopt the method for the treatment of human patients. At first he employed it in conjunction with Hogyes's dilution method, but he now uses it alone. The dosage he prefers in adults who have been bitten is 1 to 2 grams in mild cases, 3 grams in serious cases, and 4 grams in the gravest cases. Vaccination is complete apparently in three or four days, and immunity is established in four to six days. In the last three years 6,000 persons have been treated by this method, with only three deaths of these, two occurred during treatment and one during the fortnight following treatment. The great advantage of the method appears to be its rapidity, a further point is that only in exceptional instances does it cause any unpleasant reaction.

81 **Treatment of Infantile Tetany by Artificial Sunlight**

A VALDAMERI (*Raggi Ultravioletti*, April, 1925, p 98) states that ultra violet rays have not only a bactericidal, oxidizing, sedative, decongestive, and disinfecting action, but also accelerate organic exchange, and have a favourable influence on the secretion of hormones and the production of phosphorus and calcium. After referring to a paper by Hoog, who successfully treated eleven cases of infantile tetany by ultra violet rays without any other remedies, Valdameri states that during the last three years he has employed this treatment in fifteen cases of infantile tetany, some of which were in a serious condition owing to the frequency and long duration of the attacks. In all these cases the action of the rays was rapid and decisive, reducing the number of the attacks from twenty to three or four after one or two applications, and causing them to disappear completely after three or four more. Valdameri records an illustrative case which shows that the cause of the spasms was to be found in deficiency of calcium and phosphorus and imperfect oxidation of the blood. The rays were applied for five minutes at a time to the front and back of the trunk at a distance of 50 cm. with a mercurial vapour Bach lamp.

Neurology and Psychology.82 **Huntington's Chorea.**

N. M. OWENSBY (*Journal Nerv and Ment Dis*, May, 1925, p 466) records a case of Huntington's chorea of three years duration in a twin, female, aged 7. The disease is rare before adult life. The patient's paternal great grandfather, grandfather, father, and an uncle and aunt developed the syndrome after reaching adult life and eventually became insane. The maternal ancestor gave no evidence of any nervous or hereditary disorders. The patient had four healthy sisters and her twin brother was apparently normal, she herself, though slightly later than her brother in teething, walking, and talking, was apparently mentally and physically normal until 4 years of age. Physical examination was negative except for choreic movements of head, neck, body, and limbs, sluggish indistinct speech, and stumbling gait. Her growth was retarded when the symptoms commenced, since when her twin brother outgrew her. Owensby points out that the symptoms were so distinctive that her mother and family recognized the condition at once. The author adds that the familial nature of the disease is evident from its having occurred in three succeeding generations of ancestors, and that support is given to the view that females are affected earlier than males. He considers that the retardation of mental and physical development coinciding with the appearance of the first symptoms and the relative slowness in beginning to walk and talk indicate some structural changes dating from embryonic life.

83 **Amaurotic Family Idiocy**

I. EPSTEIN (*Arch of Ped*, April 1925, p 236) records four cases of this condition in one family. The parents were Russian Jews who had had eight children with the following histories. The first child, a girl was normal in every way until about 7 months of age when she became helpless and blind, had many convulsions, and died when she was 18 months old. The second child, a girl now 15 years of age, is apparently well. The third child, a boy, was well during the first few months of life, became blind when about 6 months old, could not support his head or sit up, had many convulsions and died at 2 years of age. The fourth child, a boy, died of measles when 7 months old. The fifth child, a boy died two weeks after birth from some infection following circumcision. The sixth child, a girl was normal up to 6 or 7 months, then had frequent attacks of convulsions, became blind, and died at 22 months of age. The seventh child is a girl, now 6 years old, and seems to be quite well. The eighth child is a boy, aged 8 months, who was apparently well until 6 months of age when the typical symptoms began. Ophthalmoscopic examination revealed the cherry red spot in each eye. The Wassermann, tuberculin, and spinal fluid tests were negative.

84 **The Nervous Mechanism of Dyspnoea in Epidemic Encephalitis**

W. ALDEN TURNER and MACDONALD CRITCHLEY (*Pract*, March, 1925, p 72) review the literature dealing with respiratory disturbances in epidemic encephalitis and record in detail seven illustrative cases in patients aged from 15 to 55. They point out that these manifestations cannot be regarded as accidental or hysterical, but that they constitute a very definite clinical entity playing an important role in the symptomatology of the disease. The following classification

of these various disorders is proposed: (1) Disorders of the respiratory rate, which include tachypnoea, or rapid respirations, and bradypnoea, or slow respirations, which is much rarer. (2) Dysrhythmic, or disorders of the respiratory rhythm, consisting of sighs, apnoeic pauses, Cheyne Stokes respiration, bigeminal and trigeminal respiration, and breath holding spells. (3) Respiratory tics, which are particularly common in children, such as hiccup, yawning, tic like expiration of air through the nose (*soufflement*), and spasmodic cough. Any combination of these groups may be found. These respiratory phenomena may occur in the acute stage, as residua or as remote sequelae. They may be the only after effect, but they are more usually associated with other well recognized sequelae. After dismissing as inadequate the theories of the bulbar, thalamic, and peripheral origin of these respiratory phenomena, the authors come to the conclusion that their pathogenesis lies in a derangement of the involuntary psycho-motor control of respiration, which is maintained by various cortico-pontine pathways which are capable of anatomical demonstration. The lesion, therefore, is at a higher level than the so-called respiratory centres. The prognosis is grave when the symptoms appear during the acute stage, a large proportion of such cases ending fatally. When they occur as sequelae they persist unchanged for an indefinite period, no treatment being of any avail.

Obstetrics and Gynaecology.85 **Tetanus after Abortion**

ACCORDING to H. FLECHTNER and G. QUAST (*Zentralbl f Gyn*, May 2nd, 1925, p 975), remarkably few cases (22 in all) of tetanus following criminal abortion have been recorded in the literature. In such cases, as in puerperal tetanus infections, the incubation period is very short—about nine days on the average, the distance along the uterine nerves to the spinal cord is small, and the vascularity of the pregnant uterus may facilitate absorption of toxin through the blood and the lymph vessels. In two cases described by the authors the incubation periods were as short as five and two days respectively. One of these cases is noteworthy for the positive result of inoculating a mouse with fragments of spinal (lumbar) cord taken at the autopsy, the brain and cord tissues have generally the power of fixing and neutralizing the tetanus toxin. Not infrequently it is impossible to cultivate the tetanus bacillus from the uterine contents, but animal inoculation from these proves to be positive. The mortality is about 80 per cent. Treatment by antitoxin is probably more hopeful than total extirpation of the uterus, which has been recommended and occasionally performed with success.

86 **The Prognosis for the Child in Maternal Pyelitis**

H. NAUJOKS (*Zentralbl f Gyn*, May 23rd, 1925, p 1136) observes that pyelitis during pregnancy or the puerperium, though not necessarily fatal, gravely prejudices the survival of the child. Optiz has recorded 53 cases of maternal pyelitis. 20 patients went to full term, 23 were delivered prematurely, while abortion was induced in 10 cases. Albeck has treated 52 cases. 37 were delivered at full term, 9 births were premature, one aborted spontaneously, while in the remaining 5 premature labour was induced. Naujoks has seen 81 cases. 3 patients aborted in the third, fourth, and fifth months respectively. 34 were delivered between the seventh and ninth months. 43 patients went to full term. In one case premature labour was induced but the child died a few weeks later. Among the 43 full term infants 2 were stillborn and 2 died shortly after birth. Of the 34 premature children 2 were stillborn, 13 died shortly after birth, 2 lived for a few weeks. Among 5 surviving children 3 are well. Naujoks has been unable to trace the remaining 12 children. The mortality among the premature children was approximately 50 per cent while in 33 per cent of the children whose mothers suffered from pyelitis the prognosis was very grave. Induced abortion inevitably sacrifices the child's life and has now been largely abandoned in favour of other measures. In discussing the prevention of spontaneous premature or stillbirths certain facts must be considered particularly the oxytocic action of absorbed toxins or of febrile conditions, and the direct injury of the foetus by placental bacterial infection or by absorption of toxins. Optiz holds very definite views concerning the production of uterine contractions by toxins or by hyperpyrexia, especially when the fever is ushered in by rigors. Both these factors have a well recognized action upon unstriated muscle. Another important factor according to him in the production of uterine contractions is the increase of the carbon dioxide content in the blood as a direct result of pyrexia. In

two cases Fehling found *B. coli* in the uterine cavity, and Meyer discovered the same bacillus in the placenta and also in the foetal heart blood. Naujoks classifies 57 of his cases thus: Full term, 30, 8 febrile at time of delivery, 22 afebrile. Premature 27, 14 febrile at time of delivery, 13 afebrile. In the majority of febrile cases *B. coli* kidney and blood infections were found. In a small number of cases there was definite evidence that the *B. coli* infection had been transmitted to the unborn child. Fink records the case of a patient suffering from severe *B. coli* pyelitis who gave birth to a full term child. Shortly after birth the child developed very severe purulent ophthalmia suggestive of a gonorrhoeal infection. From the pus a pure culture of haemolytic *B. coli* was obtained. The child recovered quickly under non-specific treatment. Naujoks concludes that although the danger to the child is very serious and many pregnancies terminate prematurely a considerable proportion of mothers and children ultimately do well. The treatment should be conservative in the first instance, and induction of premature labour should be reserved for cases in which the mother's condition renders it improbable that the child will survive. Nephrotomy with drainage of the renal pelvis may be indicated in severe cases, but it is almost certain to be followed by spontaneous abortion.

87 Physiology of Ovulation

A. RÜHL (*Arch. f. Gynak.*, April 18th, 1925, p. 1) describes the microscopical characters of the corpora lutea at various stages of their regression, which lasts, he says, up to six months, instead of eight to ten weeks, as is usually stated. By examination of ovaries removed at autopsy or operation and comparison of the ages of the corpora lutea present on the right and left sides he has come to the conclusion that in physiological conditions ovulation occurs on the right and left sides in regular alternation. After conclusion of pregnancy ovulation appears to start in the ovary of the opposite side to that which gave rise to the fertilized ovum as indicated by presence of a corpus luteum of pregnancy. An attempt to find support for the view of alternating ovulation was made by observation of patients suffering from "Mittelschmerz." The pain in such cases is ascribed to ovulation, and has been reported by Fraenkel to occur on alternate sides in the successive intermenstrual periods, objective evidence, however, cannot be obtained. The fact that unilateral oophorectomy is not followed by an eight instead of four weeks periodicity is to be explained, it is said, by the compensatory hypertrophy of the remaining ovary which has been found by several observers to occur.

83 Ovarian Fibroma simulating Carcinoma

F. PAPIN (*Bull. Soc. d'Obstet. et de Gynecol. de Paris*, 1925, 4, p. 305) relates the case of a woman, aged 47, who was found to have oedema of the legs, ascites, and pleural effusion. A hard tumour extending from the abdomen was fixed in the pouch of Douglas. The serous effusion increased in volume and the patient manifested dyspnoea and advanced cachexia, so that a diagnosis of carcinoma seemed justifiable. At the operation a purely fibromatous tumour of the right ovary, partially intraligamentary and weighing about 4 kilograms, was removed. Eight days later the pleural effusion had disappeared and the patient recovered. That ovarian fibromata may present the clinical features of a malignant neoplasm is well known. Papin points out that this case shows that recovery may follow operative treatment in a certain number of cases that appear at first sight hopeless.

Pathology.

89 Chemotherapeutic Studies on Rabbits

M. J. HARKINS (*Journ. Amer. Med. Assoc.*, June 13th, 1925, p. 1797) found that when fixed rabbit virus was suspended in a 1 in 200 dilution of sulphar-phencamine, 1 in 500 dilution of fluoreum, and a 1 in 1,000 dilution of sodium oxymercurey orthomethylphenolate no germicidal effect was produced. I within thirty minutes at 38°C., as was shown by the production of symptoms and death after intracranial inoculation of rabbits. If the virus was influenced at all it was not sufficient to prolong the incubation period, which was the same in the control and the treated animals. No preventive or curative effect was observed following the injection of gentian violet, neo-naphtholamine, sulpharphenazine, potassium bismuth tartrate, ethylhydrocuprein hydrochloride, quinine and urea hydrochloride, or mercurochrome 220 soluble. No prolongation of the incubation period was noted even when some of the compounds were injected as early as from two to four hours after infection and the injections were continued daily until death.

275 D

50 Specific Action of Lead

W. BLAIR BELL, R. A. HENDRY, and H. E. ANNETT (*Journ. Obstet. and Gynaecol. of the British Empire*, Vol. 32, No. 1, p. 1) report investigations into the specific action of lead on the chorion epithelium of the rabbit as contrasted with the action of copper, thallium, and thorium. They found that lead has a selective affinity for the chorion epithelium and that abortion can be produced by its action on the foetal ectoderm without affecting the maternal organism, a coagulation necrosis occurring in the ectodermal tubules of the foetal placenta. With intravenous injections in rabbits of 0.1 per cent metallic lead in a colloidal form it was ascertained that from 10 to 12.5 c.c.m. produced abortion, while the lethal dose was found to be approximately double. Experiments with copper showed that it had no specific action upon the chorion epithelium and that abortion, when it occurred, was the result of haemorrhage into the uterus, this was also the case with thallium. Both thallium and thorium preparations were relatively atoxic and had no specific or toxic action upon the chorion epithelium.

91 The Hepatic Functions in Lethargic Encephalitis

G. PEDRINONI (*Gazz. d. osp.*, April 12th 1925, p. 342) states that the presence of profound hepatic changes in Wilson's disease (progressive familial lenticular degeneration), which in so many clinical and anatomical respects resembles epidemic encephalitis, induced him to study the changes in hepatic function in the latter disease. Of 16 cases examined between September, 1922, and March, 1923, 14 had contracted epidemic encephalitis in the outbreak of 1919-20 and two in January, 1923. None showed any obvious signs of a hepatic change apart from a slight enlargement of the liver in the majority of cases, diminution in its size in one instance, and some ascites in another case. His investigations were related to the production of bile, urica, and glycogen, and the formation and destruction of red corpuscles. Search was made for the presence of the abnormal pigments urobilin and uroerythrin, which indicates an anatomical and functional change in the liver cells. The results were as follows: Urobilin was found to be constant in 11 out of 16 cases, and uroerythrin to be constant in 10 cases, while in one case it was positive once and negative in the two following tests. Examination of the urogenic function of the liver showed that the production of uric acid was always below normal. The antitoxic function of the liver is indicated by the presence of indicanuria, which was present in all the 16 cases. The glycogenic function was normal in 9 out of 14 cases in which it was examined. As regards the haemolytic crisis 64 tests were performed in the 16 cases, a positive result was obtained in all, but the various elements of the test were always dissociated and incomplete.

92 The Diagnosis of Whooping Cough

E. KRAMÁR (*Monatssch. f. Kinderheilk.*, March, 1925, p. 697) records his observations in the epidemic of whooping cough in Budapest in the winter and spring of 1923-24, with reference to the bacteriological diagnosis of the disease and its prophylaxis and treatment by means of vaccines. Of 60 cases examined in the early stages 52 gave a culture of the Bordet-Gengou bacillus. 20 children suffering from other extrathoracic affections were also examined, but the Bordet-Gengou bacillus was not found in any of them. The results of bacteriological examination proved very reliable in the early diagnosis of the disease and in the recognition of atypical cases. For the cultivation of the Bordet-Gengou bacillus a medium composed of agar with 5 per cent defibrinated human blood added was found most serviceable. Kramár states that it is easily prepared and sets firmly, the whooping cough bacilli form visible colonies on it within twenty-four (or even eighteen) hours, so that it considerably hastens the laboratory investigation. He adds that for purposes of vaccine making the organism can be grown on this medium in great profusion. To 69 children who had not had whooping cough and who were closely exposed to infection were given prophylactic inoculations with a vaccine of the Bordet-Gengou bacillus, 53 of them remained well throughout the epidemic, the remaining 16 contracted the disease. In 78 cases of whooping cough vaccine treatment was given, and it was possible to follow the course of the illness in 65 of these. Most of them were children of about 3 years of age. Of those that were inoculated within a fortnight of the onset of the symptoms 86 per cent appeared to be benefited, the good effects showed themselves ten to sixteen days after the first injection. The dose is not stated. Given at the right time the vaccine was found to shorten the catarrhal stage by two or three weeks and to render the disease milder throughout its course. Vaccine treatment begun after the third week was useless.

cells per cmm. The patient's general condition rapidly improved and the pains disappeared. The spleen appeared to be slightly enlarged, and showed some thickening under the capsule with fibrous strands passing into its substance, the condition being similar to that found in some of the anaemias and in cirrhosis. Lecene concludes, therefore, that in certain types of anaemia accompanied by gastric symptoms splenectomy appears to be indicated and may give rapid relief.

93 The Importance of Early Operation for Appendicitis

R. MOHAMMAD (*Deut. med. Wochs.*, May 22nd, 1925, p. 855) publishes an analysis of his experience of appendicitis in the Rudolf Virchow Hospital in Berlin between 1919 and 1924 to show how greatly the prognosis is impaired by delay in operating. Of the total of 1,222 cases 1,173 were cured and 49 died, the mortality being, therefore, 4 per cent. Of the 988 patients who were operated on 940 were cured and 48 died (mortality 4.9 per cent). Of the 234 patients who were not operated on 233 were cured, only 1 patient dying (mortality 0.4 per cent). Of the 218 patients operated on within the first twenty-four hours 211 recovered and 7 died (mortality 3.2 per cent). Of the 153 patients operated on within the first forty-eight hours 148 recovered (mortality 3.2 per cent). Of the 180 patients operated on more than forty-eight hours after the onset of symptoms 154 recovered (mortality 14.4 per cent). Of the 84 patients whose appendicitis led to abscess formation 76 recovered (mortality 9.5 per cent). Of the 353 patients operated on in a free interval between attacks 351 recovered (mortality 0.56 per cent). The 2 deaths in this group were due to embolism and parametritis respectively. The author concludes from these figures that an early operation is much to be preferred to a late operation.

99 Aniline Dyes in the Prevention of Wound Infection

L. L. FERGUSON (*Med. Journ. of South Africa*, June, 1925, p. 327) as a primary application to wounds and as a skin sterilizer advocates the use of a blue solution of 1 per cent of a mixture of equal parts of crystal violet and brilliant green sulphate, zinc free, dissolved in 35 per cent of rectified spirit and 65 per cent of water, the powder being first dissolved in the alcohol and the water added. Bonozy and Browning (*JOURNAL*, May 18th, 1918, p. 562) called attention to the use of a mixture of crystal violet and brilliant green dissolved in equal parts of water and rectified spirit. Ferguson found that comparative cultivation tests proved its superiority to iodine, while clinically its use as a primary application to wounds and as a means of sterilizing the skin in hospital before operations was most satisfactory. In areas not readily sterilizable, such as the perineal region, healing was exceptionally good without nutrition, with a reduction in pain and shortening of convalescence. On immersion the blue colour is found to have penetrated into the deeper layers of the skin within a few seconds. There is an absence of any toxic effect and the dye does not appear in the urine. Ferguson considers that its penetrating power, distinct colour, high germicidal properties, and cheapness owing to the small quantities required, are among its chief advantages.

Therapeutics.

100 Malaria Treatment of General Paralysis

H. CLAUDE and R. TARGOWLA (*Bull. et Mem. Soc. Méd. des Hôp. de Paris*, June 4th, 1925, p. 795) have or are treating thirty cases of general paralysis by the induction of malaria. Two of these cases they report in detail besides the malarial injections they were given antisyphilitic treatment. While the authors do not believe that this treatment is a cure for general paralysis, they are convinced that it does materially improve the condition and in the two cases reported both patients were so much improved that they were able to leave the asylum and return to their duties. The mental symptoms usually become less marked, power of attention comes back, grandeur delusions disappear and the patient keeps himself in better order taking a growing interest in his treatment. They do not, however, return to their previous mental condition before disease set in, even in the most favourable cases. The physical signs do not change very much, although, like the mental, they show signs of improvement. No important changes were noted in the cerebrospinal fluid.

101 Chlorine in Colds

H. S. DICHL (*Journ. Amer. Med. Assoc.*, May 30th, 1925, p. 1623) investigated the value of chlorine in the treatment of colds by comparing the results of such treatment in 425 cases with medical treatment in 332 cases. The treatment was given in a small room of 680 cubic feet capacity through which chlorine gas mixed with air in an average

concentration of 0.015 to 0.0175 mg. of gas per litre of air was blown. Its beneficial effects were seen within the first day after treatment, the percentage of those recovering within one day being definitely higher than under medical treatment (19.5 per cent as compared with 12.5 per cent). Cases with acute rhinitis recovering within one day gave a percentage of 23.6 with chlorine treatment as against 6.7 recovering medical treatment, and it appeared to be more beneficial in this condition than in any other type of acute cold. The largest percentages of good results were obtained in those treated on the second or third day of the disease. Except in asthmatic subjects no ill effects were definitely attributable to the treatment. Dichl records encouraging results from the treatment in eight cases of whooping cough, five being definitely improved, but the cases were too few to be conclusive.

102

Treatment of Gout

K. HARPUDER (*Klin. Wochs.*, July 16th, 1925, p. 1408) advises colchicin in the acute attack, the structure of colchicin being of variable composition. Maximum doses are to be avoided as diarrhoea is not at all uncommon and may be severe. Scarcely anything is known as to the way in which colchicin acts, it probably does not affect the purin content of the system. In milder forms of the disease, or when colchicin cannot be borne, atophan is the substitute recommended, it is said to be also of service in combination, as an alternative, and in the after treatment, the best way to give it being two intravenous injections daily. Other drugs are rarely needed, though Ebstein advised salicylates early and in big doses, but is necessary only in severe attacks. The diet must be purin free and but slightly albuminous, with plenty of fluid. As soon as the pain abates the joint must be moved to promote function and elimination of urates, antispasmodics have shown that the latter may be complete. There follow then measures directed to the gouty constitution, lowering of the habitual purin intake, and, by means of atophan, the increased elimination of uric acid. Atophan, combined with salicylates or hexamethylenetetramine may be given by the mouth or parenterally, it has the additional recommendation of being a good analgesic in gout.

103 The Indications for Serum in Sanoecrysin Treatment

K. SECHLER (*Ugeskrift for Læger*, April 30th, 1925, p. 437) tabulates the indications for giving serum in the course of sanoecrysin treatment, as practised at the Department C of the medical side of the Bispebjerg Hospital in Copenhagen. He gives it nearly always by intramuscular injection, the usual quantity being 20 ccm. every day. Only in the most severe cases of sanoecrysin poisoning is this dose doubled. He gives serum (1) in all cases of albuminuria, its appearance being the sign. This is, after the albuminuria has almost completely disappeared—is superfluous and may even be injurious. (2) When the patient has been ill for a long time serum should be given before or on the same day as the sanoecrysin injections. (3) Serum is indicated when there is a certain febrile reaction (a temperature which rises for several days and then falls uniformly) with erythema. (4) Serum is indicated in those cases in which, even before sanoecrysin treatment is instituted, there is severe toxæmia, or in which this is anticipated. (5) Tuberculin shock is also an indication for giving serum. As a rule it would seem that patients who have suffered from tuberculosis only for a short time, and whose organs have not yet become much deranged, may undergo sanoecrysin treatment without the help of serum. But this is not the case with those patients whose organs, notably the kidneys, have been seriously damaged by the prolonged action of the toxins of tuberculosis.

104

Protein Therapy of Peptic Ulcer

L. PRON (*Bull. Soc. de Mé.*, May 13th, 1925, p. 128) has treated fifteen cases of gastric or duodenal ulcer by protein therapy in the form of intragastric injections of milk twice a week. The diagnosis in each case was based on the clinical signs, radioscopic examination, and the presence of occult blood in the gastric juice in the fasting state. According to the reactions observed the patients were classified in three groups. In the first group, which consisted of three men, there was a complete absence of reaction, whether local or general. In the second group which consisted of six men and four women, the injections were followed by a moderate degree of fever simulating influenza, while in the third group, which consisted of two women, the febrile reaction was very severe. The results of treatment, which were about the same in each case—namely, suppression of the gastro-duodenal pain, improvement of the general condition, increase of appetite, and free action of the bowels—showed that the theory that the efficacy of protein therapy depended on the degree of febrile reaction was erroneous.

105

Flumoria in Syphilis

J C FOX, jun, G H GILDERSLEEVE, and J F PRESTON (*Arch Derm and Syph*, June, 1925, p 768) discuss the value of flumoria, the sodium salt of hydroxymercurifluorescein, in the treatment of syphilis, based upon experience in twenty-four patients, to whom 185 injections of a 2 per cent solution were given over a period of eighteen months. The average dosage approximated 4 mg per kilogram of body weight, administered twice a week for a total of from eight to twelve injections. Rapid regression and healing of all secondary lesions and somewhat slower but steady resolution of tertiary lesions resulted, the drug having a fairly active spirochaeicidal value though not markedly affecting the Wassermann reaction. In one case relapse occurred under treatment, and in five cases toxic symptoms developed sufficiently to contra-indicate continuance. A striking result was obtained in one arsenic-resistant case in which there had been a relapse under previous arsphenamine therapy. Individual tolerance, not always predictable, varied considerably, necessitating a careful watch for toxic symptoms and routine examination of the urine. It is generally conceded that while flumoria is therapeutically inferior to the arsphenamine group it is superior to other mercurials, and that it should be used only in conjunction with the arsenicals or in cases intolerant or resistant to them. In early syphilis, in which intensive and sustained combined arsenic and mercurial treatment is so important, its superior value outweighs the economic consideration involved in incorporating bi-weekly injections in the interval between arsenical courses.

106. Goat Serum in the Treatment of Malignant Disease

A WILSON (*Edin Med Journ*, May, 1925, p 245) reports favourably on the treatment of malignant disease by goat serum, and gives details of eleven cases. Relief of pain was general, and in some cases it appeared that there was some arrest in the progress of the growth. The doses varied from half an ounce to six ounces given intravenously, and in some cases a marked reaction occurred, characterized by pyrexia, erythema, and rheumatic pains. The author believes that in the serum of the goat there exists some substance of a chemical nature which offers resistance to the growth of cancer.

Dermatology**107. Non suppurative Nodular Panniculitis**

T PARKES WEBER (*Brit Journ Derm and Syph*, July, 1925, p 301) records a case of relapsing non suppurative nodular inflammation of the subcutaneous fat (panniculitis) showing phagocytosis of subcutaneous fat cells by macrophages. A widow, aged 50 past the climacteric, and thin rather than fat gave a history of attacks of general fibrositic pains and headache accompanied by red patches at the back of the legs above the ankles which tended to disappear, leaving some induration. Four years previously she had been operated upon for cataract in the right eye. The inflammatory swellings involved the subcutaneous fat and were accompanied by slight fever and albuminuria with, on one occasion, tubercles. Histologically lipophagic macrophages were present around or within the large fat globules of the fat cells of the affected tissue. A subcutaneous, somewhat tender swelling about the diameter of a large orange appeared later over the sacrum, and the patient complained also of pain in the shoulders and the back of the neck. Under treatment by rest, sodium salicylate, sodium bicarbonate, and liquor arsenicalis she improved and the sacral swelling disappeared. Weber states that this condition of panniculitis may be due to various causes such as fibrositis or fibromyositis. It may affect all ages and both sexes whether fat or thin. He considers the case allied to Whitfield's type of erythema induratum in spite of the hitherto little known microscopic features, the relative acuteness of some of the swellings which left pea like nodules on subsidence, and the situation of the largest swelling over the sacrum.

109

Bowen's Dermatoses

C GUTMANN (*Dermatol Week*, May 20d, 1925, p 641) states that in 1912 Bowen of Boston directed attention to a hitherto unrecognized skin disease, characterized by atypical epithelial hyperplasia with persistent tendency to epitheliomatous transformation. The disease runs a very prolonged course, thus differing from the other "neoplastic dermatoses." Bowen's first patient, a man aged 49 had on the left buttock an erythematous eruption which had existed for nineteen years, commencing as a papular rash, it changed into a more intense papulo squamous form. The second patient was a man, aged 52, who had a somewhat similar eruption on the left leg, but the hyperkeratosis was of a nodulo papular type and had existed for nearly ten years. There was a persistent

erythema, as in the former case, but the discrete patches assumed a seriginous form, strongly suggesting a late secondary syphilide. The discrete nodules showed a tendency to coalesce. There was hyper and para keratosis, with proliferation of the rete, accompanied by cellular karyokinesis and mitosis, later cell vacuolation and nuclear clubbing occurred. Many abnormal cells appeared in the rete—some showed cornification, others were thinned out with vacuoles surrounding the nuclei. There was oedema of all the epithelial layers and scabbing of the surface. The vessels of the corium were dilated, and infiltration with definite separation of the plasma cells was present. Bowen found appearances suggesting cancerous degeneration in his second case, but this was not established definitely. Two years later Darier described three similar cases, in two of which carcinoma developed. Shortly after the publication of Darier's cases a considerable number of others were described by various authors in rapid succession, these were almost exclusively from foreign sources, but in 1921 German writers—Jessenr, followed by Langei, Grutz, and Back—described other cases. Gutmann finds that more than thirty cases of Bowen's disease have been published, but only seven have occurred in German countries. An exanthem was found only in a minority of these cases, the disease being characterized generally by the appearance of rose red or brownish discrete papules of rounded or more irregular form, their surface was slightly scaly and somewhat atrophic. Any part of the skin may be attacked. Gutmann adds that the regional lymph nodes are seldom enlarged until late in the disease, when the transformation into carcinoma is complete, possibly this is due to metastatic infection through the lymphatics. The disease appears to attack both sexes in equal numbers, the majority of cases occur between the ages of 40 and 70.

109

Paraphenylenediamine Dermatitis

R JACOBY (*Boston Med and Surg Journ*, April, 1925, p 852) reports a case of paraphenylenediamine dermatitis which confirms Roxburgh's findings as recorded by him in the *BRITISH MEDICAL JOURNAL*, March 24th, 1923 (p 534). In Jacoby's case, a woman, aged 29, who had had no previous skin trouble, purchased a coat with a fur collar late in 1923. Almost immediately after wearing it for the first time she felt an itching sensation and an intensely pruritic reddish rash appeared on the left side of her neck. The eruption subsided in a few days during which the coat was not worn. Four days later she began to wear the coat daily, and the skin lesions became aggravated and spread to the chest, arms, forehead, brows, and lips. Seven weeks later there was an erythematous eruption which involved the entire neck and extended slightly above the hair line, it involved also the chin face, and chest and the flexor aspect of the forearms many vesicles and crusts were present. She ceased to wear the coat, and the lesions disappeared almost completely after three weeks. A few weeks later the coat was again used, and even more severe lesions of an eczematoid character appeared in the same situations. Para phenylenediamine was found in the fur no arsenic was present. Jacoby adds that after the patient had finally abandoned the coat there was no return of the dermatitis.

Obstetrics and Gynaecology**110. Conservation of Menstruation after Hysterectomy**

E NOVAK (*Surg, Gynecol, and Obstet*, June, 1925, p 874) insists on the importance of trying to retain the menstrual function after hysterectomy in many cases in which the psychological effect of its loss would give rise to unpleasant symptoms. For this purpose a portion of the endometrial surface needs to be preserved in high subtotal hysterectomy, this can be achieved by the simple expedient of imputating the uterus a short distance above the internal os, so as to retain a considerable cuff of endometrium. In Bell's procedure the ovaries are always removed, with the fudus and tubes, so that ovarian transplantation becomes necessary if menstruation is to be preserved. Novak finds, however, that it is nearly always possible to leave at least one ovary in position, which he considers preferable to grafting the ovary elsewhere. The complicated operation of Beutner, which removes only the upper part of the fundus, seems to Novak to have no special advantages. The disadvantage of leaving a large uterine stump is that the anterior bladder peritoneal flap cannot be utilized so readily for covering the line of suture without some considerable degree of traction occurring at times, and a risk of post operative bladder distention. Novak, however, finds that such a risk is not so great as has been suggested. A common indication for supracervical hysterectomy occurs in uterine myoma where myomectomy

for some reason is impossible or inadvisable. A more frequent indication is furnished by chronic pelvic inflammation in young women, where preservation of the menstrual function seems desirable. Novak adds that in both cases only some of these patients are suitable for this form of operation.

111 Endometrioma of the Ovaries
J WIELOCH (*Arch f Gynak*, April 18th, 1925, p 53) records the case of a nullipara, aged 25, who complained of severe pain during and a few days after the menses, which lasted five days. Operated on for supposed myoma palpable in the left fornix, she was found to have "chocolate cysts" of both ovaries, the lining showing histologically endometrial tissue. In discussing the bearing of the case on the genesis of "chocolate" or perforating cysts, Wioloch quotes Laueho as having recently abandoned his adhesion to the theory that these cysts arise from scroful epithelium, and as strongly supporting the views of the English and American authors who believe them to come from penetration of the coelom by islets of endometrium. This tissue reaches the coelom by retrograde passage through the Fallopian tube and in the ovaries menstruates regularly, forming a dark blood cyst. Wioloch's case support for the existence of retrograde tubal conveyance of menstrual blood and endometrium was found in an unusual narrowness of the internal os, the enlargement of the cavity of the uterus, which measured $3\frac{1}{2}$ inches in a virgin, and the patency of both tubes in spite of many surrounding adhesions. Microscopically inflammatory changes were conspicuously absent. Direct evidence that organized tissue can pass upwards through the Fallopian tubes has been furnished by Sitzenfreys, who found free islets of uterine carcinoma tissue in their lumen, by Jagerroos, who in patients with carcinoma coli found fragments of healthy endometrium free in the tubal cavity, and by several other writers in America and elsewhere. Experimental evidence in favour of Sampson's theory has been given by Jacobson, who in animals produced endometrial adenomatous cysts by transplanting endometrium into ovaries and elsewhere.

112 Transfusion for Premature Infants
P GUENIOT and SEGUY (*La Gynécologie*, July, 1925, p 407) report nine cases of weak premature infants treated by transfusion of blood. Six seem to have reacted favourably, the vivifying effect in half of them having been remarkable. The other infants died, but from causes of which one at any rate—double bronchopneumonia—was extraneous to the treatment. The other two deaths were due respectively to intracranial effusion and a haematoma between the dura mater and the occipital bone. Transfusion was performed into the longitudinal sinus through the posterior fontanelle. The authors add that the treatment must not be deferred too late, they prefer it to injecting stimulating serums. Before introducing it they had at their hospital among 27 weakly infants 13 deaths before discharge, afterwards only 9 out of 36 died before discharge.

Pathology.

113 The Liver as a Source of Bacterial Agglutinin
I S JONES (*Journ Exper Med*, June, 1925, p 767) has made a number of experiments which seem to indicate that one of the main sites of production of agglutinins is the liver. Normal rabbits were killed by a blow on the head, the neck vessels severed, and the tissues drained as far as possible of blood. Various organs were then removed, ground in mortars, and dried over sulphuric acid *in vacuo*. The desiccated material was powdered and suspended in distilled water in the proportion of 0.2 gram of powder to 4 c cm of distilled water, extraction being allowed to proceed for eighteen hours at 38°C. After storage in the refrigerator for eight days, they were centrifuged and the supernatant fluid tested for agglutinin content to *B. subtilis*. In this way it was found that normal rabbits contained a small amount of agglutinin, which was generally in highest concentration in the blood serum— $\frac{1}{2}$ titre of 1 in 10 or 1 in 20. Rabbits were then given small quantities of a heat killed vaccine of this organism by intravenous injections over a period of two days, and were killed twenty-four to forty-eight hours after the last injection. It was found that the greatest concentration of agglutinin was present in the liver next came the lungs and kidneys, both of which usually had more than the serum. From those experiments it would appear that the agglutinin is actually formed to a large extent in the liver. It is possible, however, that the liver acts merely as a storehouse for the agglutinin. To test this a rabbit was injected intravenously

with 4 c cm of immune serum. The animal was bled at daily intervals for a week, when it was killed. Examination of the various organs showed that the serum contained ten times as much agglutinin as the liver, thus disproving this suggestion. It was thought that if the antigen could be injected in such a way as to come into contact with the liver before reaching other organs it might be possible to obtain a higher concentration of agglutinin in the liver than could be obtained after intravenous injection. This proved to be true. The vaccine was introduced into a mesenteric vein and the animal killed four days later. The titre of agglutinin in the liver was found to be ten times that present in the blood serum. From these experiments and from the general agreement of other workers as to the importance of the liver as a site of accumulation and destruction of bacteria entering the blood stream, the author concludes that it is probable that the liver is one of the main organs concerned in the production of agglutinin.

114 Chemical Substances Inhibiting Growth of the Tubercle Bacillus.

L KARWACKI and S BIERNACKI (*Ann de l'Inst Pasteur*, May, 1925, p 476) have tested a large number of substances in relation to their powers of inhibiting the growth of the tubercle bacillus *in vitro*. The particular strain used was one several years old, which was well adapted to a saprophytic existence, and was no longer virulent to laboratory animals. To 10 c cm of glycerine broth was added the particular substance to be examined, and the tube was then inoculated with a drop of a culture of the bacillus. Under normal conditions the organism grew so rapidly that it commenced to form a surface veil after two or three days. A total of 73 medicinal preparations and 52 dyes were tested. The results showed that not one of the drugs commonly recommended for the treatment of tuberculosis exercised any marked bactericidal action in a concentration which could be reached in the human body. Most of the metals in colloidal suspension, with the exception of zinc, proved quite inactive even in a 10 per cent concentration. Colloidal arsenic, however, was very active, it inhibited the growth of the tubercle bacillus in a concentration of 0.004 per cent. Thymol was active in a concentration of 0.01 per cent, and colloidal carbon in one of about 0.01 per cent. The substances which were most inhibitory were the dyes, thus thiocyanine acted in $\frac{1}{2}$ 0.0004 per cent and methylene blue in a 0.002 per cent solution. The authors hold that for therapeutic purposes it is essential to choose a drug which is pre eminently distinguished by its high bactericidal power. Hitherto none of the drugs employed, with the exception of thymol and methylene blue, were possessed of such a power. They suggest that the most active substance of all—namely, thiocyanine—should be tested pharmacologically.

115 Carbohydrate Metabolism of Brain Cells
BARBARA C HOLMES and ERIC G HOLMES (*Biochem Journ*, vol xiv, No 3, 1925, p 492) have made a comparative study of the amount of reducing substance that could be extracted from the brains of rabbits, some being normal and others suffering from a convulsant dose of insulin. They report that the administration of insulin does not produce any marked change in the amount of reducing substance, this confirms the previous findings of Coss and Takahashi. They find also that the reducing substance in cerebral tissue cannot give rise to lactic acid formation, although this is readily formed in similar conditions by the brain from added glucose. The reducing substance is said to consist in part of pentose and partly of another reducing substance the reducing power of which is greatly increased after acid hydrolysis—probably little or none of it is glucose. They add that there is a greatly reduced formation of lactic acid in the brains of rabbits treated with insulin, but that in neither "normal" nor in "insulin" brains is there an increase of lactic acid over the "resting" value after standing or incubation at body acidity.

116 Vegetable Vitamins and Bacterial Growth
I TALLO (*Il Polichimico*, July 13th, 1925, p 979) has conducted a series of experiments to ascertain the effect on bacillary growth of adding fresh vegetable extracts to the culture medium agar. In every case it was shown that the vitamins caused more regular growth. The vegetable extracts used were derived from lemons, fresh peas, and peanut oil, and the organisms tested were gonococci, *Weichselbaum's* meningococci, streptococci, and the bacilli of influenza and diphtheria. The subsequent growth of the culture was invariably better and more regular than when the various specific media were used. The influence of varying temperature was also marked. The vegetable extracts used showed a definite catalytic power in proportion to the vitamins present. An additional advantage noted was the preservation of transparency.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

117 Cat Ringworm in Man

G THIBERGE, P LEGRAN, and CH LEBLOIS (*Bull Soc Française de Derm et de Syph*, June, 1925, p 262) record two series of recent cases of human ringworm due to *Micro sporon felinum* infection by cats, one series of seven persons being infected by the same cat. This animal had been examined twice by a veterinary surgeon, who stated that it had no contagious disease. All the patients had extensive circinate pruriginous plaques on their chests, necks, arms, and hands. One patient was first believed to be suffering from varicella, the eruptious being bullous with an erythematous zone around each bulla, and subsequently pityriasis rubra was diagnosed. Examination of scrapings, however, showed groups of spores and mycelium of *M. felinum*. In another case the patient had numerous impetiginous plaques on her face and circinate plaques on her neck, chest, and arms, eight days after she had been scratched by a cat owned by her parents, who were subsequently found to be suffering from precisely similar lesions. The scrapings were examined and the parasite was found to be *M. felinum*. Thibierge believes that this parasite is common in England, and Sabouraud reports that the disease in the cat often fails to attract attention, though in the human lesions in the above cases the mycelial "felt work" was very dense and the parasites were easily demonstrated in the epithelial debris.

118 Pneumothorax and Maternity

A PELLÉ (*Bull Soc Méd de Paris*, June 11th, 1925, p 867) reports four cases of artificial pneumothorax in tuberculous pregnant women who proceeded to full term and gave birth to children without any bad effects on their pulmonary condition. (1) A woman, aged 32, was first seen in 1922, and after a small haemoptysis in 1923 artificial pneumothorax was induced, she became pregnant eight months later and gave birth to a healthy child in 1924. Refills of the pleura are being given about every two months, and the mother keeps well. (2) A woman, aged 22, first seen in 1923, was treated by artificial pneumothorax in June, 1924, and delivered of a healthy child in November, 1924. No adverse symptoms were noted in the mother. (3) A woman, aged 26, with phthisis of four years' duration, had artificial pneumothorax performed in December, 1922, and a tuberculous empyema developed in May, 1923. She became pregnant in November, 1923, and miscarriage followed in March, 1924, without aggravation of the pulmonary symptoms. (4) A woman, aged 39, had suffered from phthisis since 1922, an artificial pneumothorax was performed in August, 1922 and she gave birth to a healthy child in December, 1924, no deterioration in the lung condition being observed.

119 Facial Paralysis following Scarlet Fever

P N MITSCHMANN (*Journ Amer Med Assoc*, May 30th, 1925, p 1633) remarks that while facial paralysis following scarlet fever complicated by suppurative otitis media and cerebral abscess is not rare, he has found only one previous case in the literature, reported by Bny in 1918, of peripheral involvement of the facial nerve due to a parotid abscess unaccompanied by otitis media. He now records two cases, in a boy aged 8 and a girl aged 9, of unilateral peripheral facial paralysis which followed attacks of scarlet fever with only a moderate degree of glandular involvement. In each case there was enlargement of the right parotid gland with a purulent discharge from the duct, but without any change in the salivary secretion.

120 An Epidemic of Wells Disease

KÖRNER (*Deut med Woch*, May 8th, 1925, p 772) records an epidemic which occurred in July and August in a school at Burg near Magdeburg, when a large number of the scholars developed febrile jaundice and petechial haemorrhages. Though 76 in all were affected, only 26 had more or less marked jaundice. In only three cases in which the blood was examined could the diagnosis be established serologically. Köfner had no doubt that all the other patients had had an attack of Wells's disease. The epidemic was not confined to the school, but spread to the town of Burg, none of the cases ended fatally. Infection could be attributed with certainty to bathing, as no other source of infection, such as rats and vermin, could be incriminated, and all those affected had recently been bathing. The epidemic was at once

arrested as soon as the bathing was stopped. The bathing place was small and situated in a marshy district. The incubation period was usually eight days. The most striking symptom, which was found in even the mildest cases, was a more or less marked painfulness of the neck muscles, suggesting incipient cerebrospinal fever. Almost all the patients also had running from the nose, pharyngeal catarrh, and injection of the conjunctivae. In 15 cases there was more or less severe epistaxis. Three had severe bronchial catarrh. Enlargement of the spleen was not characteristic, being found in only 10 per cent. If the disease began with only a slight rise of temperature a mild course might be expected, but if the temperature rose to 104° F at the onset and there was severe pain in the head and back of the neck the course of the disease was usually severe. Treatment consisted in intragluteal injection of 5 c cm of a serum obtained by immunization of rabbits with Weil's spirochaete. A distinct improvement was usually noticed after the injection, especially a rapid relief of the often intolerable headache.

121 Length of Survival after Extensive Cerebral Haemorrhage

N W WINKELMAN and J L ECKEL (*Journ Nerv and Ment Dis*, June, 1925, p 593) studied 30 cases of extensive brain haemorrhage as to the duration of life after its occurrence, and obtained results similar to those of others. From the history and necropsy findings they conclude that cerebral haemorrhage, even into the pons or ventricles, does not cause death in less than one hour. In 22 of their cases the haemorrhage involved the ventricles, and in these the most early death occurred five hours later, one patient living for fifteen days. Unconsciousness was usually sudden or developed soon after the onset of haemorrhage, and in only four instances did the patient remain fully conscious for any length of time. The shortest length of life after the haemorrhage started was one hour in a patient with bleeding into the pons, in four other cases in which there was haemorrhage into other parts of the brain as well as into the pons the duration of life was respectively two, three, six, and forty eight hours.

122 Prophylaxis of Mumps

TEISSIER (*Bull Acad de Méd*, April 7th, 1925, p 369) comments on the recent communication by de Lérvergno and Florentin (*Epitome*, June 20th, 1925, para 600), and records the results of his researches during the course of eighteen months as regards the serum prophylaxis of mumps and of mumps orchitis. Of 172 mumps patients injected with the serum of convalescents 14, or 8.13 per cent, developed orchitis, but he adds that only 12 should be taken into account as two were injected too late. This result is compared with 41 cases of orchitis, or 23.29 per cent, among 176 controls who received no injections. Of 32 patients who were given 20 c cm of convalescents' serum 4 developed orchitis, while of 30 who received 40 c cm (20 c cm subcutaneously and 20 c cm intramuscularly) only 2 had orchitis. Serum prophylaxis of mumps was organized in an orphanage of girls aged from 6 to 18 years, where there had been 37 cases of mumps before serum had been used at all. No case of mumps occurred in a group of 20 girls who were injected with convalescents' serum, some receiving 10 c cm and others 20 c cm, whereas 4 of those who were not injected contracted the disease. Teissier concludes that the prophylactic injection of the serum of convalescents is the right method to apply for preventing mumps or protecting adolescents or adults from orchitis, since it presents no dangers or drawbacks.

123 Rheumatic Nephritis

J CHALIER and P DELORE (*Journ de Méd de Lyon*, April 20th, 1925, p 243) believe that a true rheumatic nephritis exists. The prognosis is usually favourable, but the condition indicates a serious rheumatic invasion and requires energetic treatment. The incidence of rheumatic albuminuria is estimated at from 12.5 to 40 per cent, salicylates are said to be not necessarily contraindicated, and severe nephritis is rare, occurring only in approximately 1 per cent of cases. Adult males appear to be more liable to this complication. Uzan found that nephritis occurred in 55 out of 55 cases of polyarticular rheumatism, and found symptoms of nephritis in 43 per cent of cases of acute rheumatism complicated by endocarditis, these symptoms occurred also in many cases with hepatic complications, such as congestion,

jaundice, and urobilinuria. The albuminuria is usually of slight degree and disappears after a few days, occasionally granular and hyaline casts are found, but renal efficiency is seldom impaired. Much more rarely haematuria and other signs of acute nephritis occur usually in the third week of the disease, but oedema is seldom seen. Lumbar pain is more intense than in other forms of acute nephritis. Usually the prognosis is good, but occasionally chronic nephritis supervenes. In occasional cases rheumatic cystitis occurs. The authors regard sodium salicylate as a specific in all forms of rheumatism, and prescribe it constantly in these cases. They emphasize the necessity for daily examination of the urine and discontinuance of salicylates if albuminuria does not decrease. Overdoses of sodium salicylate may produce an acidosis resembling naemia in many respects. The authors recommend the addition of sodium bicarbonate to the sodium salicylate mixture in all cases. Vidal believes that salicylates should be discontinued only when nephritis precedes the acute rheumatism, if nephritis follows acute rheumatism, salicylates should be prescribed.

124 Acute Lung Abscess caused by Vincent's Organisms.
R. A. SPANO (*Amer Journ Dis Child*, May, 1925, p. 621), who records an illustrative case, states that the most important and frequent lung lesions caused by fusiform spirillar infection are abscess and gangrene. They may occur at any age and in either sex, but are more frequent in adults (90 per cent) than in children, and in men (about 70 per cent) than in women. A case of combined fusiform spirillar pulmonary gangrene and miliary tuberculosis was described on June 13th, 1925 (*Epitome*, para 572). The relative rarity of the fusiform spirillar infection in children is attributed to the fact that predisposing causes are more numerous in adult life than in childhood. The following diseases may act as predisposing causes of lung abscess and gangrene by fusiform spirillar association: Vincent's stomatitis and angina, chronic bronchitis, pneumonia, pulmonary tuberculosis, alcoholism, cardiovascular troubles, diabetes, traumatic lung lesions, pulmonary thrombosis, and every other cause of pulmonary miopragia. Another predisposing cause is inspiration of oral secretion during general anaesthesia, especially in tonsillectomy. Spano's case was remarkable for the fact that it occurred in a perfectly healthy normal boy, aged 11, who had never had any affection of the respiratory organs. His mouth was healthy, and the throat had never been infected except by slight colds. He had never had general anaesthesia. Spano concludes that there may be a primary form of pulmonary infection by fusiform bacilli and spirilla in the same manner as any fusiform spirillar infection of the oral and pharyngeal cavities. Rapid and complete recovery followed intravenous injection of neosalvarsan twice weekly.

Surgery.

125 Splenectomy for Haematemesis
P. LOJABARD, DUMOLARD, and P. GOINARD (*Bull et Mem Soc Nat de Chir*, June 6th, 1925, p. 631) record a case where splenectomy was performed for infective splenitis accompanied by severe haematemesis. The patient was a male, aged 25, who after a short febrile attack had a grave haematemesis accompanied by enlargement of the spleen. Splenectomy was performed thirteen days later, but the patient became steadily worse and after severe melæna died twenty-seven days subsequent to the operation. Examination of the spleen showed a condition of infective splenitis with numerous infarcts, and thrombosis of the splenic vein. A bacteriological examination proved negative. Lecene points out that removal of the spleen is useful in certain conditions where the splenic enlargement is primary and not secondary, in such conditions as Banti's disease it gives good results. In patients where enlargement of the spleen has been associated with gastric haemorrhages its removal has also been followed by excellent results. In the present state of our knowledge, however, he thinks that it is difficult to state when removal is the suitable treatment. The immediate mortality of the operation is extremely low, but it is not improbable that some cases relapse after splenectomy. He adds that the operation appears likely to be successful in primary enlargement of the organ, but in other conditions it must at present be regarded rather as experimental.

126 Symmetrical Tubular Haematomyelia.
G. C. BOLLEN (*Nederl Tijdschr v Geneesl*, May 16th, 1923, p. 22-1) who records an illustrative case, states that haemorrhages into the spinal cord are rare apart from injury to the cord by dislocation of a vertebra or by pieces of a broken vertebra. For the occurrence of such haemorrhage a definite mechanism is necessary—namely, overflexion or over

extension of the vertebral column as the result of external violence. As the cervical column is most likely to be affected by overflexion, haemorrhages of this kind are most likely to occur in the cervical portion of the spinal cord from rupture of small vessels. When the haemorrhage occurs it does not extend uniformly in all directions, but takes the line of least resistance—namely, the long axis of the cord. The haemorrhages are consequently tubular or columnar in form and may extend a very considerable distance. They show a predilection for the anterior cornua, and not infrequently extend from their point of origin to the lower end of the cord. Tubular haemorrhage chiefly occurs in the grey matter, which is much more vascular and offers less resistance than the white matter. Rupture into the central canal of the spinal cord does not take place, as this canal is protected by a fairly firm wall and has only a very small lumen. Bolle's case occurred in a man, aged 23, as the result of a fall from a train in motion. Complete paralysis of the legs, abdominal muscles, bladder, and rectum followed, with loss of the knee and ankle jerks as well as of the abdominal cremasteric reflexes. Vertebral dislocation was excluded by the negative result of x-ray examination. Cystitis and testicles developed but gradual improvement took place, although the final issue of the case is not recorded. A diagnosis was made of two symmetrical tubular haemorrhages in the anterior cornua, extending from the first dorsal to the fifth sacral segment. Although complete recovery was improbable, a fairly favourable prognosis was given, as part of the symptoms could be attributed to collateral oedema, which would subside. Only a few cases of this kind have been described—namely by Lervier, Minor, and Oppenheim, who are agreed as to the prognosis being favourable. When death does not occur soon after the accident a slowly progressive improvement sets in as the destructive lesions in the cord are not extensive. The chief dangers arise from cystitis and bedsores.

127 Sudden Death after Mastoid Operations in Infants
G. CANUTT and J. TERRACOL (*Rev de Laryngol, d Otol et de Rhinol*, July 15th, 1925, p. 437) report the case of a child, aged 8 months, who was operated on for an abscess of the mastoid antrum. The anaesthetic consisted of a few drops of chloroform and the opening and curetting of the abscess only took a few minutes. The child quickly recovered from the anaesthetic, but about seven hours after the operation became very pale, the pulse rate was 140 and the temperature 104° F. The child grew rapidly worse and died eleven hours after the operation with an uncountable pulse and a temperature of 107°. An autopsy revealed nothing abnormal. The authors found on inquiry that this group of symptoms was not so very uncommon, being encountered in very young children and especially in operations on the face and head. A number of cases have been reported in which an eczematous condition was present, and the authors suggest the possibility of protein idiosyncrasy. General anaesthetics, they think, cannot be the sole cause, since cases have occurred without its use. Shock would appear to be an important factor and must therefore be reduced to the absolute minimum. During the first three days of life the child is apparently immune to such a catastrophe, but for the rest of its first six months it is particularly susceptible. The authors suggest that in these operations a local or no anaesthetic should be used, that the operation should be as brief as is practicable, and if possible be restricted to a simple incision, and that the child be given no milk for twenty-four hours. Treatment consists in cold packs and baths.

128 The Etiology of Hernia of the Large Intestine
J. FLEISSIG (*Zentralbl f Chir*, June 6th, 1925, p. 1249) describes the morphology of the peritoneal covering of the caecum, appendix, and ascending colon. In normal subjects the posterior surfaces of these portions of the intestinal canal are extraperitoneal and are closely attached to the fascia of the posterior abdominal and pelvic walls. In early embryonic life the alimentary canal is a short, almost straight, mesially placed tube which becomes bent into a series of sigmoid loops, in order to accommodate the growth of the intestinal canal to the few inches of mesenteric attachment. Many changes occur in the relations of the peritoneum, some portions grow rapidly, while those in other regions, such as the inguinal canal, after birth disappear. Fleissig suggests that a certain laxity of the subperitoneal tissue in certain regions, particularly the iliac and hypogastric, permits the development of ridges and folds which may be converted into (a) mesenteric attachments of a portion of the growing alimentary canal, or (b) into bands to which the peritoneal covering of the caecum, appendix, and ascending colon becomes attached. Such abnormal laxity might permit the formation of adhesions in the region of the internal inguinal ring into which the caecum or appendix or both might pass.

and become attached to the posterior wall of a patent inguinal canal or congenital hernial sac. This hypothesis would account for the origin of a meso caecum meso appendix, or meso colon. Flouissig, who quotes Finsterer's statement that "small hernial sacs are congenital, the larger sacs are acquired," has recently operated upon two patients, and the conditions found confirm his theory. A man, aged 20, had noticed a painless swelling at the right external ring for two years, but four or five months before the operation the swelling became painful and increased in size. It extended to the upper part of the scrotum, but there was scarcely any increase on coughing or straining. The sac contained the caecum and appendix, both being firmly united to the lateral wall of the sac. Barely half the circumference of the appendix was intraperitoneal, the other formed a well developed meso appendix with an abundant blood supply. A much smaller proportion of the circumference of the caecum was extraperitoneal. The hernial sac extended beyond the apex of the appendix to the middle third of the scrotum, no other hernia was present. In his second case, a man, aged 26, had noticed a swelling in the right groin for thirteen years. During the last month it had become larger and he had had severe pain occasionally. The swelling barely reached the scrotum, and there was very slight increase in size on coughing or straining. On opening the sac it was found to be congenital, the caecum throughout its entire length was firmly united to the lateral wall of the hernial sac, as was also the proximal half of the appendix, while the distal half lay free in the hernial sac. Flouissig believes that both these cases confirm Finsterer's statement and his own hypothesis of the origin of hernia of the large intestine.

129 Lesions of the Semilunar Cartilages

CHARLES LASSEUR and S. RADOEVITCH (*Journ de Med de Bordeaux et du Sud Ouest*, May 25th, 1925, p. 403) state that, though the treatment of lesions of the semilunar cartilages is still unsettled, these cases are now seldom diagnosed as "recurrent effusion" or "chronic arthritis." Many athletes' knees are immobilized in plaster of Paris, often without improvement, although it has been shown that complete removal of the damaged semilunar cartilages is both simple and efficacious when certain precautions are observed, especially the preservation of the internal lateral ligament, with out which the operation not only fails but also aggravates the disability. The authors divide these injuries into two classes: (1) Lesions of the semilunar cartilages (McNeill Love states that in 98 per cent. of these cases the internal semilunar cartilage is that involved). In the great majority of cases the whole or only the anterior segment of the cartilage is torn longitudinally, much more rarely the cartilage is split longitudinally into two or three strips. (2) Lesions of the "attachments, usually associated with tearing of the anterior cornu and its tibial and capsular attachments. The cartilage may be displaced outwards or inwards, or "doubled over," like the corner of a visiting card, as is well known the free portion frequently slips between the articular surfaces, causing pain and locking. Occasionally the "bucket handle" condition is found, the cartilage being held in place only by its anterior and posterior tips. Stripped from its capsular attachments the cartilage may twist on its antero-posterior axis and lodge in the intercondylar fossa of the femur. Under these conditions the loose cartilage becomes deformed, thinned, and fibrous, and its fragments constitute one type of "foreign body." When neglected these conditions lead to chronic synovitis and arthritis. The authors stress the distinctions between sudden traumatic hydro-haemarthrosis and the gradual effusion which increases slowly for eight days and which is absorbed in about fifteen days, leaving a sense of discomfort and insecurity in the joint. Recurrent attacks lead to lameness, muscular atrophy, and increased mobility of the bones in all directions. In atypical cases radiograms are very helpful, in some distension of the capsule with air aids diagnosis. In recent injuries conservative treatment is indicated in the majority of cases—reduction of the fracture or dislocation (if required), with or without paracentesis, followed by fixation of the joint for ten days. In old cases of recurrent dislocation all authorities agree that operative treatment is indicated. Three methods have been employed: (1) fixation of a dislocated or suture of a fractured cartilage, both difficult operations and now generally discarded, (2) partial, or (3) total ablation. The present authors condemn extensive and mutilating incisions and recommend the following technique. The knee is flexed at 50 degrees and placed with the inner condyle upwards, a crescentic parapatellar incision from the tibial tubercle is carried upwards and backwards, two fingerbreadths outside the patellar margin, from the centre of this crescent a transverse incision of 3 cm. is carried backwards. The capsule is opened by a transverse incision from the edge of the ligamentum patellae to the internal lateral ligament. This gives a full view of the semilunar cartilage and of its attachments. The authors

always use a pointed tenotome when dividing the anterior attachments, and a very short round pointed tenotome for the posterior attachments of the cartilage, they claim that these instruments can be employed where neither bistoury nor scissors can be used. The authors conclude with statistics from numerous authorities and an extensive bibliography.

Therapeutics

130 Local Vaccine Treatment in Puerperal Fever

LÉVI SOLAL and SIMARD (*Presse Méd*, July 22nd, 1925, p. 977) treat puerperal fever, directly the temperature rises, by packing the uterus and vagina with gauze soaked in a polyvalent streptococcal vaccine. The uterine pack, which must extend into the vaginal fornices and reach down to the vulva, is changed every twenty-four hours for four or five days. Usually, the authors claim, three packs suffice, at least three should be given, however, even if the pyrexia subsides after the first. They give details of eight cases, all quickly cured, in two of these the blood culture was positive before the start of treatment. In other two cases there was urticaria after the packs, and most of the patients noticed a peculiar taste in the month following their application, facts which the authors consider may be taken as evidence of the existence of a very large absorptive area represented by the uterine lesion. In various obstetrical procedures, such as embryotomy and version, they have successfully employed these packs as a prophylactic.

131 Treatment of Fulminating Meningococcal Infection by Adrenaline

FONTANEL (*Paris med*, June 6th, 1925, p. 528) has recently seen three cases of fulminating meningococcal infection in which the *post mortem* findings convinced him of the importance and frequency of haemorrhagic lesions of the suprarenals ending in the formation of a bilateral haematomata which caused rupture of the delicate cortical and medullary tissue. He advocates the treatment suggested by Maclean and Cooke, which consists in an intravenous injection of 20 drops of 1 in 1,000 adrenaline solution as soon as symptoms appear, especially those of cardio-vascular collapse. Intravenous injection of 10 drops should be repeated every four hours. Subcutaneous or intramuscular injection is not advisable owing to the slowness of absorption. Fontanel suggests that this physiological treatment may temporarily control the cardio-vascular collapse or intoxication until the appearance of the results of specific treatment, which should consist in large doses, such as 150 c.c. at a time, of polyvalent or monovalent serum given intravenously, or intraspinally if there is the slightest sign of meningeal reaction.

132 Trypsinamide in Neurosyphilis

U. J. WIRE and L. M. WILDER (*Journ Amer Med Assoc*, June 6th, 1925, p. 1710) describe the progress of 85 carefully selected patients with neurosyphilis treated by trypsinamide for about eighteen months. They received over 800 injections in addition to mercurial treatment, in the intervals between courses of trypsinamide. Among these 85 patients 32 were cases of general paralysis of the insane, 12 of tabo paresis, 7 of the dorsals, 33 had diffuse cerebrospinal syphilis, and the last was a case of acute basal meningitis. The authors observed an appreciable reduction in the cell count after treatment in 23 of the 31 cases of the entire group in which pleocytosis had been present previously. One patient had acute basal meningitis. Material reduction of the quantity of albumin and of globulin in the cerebrospinal fluid occurred in only 16 of the 79 patients who showed an increase in the amount of these constituents of the cerebrospinal fluid. In the 85 cases under observation only 6 patients showed a reduction of the Wassermann reaction from positive to negative, even after twenty-four injections or four courses of trypsinamide. Such a reduction occurred in 3 cases of cerebrospinal syphilis, in 2 cases of tabo paresis, and in 1 case of general paralysis, but many patients who showed the greatest clinical improvement had as strongly positive a Wassermann reaction at the end of trypsinamide treatment as before it. The "colloidal gold curve" was also but little influenced by treatment. Among the whole group of 85 cases 24 patients were considered to be improved clinically. Such improvement occurred in 7 cases of general paralysis, 2 of tabo paresis, 2 of tabo dorsalis, 12 of diffuse cerebrospinal syphilis, and 1 of acute basal meningitis. Ten cases of the entire group were asymptomatic, so no improvement could be expected. Lightning pains and gastric crises showed diminution in 5 cases out of 12. In every case with this clinical improvement there was also a gain in weight and in general nutrition. Out of 18 cases of general paralysis 7 patients were discharged from hospital to their homes, a few were able

to resume work, at least, for a time. One general parietic patient died after twelve injections during an epileptiform attack, and 5 other general parietics and 1 patient with tabo paretis grew worse. Four of the 85 patients died: one with general paralysis, one with tabo paretis, and one, who had cerebro spinal syphilis with spastic paraplegia, died five weeks after the sixth injection. The authors conclude that tripanamide was of value in producing clinical improvement in almost 30 per cent of a carefully selected group of cases. No serious or permanent optic nerve changes followed the treatment.

133 Spinal Drainage in Treatment of Neuro syphilis

C. E. ALLEN (*Urol. and Cut. Review*, May, 1925, p. 250) describes the following method which he has found of value in the treatment of neuro syphilis. The patient is prepared in the usual manner for salvarsan by free catharsis and abstinence from food for at least three hours before treatment. Sulpharsphenamine in 0.6 gram doses is then dissolved in 50 c.c. of freshly distilled water and injected intravenously. The patient is allowed to rest for an hour and then lumbar puncture is performed, the cerebro spinal fluid being withdrawn slowly until the pressure approaches zero as recorded by a mercury manometer. The patient then remains flat in bed for at least four hours, and is given a soft diet. After effects are very slight if any. The treatment is continued at intervals for a week until ten injections have been given. Then follow twelve bi-weekly intramuscular injections of mercury silicilate or intravenous injections of mercurous iodine. A tonic is usually ordered at the end of the mercurial treatment, and after one month serological tests are made on the blood and cerebro spinal fluid. Under this method of treatment the irritative symptoms promptly subside, not in frequently disappearing after a single injection of salvarsan followed by spinal drainage. Allen's conclusions are as follows: (1) Spinal drainage following injection of salvarsan offers the combined advantages of all other methods of intraspinal antisyphilitic treatment. (2) Less time and labour are expended with it than with any other method. (3) The technique is simple and the reactions negligible. (4) The method can be employed in clinics and dispensaries. (5) Drainage following sulpharsphenamine injections has proved more efficient than the injection of salvarsanized serum into the spinal canal.

131 X-ray Treatment of Hodgkin's Disease

D. J. STEENHUIS (*Nederl. Tijdschr. v. Geneesk.*, March 28th, 1925, p. 1393) records his observations on twelve cases of Hodgkin's disease treated by x-rays. Six were males and six females. The youngest was aged 16 and the oldest 58, the majority being between 16 and 30. The duration of the treatment varied considerably. Most had two courses of treatment with an interval of two months or more between the courses. In some cases the tumours disappeared very rapidly, and in others more gradually. Two cases were excluded from further consideration, as the treatment was insufficient. Four made a complete recovery, while the remaining six all showed an initial improvement, but soon had a recurrence which ended fatally. As regards the delayed effects of treatment the results were as follows: The lymphomatous disappeared very rapidly under treatment, though not so rapidly as sarcoma or leukaemic tumours. On microscopic examination the cells of the glands which had been irradiated showed a disappearance or degeneration of all the abnormal cells and their replacement by granulation tissue, which was converted finally into hyaline connective tissue. The fever usually increased after irradiation, some times reaching a very high level, but rapidly fell, especially after a large dose of the rays. The treatment had no direct effect on the red corpuscles, but had a decided influence on the white cells, as was shown by a rapid diminution of the lymphocytes and polymorphonuclears, and a transient or lasting leucopenia according to the dose of the rays. The effect of treatment on the spleen was that the organ first became much larger and then much smaller. In conclusion, Steenhuis states that the treatment should be very vigorous, and that the whole trunk should be irradiated.

135 Standardization of Thyroid Preparations

R. HUNT (*Arch. Intern. Med.*, June, 1925, p. 671) urges the standardization of thyroid preparations by the acetanilid reaction—that is, the increased resistance to acetanilid produced in white mice by the administration of thyroid extract. The results of this method agree with those of other methods, the best of which is probably the determination of the effects on basal metabolism in myxoedema or on thyroidectomized animals. The physiological activity of thyroid preparations was found to run closely parallel to their iodine content, and little or no physiologically inactive iodine was detected by this test in the thyroids of adult animals. By the use of aceto-

nitric very small amounts of non thyroid iodine in adulterated thyroid preparations could be detected, and it has the advantage over chemical tests of being applicable when only a few milligrams of material are available. Most of the thyroid preparations on the market were found to vary greatly in physiological and therapeutic activity, some tablets containing the equivalent of 15 little as 1/100 grain of fresh gland, while others contain 25 grains of fresh gland, since some thyroid preparations had five times as much iodine as others, and the physiological activity was closely parallel to the iodine content, one tablet might thus be physiologically equivalent to 12,500 other tablets. Hunt points out that no other iodine compound causes an increase in the resistance of mice to acetanilid at all comparable with that caused by thyroid extract, the mice recovering from 13.7 times the dose of acetanilid fatal to the controls.

135 An Antitoxin Treatment of Scarlet Fever

C. I. THENGBE (*Boston Med. and Surg. Journ.*, May 14th, 1925, p. 939) has treated 22 cases of scarlet fever with Doebe's antiscarlatina serum intravenously, and like Blake has come to the conclusion that it is a valuable therapeutic agent in the treatment of scarlet fever. The toxæmia accompanying scarlet fever can be combated effectively by administration of serum intravenously in smaller doses than are usually given intramuscularly. The intravenous administration of serum causes an immediate maximum concentration of antitoxin in the blood stream, its use being indicated in the moderate to severely toxic and septicæmic types of disease. Doebe found that it could be used without undesirable or untoward effects. Only two of his patients complained of a chilly feeling during or after the injection, none developed a skin chill, and only one had a serum rash. Lastly, the incidence of complications appeared to be lessened by the use of the serum.

Radiology.

137 Prevention of X-ray Sickness

E. H. ZWEIFEL (*Brit. Journ. Radiol.*, July, 1925, p. 267) discusses the prevention of the vomiting following irradiation of the abdomen, which is most severe after x-ray treatment on the stomach, liver, uterus, or ovaries, and is regarded by some as an unavoidable sequel. It is most frequently met with after intensive treatments where the whole series of exposures is completed in one day. The cause of the hyperemesis has been attributed to ozone and to uric acid, and the use of high well ventilated rooms helps in its prevention. Zweifel has obtained good results in treatment from the administration of 200 c.c. of salt solution either as an enema or subcutaneously. He adds that sickness can be prevented by encasing the tubes in lead boxes constructed to prevent the escape of all rays except those directed on to the lesion after first passing through a zinc or copper filter. During an experience over eighteen months of 200 such treatments of from four to six hours or more for fibroids or cancer, and for tumours of the liver and cancer of the stomach, no case of sickness occurred. He concludes that avoidance of vomiting is important in all cases, but that it is especially so in cancer, as it enables the patient more quickly to recover from the strain of the treatment.

138 Bronchial Skiagraphy

O. BECK and M. SGALITZER (*Zentralbl. f. Chir.*, July 11th, 1925, p. 1537) describe the use of the laryngeal catheter in bronchial skiagraphy. Their method is as follows: They anaesthetize the pharynx and larynx with a 10 to 15 per cent cocaine solution before passing a semi rigid catheter having a terminal orifice and a thin flexible metal stylet bent to correspond to the curvature of the larynx. The horizontal oral portion of the catheter passes through a block or gag which is fixed between the teeth. The catheter is sufficiently small to allow the patient to breathe easily throughout the examination. To the proximal end of the catheter is attached a small oil pump or Junker's apparatus, controlled by a screw valve which regulates or closes the calibre of the air tube of the apparatus thus regulating the flow of the 40 per cent iodipin solution. They recommend that if this solution causes coughing the rubber tube should be detached from the catheter and the interior of the larynx and trachea sprayed through the catheter with a cocaine-adrenaline solution. They report that the technique is simple and easy, that it remains throughout under the control of the operator, and that the iodipin does not come into contact with the mouth or pharynx. By means of the fluorescent screen the skiagrapher can watch the flow of the solution into each bronchus, the patient's position being varied to assist and regulate the

passage of the fluid. They believe that by this procedure the diagnosis and treatment of diseases of the lungs and bronchi, especially in regard to bronchiectases and tuberculous cavities, will be much facilitated.

139 X ray Treatment of Catarrhal Otitis Media

C. GRANDE (*Arch Ital, di Otol, Rinol e Laringol*, April, 1925, p 197) discusses the various attempts to cure deafness by means of x rays. Many writers had tried short exposures at short, often daily, intervals, and had given several of such courses. The results had not been very satisfactory and demanded a considerable amount of attendance on the part of the patient. The author in conjunction with Benini, a radiological colleague, has devised a technique which, he finds, is much less inconvenient and gives better results. He uses a current of 2 ma, a spark gap of 22 cm, with an aluminium filter of 3 mm and a diaphragm of 6 cm. His first exposure is of ten minutes or less according to the tolerance of the individual. He gives a second, third, and fourth exposure at intervals of five to six days, increasing the dose to fifteen minutes. Usually this course results in considerable improvement, but if there is none the treatment is not continued. If a moderate amount of improvement accrues another two doses are given, and after a month's rest the series can be repeated. Fifteen patients with catarrhal otitis were so treated five had a history of only six months, but all were markedly improved as regards tinnitus and acuity of hearing. Two patients with otitis with internal ear affection were treated and one showed improvement as far as tinnitus and vertigo were concerned, but with no gain in hearing. The other case was not traced. In two cases of resolved suppurative otitis no benefit followed. Of five cases of otosclerosis two were definitely improved as regards tinnitus but not as regards hearing. One patient was a married woman who was treated through pregnancy and parturition without any increase of deafness. One case of auditory nerve deafness treated was not improved. The author concludes that catarrhal otitis and some cases of otosclerosis can be greatly benefited, but that nerve deafness and the results of suppuration do not respond to treatment.

140 Indications for the Use of Ultra-violet Energy

L. C. DONNELLI (*Journal of Radiol*, May 1925, p 183) is the result of his experience and a study of the literature, has come to the conclusion that in ultra violet energy intelligently used the physician has under his control a force which is (1) a direct germicide, (2) an indirect germicide, (3) a counter irritant, (4) a means of producing increased resistance to infection, (5) an analgesic, (6) a means to depress metabolism, (7) a means to stimulate metabolism, (8) a means to stimulate the sympathetic nervous system, (9) a means to regulate mineral metabolism, (10) a means to balance endocrine secretions, (11) a means to overcome disturbances caused by vitamin deficiencies.

Obstetrics and Gynaecology.

141 Streptococcal Infection of the Uterus

C. W. BARRETT, A. I. LASH and I. PILOT (*Amer. Journ. Obstet. and Gynecol.*, June, 1925, p 797) have investigated streptococcal infections of the cervix uteri and Fallopian tubes with a view to discovering the predominating organism. The type of infection considered was that giving rise to clinical conditions extending over long periods with recurrent acute exacerbations. Prior to operation cervical cultures were taken and smears examined, and directly afterwards sections of the Fallopian tubes were studied microscopically and smears made of the exudate covering the endosalpinx. From these investigations and those recorded by others it would appear that primary or secondary infections of the Fallopian tubes may be carried in through the vagina or may come from the throat or intestinal tract, but that they rarely result from streptococci normally present in the vagina or intestinal tract. The authors think that the throat may be an important source, and it is possible that many infections, especially those due to hemolytic streptococci are exogenous from the vaginal tract or throat. The authors found streptococci in 40 per cent of chronic cervical infections and in 35 per cent of the Fallopian tube infections. *S. haemolyticus* occurred in 14 per cent of cultures of the Fallopian tubes and in 5 per cent of cultures from the cervix, while *S. viridans* occurred in 21 per cent of the Fallopian tube cultures and in 27.5 per cent of those from the cervix. No specificity for the Fallopian tubes was demonstrated, and no relation appeared to exist between the incidence of the organisms in the cervix and in the Fallopian tubes. The pathogenicity of the different strains was similar to that of

those isolated from various streptococcal infections, and their morphological and cultural characteristics resembled those of streptococci isolated from abscesses, peritonitis, and fatal streptococcal infections.

142 Diagnosis of Early Pregnancy

A. STRECK (*Zentralbl. f. Gynak.*, May 2nd, 1925, p 968) describes a method of diagnosis of early pregnancy which is dependent, like the Abderhalden reaction, on the detection in the blood serum of pregnant subjects of destructive antiferments acting on a substrate of placental extract. The serum is incubated with the extract for twenty-four hours and the protein breakdown estimated by means of the fluid interferometer. The use of this instrument in this connexion appears to have been suggested in the first instance by Hirsch, it is extremely sensitive and gives quantitative results. German veterinary surgeons have previously reported striking successes obtained by this method in the early diagnosis of pregnancy in several animal species. In 38 cases of women in various months of gestation after the first, Streck claims to have found the interferometric reaction positive in at least 81 per cent, the proportion of very early pregnancies is not specified. A substrate of animal placenta was as effective as one of human placenta. In 3 cases the reaction confirmed a diagnosis of tubal pregnancy. By using ovarian and testicular extracts as substrates a prediction of the sex of the foetus was made in 23 patients and was accurate in 72 per cent. It is admitted that the technique of the test is complicated and exacting. In a few cases it is claimed that myoma, carcinoma, and sarcoma substrates gave positive results after the interferometric test with the serum of a patient suffering from the corresponding tumour.

143 Subcutaneous Symphysiotomy in Labour

J. ORTIZ PEREZ (*Gynecol. et Obstet.*, June, 1925, p 411) reports sixteen cases of labour, thirteen in primiparae, where subcutaneous symphysiotomy was performed with success. All the mothers did well, but two of the children died. In two cases there was troublesome bleeding from a tear, and in two cases temporary incontinence of urine. No difficulty in walking followed. X-ray examination showed that the separation remained permanent, and the author refers to cases where subsequent labour has occurred without any necessity to repeat the section of the symphysis. He uses a pointed knife to cut the soft tissues and a blunt pointed bistoury to divide the cartilage. Ortiz Perez states that the operation is contraindicated when the foetus is dead and when the bony pelvis is less than 8 cm in diameter or 9 cm in the sacro-pubic line. The forceps he says, should be reserved for difficulties in the soft parts. No phlebitis or thrombosis was seen in any of the sixteen cases of which details are given.

144 Unrecognized Pregnancy carried to Full Term

R. BLOCKERS (*Bruxelles med.*, April 19th, p 843) records the following case in a married woman, aged 30, the mother of three children, aged 3, 4, and 5, who had no reason to conceal her pregnancy. One morning she found that her bedclothes had been soaked by a clear vaginal discharge. On examination she was surprised to learn that she was at full term, as she had menstruated regularly as usual for four or five days at a time and had felt no quickening, or had any digestive disturbances. Her abdomen and breasts had remained large since her last confinement. The patient gave birth to a normal infant the next day after expulsion of a considerable amount of amniotic fluid. The case is of interest from an obstetrical point of view owing to the persistence of the monthly periods throughout pregnancy and the hydramnios without any obvious explanation of it. The three former deliveries had been normal, the woman was not suffering from cardiac disease, and her Wassermann reaction was negative. The case was also of medico-legal interest, as errors of diagnosis in such cases may be made.

145 Conception with Intact Hymen

O. W. BISCHOFF (*Zentralbl. f. Gynak.*, May 9th, 1925, p 1034) states that modern medical teaching is unanimous in admitting the possibility of pregnancy in a woman whose hymen is intact. He quotes the observation of Marion Sims, who found in a patient suffering from vaginismus whose hymen was intact, four hours after coitus, a living spermatozoon in mucus taken from the cervix. Bischoff records a case in which the patient complained of pain and vaginal bleeding, coitus with intromission had not occurred during her seven years of married life and the possibility of pregnancy was not suggested. The hymen was free from tears and scars and admitted a pencil vaginal examination showed a dilated cervix, and was followed by expulsion of a two-months' foetus.

146 Myomectomy in Pregnancy

LOUBAT (*Bull Soc d'Obstet de Paris*, No 5, 1925, p 372) reports two cases of uterine fibroid successfully operated on during pregnancy without interrupting the pregnancy (1) Laparotomy was performed on a primipara, aged 32, three months pregnant, for the removal of a fibroid about the size of the fist. On section the tumour was seen to be undergoing extensive necrosis. Operation was undertaken because of severe pain in the tumour, which was thought to be a twisted ovarian cyst. The woman was delivered later of a full term child. (2) A multipara, aged 35, four months pregnant, was seized with severe pains and vomiting, and a lump was felt in the left iliac fossa. At the operation a necrosing fibroid as large as an apple was found on the anterior aspect of the uterus. After the operation there was troublesome colic for four days, but this passed off, and the remainder of the pregnancy was normal.

Pathology.**147 Production of Local Immunity by Diphtheria Toxin**

J A BROWN (*Journ Infect Dis*, June, 1925, p 501) has tried to determine by experiments whether it is possible to produce by inoculation a local immunity of a mucous membrane to diphtheria. Direct inoculation of virulent diphtheria bacilli on to the conjunctiva of a guinea pig is without effect, but if the conjunctiva be previously excoriated then a marked inflammation follows, accompanied by oedema, which results sometimes in total loss of the eye, and sometimes in death. The inoculation twice daily on to the normal conjunctiva of diphtheria toxin, or of a saline suspension of diphtheria bacilli killed by heat at 70° C for one hour, may produce profound systemic disturbance due to absorption of toxin, and after eight days may prove fatal to the animals, some, however, survive. To ascertain whether such animals have acquired immunity, it is sufficient to inoculate the scarified conjunctiva with living virulent diphtheria bacilli. Experiments made in this way showed that guinea pigs which had survived vaccination either with toxin or with dead bacilli were immune to infection with living bacilli. Other experiments seemed to indicate that this immunity persisted for at least two months. Further work was performed to ascertain whether the immunity was local or general. Vaccinated guinea pigs were inoculated with living virulent bacilli on to the shaven, scarified abdominal wall. After four such inoculations all showed local oedema and general systemic disturbance, one of the animals died. Two unvaccinated controls both died after the second inoculation. This experiment indicated that conjunctival vaccination with toxin or with killed bacilli gave rise to a low degree of general immunity, this was not nearly so marked as the local immunity affecting both eyes. Brown concludes that it would appear, therefore, that by treatment with diphtheria toxin or with heat killed bacilli it is possible to produce a local immunity of a mucous surface to virulent diphtheria bacilli.

148 The Susceptibility of the Skin to B anthracis

J BASSET (*C R Soc de Biologie*, June 5th, 1925, pp 1513, 1515, and 1517) has performed a number of experiments in connexion with the pathogenicity of the anthrax bacillus for guinea pigs and rabbits. Besredka has affirmed that the sensitivity of the guinea pig for *B anthracis* is strictly limited to the skin (see *Epitome*, July 5th, 1924, para 22), but Basset's work does not confirm this. He took a three day broth culture and determined the minimal lethal dose when injected in various situations. Given subcutaneously 1/120 c cm killed a guinea pig of 600 grams in two and a half to three days, given intracutaneously 1/60 c cm was fatal in three and a half to four days, given intramuscularly in such a way as not to infect the skin 1/60 c cm was fatal in two and a half to three days, while given by cutaneous inoculation, the culture being rubbed into the depilated skin, 2 c cm were required to prove fatal in four to five and a half days. From this it is seen that the skin, by which the author means the epidermis, has no special susceptibility, but rather the reverse, for it was necessary to use a dose 240 times greater than that required to produce death by subcutaneous inoculation. These results were confirmed by the use of spores instead of vegetative bacilli. A culture on agar four to five days old, consisting mostly of spores, was heated to 80° C for one hour to destroy any non sporing bacilli and their endotoxin, this culture was injected by various routes and the minimal lethal dose estimated. Given subcutaneously, this dose lay between 1/16 and 1/60 c cm given intracutaneously it was much the same, though the time before death was rather longer, given intramuscularly it was about 1/8 c cm while rubbed on to the depilated skin 1/8 c cm produced no effect. It may be concluded that the spores are not so pathogenic as the vegetative bacilli and that the most

susceptible tissues are, in order, the subcutaneous tissue, the dermis, the muscle, and lastly the epidermis. The peritoneum comes between the muscle and the epidermis. It was found that the pathogenicity of the spores could be increased if they were injected together with a solution of lactic acid in this way the subcutaneous minimal lethal dose was lowered from about 1/30 to 1/300 c cm. Lastly, Basset showed that mixture of the spores with a non pathogenic strain of staphylococci had very little effect, provided that sufficient spores are present the extra diapedesis of leucocytes caused by the staphylococci does not seem to be sufficient to interfere with the final result.

149 The Schick Reaction in the Newborn

A RONCHI and I REDLICH (*La Pediatria*, June 15th, 1925, p 617) review the literature on diphtheria in the first year of life and record their observations on the Schick reaction performed on 100 mothers and their children in the first eight days of life at the obstetric clinic at Rome. The reaction was positive in 14 and negative in 86. Positive reactions were obtained in 10 out of 60 males and in 4 out of 40 females. In a pair of twins the reaction was negative in both, as well as in their mother. The reaction was also negative in a premature child born at the seventh month and its mother. The test was performed on the first day of life in 13 infants before they had been put to their mothers breast. In 3 of these the reaction was positive and in 10 negative. Contrary to the opinion held by most investigators, the antibodies present in the serum of these 10 children must undoubtedly have been transmitted from their mothers through the placenta. A paradoxical reaction—that is to say, greater intensity of the reaction to inactivated toxin—was well marked in one case and less definite in another. The positive reaction in the mother differed from that in the newborn by the redness and infiltration being always more intense and extensive and of longer duration. Pseudo reactions—that is, reactions to inactivated toxin—were observed in 14 mothers and only 2 infants. The present authors' researches confirm those of previous investigators to the effect that most of the newborn possess a sufficient quantity of antibodies to protect them against diphtheria.

150 The Phosphorus Content of the Blood in Carcinoma

SCHAUDIG (*Zentralbl f Chir*, May 30th, 1925, p 1204) states that Gröbly had tried to facilitate the diagnosis of carcinoma by qualitative estimation of the blood phosphorus, a considerable increase of which occurs in carcinomatous subjects. Schaudig found that in most cases of carcinoma there was an enormous increase of the phosphorus content of the blood. The increase, however, was most marked in advanced and inoperable cases, whereas in those in which the diagnosis was most important, such as gastric and intestinal tumours, the method completely failed. It was also useless in incipient carcinoma. In other diseases, especially tuberculosis and metabolic diseases, results were obtained similar to those observed in cases of carcinoma, so that an increase in the phosphorus content of the blood cannot be considered to be indicative of carcinoma.

151 Neural Localization of the Virus of Herpes

LE FÈVRE DE ARRIG and M MILLET (*C R Soc de Biologie*, June 12th, 1925, p 45) have been working on the various factors which favour the localization of the virus of herpes in the central nervous system. It is known that for true infection to occur it is necessary for this virus to penetrate the nerve cells, but by what means it does this is not definitely certain. If the virus is injected into the blood stream of a rabbit it rarely gives rise to infection. But if a short time before the injection the animal be given a slight blow on the head, it contracts the disease and dies about six days later with the typical picture of encephalitis. This is true so long as the interval elapsing between the injury and the inoculation does not exceed six hours. In order to find out how the injury acts they performed a spinal puncture by the sub occipital route and found that in those animals which had received a blow on the head the cerebro spinal fluid, instead of being perfectly clear, contained a variable amount of blood, sometimes visible macroscopically, sometimes only microscopically. It was clear from this, and from sections of the brain, that some of the blood vessels—mostly those on the meninges—had been ruptured, thus breaking down the barrier which normally exists between the vascular and the nervous systems. The injection of the virus previous to the cephalic injury was without effect, in the quarter of an hour elapsing between the two procedures the virus was evidently reduced to such an extent that it was no longer able to give rise to infection. Other methods of causing the localization of the virus were found, such as simple spinal puncture or the intrathecal injection of distilled water or of hypertonic saline shortly before the introduction of the infective material.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

152

Serum Adenitis

H VADIER (*These de Paris*, 1925) states that adenitis, especially of the cervical and submaxillary glands, may be regarded as a serum phenomenon, as was first shown by Pirquet and independently by J D Rolleston in 1905. It may precede the other symptoms or follow them, and rarely appears as the only manifestation of serum sickness. When adenitis occurs at the onset of diphtheria, whether it persists or not until convalescence, the gland undergoes a sudden increase in size during serum sickness. Rapid and complete resolution is the rule, and suppuration is exceptional. Chronic enlargement is also very rare. In the pure form rapid and spontaneous disappearance of the adenitis occurs in three or four days. In the forms in which secondary infection plays a part the prognosis is not so good, but recovery without suppuration is the rule. Adenitis in convalescence from diphtheria, unlike the adenitis of the onset, has no prognostic significance. Serum adenitis appears to be more frequent after severe than after mild angina, but seems to be independent of the amount of serum employed. Although serum adenitis is particularly frequent in the course of diphtheria, diphtheria antitoxin has not a monopoly of this phenomenon, the heterogenic principles contained in the normal horse serum appear to be responsible. The specific toxin also plays a part and thus explains the localization of the adenitis.

153

Typhoid Fever in Children

L MORQUIO and J BONABA (*Anal de la Fac de Med*, No 2, 1925, p 83) record their observations on 1,440 cases of typhoid fever in children at Montevideo from 1908 to 1914. Nearly all lived in the suburbs where there was no proper drinking water or sewage system, whereas in the city of Montevideo typhoid fever has almost entirely disappeared. The disease was commonest between the ages 7 to 13, 968 of the cases occurring at this time. There were 130 deaths, a mortality of 9 per cent. The causes of death were malignancy of the disease in 48 cases, secondary infection in 31 cases, haemorrhage 18 cases, perforative peritonitis 13 cases, tuberculosis 12 cases, sudden death 6 cases, and diphtheria and cachexia one case each. The principal complications were broncho-pneumonia 30 cases, intestinal haemorrhage 25 cases, otitis 25 cases, perforative peritonitis 20 cases, meningeal reaction 20 cases, subcutaneous abscesses 20 cases, parotitis 9 cases and aphasia 7 cases. Treatment consisted in tepid baths, adrenaline by mouth or subcutaneously, and injections of normal saline or urotropine. Vaccine treatment had no effect upon the course of the disease.

154

The Diagnosis of Measles

E STEINERT (*Med Klin*, June 5th, 1925, p 846) states that though the most frequent localization of Koplik's spots is the mucous membrane of the lips and cheeks, especially at the corners of the jaw, they have also been observed on the vaginal mucous membrane and lacrimal caruncle. Steinert has recently seen several cases in which simultaneously with the occurrence of typical Koplik's spots on the buccal mucous membrane similar lesions were present on the nasal mucosa. Only slight extraversion of the tip of the nose was required to bring the corresponding part of the nasal mucous membrane into view. Steinert considers that this phenomenon represents an extrabuccal localization of Koplik's spots which may aid in the early diagnosis of measles in children who offer resistance to inspection of the mouth.

155

Pancreatitis in Mumps

A M STEVENS (*Arch of Ped*, May 1925, p 333) reports four cases of mumps in boys aged from 6 to 12 years complicated by pancreatitis. The onset was sudden on the fifth or sixth day of mumps, with rise of temperature to 102° or 104° F and rapid pulse. Pain was generally mild at the onset and referred to a point just below the xiphisternum. Prostration was out of proportion to the degree of pain and persisted for several days after the temperature had become normal. Vomiting was a prominent symptom, coming on within an hour of the rise of temperature, and persisting for two days. Constipation was the rule. Icterus was noted in two cases. The duration of the symptoms varied from one and a half to two and a half days, the attack ending with a rapid fall of temperature to normal and cessation of nausea. It was noted

worthy that none of the four signs described by Farquhar as characteristic of mumps pancreatitis in adults—namely, pain in the left hypochondrium, bradycardia, diarrhoea, and glycosuria—was present in these cases. The importance of excluding appendicitis, intussusception, and ileus is emphasized.

156

Subcutaneous Phosphatic Concretions

A GILBERT and L POLLET (*Bull Soc Med de Paris*, July 2nd, 1925, p 957) report a case of multiple subcutaneous concretions in a man aged 61. The concretions varied from the size of a pea to that of a small nut and were confined to the scrotum. There were thirty or more in all and they had been appearing for the last thirty years. They were quite painless, hard, and adherent to the skin. At different times they had been excised, but they usually returned, and sometimes evaded spontaneous excretion as chalky mass. There were no signs or symptoms of gout. On examination the little tumours were found to be made up of 63 per cent phosphates of lime and 7 per cent phosphates of calcium, no urates and no cholesterol were present. There was no albumin or sugar in the urine, but the phosphoric content was diminished. The blood showed a slight excess of phosphates.

Surgery.

157

The Treatment of Recurrent Dislocation of the Shoulder

M WULFING (*Zentralbl f Chir*, June 6th, 1925, p 1244) states that in 1917 E Joseph devised a new method of "mooring" the head of the humerus as a radical cure for recurrent dislocation. After widening the laceration in the capsular ligament, he drilled a hole through the head of the humerus, and having excised several strips of fascia lata each measuring 10 cm by 2 cm, he passed these through the passage in the bone, the capsule was then sutured, leaving a small opening through which the strips of fascia were brought out. These were then sutured to the periosteum and soft structures beneath the acromion. In 1919 Joseph modified his original operation. Instead of drilling through the head of the humerus, he removed a small area (1 cm square) of the articular cartilage, with three catgut sutures he attached the strips of fascia lata to the denuded bone, fixing the free ends of the strips to the acromion, as in the former operation. Schmieden has introduced a further modification without widely opening the capsular ligament he drills through the capsule and humeral head a straight "canal" from front to back of the bone. Another hole is drilled through the acromion from beneath. Strips of fascia measuring 20 cm in length are then passed through these canals and the ends are sutured over the acromion. Loeffler and Kirschner perform an entirely extracapsular operation; they drill through the base of the greater tubercle and the acromion and pass the strips of fascia through these holes. Joseph has published his results two or three years after operation. Schmieden reports good results attained by Joseph's method but more extensive observations on the results of this operation have not been published. According to Voelcker Schmieden's modification of the original operation has had disappointing results. Voelcker, Horfchirt, Haulc and Nissen report good results after Loeffler's operation. The ultimate results of Schmieden's and Loeffler's modifications have not been published. Wulfing has operated upon six cases of recurrent subcoracoid dislocation during the last year. In three cases Schmieden's technique was employed and in the others Loeffler's operation was performed. In two of the former cases the result was entirely satisfactory in the third case there was slight wasting of the shoulder muscles but otherwise the result was very good, movements being free and painless. Of the three latter cases the first patient complained of slight pain in the shoulder without objective symptoms, she was able to do her household work. The second patient was a hospital sister aged 29, two and a quarter years after operation she had had no recurrence although her occupation necessitated considerable muscular exertion. She had had occasional sharp pain in the shoulder and there was slight wasting, possibly from disuse. The third patient, a butcher aged 42, was readmitted to hospital three weeks after operation complaining of definite limitation of mobility of the right arm. No cause for this could be found. In regard to Joseph's operation Wulfing points out that the following

points deserve further consideration (a) the possible danger of serious septic infection of the opened joint, (b) the possibility of absorption of the strips of fascia, (c) the possible danger of osteo arthritis. He concludes that the number of cases hitherto reported is too small to permit of definite conclusions being drawn, but as the result of his own experience he prefers Schmieden's modification of Joseph's operation.

158 Multiple Paratyphoid Osteomyelitis

G L CARTINGTON and W C DAVISON (*Bull Johns Hopkins Hosp*, June, 1925, p 428) report a case of multiple osteomyelitis due to the paratyphoid B bacillus in a coloured boy aged 8, motile bacilli being found in fresh blood preparations. Although osteomyelitis and periostitis of one or more bones are not unusual complications of typhoid and paratyphoid fevers, no case has hitherto been reported in which the right humerus, radius, and ulna, both fibulae, the left ulna and scapula, and the third to ninth ribs on both sides were successively implicated at intervals during a period of two months. *B. paratyphosus B* was isolated from the pus of the lesions in the humerus, fibulae, and left ulna.

159 Sympathectomy for Tinnitus

E BRUNING and E FORSTER (*Deut med Woch*, May 22nd, 1925, p 860) prefix their account of an operation they have devised for the relief of tinnitus with a review of the present day treatment of this condition, which is probably due to a localized spasm of the blood vessels of the internal ear. Drugs which relieve such spasm may, indeed, banish tinnitus temporarily, but their effects soon wear off and ultimately the patient's general health and nervous system may suffer so severely that he commits suicide or becomes a drug addict. As angio spastic conditions in various parts of the body other than the internal ear have responded satisfactorily to resection of the sympathetic filaments supplying the parts concerned, the authors argued that such an operation might also be beneficial for tinnitus. The patient on whom they first performed this operation was a man aged 73, without a history of syphilis or of heavy smoking and drinking. He had suffered since June, 1924, from severe tinnitus on the left side. As the usual remedies had failed, and he was getting desperate, he insisted on an operation, although the dangers and possibility of failure of such an undertaking were put before him. On December 26th he was given a general anaesthetic, and an extensive resection of the sympathetic system in the left side of the neck was performed, the stellate ganglion and its connections were removed, and perivascular sympathectomy of the carotid artery was performed for a distance of 5 cm. The wound healed by first intention and two days after the operation the tinnitus had already become less loud. Horner's symptom complex was demonstrable and there was marked hyperemia of the left side of the face and head as well as of the left arm. When the patient was re-examined on March 4th 1925, his general health was vastly improved, and the tinnitus had abated so much that he noticed it only when he thought of it. The authors suggest that when further experience of their operation has been gained, it may not be necessary to resect the sympathetic system in the neck so radically as they did.

Therapeutics

160 Radiotherapy in Non-malignant Gastric Diseases

R BENSAUDF I SOLOMON and P OLRY (*Presse Med*, June 24th 1925 p 841) review the literature relating to the action of x rays on gastric ulcers and painful functional gastric disorders and report new investigations. They used the Royce et Ropiquet apparatus, which gave with a 25 cm spiral a current of 3 milliamperes. The focal distance was 20 cm, a 5 mm aluminium filter was employed and the ionometric dose was 500 R (2 H 5). One or two sittings were given every week each patient receiving a total of fourteen or sixteen irradiations of the gastric region after a preliminary screening. In the majority of patients a definite erythema was observed between the eighth and twelfth applications; this necessitated posterior instead of anterior irradiation. Variations in gastric secretion were the most obvious phenomena produced by irradiation; they were easily explained by the definite and almost elective action of x rays on the stratum of secreting cells. In one third of the cases it was found that a single dose of 500 R (2 H 5) produced a definite reduction of acidity occasionally suddenly but more usually one hour after irradiation. In almost every case the reduction was brief the acidity returning next day to its former ratio. In the remainder two thirds of the cases a single irradiation had no effect on the acidity and in no case was the percentage of pepsin modified by a single irradiation. After

several doses, at intervals of from three to eight days, variations in gastric secretion were more definite. In 55 per cent of the cases there was a great fall in acidity, in 25 per cent a slight fall, while in 20 per cent there was no perceptible reduction. In a few cases free hydrochloric acid disappeared entirely. Usually the reduction of acidity was delayed until between the eleventh and sixteenth irradiations, occasionally it occurred between the third and fifth. In a large proportion of patients, especially among those suffering from slight functional disturbances with approximately normal secretion, the evolution of acidity followed a very regular sequence. The first application increased the acid and pepsin secretion, subsequent irradiations diminished them both. The patients suffering from gastric ulcer with hyperchlorhydria were therefore those who derived the greatest benefit from irradiation; cases of hypochlorhydria were not improved. In the cases which showed the greatest modification of gastric secretion the effect of irradiation lasted for a few weeks only. Occasionally a second series of irradiations produced a more lasting effect. The authors found that the analgesic effect of irradiation was very inconstant, in some cases intense and chronic pain was relieved entirely, but the number of failures was approximately equal to that of the successes. Schultze Beiger has reported five cases of gastric irradiation a few days after profuse haemorrhage had occurred. Four patients had no recurrence, while the fifth patient had a haemorrhage a few months later. The present authors used no treatment other than x rays. 6 among 18 patients were greatly improved—pain disappeared, and they gained weight, being able to return to their normal mode of life.

161 Prophylactic Treatment of Measles

R DEBRE, P JOINNON, H BONNET, and J C DECAM (*Bull et Mem Soc Med des Hop de Paris*, May 14th, 1925, p 682) have performed more than two hundred prophylactic injections with the blood or serum of adults who have previously had measles, and by this method have checked the extension of the disease in several families or in communities where crowding facilitated contagion and would tend to aggravate the disease. The dose of serum was 12 to 15 c cm below the age of 2 years and 20 to 25 c cm above that age. It is advisable to mix the serum of several individuals, since the richness in antibodies of the donors is not known a priori. No bad results were observed. In practice the donors to be preferred are the parents of the children concerned without any notice being taken of the date when they had measles, since parents who have had measles twenty or thirty years previously have supplied excellent serum. The serum of a person who has had measles is obtained much more readily than convalescent serum and the method is willingly accepted, because parents gladly give their blood to save their children from a disease or to diminish its gravity. The serum of adults who have previously had measles may contain also the immune bodies of diseases frequently associated with measles and may in this respect be superior to convalescent serum. LESTER (*ibid*, p 689) reports that he has injected twenty children suffering from whooping cough with the whole blood of their fathers and mothers who had had measles in childhood. Intramuscular injections of 10 c cm were given three days in succession, six days of possible incubation and measles, which was abortive as regards both incubation and the general symptoms.

162 Treatment of General Paralysis

A MARIE and V KOHN (*Bull Soc de Hyg*, June 10th, 1925 p 198) claim to be the first to have employed inoculation of malvarin in France on a large scale for general paralysis, as they have subjected more than a hundred patients to this method at the St Anne Asylum in Paris and elsewhere. Recently they have had even better results by inoculation of relapsing fever and have inoculated thirty cases with *Spirochaeta duttoni*. Their results were as follows of 103 patients inoculated with malvarin, 12 died, 5 had remissions and 18 showed considerable improvement while out of 15 who had been inoculated with relapsing fever more than three months previously 9 showed remissions and none had died. The authors attribute the good results to the sudden high temperature accompanied by hyperleucocytosis which checks the growth of the treponemata. On the other hand, after febrile diseases accompanied by leucopenia such as typhoid fever, a remission of general paralysis is never observed. After three years' trial of various pyrogenetic agents the authors are convinced that the mildest, such as sterilized milk or sodium nucleinate should first be employed. If the patient does not react, and he has not obvious tuberculosis—a rare occurrence in general paralysis—injections of tuberculin in increasing doses should be tried alternately with bismuth. Patients who are capable of a reaction show a fever of 102.2° before reaching the dose of 10 to 20 mg. Advanced cases of general paralysis do not react even to

doses of 2 to 3 grams. After these methods have failed one may try inoculation of relapsing fever or benign tertian, if the patients are young and have no hypertension or pronounced renal, cardiac, or hepatic lesions. The attack, however, should be cut short at once if the patient shows signs of intolerance or collapse. When once a remission or improvement has occurred, two or three series of injections of bismuth, stovarsol, or triparasulide should be given every year.

163 Rashes produced by Veronal and its Allies

A TARDIEU and A BLOUDEL (*Rev. de Med.*, No 4, 1925, p 255) report a case of poisoning by dial, accompanied by very characteristic rash. They refer to several records of poisoning by veronal, luminal, dial, and other allied drugs where rashes followed. They state that the most striking thing about these rashes is their polymorphic character—bullous, pustular, morbilliform, scarlatiniform, or urticarial. Usually there is much itching and slight desquamation at the end, and sometimes in the scarlatiniform type the rash may be so varied and general as to make one suspect scarlet fever, especially as a sore throat is often present. In addition to these acute forms of toxic rash, the authors refer to a chronic type lasting for three years in a veronal taker, who lost the rash when she gave up taking veronal. As to the prevalence of these rashes, the authors say they found a rash in 20 out of 100 veronal takers. The rash is considered of favourable prognostic importance, as it usually occurs in subacute crises of veronal poisoning or in the convalescent stage of acute poisoning. These rashes are not thought to be specific, but probably occur mainly in people with a badly balanced vaso-motor system.

Laryngology and Otology.

164 Autoplastic Treatment of Small Perforations of the Septum

J B VAN NIEUWENHUISE (*Rev. de Laryngol., d Otol. et de Rhinol.*, June 15th, 1925, p 380) states that small perforations of the nasal septum are very often the outcome of old syphilis and serve as a diagnostic point, though they may be caused by many other conditions, of which trauma and ulceration are the most common. The formation of crusts on the margin of the perforation and repeated epistaxis from the free edges require treatment, and in other cases there is a whistling sound on ordinary quiet respiration due to the passage of air through the narrow hole. This is only met with in the smaller types of perforation. The author points out that before attempting any form of repair it is necessary to make sure that the cause of the perforation has become quiescent, and in cases of tuberculosis, syphilis, and lupus attention must be paid to the general and neighbouring manifestations of the disease. If, however, the condition is quiescent and there are no other contraindications various plastic measures may be adopted. In the method of Laurens the mucous membrane of both inferior turbinates opposite the perforation is dissected up and carried across to the septum, the edges being sutured to the margins of the perforation. In Scifert's method the surface of the inferior turbinate process is scarified and the septum is pressed over by packing in the opposite nasal fossa until it comes into contact. The turbinate process becomes adherent and fills up the perforation. The turbinate mucosa is incised round the margin of the perforation and a portion is left filling up the gap. Roy's method consists in dissecting up a flap from the septum, turning it back or forwards as the case may be, and suturing it to the freshened edges of the perforation. Other surgeons have turned up a similar flap from the floor of the nose. The author has recently had a case in which he undermined the mucosa round the perforation for a distance of 1 cm and then inserted a portion of the inferior turbinate which he resected for the purpose. He placed the graft so that the mucous membrane of the graft fitted into the perforation, with the fragment of bone to support it, the edge of mucous membrane around it was insinuated under the loosened edge of the septal mucosa. The result was very satisfactory and the technique was very easy.

165 Oto Laryngology in the Philippine Islands

A S FERNANDO and I ELISA NICHOLAS FERNANDO (*Journ. Trop. Med. and Hygiene*, June 1st, 1925, p 202) describe the special characteristics of tropical oto laryngological diseases, with particular reference to their work in the Philippine Islands. The most prominent features are the high incidence of acute rhinitis, tonsillitis, middle ear suppuration, and furunculosis of the ear. The relative frequency of atrophic rhinitis in young girls and women leading a sedentary life, and the comparative rarity of septal deviation, submucous resection being an unusual operation. Leprotic involvement

of the ear is common, and the authors suggest that the frequent atrophic condition of the nose resulting from leprosy is perhaps an important factor in the high incidence of tuberculosis among these patients. They find that the throat is only affected in advanced leprosy and when extensive destruction of the interior of the nose is present. Tertiary manifestations of yaws appear in the form of extensive infiltration and ulceration of the nose, pharynx, and palate, with bony destruction sometimes, and much deformity. Paralysis of the vocal cords, due to beriberi, has been reported, and the authors believe that this is due to neuritis rather than to pressure on the nerve.

166 Injection of the Spheno palatine Ganglion

J TERRACOT (*Arch. Internat. de Laryngol. et Otol. Rhinol.*, July-August, 1925, p 787) describes the anatomy and relations of the spheno palatine ganglion of Meckel in connection with injection operations. The posterior portion of the pterygo maxillary fossa contains the ganglion and the spheno palatine and palatine nerves, the anterior contains the terminal portion of the internal maxillary artery and its branches. He questions the usual description of the roots of the ganglion, agrees that there are often filaments leading from the ganglion to the spheno palatine nerve and its branches, but adds that these are very small and not always demonstrable. He suggests that the ganglion has no motor root, but that the great superficial petrosal nerve is a sensory nerve linking up the fifth and seventh nerves, and that the direction of the impulses is from the spheno palatine to the geniculate ganglion. The ganglion is also connected with the superior maxillary nerve, with the ciliary and optic ganglia and with the optic nerve. Terracot describes three methods of injecting the ganglion. The first or endo nasal can be performed in two ways: the needle, 8 to 10 cm in length, is passed under the middle turbinate and made to perforate the spheno palatine notch at the point of insertion of the tail of the middle turbinate. Sinder modified this method and passes the needle through the tail of the turbinate. These methods require much practice and there is some difficulty in hitting off the notch. In Cushing's method the needle is passed directly upwards from the lower margin of the zygomatic process. Terracot considers this a good method, but accuracy of direction is required. The third method, as practised by dentists, consists in passing a needle which has a right angle bend into the posterior palatine foramen and then up the bony canal. Once in the canal, Terracot states, nothing can go wrong and the injected fluid must reach the ganglion. He considers this the easiest and most reliable method.

167 Laryngeal Stridor with Dysphagia

D MCKENZIE (*Journ. of Laryngol. and Otol.*, May, 1925, p 285) describes a case of laryngeal stridor and dysphagia in a girl, aged 3. Inspiration was very noisy, especially during sleep when the respiration rate was remarkably slowed down to nine or ten a minute. The symptoms had gradually increased from the age of 9 months, and during this time difficulty in drinking with much coughing and spluttering had been noticed. Dyspnoea was considerable and the patient was rachitic and weak. The symptoms became so urgent that tracheotomy was performed. The stridor disappeared but the respiration rate remained very slow. After tracheotomy food began to appear through the tracheal cannula and food was henceforth administered by a nasooesophageal tube with considerable difficulty. Septic bronchopneumonia supervened and death followed four weeks after the tracheotomy. The necropsy showed that the upper part of the larynx had fallen in and the intrinsic larynx was of a cruciform shape between the doubled up epiglottis and the approximated arytenoids, which were all bunched up close together. This condition has been seen by many observers during life. The occurrence of dysphagia with the stridor has been but rarely mentioned before and receives careful study. The author dismisses the idea that there is any nervous innervation but he considers that there is a weakening and flaccidity of the upper part of the larynx and that during inspiration the arytenoid processes and the uvula and epiglottic folds are drawn inwards and downwards instead of being held away from the glottis. The condition progresses and becomes a vicious circle. The slowing of the respiration rate McKenzie describes as compensatory and its persistence after tracheotomy as a habit. The coughing and spluttering on drinking he considers as a reflex to prevent food from entering the weak and non-resistant laryngeal aperture. The fact that food entered the larynx he ascribes to the loss of the protective blasts of air which were diverted through the tracheal cannula. The author expresses the view that tracheotomy should be avoided when possible in congenital stridor, but if dyspnoea is very marked this risk must be taken.

Pathology.

Filterable Forms of the Tubercle Bacillus

171 Filterable A. DUTOURI (C. A. R. ARLOING and A. DUTOURI (C. A. R. 26th, 1925, p 165) have been working on the filtrate of the tubercle bacillus, and have confirmed to a certain extent the results of previous authors. Most of their experiments were made with pathological products from infant and children, such as pulmonary lesions, a subcutaneous nodule, tracheo bronchial glands, or cerebro spinal fluid, but a few were made on laboratory cultures of the bacillus. The material was passed through a Chamberland L3 filter and tested for sterility. If no contaminating organisms were present, glycerin peptone water and glycerin broth were inoculated with the filtrate, 2 ccm of which was also injected intraperitoneally and 2 ccm subcutaneously into guinea pigs which were killed from three to ten weeks later. The results were somewhat unexpected. No organisms were recovered from artificial cultures, but four out of five of the pathological products tested rendered guinea pigs tuberculous. The type of tuberculous appeared normal no caseation and no tubercles were seen, and the focal glands were unchanged, or only quite insignificantly enlarged. But on microscopic examination tubercle bacilli, indistinguishable from the usual type, were found in one or more groups of glands—generally the lumbar the tracheo-bronchial, or the submaxillary. The infection was exclusively a lymphatic one, and no appearance quite different from that following the injection of unfiltered tubercle bacilli. Filtrates of old laboratory cultures of tubercle bacilli were without effect on guinea pigs. H. DUPONT, 1925, p 439

172 SEVERAL workers have been successful recently in infecting animals with filtered tuberculous pus. H. DURAN and CHARCHANSKI (C R Soc de Biologie, July 24th, 1925, p. 439) report a similar observation. The fluid from a guinea pig pleurisy was filtered through a Chamberland L3 candle, and injected in 1 c.c. dose subcutaneously into a guinea pig. Three weeks later the animal was killed. No local lesion was then found and no evidence of tuberculosis in the spleen or viscera. But numerous tubercle bacilli. Reviewing similar cases that have been reported, the authors conclude that tuberculosis set up by filtered infective material follows one of two courses: either it gives rise to a local lesion with subsequent involvement of the local glands, or, as in this case and in those of Auloung and Coumont, it gives rise to discrete lesions having no apparent connexion with the site of injection.

173 **Vaccination by Means of the Bacteriophage** Monget and in the case of Allouin lesions having no apparent connection with the course of an epidemic of septicaemia amongst their stock rabbits A. GRATIA and DOLORE DOLE (C 1 Soc de Biologie, July 17th, 1925, p 452) isolated a lactose fermenting organism similar in many respects to *B. coli*. Injected in a small dose (1/1,000 c.c.m.) into a guinea pig, it gave rise to a septicaemia terminating fatally in about twenty hours. As the organism was very susceptible to an anti *B. coli* bacteriophage, the authors considered it suitable for vaccination experiments. Guinea pigs which were injected intraperitoneally with ten minimal lethal doses, and which were then given either subcutaneously or intraperitoneally 1 to 2 c.c.m. of bacteriophage, invariably survived but if the bacteriophage were given later than four hours after the infection, organisms the animals died. With these limitations the bacteriophage exerted a definitely protective action, and they work on an antistaphylococcus bacteriophage, and they to doubt the specificity of this protective action, as if their therefore made further experiments with guinea pigs. Suspensions held true with the anti *B. coli* variety. The same experiment was repeated with the substitution of the bacteriophage by an old filtered culture of *B. coli* entirely free from bacteriophage. These animals likewise survived. Again instead of the bacteriophage an old filtered culture of *V. cholerae* was given and again the protective action of the bacteriophage was deduced that the same effect could be obtained by the use of a specific filtrate of subcultured age. Again, it was found that by inoculating a guinea pig for some weeks with an anti *B. coli* bacteriophage it was possible to render the animal immune to the virulent coliform bacillus even though an indistinct principle had been formed and was present in the blood. The immunity in this case was specific. From all these experiments it would appear that the bacteriophage as such has no specific vaccinating power.

173 Vaccination by the course of an epidemic and

170 **Carcinoma of Body of Uterus** July, 1925 p 131), from a clinical and histological study of fifty cases of carcinoma of the body of the uterus, regards the condition as a disease entity rather than and distinct from, cervical carcinoma. He finds that even when the disease is advanced the cervical canal is rarely involved. The growth usually appears as papillary or polypoid outgrowths into the cavity causing some enlargement of the uterus. It tends to invade the body of the uterus and tubes and with secondary involvement of the ovaries and tubes the average age of the patients was 54 and nearly 70 per cent had passed the menopause over a year. The chief symptoms were hemorrhage and discharge frequently accompanied by colic pains, he states that these symptoms occurring after the menopause are pathognomonic of the condition. He adds that in all cases of doubt diagnostic curettage is important because of the frequent association of adenocarcinoma with myoma. He considers it a safe procedure provided that, if the curettings are positive, hysterectomy follows immediately so that the practical advantages of early disease does not follow the theoretical dangers of and certain diagnosis outweighing the theoretical dangers of dissemination of the growth. Total abdominal hysterectomy is he thinks the operation of choice as it affords a better means of dealing with metastatic complications though the vaginal route has advantages in the obese and aged. As matters of importance in operating Davis emphasizes (1) the avoidance of the use of tenacula traction (2) the preliminary ligation or clamping of the distal ends of the tubes by means of clamps on the broad ligaments and (3) preoperative disinfection and closure of the cervical canal by packing and sutures in order to avoid the possible exudation of infected material.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

174 Angina Pectoris in Mitral Stenosis

L. TELIA (*Arch des Mal du Cœur, des Vaisseaux et du Sang*, August, 1925, p. 531) discusses the precordial pain of mitral stenosis, which ranges from a sensation of pressure to a most severe attack of angina pectoris. Many French writers have attributed the pain to dilatation of the left auricle, and Castaigne published a fatal case in which one of the coronary arteries was blocked by an embolism and many areas of myocardial sclerosis and chronic endarteritis were present. Sternberg believes that anginal attacks in mitral stenosis are due to compression of the left coronary artery between the dilated and hypertrophied left auricle and the dilated pulmonary artery. Tolia now reports the case of a governess, aged 17, who had had repeated attacks of tonsillitis and of acute articular rheumatism with very definite mitral stenosis. At the autopsy the heart (especially the auricles) was enormously dilated and hypertrophied. The mitral valve was represented by a fibrous ring, hardly admitting one finger. The left coronary artery was slightly thinned. The tricuspid valve was normal in appearance, while the aortic and pulmonary valves were slightly thickened, and the pulmonary artery was dilated throughout its entire length. The great dilatation and hypertrophy of the right side of the heart had caused a rotation of the heart about its axis from right to left, which brought the ascending aorta in contact with the manubrium, while the left auricle touched the vertebral column. These findings support Sternberg's theory of compression of the coronary artery between the left auricle and pulmonary artery. The heart was so greatly enlarged that it occupied the whole of the mediastinum. Tolia has under observation two other young patients, aged 18 and 27, both have suffered from articular rheumatism repeatedly with attacks of angina pectoris secondary to mitral stenosis. Electrocardiograms show permanent arrhythmia, while in one case there are right ventricular extra systoles. Tolia thinks that treatment should be limited to free bleeding for the purpose of relieving the congestion of the right auricle. In addition to this, Sternberg recommends antispasmodics such as papaverine and novatropine.

175 Angina Pectoris in the Young

CASES of angina pectoris occurring in persons under 30 form less than 1 percent of all cases of angina. M. L. GALLAVARDIN (*Lyon Med*, May 3rd, 1925, p. 539) considers that it is possible that the unknown cause of non-syphilitic angina pectoris may exceptionally develop at an early age, but that it is probable that most juvenile cases are of syphilitic origin. Two cases in the literature, reported by (1) Nakaja and Ishiguro and (2) Vaquez, were undoubtedly due to acquired syphilis. The incubation period of the aortitis, usually twenty years or more, may occasionally be reduced to a few years. Gallavardin has seen angina pectoris develop at 31 in a man infected with syphilis at 25. Lunbry gives eighteen months as the incubation period in one case. The juvenile type may be due to infantile acquired syphilis with either normal or much reduced incubation period, but apart from these cases congenital syphilis as a cause must be taken into account. Gallavardin has seen 4 cases of angina pectoris occurring in patients between the ages of 20 and 30 years. In one of these the symptoms began at the age of 27. In the second case the patient, aged 30, was born when his father, who had had syphilis at 22, was 31. The Wassermann reaction was negative, but in neither case could acquired syphilis be absolutely excluded. The remaining two cases, however, were undoubtedly due to hereditary syphilis. One, a woman of 22 with aortic incompetence and a strongly positive Wassermann reaction, had had typical anginal attacks for six months. There was no family history of heart trouble, rheumatism, or choler. The mother's Wassermann reaction was strongly positive. The patient improved temporarily under intensive antisyphilitic treatment, but death supervened on a subsequent series of vaginal attacks. The other case, a man aged 29 with three months' symptoms, had no obvious cardiac lesion and the Wassermann reaction was negative. The father had had syphilis six years before the birth of the patient. In neither case were there any physical signs or stigmata of congenital syphilis. Gallavardin adds that many more similar cases must be recorded before congenital syphilis can indisputably be recognized as the causal agent in juvenile angina pectoris.

176 Diabetes Mellitus combined with Renal Glycosuria

P. VOGELENZANG (*Ned. Tijdschr. v. Geneesl*, July 25th, 1925, p. 446) defines renal glycosuria as an unduly easy permeability of kidneys unaffected by nephritis for sugar, the blood content of which is normal. In typical renal glycosuria the sugar excretion is small. Vogelenzang has been able to find few records of a large glycosuria, and thinks that in such cases the renal attribution is often made in doubt. He cites Stoussé's opinion on a case of renal glycosuria observed for some years, that the outcome of glucose diet tests indicated "the beginning of a metabolic disturbance" also the comment of another author on another case diagnosed at first as renal glycosuria, that by the same diet test the condition was later shown by repetition of the curves to be progressing to true diabetes. The author communicates two cases of his own in which, although the blood sugar was normal, addition of carbohydrate to the diet caused a slow but marked increase in excretion of sugar, and the blood sugar index varied according to the carbohydrate ingested, as is the case in diabetes. He concludes that, before deciding upon the treatment of a patient with glycosuria, it is necessary to determine the nature of the glycosuria by repeated blood sugar estimations.

177 Ulcerative Aortitis in Typhoid Septicaemia

G. VASILESCO POPESCU and G. LITARCZUK (*Picasso med*, June 17th, 1925, p. 806) record the case of a man, aged 48, who contracted typhoid fever in July, 1922. The disease pursued an ordinary course until August, when, instead of recovery ensuing, a subfebrile condition persisted for sixteen months interrupted by attacks of shivering, high temperature, and aggravation of the general condition. The possibility of one of the sequelae of typhoid was considered, such as polyneuritis or osteomyelitis, and it was only a few days before death that the appearance of a pulsatile tumour in the left flank suggested the persistence of typhoid infection localized in the aorta with formation of an aneurysm. Laparotomy, which was performed with the object of applying a ligature, showed a retroperitoneal pulsatile tumour which it was impossible to isolate, it involved the abdominal aorta and common iliac artery. Death occurred two days after the operation, being preceded by signs of rupture of the aneurysm. A sacular aneurysm of the abdominal aorta was found above the bifurcation, together with a large retroperitoneal haematoma from rupture of the aneurysm, cardiac hypertrophy, and chronic interstitial nephritis. There was no history or other evidence of syphilis, and the Wassermann reaction was negative. The formation of the aneurysm was attributed to the patient's hypertension as well as to the aortic lesions caused by the typhoid infection. This is the second case on record of rupture of an aneurysm of the abdominal aorta following ulcerative aortitis in typhoid fever. The first case was that of the Rumanian statesman, Take Jonesco, reported in 1923 by Marchisava and Nazari.

Surgery.

178 Prolapse of the Bladder in Whooping-cough

ROCHER (*Journ de Med de Bordeaux et du Sud-Ouest*, June 10th, 1925, p. 484) records the case of a female infant, aged 18 months, who developed a subtotal prolapse of the bladder through the urethra in the course of whooping-cough, the organ presenting the appearance of a mushroom-like bleeding growth. At times the vesical trigone could be seen, as well as the escape of urine from the ureteric orifices. There was also a prolapse of the rectum. Reduction was easily effected under an anaesthetic. The urethra was much dilated and readily admitted the little finger. In order to maintain the reduction Rocher sutured the labia minora together and no further prolapse occurred. As regards the pathogenesis, whooping-cough was not entirely responsible, but congenital dilatation of the urethra was the principal factor in the prolapse.

179 Blood Transfusion

J. F. BALDWIN (*Am. Journ. Med. Sci.*, July, 1925, p. 118) examines the present position of blood transfusion in order to determine its real value, dangers, and abuses. From a study of the literature, his own experience, and the results of replies to a questionnaire among surgeons, he concludes that the procedure is by no means free from unavoidable dangers, especially in acute sepsis. In chronic sepsis and in the chronic stages of brain he finds that its only value is in improving the advanced anaemia, in pernicious anaemia it

is of no ultimate value and is attended with risk. Ho considers it of value in profound shock or acute anaemia from some haemorrhages, such as post partum haemorrhage, and ectopic pregnancy, but it does not appear to be of much use in shock other than that resulting from acute haemorrhage. When administered immediately before or after an operation involving the possibility of acute haemorrhage transfusion is, he thinks, of special value, as also in the haemorrhages occasionally occurring in newborn infants, in which latter condition he states that it is not necessary to type the mother's blood, which can be at once injected in small quantities into a vein, or preferably into the superior longitudinal sinus. His own experience confirms the conclusion of Callen, who examined the gynaecological records of the Johns Hopkins Hospital for the previous twenty five years, that patients with a low haemoglobin content stand pelvic or abdominal operations fairly well and that transfusion in such cases appears therefore to be unnecessary.

180 Surgical Treatment of Subphrenic Abscesses

E. ORSÓS (*Zentralbl. f. Chir.*, July 25th, 1925, p. 1637) states that the mortality of subphrenic abscess is 85 to 95 per cent in the absence of operation, and between 21 and 33 per cent when operative treatment is employed. With a view to minimizing the risk of the occurrence of such sequelae as empyema and peritonitis Orsós has now adopted the following procedure. The tenth rib is resected for a distance of four and a half inches in the posterior axillary line, the parietal pleura is incised, and the closely approximated parietal and diaphragmatic pleural layers are then united by a continuous catgut suture which passes deeply through the pleura, subpleural fascia, intercostal muscles, and diaphragm. The free pleural edge is sutured to the diaphragm in the same manner. The diaphragm is then incised and the abscess cavity evacuated. Orsós claims that this method completely shuts off the pleural surfaces of the costo diaphragmatic angle and prevents the entrance of either air or pus. The deeply placed continuous suture will withstand the strain of the diaphragmatic contractions, and it will not be infected by the abscess contents, being effectually protected by the outer suture which approximates the pleural surfaces.

181 Surgery under Ultra violet Ray Antisepsis

VAN LIER (*Bull. et Mem. Soc. Nat. de Chir.*, July 18th, 1925, p. 809), a Dutch surgeon, reports having performed 800 operations with no other sterilization than ultra violet irradiation. The operations were of all kinds—some clean, such as for hernia and appendicitis, and some septic, many involved the skull and brain. The lamp used was a mercury vapour quartz one, fitted with a rheostat with which to graduate the light. First the surgeon's hands and the instruments were irradiated, no rubber gloves being worn but the eyes were protected by glass. Then the patient's skin was treated, the radiologist watching for any change of colour, as such would indicate harm to the tissues. Two other lamps, horizontally placed, sterilized the field of operation and the atmosphere above. Ultra violet light was the sole illumination. Van Lier states that the only organ showing special sensibility to the rays is the kidney. Application of the light is continued until the last (indicated) suture is in place. Results superior to those reached with ordinary methods are claimed. A note of warning is sounded regarding the care the radiologist must take to avoid an overdose of the light. Failing this precaution there may supervene in six or eight hours serious complications, which are generally fatal.

182 Epicondylitis

R. M. CARTER (*Journal of Bone and Joint Surg.*, July, 1925, p. 553) points out that epicondylitis constitutes a definite clinical entity which it is important to recognize. It is characterized by pain and tenderness on pressure over the lateral epicondyle of the humerus, the pain often passing down into the fingers. It is spoken of as "tennis elbow," "musician's palsy," or "sportsman's elbow." It occurs almost exclusively in adults between the ages of 30 and 50 years. In women more often than men, it seems to follow certain occupational or sport activities, particularly those in which the combined movements of supination and flexion of the forearm are employed. The characteristic feature of the condition is pain as described, usually with a complete lack of objective findings. It is probable that the majority of cases are due to a localized periostitis in the region of the external epicondyle the result of opposing muscle action frequently repeated. A few cases may be due to inflammation or calcification in a bursa which is found in this region. The ultimate prognosis is good, all patients eventually recover, but the course may be extremely chronic. The treatment usually necessary is prolonged rest. Diathermy may be of value while where an inflamed bursa is suspected or found, surgical intervention may be necessary.

Therapeutics.

183 Tryparsamide in Neurosyphilis

H. C. SOLOMON and J. R. VIFTS (*Journ. Amer. Med. Assoc.*, August 1st, 1925, p. 329) report very favourably on the treatment of neurosyphilis by tryparsamide. In addition to decrease in pleocytosis in the spinal fluid they have found improvement in the Wassermann reaction, colloidal gold curve, and the globulin content. They state that although a few injections of tryparsamide sometimes resulted in the spinal fluid becoming normal, in the majority of cases of parenchymatous neurosyphilis more than fifty injections were required to produce improvement in the serum reactions, and that it was often necessary to continue the treatment for a year or longer. Some patients, after being treated by arsphenamin and other methods without much improvement, responded well to tryparsamide. Cases of early paresis showed remissions which were maintained during the two year period of treatment. The clinical results were not so good with the later cases of tabes, with marked signs of degeneration of the spinal cord. Very few unfavourable symptoms, and none of any severity, were observed, occasionally a slight amount of nausea or even vomiting followed the injections. Amblyopia occurred in one patient with optic neuritis.

184 Mercurochrome in Obstetrics

H. W. MAYES (*Amer. Journ. Obstet. and Gynecol.*, July, 1925, p. 61) advocates the use of a 4 per cent solution of mercurochrome in vaginal examinations, the induction of labour and during delivery, or in preparation for Caesarean section. Believing that an attempt should be made to sterilize the birth canal before delivery and that an antiseptic in the vagina during labour reduces the chances of infection, Mayes adopts the following preparatory procedure. The inner sides of the thighs, buttocks, lower abdomen, and external genitalia are sprayed and the vaginal outlet and anal region painted with a 4 per cent solution of mercurochrome. One drachm of the solution is introduced into the vagina and worked well into the folds of the mucous membrane, round the cervix and the presenting part of the child. This treatment is repeated if more than one hour elapses between the vaginal examinations or between the vaginal examination and delivery. If possible, at least one hour should elapse between the treatment and the commencement of delivery or any operative measures. In Caesarean section in possibly infected cases the injection of the solution into the amniotic cavity is recommended. The advantages possessed by mercurochrome over iodine are said to be that its application is painless and non-irritating and that it can be used freely and repeatedly without harm to the baby. Mayes adds that it is not incompatible with mercury bichloride, does not coagulate protein, and can be applied to lacerated tissue. He believes that convalescence is more rapid with it than is the case with iodine, and recommends it particularly for induction of labour and in all deliveries associated with operative treatment. The staining of the linen and the hands is said to be its only objection and in practice is found to be almost negligible.

185 Tannic Acid in the Treatment of Burns

E. C. DAVIDSON (*Surg., Gynecol. and Obstet.*, August, 1925, p. 202) advocates the use of gauze dressings saturated with a 2.5 per cent freshly made aqueous solution of tannic acid in the treatment of burns. He states that by precipitating the poisonous material, their absorption is prevented and a protective coating is provided against chemical, bacterial, and mechanical action as well as against sensory and inflammatory irritation. After the administration of 1/4 grain morphine sulphate hypodermically the burned area is covered with dry sterile gauze pads held in position by sterile gauze bandages and this dressing is then soaked with the tannic acid solution. In order to avoid any deep caustic action inspection is made at the end of twelve, eighteen, and twenty-four hours by removing a small section of the dressing. As soon as the part has assumed a light brown colour all dressings are removed and the wound is left exposed to the air, being carefully protected from injury, chilling, and bacterial invasion by being covered by a cradle draped with sterile linen. He recommends as less efficacious but yet definitely beneficial, a 5 per cent tannic acid ointment made with equal parts of vaseline and lanolin, especially for burns about the eyes. Davidson adds that it is most essential to keep up the fluid balance of the body either by giving liquids, by intravenous infusion, or by removal of exudate by wetting the gauze with fresh solution. The initial dressing is analgesic, and with the subsequent exposure to the air lessens toxæmia and promotes comfort. The local astringent

effect prevents loss of body fluid and the dangers of secondary infection are reduced. The protective layer of coagulated protein was found to act as a scaffold for the growth of epithelial cells over the denuded surface, and the formation of scar tissue was notably less than that observed in other methods of treatment.

Ophthalmology.

185 Coloboma of the Mesodermal Layer of the Iris

J S FRIEDENWALD (*Arch of Ophthalmol*, July, 1925, p 349) describes a case in which one eye showed a typical coloboma of the iris and the other a symmetrically situated defect of the mesodermal layers of the iris, and discusses the interest of this occurrence from the developmental point of view. The modern theory of the origin of coloboma of the iris is that a persistence of the vascular connexions between the stroma of the iris and the hyaloid system at the back of the lens occurs. In order to account for the absence of the mesodermal layer in this case Friedenwald assumes that a vessel connecting the iris stroma with the hyaloid system persisted sufficiently long to prevent the proper formation of the iris mesodermal layer, but that the growth of the margin of the optic vesicle on either side of the vessel was sufficiently active to close in front of the vessel and so form a round pupil.

187 Oxycephalus

F A DAVIS (*Amer Journ Ophthalmol*, July, 1925, p 513) reports six cases of oxycephalus, which, he thinks, must be more common than is usually supposed especially in regard to milder degrees of the condition. He considers that it should probably be considered more a malformation than a disease. Premature fusion of some of the sutures of the skull is the pathological change which causes the condition, the basal and transversal sutures are more usually affected. The etiology of the condition is obscure, but heredity is thought to play a part, rickets, syphilis, meningitis, and prenatal osteitis have all been considered and more or less discarded as etiological factors. Davis thinks the condition must be considered as a developmental fault, and points out that other congenital malformations are often associated with it. Patients with the severe type of the deformity rarely reach maturity, but in the mild cases which do so there is usually a quite normal mentality. Davis deals at length with the signs and symptoms of the disease and gives details of his six cases.

188 Intraocular Steel Foreign Bodies

F ALLPORT (*Amer Journ Ophthalmol*, June, 1925, p 472) in this paper reviews the results of 223 cases of intraocular steel foreign bodies. In these cases 72 enucleations were necessary, but in the majority of these the eye was so severely damaged that there was little chance of a successful issue. In none of the series did sympathetic ophthalmia supervene. Allport is an advocate of the posterior scleral route with the use of a small magnet in cases where the foreign body is in the vitreous, rather than of the use of the giant magnet to draw the foreign body forward into the anterior chamber. He has never found that better results could be obtained by the method of Haab with the giant magnet. The curious fact is noted that intraocular steel foreign bodies sometimes prove unresponsive to the magnet, although after subsequent enucleation they appear to be lying free in the vitreous. He advises that the steel should be removed as soon as possible after entry. In 112 cases the point of entry was the cornea, in 90 cases the sclera, and in 21 the corneo scleral junction. The results appear to be very satisfactory, but many of the cases have been watched for only a few months.

Obstetrics and Gynaecology.

189 Injury to the Child at Birth

A STERN (*Arch f Gynakol*, July 25th, 1925 p 683) states that birth injuries, though very frequent, rarely leave permanent marks. In over 60 per cent of the deaths of infants up to the age of 5 weeks an autopsy reveals intracranial haemorrhage. Stern thinks that the start of many a case of infantile pneumonia may be thus explained, from lack of due nervous control of the vital functions. Recovery from similar central nervous lesions may be inferred from the common occurrence in the newborn of spontaneous nystagmus, which nearly always disappears in a few days. The incidence of these affections can be shown to be increased by conditions unfavourable to parturition—as, for example, in abnormal presentations, or premature rupture of the membranes. The author thinks that he has correlated the same difficulties in

labour with unduly heavy loss of weight after birth, indeed, he is inclined to ascribe this phenomenon, even when of normal extent, to recovery from trauma during birth. He adds that the experience of his own clinic is to the effect that premature infants show the stigmata of birth trauma almost three times as often as do full term infants, his explanation being that the premature foetus is particularly liable to injury.

190 Premature Separation of the Placenta

J W WILLIAMS (*Journ Obstet and Gynaecol of the Brit Empire*, Summer Number, 1925, p 259) considers that ante partum haemorrhage is almost as frequently associated with premature separation of the normally implanted placenta as it is with placenta praevia. The case is recorded of a woman, aged 33, who had previously had two normal deliveries, and in whom complete separation of the normally implanted placenta occurred, associated with concealed haemorrhage (retroplacental haematoma) as well as with a disorganization of the uterine walls caused by intramural haemorrhages, giving the organ a ligneous consistency and a characteristic mottled metallic appearance. He adds that his personal experience in forty cases indicates that the condition occurs most frequently in primiparae or in those who have had six or more children, it may occur in succeeding pregnancies. The etiology of the condition is unknown, and while in many of the severe cases such a condition as pre-eclamptic toxemia, eclampsia, or chronic nephritis, may precede the lesion, in 15 out of 37 patients albuminuria was entirely absent. Furthermore, traumatism, syphilis, inflammation of the decidua, shortness of the umbilical cord, and torsion of the pregnant uterus are rarely if ever factors in its production. The mortality was 75 per cent for the mother and 75.5 for the child. In treatment an expectant course is justified only if the bleeding is slight and the patient's condition good. Caesarean section should be performed if the bleeding is profuse or concealed and the patient shows signs of excessive loss of blood, the uterus being amputated if it remains flabby and presents the pathognomonic ligneous consistency observed in about every third case. Williams concludes that in any operative procedure for this condition the knowledge that a previously satisfactory pulse may suddenly become rapid and weak renders it advisable to be prepared beforehand for the transfusion of compatible blood.

191 Radiation Treatment of Cervical Cancer

F VOLTZ (*Klin Woch*, July 16th, 1925, p 1396), from a study of his own results and of the literature, states that the proportion of cases of cervical cancer in which there was freedom from relapse for five years was 16.9 per cent with radiation treatment and 26.9 per cent after surgical operation. In the case of operable cases the comparable figures were 41.9 per cent for radiation treatment and 39 per cent for surgical treatment. Voltz thinks that at the first glance these figures might favour the cry now often raised that exclusive radiation treatment is not justifiable. Such a conclusion, he maintains, would not be correct, for the following reasons. Clinics giving exclusive radiation treatment receive far more advanced clinical cases than do the surgeons. In the Erlangen, Munich, and Dresden clinics only about one-seventh of the cases coming for treatment are operable, whereas the lowest proportion, at clinics where they operate, is a half, at Jena and Berlin, indeed, over four fifths. Then the figures for radiation go back to the very beginning of that treatment, when it was undeveloped. There is further the disadvantage that a course of radiation may be interrupted or cut short, as was frequently the case in the bad economic conditions after the war. Regularly treated patients will yield, he concludes 74 per cent of cures in the operable stage, 41 per cent when on the border line, and 13 per cent when operation is out of the question.

192 Radical Treatment of Salpingo oophoritis

V MANNHEIM (*Zentralbl f Gynakol*, July 4th, 1925, p 1471) states that since 1910 at Ash's clinic at Breslau there has been an increasing preference for the abdominal as against the vaginal route in operations for chronic salpingo oophoritis, and also for radical rather than conservative operative measures. By radical operation is understood total extirpation, or supra-vaginal amputation of the uterus with the whole of both adnexa. The conservative method has been reserved of late years for about one third of cases—namely, those in which the naked eye morbid appearances of the adnexa are less extensive and less serious, and the adhesions to neighbouring organs less marked. Nevertheless, it is found that about 90 per cent of patients are discharged as cured after radical as against 65 per cent after conservative operation, 1 in 200 of the former group requires a second operation, against 1 in 10 of the latter. The percentage mortality was the same (3 per cent) in each group. A recent examination of the patients concerned, who were of the working classes

and in about one half of whom the adnexal disease was certainly of gonorrhoeal origin, showed that of those operated on consecutively 19 per cent were quite well, in addition to 35 per cent who were able to do their work, amongst those who had a radical operation the corresponding figures were much higher—namely, 35 and 47 per cent respectively. Unpleasant subjective symptoms attributable to the artificial menopause were absent or very slight in about 80 per cent of the radically treated patients aged under 30 and about 90 per cent of those above that age.

193 Spontaneous Lacerations of the Cervix

F. MONTUORO (*Riv. d'Ostet. e Ginecol. Prat.*, July, 1925, p. 323) emphasizes the importance of the recognition and treatment of lacerations of the cervix occurring during spontaneous labour. Factors favouring their occurrence are, he states: (1) pre-existing lacerations (the relics of previous labours), (2) defective development of the cervix, which is of the conical, infantile type, and may not undergo the usual anatomical rectification due to the hyperaemia and myometrial hypertrophy of pregnancy, (3) anatomical rigidity of the cervix, which is met with not only in aged primiparae, but also in young subjects aged from 14 to 16, (4) tumours and inflammatory sequestrations of the cervix, which often justify Caesarean section, (5) spasmodic rigidity of the cervix or uterine tetanus—here cervical lacerations are apt to become true uterine ruptures. The ultimate determining factors in lacerations of the cervix are anomalies of presentation disproportionate relative size of foetus and pelvis, and precipitate labour, to these Montuoro would add a fourth—namely, injudicious nursing instructions whereby the patient is urged to make violent expulsive efforts at a stage when cervical dilatation is still incomplete. Cervical lacerations demand immediate repair, and the practitioner is recommended by Montuoro to carry in his midwifery bag catgut, volsella, and a vaginal valve speculum.

Pathology.

194 The Complement Fixation Test in the Diagnosis of Gonorrhoeal Rheumatism

AFTER recalling the discoveries of previous workers, T. BEZANÇON, M. P. WEIL, and M. RUBINSKIN (*C. R. Soc. de Biologie*, July 3rd, 1925, p. 235) proceed to give their own results in connection with the diagnosis of gonorrhoeal rheumatism by the complement fixation test. The antigen they employed was an emulsion of six different strains of gonococci, made by washing off the growth from twenty-four hour ascitic agar cultures, centrifuging, washing the deposit, and suspending it finally in saline solution. It was then heated to 60°C for one hour. The sera of 14 patients, suffering from non-gonococcal infections of the joints, all gave negative results. On the other hand of 24 sera taken from patients who were undoubtedly suffering from gonorrhoeal rheumatism, no fewer than 21 gave positive results, a percentage of about 87.5. These figures are in fairly close agreement with those obtained by previous workers, and serve to show that, whereas a negative reaction does not exclude the presence of gonorrhoea, a positive reaction is very strong evidence in favour of it. The complement fixation reaction is of special value in the diagnosis of the nature of an obscure arthritis, for it is not uncommon for the joints to become affected in gonorrhoea long after all signs of the disease have passed away. The authors describe three cases, in which the joints were affected five, seven, and twenty-four years respectively after the primary infection.

195 Vaccination against Tuberculosis

J. WILBERT (*Ann. de l'Inst. Pasteur*, August 1925, p. 641), working under the direction of Calmette, has performed a number of experiments on the vaccination of monkeys against tuberculosis. The vaccine used was the living, avirulent "B.C.G." strain of Calmette and Guérin. It was given either in a single dose of 50 mg subcutaneously, or in five doses of 50 mg every other day by the mouth up to a total of 250 mg. The general plan of the experiments was to introduce into a single ergo vaccinated animals, animals artificially infected with a virulent human or bovine strain, and as controls unvaccinated and non-infected animals. After a number of months the mortality from tuberculosis of the three classes was calculated. The artificially infected monkeys were given either a single injection of 1/100,000 mg subcutaneously, or two doses by the mouth at forty-eight hours interval of 1/1,000 mg. No difference was found in virulence between the human and the bovine strains of bacilli nor between the susceptibility of different species of monkeys to the two types of bacilli. In the first series of experiments with chimpanzees there were 3 vaccinated, 5 infected, and 7 control animals. After about a year all the

vaccinated animals were alive and well, all the infected animals were dead of tuberculosis and of the 7 controls 4 were dead of tuberculosis and 3 of dysentery. In the second series, made with pithecius monkeys, there were 19 vaccinated, 20 infected, and 20 control animals. After five months of cohabitation 6 of the 19 vaccinated animals were still alive, and the remainder were dead of different diseases—malaria, dysentery, pasteurellosis, etc., none showed the least sign of tuberculosis at autopsy. All the infected animals were dead—19 of tuberculosis and 1 from intestinal obstruction developing a week after infection. All the control animals were dead—19 of tuberculosis and 1 from pasteurellosis. From these experiments the author concludes that it is possible to vaccinate monkeys of all ages and enhance immunity by the mouth against tuberculosis, that the protection afforded against the risk of contracting the disease by contact with tuberculous monkeys is complete and lasts for over a year, at the end of this period revaccination may be performed.

196 Hydrogen Peroxide and Bacterial Growth

THE disinfectant action of light has long been known, the deleterious effect of light on nutrient media has received much less attention. F. M. BURNET (*Australian Journ. Exper. Biol. and Med. Sci.*, June, 1925, p. 65) has shown that agar plates exposed to sunlight become unsuitable for bacterial growth. The reason for this appears to be that under the influence of light of short wave length hydrogen peroxide is formed in the medium, this substance exerts a strongly inhibitive effect on the growth of staphylococci—the organisms chiefly studied. So powerful is it that even in a concentration of 1 in 40,000 its inhibitive effect is noticeable. It was found, however, that staphylococci are able to produce substances to neutralize this hydrogen peroxide. These substances have not been identified, but it appears likely that they are of more than one kind. Some are thermostable, others are thermostable. They act as reducing agents, destroying the hydrogen peroxide. Burnet thinks that it is unlikely that they are enzymes for they are capable of diffusing out from the bacterial colonies. Thus in one experiment their radius of diffusion through an agar plate was found to be 3.35 cm after forty-two hours—a rate that could only be attained by substances of molecularly small dimensions. Not only are these substances able to neutralize hydrogen peroxide, they can also neutralize potassium cyanide. Both hydrogen peroxide and potassium cyanide interfere with the metabolic activity of the cell. How the former acts is not clear, but the latter apparently acts by paralyzing the peroxidases and thus allowing hydrogen peroxide to accumulate in the neighbourhood of the cell. When staphylococci are grown under anaerobic conditions they are able to withstand a concentration of cyanide that completely inhibits growth under aerobic conditions. This indicates that the metabolism of the cocci under anaerobic conditions is so altered that they no longer depend on the activity of their peroxidases, and are therefore no longer injured by substances that paralyze these enzymes. The author concludes that the presence of catalase and of the diffusible substances in the bacterial colony is an indication of a primitive means of keeping constant the immediate environment so as to allow of the type of metabolism most suited to the organism.

197 Unusual Sequelae of Tuberculous Tracheo-bronchial Adenitis in Children

J. M. SMELLIE (*Brit. Journ. Child Dis.*, April-June, 1925, p. 110), who has observed the presence of recent or old tuberculous infection in 47 out of 450 consecutive autopsies, records two cases of oesophageal perforation, two of oesophageal traction diverticula, four of bronchial perforation, and one of pericardial perforation, all resulting from erosion of the mediastinal glands. In neither of the two cases described did the oesophageal perforation occur as an isolated lesion but the first showed also a perforation into the left bronchus, and the second a minute perforation into the pericardial sac. Neither patient presented symptoms that could have enabled a diagnosis to be made during life. Of the two cases of oesophageal diverticula one was an accidental post mortem finding and the other occurred in a child who died of a primary tuberculosis. In both cases the diverticulum was small, and the line of direction was upwards, so that they gave rise to no symptoms. Of the four cases of bronchial perforation one showed also an oesophageal perforation, and in the other three the perforations were multiple. In one case the perforation probably occurred when the child suddenly coughed up an ounce of purulent material eighteen hours before death. The case of pericardial perforation—which is by far the rarest sequel of tuberculous tracheo-bronchial adenitis—occurred in a girl aged 8 years, and was associated with perforation of the oesophagus.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

198

Thyroiditis of Tonsillar Origin

B. SOLER and M. CALDERIN (*Arch de Med, Cir y Esp*, July 11th, 1925, p 49), who record an illustrative case, state that many cases of thyroiditis have been recorded secondary to infection by various micro organisms, such as the typhoid bacillus (Griesinger, Jeanselme, Lemicco and Lalbet, Sabrazes, Sabrazes and Grailly, etc) and the pneumococcus (Marchand, Léri, and Bensaude). Roger succeeded in producing hyperplasia of the thyroid by injection of typhoid cultures. Jeanselme has described thyroiditis as a complication of influenza, Bnscartels of gonorrhoea, and Vincent of rheumatism. Strumitis, or inflammation of a goitre, is rarer than thyroiditis and is more commonly met with in women than in men. The eumetric is a predisposing factor. Marañón has observed the sudden appearance of strumitis in an old goitre on the cessation of menstruation. Although almost all writers note tonsillitis as a cause of acute thyroiditis or strumitis, there are very few cases on record illustrating this etiological relationship. The authors' case was that of a girl, aged 20, who since the age of 14 had been subject to frequent attacks of tonsillitis with the appearance of a tender swelling in the thyroid region. When seen by the authors she also complained of headache, suffocative attacks, gastric pain, and amenorrhoea. A diagnosis of cystic goitre and recurrent strumitis of tonsillar origin was made. Tonsillectomy was performed and considerable improvement followed, as shown by disappearance of the headache, suffocative attacks, tremors, and loss of appetite, and by return of menstruation. It was obvious in this case that the thyroid was constantly being stimulated by an infection resulting in a state of functional deficiency. The authors conclude that an extensive operation on the thyroid may perhaps be prevented in many cases by a previous tonsillectomy.

199 Acute Delirium at the Onset of Typhoid Fever

COURTOIS SUFFIT and G. GARNIER (*Gaz des Hop*, June 27th, 1925, p 836) record the case of a previously healthy student, aged 22, admitted to hospital with acute delirium, hyperpyrexia (105.8° F.), and extreme tachycardia. Death occurred thirty six hours after admission, the illness having lasted a little more than a week. After infectious endocarditis, tuberculous meningitis, and cerebral rheumatism had been excluded, the diagnosis of acute delirium of typhoid origin was made owing to typhoid bacilli being found in the blood culture. There was no autopsy. The authors think that overwork was the predisposing cause, as the patient had been spending as much as fourteen hours a day in preparation for an examination, and consider that a massive infection with typhoid bacilli occurring in an unvaccinated subject was responsible for the severity of the attack. The unusual symptom of extreme tachycardia was probably due to an early typhoid myocarditis. In spite of the statement of Marchison to the contrary, the authors maintain that acute delirium is very rare at the onset of typhoid fever, especially when it is the only manifestation of the disease, as in their case. This is the first example of the kind that Courtois Suffit has met with in the course of twenty five years, during which period he has seen nearly four thousand cases of typhoid fever.

200

Prognosis of Diphtherial Conjunctivitis

BEAUVIEUX (*Gaz hebdomadaire de Bordeaux*, May 31st, 1925, p 340) remarks that membranous conjunctivitis, whether due to a variety of organisms or to a variety of organisms, such as the streptococcus and Klebsiella, can produce false membrane. Membranous conjunctivitis of diphtherial origin, however, is becoming increasingly rare as it is getting better known, and strict prophylactic measures are being taken as soon as its appearance is suspected. Conjunctival diphtheria may occur clinically in two different forms—namely, a superficial or croupal and an interstitial or deep. Some writers, including Sourdille, Coppez, Guistous, and Hass, describe a catarrhal form without false membrane, though Morax doubts its occurrence. Two types of croupal conjunctivitis may be described. The first is characterized by the appearance on the mucous surface of the tarsus of a membrane which can be easily detached, leaving the subjacent conjunctiva bleeding, the membrane soon reforms. In the second type,

which is called diphtheroid, the membrane is very thick and of a dirty white colour, extending not only over the tarsus but also sometimes over the whole conjunctival surface, and is accompanied by greater destruction of the epithelium. For the conjunctival mucous membrane to be infected by the Klebsiella bacillus or its toxins it must have been damaged previously in some way or another—as, for instance, by cauterization or by a previous infection such as measles or scarlet fever. The author adds that the prognosis of superficial diphtherial conjunctivitis is very favourable, for, as it is usually associated with a satisfactory general condition, it may be cut short rapidly by sordum treatment, and it is exceptional for involvement of the cornea to develop. In the interstitial form, on the other hand, the cornea is in danger from the first. The diphtheria toxin weakens the resistance of the epithelial barrier, and so facilitates admission for secondary invaders such as streptococci, pneumococci, and staphylococci. The use of diphtheria antitoxin is then of no avail, and perforation of the cornea ensues.

201

Sterility in the Male

K. M. WALKER (*Brit Journ Venereal Dis*, July, 1925, p 192) states that the treatment of a barren marriage should begin with the examination of the husband, not the cretting of the wife. In one set of statistics the male was found of impaired fertility (though not necessarily solely responsible for lack of offspring) in 167 out of 253 childless unions. Of 32 husbands referred to the author for a similar cause only 13 were quite normal. Remembering that an abnormality must be gross to be detected by the microscope or test tube, Walker believes that relative sterility is common in males and adds that blockage is the cause much more often than aspermatogenesis, the blockage is, unhappily, mostly permanent. Men with a history of bilateral epididymitis are sterile in 40 per cent of cases, according to Benzer's figures, and Walker thinks that this risk is unaffected by any particular treatment of the epididymitis. He has abandoned as useless excision of the block and anastomosis of the vas with the epididymis. In blockage of the ejaculatory ducts the chances of successful surgical treatment are much greater. Age counts as a cause of impaired fertility for much less in the male than in the female, Walker has seen active spermatogenesis in a non-german. He does not think that drugs have much effect on spermatogenesis. Treatment on general lines is recommended with the substitution of an outdoor life for a sedentary one and the selection of a diet rich in vitamins and fats.

202 Disturbances of Cystin Metabolism in Children

G. O. L. LIGNAC (*Nederl Tijdschr v Geneesk*, August 15th, 1925, p 819) refers to his previous paper (see *Epitome*, September 24th, 1924, para 222), in which he described three illustrative cases of disturbed cystin metabolism in children, and records a similar example in a girl, aged 14 months, who had developed hydrocephalus following an attack of cerebro spinal fever at the age of 3 months. Death followed from progressive atrophy. The necropsy showed bilateral nephro lithiasis and deposits of cystin in the various organs, especially the spleen, though in much smaller quantities than in the cases which he had previously described. Lignac states that the most striking clinical feature in these cases of disturbance of cystin metabolism is the defective or at least delayed growth, so that the latter may be regarded as the result of incomplete assimilation of cystin. The factors responsible for this incomplete assimilation are unknown.

203

Measles on an Immigrant Ship

F. MCCALLUM and G. A. BLUMER (*Med Journ Australia*, May 2nd, 1925, p 453) remark that records relating to maritime epidemiology seldom appear in medical literature, although the conditions in a ship at sea offer an almost unique opportunity for studying the natural history of any infectious disease. They report an outbreak of measles on an immigrant ship from London to Australia which contained a crew of 210, with 866 passengers, of whom 150 were children. Six days after leaving London an infant developed a measles rash, and during the next five weeks a succession of cases occurred. A total of 51 cases was discovered though it is probable that a number of cases were not reported to the ship surgeon. All the cases were mild subsequent recovery was rapid and uncomplicated. The authors recommend that the following measures should be taken on the discovery of a primary case on board ship: (1) Compilation of a census of all children on board, with name, cabin number, destination, age, sex, and history of previous attack of

mersles (2) Consultation with the master of the ship about provision for an outbreak, such as isolation in the ship's hospital or cabins situated preferably aft, away from the ship's general traffic (3) Daily record of each case, showing exact time of onset and nature of initial symptoms (4) The relationship in terms of cabin accommodation or possibility of contact of each patient to each of the previous patients (5) Daily inspection of all children under 15, particular attention being paid to the initial signs of mersles (6) Isolation of each patient on discovery of the initial symptoms and provision for dealing with susceptible contacts

203 The Growth of Diabetic Children

L. P. JOSLIN, H. I. ROOT, and PRISCILLA WHITE (*Journ. Amer. Med. Assoc.*, August 8th, 1925, p. 420) have watched the growth of 296 diabetic children, of whom 164 died, while 132 survived. They found that the gain in weight of the diabetic child treated with insulin resembled that of the normal child, but the weight of the diabetic child was less than the normal for his age, though not in proportion to his height. The child was generally less tall than the normal, whether his general condition was good or bad. There appeared to be no retardation of maturity when insulin was being given, though this was usual in untreated cases. The authors invite further investigation with a view to determining whether diabetic children under insulin treatment can achieve eventually healthy manhood and womanhood. They refer also to the evidence now appearing that regeneration of the pancreas is possible, more particularly in the later than the earlier years of the disease.

205 Acute Haematogenous Streptococcal Peritonitis in Children

J. L. RANSOHOFF and J. V. GREENBAUM (*Arch. of Ped.*, May, 1925, p. 315), who record two cases in a white boy, aged 10, and a coloured girl, aged 5, state that acute streptococcal peritonitis presents a clinical picture sufficiently characteristic to make diagnosis possible. The disease is characterized by a violent onset with acute pain and high fever. The abdominal rigidity is general and of a high grade intensity, quite unlike the localized rigidity accompanying appendicitis. Marked and persistent vomiting is present. The leucocyte count is usually higher than in any other form of acute intra-abdominal inflammation. The condition is seasonal in incidence, occurring in the winter or early spring months, and may occur with or without preceding tonsillar infections. As a rule streptococci may be isolated from the throat, blood stream, and peritoneal cavity. The treatment is surgical as soon as the diagnosis is made, the mortality being 100 per cent in cases with purely medical treatment. The operation consists merely in evacuation of the pus and insertion of numerous drains.

Surgery.

206 Surgical Sequels of Anterior Poliomyelitis

S. W. BOORSTEIN (*Surg., Gynecol. and Obstet.*, August, 1925, p. 149) records the results of operative treatment in 100 cases of anterior poliomyelitis since the beginning of 1917 and following the epidemic in 1916. Post-operative treatment consisted of the application of plaster and braces, massage, and muscle training, and he is convinced that every orthopaedic surgeon should personally supervise the after-treatment, since many valuable operations were discredited through want of this precaution. He considers astragalotomy for stabilization of the foot the best operation as regards both function and shape, and reports that after it all the muscles of the lower extremity greatly improve. Open instead of subcutaneous tenotomy is advised, and transplantation of the biceps for the quadriceps was found to give good results, as also Soutter's operation for transplantation of the hip flexors. He adds that Steindler's operation of transplantation of the plantar muscles gives satisfactory results if care is taken to stretch the foot thoroughly and to use a brace for a long time. While Gallie's operation of tendon fixation has not given him the results desired, he has found Jones's operation of transplantation of the longus hallucis satisfactory. It is pointed out that tendon transplantation is likely to fail if a weak muscle is expected to do the work of a strong one.

207 Multiple Cysticercal Infection

L. P. MARIANTSCHIK (*Zentralbl. f. Chir.*, June 6th, 1925, p. 1234) records the case of a railway man, aged 41 years, who complained of chronic dyspepsia—foul eructations and very frequent vomiting. Twenty years earlier he had had similar symptoms, which were found to be due to taeniasis. An

analysis of the gastric juice showed some hyperchlorhydria. Stagnations showed no definite abnormality, but there was a localized tender point over the region of the lesser curvature. Although the chemical and radiographic examinations were negative, the vomiting and persistent tenderness impelled Mariantschik to perform an exploratory laparotomy. On opening the peritoneum, very old adhesions were found between the liver, stomach, and parietal peritoneum. The gall bladder was attached to the abdominal wall by more recent adhesions. All these adhesions were divided, those between the stomach and abdominal wall evidently interfered with gastric peristalsis. On the posterior gastric wall in the pyloric region there was a sharply defined stellate scar. After the separation of the adhesions in the region of the lesser curvature much fibrous thickening with numerous punctiform haemorrhages and many nodules as large as pens were found. Posterior gastro-enterostomy (by Hacker's method) was performed. Some of the tissue removed showed typical cysticercus formation. Mariantschik remarks that cysticercosis of the gastric wall is very rare, more commonly cysticerci are found in the mesentery, liver, eye, brain, or meninges. The patient had suffered twenty years earlier from tapeworm (species unknown), Mariantschik thinks that he must have infected himself.

208 Haemangioma of the Spleen

H. NAHER (*Deut. Zeit. f. Chir.*, June, 1925, p. 87), who records an illustrative case, states that genuine tumours of the spleen very rarely call for surgical treatment. The most common form of splenic tumour seen by the surgeon is sarcoma. Only four cases of primary angioma of the spleen have been reported—by Moltrecht, Ombredanne, von Beckendorf, and Steden respectively—in which operation was performed. In Moltrecht's case the tumour weighed 3150 grams directly after its removal, death ensued on the following day. The other three patients recovered after operation. Steden's case provides the largest cavernous tumour of the spleen on record, the growth weighing 4,125 grams. A few other cases have been reported in which the growth was found unexpectedly at the necropsy. Thus Forster describes a case in which several haemangiomas of the spleen were found, each the size of a hazel nut, and Theile mentions a case in which three haemangiomas were discovered ranging in size from a bean to a cherry. In Langhans's case angioma of the spleen was accompanied by a similar growth in the liver. Nabel now records a case in a woman, aged 42, who had suffered five years from discomfort in the left hypochondrium, especially after food. Operation revealed a large haemangioma of the spleen weighing 2,500 grams and measuring 24 by 20 by 10 cm. Pulmonary emboli occurred in the second week after laparotomy, and three weeks after the operation symptoms of intestinal obstruction developed due to mesenteric embolism. Laparotomy was performed, and 30 cm. of the ileum was resected. Death occurred three days later.

209 Subacute Venous Septicaemia

C. LEGRAND (*Rev. de m. d.*, No 3, 1925, p. 169), who records an illustrative case in a woman aged 45, states that subacute venous septicaemia, first described by Vaquez and Leconte, is a rare condition characterized by the following clinical triad: (1) a tenderness which suggests the intervention of a process, which is relatively benign but of prolonged duration. Sometimes there is a history of a recent infection, such as influenza, as in the cases of Vaquez and Leconte, and Ponthieu, or of varicose veins and endocrine disturbance, as in Legrand's case. Women appear to be predisposed to the disease, but Ponthieu's patient was a man aged 36, and Roux's patient was a child. Fever which is never absent, is only slight, hardly ever exceeds 100.4°, and presents slight daily oscillations. The disease proceeds in successive stages separated from one another by intervals of improvement and sometimes by a complete but transient intermission. A segment of a vein may be involved or a whole limb, as in phlegmasia alba dolens, or all four limbs may be affected. The pain and oedema vary in degree in different cases. Vaquez and Leconte have described a form characterized by haemoptysis, apparently due to localization of the infective agent in the lung and manifested by dyspnoea, and an area of riles with or without haemorrhagic sputum and a slight rise of temperature. The gravity of the disease is due to its persistence. The joints become affected by false ankylosis, which is extremely obstinate. Considerable amyotrophy results and sometimes marked retraction of tendons. There is no specific treatment, though good results have been claimed by some observers from vaccine therapy or intravenous injection of collargol. Gentle mobilization of the limbs should be undertaken about three weeks after the fever and pain have subsided.

210 Thrombosis of the Mesenteric Vein

P R MICHAEL (*Nederl Tijdschr v Geneesk*, August 1st, 1925, p 584) records a case in a woman, aged 30, who for the last four weeks had suffered from anorexia, constipation, abdominal pain, and repeated vomiting. Owing to the sudden onset of violent pain in the region of the umbilicus she was admitted to hospital, where a diagnosis of purulent peritonitis was made and laparotomy was performed. Much yellow fluid was found in the peritoneal cavity and a large part of the small intestine presented a darkish discoloration. Nearly ten feet of the affected gut was excised, and a lateral anastomosis with the caecum was performed. Violent diarrhoea followed the operation, but gradually subsided under an appropriate diet. A month after the operation the pulse rate increased and the temperature rose. Signs of fluid were again found in the abdomen, the spleen became distinctly enlarged, and a painful swelling occurred in the region of the left femoral vein. The symptoms, however, gradually subsided without operation, and the patient was discharged well after three and a half months' stay in hospital. As regards the cause of the thrombosis, apart from congestion nothing remarkable was found on examination of the intestine, and in particular there were no ulcers. The mesentery showed thrombosed veins. The Wassermann reaction was negative. The acute enlargement of the spleen and the sudden development of ascites indicated obstruction of the portal vein, while the appearance of the left leg pointed to thrombosis of the femoral or common iliac vein. The patient, who was very anaemic, had thus an obvious tendency to thrombosis. The microscopical appearances and the clinical symptoms suggested that the condition was of an infective nature. Michael adds that in view of the woman having had a miscarriage four months previously it is possible that the uterus was the source of the mischief.

211 An Undescribed Symptom of Acromegaly

F HERZOG (*Klin Woch*, August 6th, 1925, p 1545) states that a normal person's hand cannot be bent dorsally until the long axes of the fingers are almost or quite parallel to the forearm, but that in acromegaly patients with no joint deformity or muscular atrophy, such as might be supposed to favour exaggerated passive movement, he has been able to produce the position described. The reason he ascribes is a pathological relaxation of the enlarged joint capsule and ligaments, and he supports this with a skiagram, taken while slight traction was being made on the middle finger, which shows a separation at the metacarpophalangeal joint of that digit of 4 mm. Without traction, Herzog adds, the articular intervals may be wider than normal, owing to the yielding capsule, so long as arthritis is not present, when passive movement may be often diminished. He has not found any account of this joint condition in the literature, and thinks it may play a part in the subluxations sometimes seen in acromegaly, and in the more frequent and almost typical scoliosis.

212 Primary Carcinoma of the Duodenum

G B EUSTERNAN, D M BEREMAN, and T S SWAN (*Ann of Surg*, July, 1925, p 153) report 15 cases of primary carcinoma of the duodenum from the Mayo Clinic, verified either at operation or autopsy, 6 were in the first or supra ampullary portion of the duodenum, 6 in the second or ampullary, and 3 in the intra ampullary. Twelve of the patients were males, the average age being 56. The majority showed the syndrome of duodenal ulcer, but the onset in later life, its rapid progress, and the presence of marked pyloric obstruction with frequent subacid or anacid gastric contents and the general appearance of the patient, pointed to a more serious lesion. The mode of onset was gradual in seven of the cases and sudden in eight with epigastric pain or discomfort, which was usually moderate, being severe in only two cases, in two thirds of the cases the pain occurred from one to four hours after meals. Except as a terminal symptom, jaundice was rare even in the ampullary cases, and flatulence, vomiting of the retention type, thirst, dehydration, toxæmia, and wasting were among the chief symptoms. A tumour was present in five of the cases, always in the supra ampullary and ampullary portions, and no palpable mass was found in the third or intra ampullary portion. X rays usually revealed a dilated stomach with considerable barium residue without any demonstrable gastric lesion, and gastric analysis showed free hydrochloric acid in subnormal amount or achlorhydria. Differential diagnosis rests between malignant and benign pyloric obstruction, carcinoma of the head of the pancreas or gall bladder involving the duodenum, carcinoma of the terminal portion of the common duct, duodenal obstruction from bands, inflammatory masses, peritoneal tuberculosis, and post operative adhesions. Since the toxæmia of high intestinal obstruction is so serious, it is held that a palliative gastro-enterostomy is justifiable after preoperative preparation, intravenous injections of sodium chloride and glucose in severe cases gave relief.

Therapeutics.

213 Toxic Sequels of Stovarsol Treatment

G IZAR (*Paris Med*, August 8th, 1925, p 139) gives details of four cases in which moderate doses of stovarsol, the sodium salt of acetyl amino hydroxyphenyl arsenic acid, given for the treatment of intestinal amoebiasis, were followed by severe symptoms, including vertigo, collapse, cyanosis, abdominal pain, pyrexia, and tachycardia, recovery in each case was not complete for a few days. Izar has not been able to find any reference to such toxic phenomena in the literature, even when large doses of stovarsol were employed. He is inclined to attribute the results in these cases to individual idiosyncrasy, in the form either of a lowered resistance or of sensitization, rather than to any fault in the drug itself.

214 Calcium Diuretin

K KAISER (*Klin Woch*, August 6th, 1925, p 1574) strongly recommends the use of calcium diuretin in chronic high blood pressure from arterio sclerosis or any other cause. Early in 1923 he suffered from slight attacks of cardiac oppression, pain down the left arm, and dyspnoea, brought on by going upstairs. In spite of treatment with iodine and diuretin, he became worse, exposure to cold or any excitement causing severe respiratory difficulty. The heart and aorta were scarcely enlarged and no signs of atheroma were found, but the blood pressure reached 150 mm (Riva Rocci). Neurosis was diagnosed, and calcium bromide was given intravenously for six weeks without any complete or lasting benefit. Calcium diuretin in ordinary dosage was given orally for six days and removed all symptoms except after heavy exercise had been taken. The pulse and blood pressure became normal and in three weeks improvement became complete. The benefit has now lasted six months, the patient taking every six or eight weeks a course of the drug for ten days or so, as a precaution.

215 Diathermy in Rectal Stricture

H PICARD (*Zentralbl f Chir*, August 1st, 1925, p 1709) prefers diathermy to dilatation or excision of the scar in rectal stricture, and claims that after diathermy the scar tissue becomes vascular, soft, and elastic. While excision or dilatation may have serious sequelae, diathermy is stated to be quite free from danger. Picard's technique is as follows. After preliminary dilatation with Hegar's dilators a double cathode is placed in contact with the stricture and two compound plates are applied externally—one in front over the hypogastrium, and the other over the sacrum. By using various external poles of large size the average temperature at the site of the stricture may be raised to 113–117°F. The strength of the current employed is about 1 ampere, and the treatment is given daily for fifteen to twenty minutes for about four to six weeks. Picard has treated fourteen cases of simple rectal stricture and two cases of anal stricture by this method, in five cases the Wassermann reaction was positive. He has seen only two relapses after diathermy during the last three years.

216 Active Immunization against Diphtheria

H ALDERSHOFF (*Nederl Tijdschr v Geneesk*, July 4th, 1925, p 6) discusses the question whether the time has come to replace toxin antitoxin by anatoxin. In view of the immunizing action of anatoxin, one might be inclined to answer this question in the affirmative, and follow the example of Loiseau, Park and Zingher, and others. Aldershoff, however, as the result of his experience at the Utrecht Serological Institute, is opposed to this change on the following grounds: (1) Undiluted anatoxin, though free from toxic action, produces, especially in older children and adults, who are generally allergic, a violent local reaction, which, though harmless, is a great obstacle to the general employment of anatoxin. (2) It is not decided whether anatoxin has a reliable immunizing action when it has been sufficiently diluted to prevent the appearance of a more violent local reaction than that caused by toxin antitoxin. (3) An anatoxin freed from proteins is not available.

217 Treatment of Sprue by Raw Pancreas

A CASTELLANI (*Journ Trop Med and Hygiene*, June 15th, 1925, p 230) reports that in some cases of typical sprue, with copious white motions and a sore mouth, the administration of raw pancreas seems to be beneficial. He now adopts a routine treatment in which the patient is kept at complete rest in bed on a strict milk diet. In most cases half a drachm or a drachm of sodium bicarbonate is given three times a day, or well diluted liquor potassae. Fresh sweetbread from lambs, sheep, or calves are minced and the stringy parts removed. At first a teaspoonful and later a tablespoonful of the chopped mass with the juice is given once or twice a day. Castellani

has also employed pancreas tablets and capsules, which he finds useful but not so active as raw pancreas. He adds that in three cases of spurs complicated by typical diabetes, the administration of insulin brought about disappearance of the glycosuria and polyuria, without alleviating the spur symptoms. In two of these cases raw pancreas given by the mouth benefited the spur condition, but did not control the glycosuria. In such cases, therefore, he advises the administration of subcutaneous injections of insulin, combined with raw pancreas by the mouth. He remarks that he sees no reason why this pancreas treatment should not be combined with Scott's parathyroid calcium lactate method.

218 Treatment of Chronic Albuminuria by Tonsillar Extract

M LAEMMER (*Bull Soc de Théor*, June 10th, 1925, p 170) states that it is well established that tonsillitis frequently gives rise to albuminuria, which may be transient only, but sometimes becomes very chronic. In the course of his study of chronic albuminuria in childhood and adolescence Laemmer found that it frequently originated in a chronic infection, not only of the tonsil, but of the whole of Waldeyer's ring. He has recorded cases in conjunction with Tarneaud to show that the obstinate albuminuria occurring in influenza or other infectious diseases was merely due to an infection of some part of the naso-pharyngeal lymphatic ring. He now reports two cases—in a boy aged 12 and a girl aged 20, respectively subject to attacks of tonsillitis and albuminuria—whom he successfully treated by injection of tonsillar extract containing 25 c cm of fresh pig's tonsil in 3 c cm of normal saline. If these results are confirmed by further observations, Laemmer suggests that there may be a special endocrine secretion in the tonsils.

219 Manganese Treatment of Tuberculosis

O HELMS (*Deut med Woch*, July 17th, 1925, p 1189) gives a brief summary of his experience with twenty-eight cases of tuberculosis treated with intravenous injections of manganese chloride in a Danish sanatorium, according to Walbum's principles, to which we have previously referred (*Epitome*, January 20th, 1925, para 51). Among the twenty-eight there were sixteen whose sputum contained tubercle bacilli. At the end of the treatment, the average duration of which was sixty days, ten of these sixteen were sputum negative, and seventeen of the twenty-eight were improved. The average gain of weight was 2.8 kg. The treatment was, on the whole, well tolerated, and a prolonged febrile reaction was very exceptional. The author is continuing his therapeutic investigations in conjunction with Walbum of the Serum Institute in Copenhagen.

220 Treatment of Hypertension by Sodium Nitrite

A MUZANI (*Rev Sud Amer de endocrin, immunolog y quimoter*, July 15th, 1925, p 409) reviews the literature and records his observations, illustrated by charts, of treatment by sodium nitrite of various cases of hypertension, including arterio-sclerosis, cardiac renal disease with compensation, and angina pectoris. On the first day 0.04 g was given, 0.01 g on the second day, and 0.02 g on the following days, in solutions of the strength of 1 and 2 per cent. The results were as follows: (1) A well marked fall of the maximum tension in a time not exceeding fifteen minutes, in one case there was a fall of the maximum tension to normal in not more than fifteen minutes. (2) The fall of tension persisted throughout the duration of the treatment, except from the second to the fifth day, when there might be an irregular stage of reaction. (3) The minimum tension showed only slight modification. (4) The pulse rate remained unchanged except in two cases in which three hours after the first injection it fell by 8 to 10 a minute. (5) There was no disagreeable symptom attributable to the drug. (6) In a case of angina pectoris the precordial pain permanently and entirely disappeared after ten days' treatment.

221 Prophylactic Use of Iodine in Goitre

ORATOR (*Wien Min Woch*, August 27th, 1925, p 974) says that the period necessary to estimate the effect upon endemic goitre of adding iodine to the diet runs into decades of years. It is, further, necessary to recognize at the outset those subjects in whom even small doses of iodine will bring on the symptoms of Graves's disease. The form of goitre against which prophylactic doses of iodine are specially directed is a juvenile enlargement consisting in a colloid-free parenchymatous hyperplasia suggesting compensatory enlargement at least in early stages, as though the gland originally were not equal to the demands upon it. When such goitres are already present the effect of prophylactic iodine would be to break down the parenchyma and favour an accumulation of colloid. Orator adds that when symptoms

of Graves's disease are precipitated epithelial proliferation and excretion of colloid result. The hypertrophy in these cases cannot be conceived of as an enlargement to meet increased demand, but as a gross overproduction, over functioning. This is the invariable action of iodine on the thyroid—primarily, increase of function—works sometimes for good, sometimes for ill. The author dwells on the need for better diagnosis to identify patients on the verge of exophthalmic goitre.

222 Sodium Salicylate in Lethargic Encephalitis

D DENLECHAU and J BARBARY (*Bull et Mém Soc Méd des Hop de Paris*, July 30th, 1925, p 1199) record a case of lethargic encephalitis in a woman aged 50, in whom the disease had a sudden onset with extreme headache, marked drowsiness, slight nuchal rigidity, and Kernig's sign, a temperature of 100.6°, and excess of sugar in the cerebrospinal fluid. There were no ocular symptoms or myoclonus. Treatment by sodium salicylate was at once instituted, the intravenous and intramuscular routes being simultaneously employed. An intravenous injection of 0.5 gram was given morning and afternoon, and 1 gram intramuscularly, or a total of 2 grams daily, for twenty-two days. The result was remarkable and extremely rapid. The temperature fell in forty-eight hours, the nervous symptoms disappeared after the first few injections, but a slight relapse occurred when one of the intravenous injections was omitted. Complete recovery ultimately occurred. The intravenous injections, of which forty-four were given, were well borne without any local reaction, but on two occasions they were followed by shivering and rise of temperature. The pain of the intramuscular injections was diminished by simultaneous injection of 1 eg of cocaine.

Diseases of Children.

223 Hypertelorism

D C MUIR (*Brit Journ Child Dis*, April June, 1925, p 107) records a case in a female infant aged 13 months of this congenital cranio-facial deformity first described by Greig (*Edin Med Journ*, 1924, xvi, p 560). The outstanding feature is a great breadth between the eyes, which is attributed to abnormal evolution of that part of the sphenoid which is developed in cartilage. The skull as a whole is square in shape, with a low forehead, a high vertex, and a flat occiput. The frontal eminences are prominent. Apart from the peculiar head Muir's patient was physically well made. There was no digital deformity as in Greig's cases, nor any peripheral vasomotor phenomena. The general appearance and responses of the child suggested mental defect, which was present in Greig's cases. The eyes were very wide apart, and the bridge of the nose markedly flattened. The tip of the nose was turned up, and the nostrils looked somewhat forwards. The palpebral fissure was wider than normal, and its direction markedly oblique from mesially downwards and outwards. A capillary naevus extended from the left temporal region on to the upper lid on the same side. The ears were large and stuck out abruptly from the sides of the head. The palate was narrow and high.

224 Craniotabes and Rickets

S J WILSON and M SEIDOWITZ (*Amer Journ Dis Child*, May, 1925, p 603) discuss the relation of craniotabes to rickets from clinical observations in a series of 469 babies under 1 year of age, of which 164 (35 per cent) had craniotabes and 121 (25 per cent) showed rickets. Of these latter 48 (39 per cent) had craniotabes, which coincides with its incidence in the entire series, and of the 164 with craniotabes 48 (29 per cent) either had rickets or developed rickets later. Since the association of craniotabes with rickets was found to be inconsistent it is inferred that such an association is merely a coincidence. A greater predisposition to craniotabes was observed in coloured than in white babies. The age incidence of craniotabes (the first four months of life) appears to be earlier than that of rickets. The seasonal incidence of craniotabes during the spring and early summer was apparent since the greatest number of cases appeared in babies born in May, June, and July, and the disease was almost absent during the winter. Of 106 patients with craniotabes 30 were treated with cod liver oil 3ss to 3i tds, 36 were exposed to direct sunlight for at least fifteen minutes twice a day, and in 40 cases the mother's diet was regulated so as to ensure an ample amount of milk, cream, butter fat, and leafy vegetables. The exposure to sunlight produced the most marked effect, the skull areas becoming calcified at the end of the first month in 42 per cent, and at the end of the third month in 91 per cent, whereas within the same period only a few cases resulted from regulation of the mother's diet and none from

reatment with cod liver oil. A definite seasonal influence was found, since 93 per cent were cured during August and September irrespective of the therapeutic agent employed, and season rather than age seems to be the main factor in the disappearance of craniotabes. The authors add that study of the calcium and phosphorus concentrations in the blood is important before arriving at any definite conclusion.

225

Diabetes in Children

A. G. MITCHELL (*Journ. Amer. Med. Assoc.*, May 30th, 1925, p. 1620) points out that in the treatment of diabetes mellitus in children insulin assists dietetic measures, but should not replace them. While adult diabetics can often be kept sugar free by diet restrictions alone, nearly all children are benefited by the addition of insulin, commencing with 1 or 2 units three times a day and increasing by increments of 1 unit until the urine is sugar free. Since the aim should be to give the smallest dose of insulin necessary the patient's nutrition and urinary sugar should be frequently examined so that changes in glucose tolerance may be met by corresponding changes in insulin dosage. The presence of diacetic acid indicates faulty fat metabolism and the danger of acidosis and coma, the fat in the diet should be decreased and the carbohydrate increased, with an approximate increase in insulin dosage by 1 unit for each gram of added carbohydrate. In threatened coma sufficient glucose should be given to produce the presence of sugar in the urine, and from 15 to 30 units of insulin administered according to the urgency of the symptoms, the age, and the degree of diacetic acid reaction. Since infectious lower the glucose tolerance the food intake during the acute stage of any infection should be reduced by one half or one third, and after the acute stage the glucose tolerance should be again ascertained before full diet is resumed. Mitchell suggests that for reference in an emergency patients or their attendants should be given written instructions upon the early symptoms and treatment of acidosis and hypoglycaemia, the indications for stopping insulin injections, and the danger of infectious

filled with olive oil and the catheter inserted about 6 to 8 inches into the rectum, the patient being directed not to press down while the enema is being given. The ether mixture is slowly added to the oil in the funnel and the remainder of the oil finally added, the whole procedure taking the intervals between from three to five prisms to complete. The clamped catheter should be kept in position for about fifteen minutes by a towel pressed against the anus. Directly after the instillation a third intramuscular magnesium sulphate injection should be given, as this tends to prolong the action of the ether. The author adds that, if the effect of this first instillation should wear off, a second, or even a third, may be given, each followed by magnesium sulphate injections, provided that only 10 grains of quinine are administered, and that not less than two and a half hours have elapsed between the instillations. Colitis, diarrhoea, and auditory disturbances are said to be the only contraindications for the method.

228

Scopolamine-Morphine Narcosis or Rapid Delivery by Pituitrin?

J. EVERSMAUN (*Zentralbl. f. Gynäkol.*, June 13th, 1925, p. 1297) compares the procedure of "twilight sleep" in labour with rapid delivery by pituitrin, and concludes that the former should be abandoned for the following reasons: (1) the duration of labour is prolonged, (2) there is a higher percentage of instrumental delivery, (3) as the result of (1) and (2) the danger of infection is increased, (4) the patient has often painful memories of her confinement, (5) the child incurs greater risk. Eversmann has given scopolamine at the beginning of labour in order to overcome initial nervousness and the pain due to dilatation in primiparae, but he finds that there is always some consequent retardation of uterine contractions, by the subsequent injection of pituitrin this retardation was quickly corrected. He believes that rapid delivery by the aid of pituitrin is the ideal method, and he agrees with Stein that it can be used at any stage of labour without anxiety regarding the result, as minimal doses are found to act with great uniformity. He believes that in 50 per cent or more of all cases the length of labour should be reduced by one third. Eversmann adds that this shortening of the period of labour may preserve the life of an endangered infant. Reifferscheid reported that pituitrin might produce tetanic uterine contractions, and that the atony resulting from the action of pituitrin produced occasionally to immediate or delayed postpartum haemorrhage. In Eversmann's opinion any such occurrence is unlikely if watch is kept for any irregularity in the pains, or if pituitrin is withheld when the regularity of the pains shows that its aid is not required. He thinks that postpartum haemorrhages, due to uterine atony, are less frequent than formerly, when patients were allowed to huddle for days with ineffectual and irregular pains, and also that the occurrence of postpartum haemorrhage is often due to mismanagement of the third stage of labour. Any indication of atony may be combated by a further dose of pituitrin. He concludes that "medicinal" rapid delivery is in the patient's interest absolutely to be preferred to "twilight sleep" it is easily employed by any physician in a private house and is entirely innocuous to both mother and child. He finds that it limits the duration of labour, thereby lessening the danger of infection and the probability of eventual operative intervention. While it does not render the patient unconscious, it alleviates the pains by reducing their duration.

229 Puerperal Septicaemia in a Malarial Subject.

AUDEBERT and RASCOL (*Bull. Soc. d'Obstét. et de Gynéc. de Paris*, 1925, No. 6, p. 501) describe a fatal case of puerperal streptococcal septicaemia which was attended with considerable difficulty of diagnosis. The patient, a 2 para aged 22, had a normal and spontaneous delivery, there was no pain and no pyrexia until the thirteenth day, and uterine involution was normal. From the fourteenth day rigors and remittent fever were noted, and were first attributed to malaria, from which the patient had suffered since the age of 10, the spleen, already enlarged, became larger and painful. Malarial parasites were not found in the blood. Death ensued on the twentieth day after a hyperpyrexial period, and culture of blood taken on the previous day showed streptococci; the lochia had contained staphylococci only. The autopsy showed a minute placental retention in one uterine cornu and visceral signs of pyaemia.

230

Pregnancy and General Paralysis

G. SUSSTRUNK (*Zentralbl. f. Gynäkol.* June 27th, 1925, p. 1436) records the case of a primipara, aged 29 who had suffered during three months from morbid alterations of gut, speech, and mind, she was found to have general paralysis of the insane and to be seven months pregnant. Labour was rapid, spontaneous and unaccompanied by pain, the child had a positive Wassermann reaction without clinical signs of syphilis. The mother's malady became rapidly worse before

Obstetrics and Gynaecology.

226

The Ovarian Lipoids in Pregnancy

H. EUFFINGEN and O. W. BADEN (*Arch. f. Gynäkol.*, June 3rd, 1925, p. 483) examined, for their lipid contents, 37 ovaries, 34 of which had been removed during pregnancy and 3 in the puerperium. The specimens had been obtained at laparotomies performed for extrauterine gestation, Caesarean section, and interruption of pregnancy in the early stages. The duration of pregnancy in the various cases ranged from four to forty weeks. The authors' conclusions are as follows: (1) The lipid content of the corpus luteum gradually diminishes as pregnancy advances. During the first two months a considerable amount of lipoids may be found, but at the end of pregnancy only traces can be detected. The lipid droplets are situated almost exclusively in the granular luteal cells. (2) The lipid content of the follicles is very scanty during pregnancy, and usually only traces of it can be found. (3) The chemical constitution both of the corpus luteum and of the follicles is mainly represented by cholesterol esters and cholesterol fatty acid mixtures. (4) During the puerperium the lipid content of the corpus luteum and of the follicles undergoes a considerable increase.

227

Reduction of Pain in Labour

A. B. DAVIS (*Surg., Gynecol. and Obstet.*, June, 1925, p. 868) advocates the amelioration of labour pains by morphine-magnesium sulphate injections and ether introduced into the colon, a method used at the Lying in Hospital, New York. Within eight hours after an initial enema, and when strong pains are established, with the os dilated to the breadth of at least two fingers, 1/4 grain of morphine sulphate with 2 c.c. of a sterile 50 per cent solution of magnesium sulphate is injected intramuscularly into the gluteal region. This is followed half an hour later by 2 c.c. of the magnesium sulphate solution alone. If a sedative effect results delivery may take place before ether instillation is needed, which should in no case be given until strong contractions are again occurring every three to five minutes and the patient begins to complain again of pain. If, however, within twenty minutes after the second injection no sedative effect has been produced, then ether instillation may be employed, but, preferably, not before the cervix has reached the breadth of three fingers. Two bottles are required, one containing 20 grains of quinine by dibromat mixed with 3 drachms of alcohol, to which are added 2 1/2 oz. of ether and 4 oz. of olive oil, the other bottle contains 2 oz. of oil, and both should be warmed to body temperature. A funnel and catheter connected to 20 inches of rubber tubing by a glass connexion are

and after the birth of the child, and showed no improvement after treatment by malarial inoculation. Susstrunk states that conception, although admittedly possible even in advanced cases of general paresis of the insane, rarely occurs, he has found records of some sixty cases only in which paralytics became pregnant or in which the disease was detected during pregnancy or the puerperium. Morbid changes in ovulation may be inferred from the fact that more than one half of paralytics who have not attained the menopause show absence or diminution of menstruation, "from 20 to 40 per cent of pregnancies in paralytics end in abortion or premature labour." Pregnancy appears frequently but not invariably to be accompanied by rapid progression of the nervous disease. The author remarks that recent successes in some cases of malarial treatment afford grounds for the revision of the former opinion that general paralysis does not constitute an indication for induction of abortion—fore example, in patients who have improved after malarial inoculation and on discharge from institution have become pregnant. Here aggravation or recurrence are to be feared and it may be right to terminate the pregnancy.

231 Infection of Ovarian Cysts

ACCORDING TO P. BURGER (*Lancet Gynecol.*, June, 1925, p. 364), infection occurs in about 3 per cent of ovarian cysts and may follow gonococcal salpingitis, appendicitis, the acute exanthemata, or pneumonia. Post partum infection is comparatively frequent, and is less commonly haematogenous than is usually supposed, the infection spreading along the lymphatics of the broad ligament and through the hilus of the ovary. Diagnosis of infection of an ovarian cyst often presents considerable difficulty; general symptoms such as pyrexia may be inconspicuous, and the local symptoms (pain and tenderness, increase of size, increased tenderness), which are regarded as pathognomonic, may be absent. In one case described by Burger, a small soft ovarian cyst, not painful or tender, was detected on the ninth day of a slightly febrile puerperium, eighteen days after her discharge from the clinic in good condition on the seventeenth day the patient was found to have a greatly distended abdomen with well marked fluid thrill and to show considerable wasting. Malignant ovarian disease with ascites was suspected, but at the operation six litres of pus was found in one coeculus of a pseudo mucinous cyst. The temperature had not ranged above 100°. In a second case a primipara, aged 31, was found during manual extraction of the placenta after breech delivery to have a juxta uterine tumour, on the twenty-fourth day of a febrile puerperium a cystic tender tumour extending upwards above the umbilicus was found in the left fornix. Operation disclosed, instead of an infected ovarian cyst, an abscess in a large myoma in the posterior wall of the uterus.

Pathology.

232 Herpetic Encephalitis

J. BOUMAN and S. I. BOK (*Nederl. Tijdschr. v. Geneesk.*, May 30th, 1925, p. 2406) are the result of experiments on rabbits have come to the following conclusions: (1) The histological lesions of herpetic encephalitis are identical with those of epidemic or lethal encephalitis. (2) The perivascular infiltration surrounding the cerebral vessels and the diffuse infiltration of the cerebral meninges consist of lymphocytic elements, but in the earliest stage of the specific herpetic disease—that is to say, on the occurrence of herpetic meningitis—polymorphonuclear leucocytes appear for a time among the lymphocytic elements. (3) In the cerebral hemispheres (apart from the direct results of the injection) an infiltration of the pia mater is the first result of the herpetic infection. Perivascular infiltration of the cerebral tissue does not develop until much later, and it is only just before death that lesions of the actual cells of the nervous system appear. (4) On the other hand, in the mid brain the occurrence of changes in the glial cells and nerve cells (neurocytology) is not preceded by an infiltrative process. The contrast in the manner of development of the disease in the cerebrum on the one hand and in the mid brain on the other supports the view that damage to the glial cells and nerve cells in cerebral infection is, not the result of perivascular infiltration, but is directly due to the causal agent of the disease like the perivascular infiltration itself.

233 The Blood Pressure in Arterial Embolism

WIDHOFF (*Centralbl. f. Clin.*, May 30th 1925, p. 1185) describes the following results of his experiments on animals to determine the effect of embolism of the aorta and its principal branches on the blood pressure. (1) A piece of muslin placed as an embolus just above the bifurcation of the aorta caused a rapid rise of general blood pressure

(15 to 20 mm Hg), with a rapid fall to the normal level. Removal of the embolus after fifteen minutes caused a fall of about 15 to 20 mm Hg, with rapid return to the initial level. (2) If the embolus was left longer (one hour to seventeen or twenty-two hours) the general blood pressure rose considerably and the pulse rate became twice as quick, rising from 120 to 220 or 240. (3) In seventeen out of nineteen experiments the blood pressure on the peripheral side of the obstruction fell approximately to zero, the measurement being made in the femoral artery in Hunter's canal. (4) Attempts to prevent the rise of blood pressure and increase of pulse rate by exclusion of the vagus and sympathetic were unsuccessful. On the other hand, fall of blood pressure could be prevented by intravenous injection of suprarenal after embolotomy. The practical conclusions drawn from these experiments are as follows: (1) Embolotomy should be performed as soon as possible, because there is no other means of preventing severe damage to the general circulation, which is the most important sequel of arterial embolism. (2) The dangerous fall of blood pressure after embolotomy can be prevented by intravenous injection of small doses of adrenaline.

234 Hyperglycaemia following Injections of Killed Bacteria

ISOLDE T. ZECKLER and HELEN GOODALL (*Journ. Exper. Med.*, July, 1925, p. 43) have made some observations on the effect on the blood sugar of the intravenous injection of killed bacteria into rabbits. Agar cultures of various organisms were suspended in saline solution, killed by heat, and 1 c.c. of the suspension, containing about 2,000 million organisms, was injected intravenously into young rabbits. Blood was withdrawn from the carotid immediately before, and at short intervals after the injection. Sugar estimations were made on each sample by the Folin Wu method, and the leucocytes were counted, sometimes the rectal temperature was taken. It was found that certain organisms—notably *B. proteus*, *B. coli*, and *B. paratyphosus* B—produced a rapid rise in the blood sugar. From the normal figure of about 0.1 per cent it rose in two hours to a height of 0.2 or 0.3 per cent, occasionally it passed even this level. Soon after reaching its peak it fell, the fall was more gradual than the rise, so that the normal was not reached till six or eight hours after the injection. Accompanying the hyperglycaemia there was a diminution in the number of the circulating leucocytes from a normal figure of about 6,000 per c.c. mm they were reduced to 450 per c.c. mm in one experiment, and generally they fell below 1,000 per c.c. mm. The fluctuations in temperature bore little relation either to the blood sugar curve or to the leucocyte count. The systemic reactions of the animals were often severe, but did not appear to be due solely to the hyperglycaemia, some organisms produced considerable systemic reactions without giving rise to hyperglycaemia. It would appear that the increase in the blood sugar level is dependent on increased glycogenolysis, probably due to sympathetic stimulation.

235 Toxaemias of Pregnancy

H. J. STANDER, L. E. DUNCAN, and W. L. SISSON (*Bull. Johns Hopkins Hosp.*, June, 1925, p. 411) report the results of chemical analyses of the blood and urine in a large number of normal non-pregnant, normal pregnant, and abnormal pregnant women. They found that in normal pregnancy a slight decrease occurs in the non-protein nitrogen and in the blood urea nitrogen, that the CO_2 combining power becomes decidedly lower in pregnancy than in the normal non-pregnant state, and that the inorganic elements remain within normal limits. In nephritic toxæmia an increase occurs in the ratios between the blood urea nitrogen and the non-protein nitrogen, and between the blood urea nitrogen and the urea nitrogen percentage, though the inorganic elements remain within normal limits. In pre-eclamptic toxæmia no marked variations occur beyond a slight decrease in these ratios. In eclampsia there is a rise in the acid content of the blood and a decrease in the CO_2 combining power proportionate to the intensity of coma. The blood sugar is raised and remains above normal for an appreciable time after the cessation of the convulsion, and there is an increase in the phosphorus/calcium ratio due to a high inorganic phosphorus value, this suggests that there is some a scia tion between carbohydrate metabolism as well as a change in cell metabolism as a result of alterations in the nervous irritability in eclampsia may be produced by variations in the sodium/calcium, phosphorus/calcium, and other ratios such alterations being associated with the problem of foetal nutrition. They add that the hyperglycaemia in eclampsia is probably due to a variation in the hydrogen ion concentration in the liver cells rather than to muscular activity, and that it may be significant that both the sugar and the inorganic phosphorus content are raised in this condition.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

236 The Chronic Stage of Lethargic Encephalitis

J MENDEL (*Wien Arch f Klin Med*, June 15th, 1925 p 559) describes the following characteristics of the chronic stage of lethargic encephalitis. The first is the corpse-like attitude of the patient who lies motionless on his back in bed very rarely on his side, with an apparent absence of interest in his surroundings, and the eyes wholly or partially closed. In advanced cases the patient lies the whole day with his arms across his chest and his legs extended, and the feet in a position of equino varus. The second characteristic feature is that in spite of this absence of movement which may last for months, it is only rarely that extensive bedsores develop, in contrast with other severe chronic diseases of the central nervous system. This absence of susceptibility to bedsores indicates immunity of the trophic nerves or a diminished vulnerability of the skin, or an association of these two factors. The third characteristic is the patient's grip, in which the extensor type predominates. The head is drawn slightly back, and the vertebral column and scapulae are kept rigid. The spastic character of the gait is more or less pronounced. In an advanced stage the patient walks on the balls of his toes, keeping the rest of the foot in a position of equino varus. In milder cases the foot is brought to the ground with a stamp. The arms are kept in a position of adduction in walking, and slightly flexed at the elbow. Treatment of any kind, including protein therapy, injections of salvarsan, and inoculation of malaria has proved ineffective.

237 Diagnosis of Purpuric Small pox

K IKEDA (*Journ Amer Med Assoc*, June 13th, 1925, p 1807) states that at the Minneapolis General Hospital 48 cases were diagnosed as purpuric out of a total of 480 small pox cases, in the twelve months ending February 28th, 1925. Concurrently there were 131 cases of hemorrhagic pustular small pox. The diagnosis of purpuric small pox in general practice is an exceedingly difficult if not impossible task, especially if the case happens to be an isolated one. Ikeda maintains that examination of the blood gives findings of extreme interest and vital diagnostic value. The principal changes are in the numerical value of the platelets and leucocytes, and the morphological structure of the leucocytes and erythrocytes. Mailed and progressive thrombopenia is said to characterize the purpuric type in contrast with the steady and rapid rise in the platelets after the vesicular stage in all other forms of small pox. A rapid and decisive decline of the polymorphonuclear leucocytes is another significant finding. The disappearance of the polymorphonuclear elements is so sudden and complete that with a very high leucocyte count a leukaemic state, or acute benign lymphadenosis, might be diagnosed from the blood smear alone. Another striking condition is the appearance of normoblasts, basophilic stippling and polychromatophilia without clinical or laboratory evidence of severe anaemia or chronic sepsis. In the terminal stage bacteremia is intense, showing large Gram positive diplococci which on culture prove to be hemolytic streptococci. The haemoglobin and erythrocyte count are practically normal. Changes in the lymphocyte series are identical with those in pustular small pox—namely, the appearance of pathological forms such as atypical leucocytes, plasma cells, irritation forms of leukocytes and occasionally cells of a slightly immature type. In the leucocyte series myelocytes and metamyelocytes are found. The percentage of eosinophils and basophils remains unchanged throughout the course of the disease. The bleeding time is considerably prolonged. Tests for the coagulation time give inconsistent results.

238 The Electro cardiogram and Anatomical Findings

A DILLAYLE (*Chronic Circulation*, July, 1925 p 265) who records four cases illustrating the relations existing between the changes in the electro cardiogram and the lesions in the heart demonstrable on naked eye or histological examination comes to the conclusion that the electro cardiogram and anatomical findings mutually supplement each other. In many points the results are the same—as, for instance, the predominating action of a given segment of the heart is always confirmed by a demonstrable hypertrophy, the occurrence of extra systoles is associated with signs of stasis and the presence of inflammatory foci, and the inversion of the T wave in the first two leads by degeneration of the

myocardium. The author adds that the electro cardiogram gives a remarkable demonstration of the disturbances of conductivity and excitability (extra systoles) in cases where no special lesions are found on pathological examination. As a general rule it is possible to obtain a relatively accurate idea of the function and condition of the myocardium by the electro cardiogram and clinical examination, while the anatomical examination may in some cases be negative and in others confirm, explain, or add fresh information.

239 Diabetes Mellitus in Children

J C SCHIPPLIS (*Medicinal Lydschi v Geneesl*, May 16th 1925, p 2206) states that since his previous paper (*ibid*, 1915, ii, p 788) he has seen six cases of diabetes in children between 6 and 12 years of age, but that the disease is very rare in infants. Jeans in 1917 came to the conclusion that of 100 recorded examples of diabetes mellitus in infants only a few could withstand euthanasia. In 1913 Knop had found only 15 genuine cases in the literature. Schipplis now reports a case in a child in whom the disease started at the age of 4 months. With an appropriate diet and insulin treatment improvement occurred, although the patient did not become sugar free, but after an attack of acute pharyngitis at the age of 13 months there was a considerable increase in glycosuria, coma set in, and death followed.

240 Tuberculosis in Jews

I WEFNER (*Zeit f Tuberk* 1925, B1 25, p 130) recalls that before the war Jews were credited with a smaller morbidity and mortality from tuberculosis than those of other nations—conclusions supported by a communication in 1915 from the Jewish Hospital in Berlin. He now reports on 138 men and 87 women treated from 1920 to 1924. Just over one half of these patients were in the third stage of the disease, whereas the proportion in the 1915 cases had been under 10 per cent. Similarly the mortality had risen from 20 to almost 40 per cent, and nearly a fifth of Wefner's fatal cases occurred within a year of the commencement of illness. Tubercle patients also were encountered more frequently. The author considers these changes are obviously attributable to the hardships of the war and the bloodshed, but believes that even so the doctrine of the relatively small incidence and favourable course of tuberculosis among Jews still holds good. He suggests that the reason for this peculiarity is perhaps racial immunity required by the elimination of the less resistant throughout the generations of many centuries of urban life.

Surgery.

241 The Diagnosis of Calculi in the Bile Ducts

J LEVEUR and D BERGEAU (*Rev de Chir*, No 6 1925, p 422) recall that the diagnosis of gall stones in the common duct is rarely made except when jaundice is present. The type of colic met with in stones in the gall bladder or biliary passages is usually of the same character whereas, on the other hand, the clay coloured stools and appearance of bile pigments in the urine are usually only found in obstruction of the bile duct. The diagnosis of stone in the common duct under such conditions is usually simple particularly when associated with rigors and a rise in temperature. Again cases occur in which after death large stones are found in the bile passages though there have been no obvious symptoms during life. The presence of stones in the ducts causes a retrograde dilatation of the ducts often associated with hepatic insufficiency and in the patients operation only serves to precipitate a fatal ending. Various methods have been devised to diagnose the presence of gall stones prior to operation. Radiography is uncertain, the duodenal tube and search for the presence of the bile pigment and of cholesterol in the blood, have all been recommended. The present authors find that the detection of the biliary pigments in the urine of these cases is a valuable sign, and they have adopted the method of Dabbert. They state that if the urine is examined every two hours in these patients after an attack of colic it is usually possible to discover the biliary pigments in the urine. If the test is positive it has been shown by operation that gallstones are present in the bile ducts although jaundice may not have been found in the patient. They add that this test is of value in that it allows surgeons to diagnose the condition before the appearance of jaundice and thereby much improve the prognosis after operation in these cases.

242 Liver Abscess due to a Fishbone

E WILHEIM (*Zentralbl f Chir*, July 4th, 1925, p 1464) states that primary abscess of the liver is one of the rarest of surgical diseases and is usually due to the migration of ascarides, which reach the liver by the blood vessels or the lymphatics. He reports the case of a woman, aged 59, who had been in good health until six months previously, when she began to suffer from occasional pain in the hepatic region unrelieved by treatment at Karlsbad. A sudden attack of severe pain and high temperature followed. The pain was referred to the gall bladder region, but the liver was not enlarged, nor could the gall bladder be felt. On opening the peritoneum there was found on the convexity of the right lobe of the liver a fluctuating tumour as large as a hen's egg. An exploratory puncture was made, and about 9 oz of very thick offensive pus was evacuated. On exploring the abscess cavity, a fishbone two and a half inches long was found. The cavity was probed and the peritoneum drained with strips of gauze. A few days later rigors recurred, with vomiting and hiccup. There was very little discharge from the wound, but the patient was very ill and had intense pain in the hepatic region. The pulse was 120, the abdomen was soft, and faeces and flatus were passed. Puncture of the abscess cavity yielded a negative result and the patient died three days later. A necropsy was refused. Wilhelm believes that the fishbone had perforated the duodenal wall and had thus reached the liver. He gives details of a large number of cases of hepatic abscess, only a small minority of which were caused by foreign bodies such as parasites, calculi, and fishbones.

243 Splenectomy in Purpura Haemorrhagica

H Z GIFFIN and J K HOLIOWAY (*Amer Journ Med Sci*, Aug, 1925, p 186), in order to assess the value of splenectomy in purpura haemorrhagica, have collected twenty-eight cases from the literature and from the Mayo Clinic. They conclude that, while the uniformly favourable results point to temporary cure, the occasional recurrence of petechiae, the slowness with which the bleeding time becomes reduced, and the variability in connexion with the recovery of the retractility of the clot, indicate that although a change has been brought about by splenectomy sufficient to arrest gross haemorrhage the finer mechanism of coagulation requires a complex readjustment on the part of the organism, which may or may not become complete. They consider that only well marked cases of purpura haemorrhagica should be submitted to splenectomy, and correct diagnosis is thus especially important. Aplastic anaemia with haemorrhagic features provides the most likely diagnostic pitfall, but here, besides the haematological picture, the period of bleeding will have been preceded by a period of rapidly developing anaemia. They add that it must always be borne in mind that borderline conditions occur with confusing coagulation signs, in these the diagnosis between haemophilia and purpura is impossible.

244 Splenectomy in the Acute Stage of Purpura Thrombopenica

H HARTUNG (*Deut Zeit f Chir*, June, 1925, p 91), who records an illustrative case, states that that form of purpura known as purpura thrombopenica is rarely encountered and that extraordinarily good results may be obtained in it by splenectomy. Frank was the first to describe the condition of purpura thrombopenica, which consists in a diminution of the blood platelets. Their normal number is about 300,000 per c mm. In any case values below 100,000 may be regarded as pathological. Kaznelson and Eppinger are of opinion that in thrombopenia an increased destruction of blood platelets occurs in the spleen, while damage to the vascular endothelium must also be regarded as a factor. Hartung reports a case of thrombopenia in a man aged 45, characterized by bleeding from the gums, generalized skin haemorrhages, and asthenia. The red cell count was 1,630,000 per c mm, the leucocytes 8,300, the colour index was 0.9, the bleeding time fifteen minutes (that is, three times as long as the normal), the coagulation time being normal (forty-five seconds). The blood platelets numbered 100,000. The differential count was normal. Splenectomy was performed, but the patient died ten hours later. Engel has reported four cases of thrombopenia in which splenectomy was performed as a last resort in the acute stage. Three of the patients died very soon after the operation, so that there are now five cases on record of splenectomy during the acute stage of thrombopenia, of which four were fatal. On the other hand, out of twenty cases of chronic thrombopenia in which operation was performed eighteen patients recovered, one died from the anaesthetic and another from subphrenic abscess. Hartung concludes that splenectomy should not be performed during the acute stage of thrombopenia even as a last resort, but that it is quite justifiable in the chronic stage, when it yields excellent results.

Therapeutics.**245 Hexyl Resorcinol**

D C ELLIOTT and H G BARBOUR (*Canadian Med Assoc Journ*, August, 1925, p 787) describe a sensitive alkaline chloroform test for hexyl resorcinol. To 2 c cm of the fluid to be tested 0.25 c cm each of 40 per cent potassium hydroxide and chloroform are added and gently boiled until one minute after the chloroform has been driven off. A pink colour develops, most marked after standing for five minutes, any doubtful reaction being compared with an unboiled control test. With this test the presence of hexyl resorcinol can be detected in dilutions of 1 in 100,000 in distilled water, 1 in 50,000 in urine, 1 in 25,000 in serum, and a 1 in 5,000 dilution added to bile will show a pink colour in the foam after the reagents have been boiled. The authors state that in pyelitis and urological surgery hexyl resorcinol in 0.9 gram doses daily in olive oil capsules produced distinct improvement in over twenty out of forty cases investigated by them. When administered prophylactically two days before and daily after suprapubic and external urethrotomy operations the wounds remained healthy in spite of constant contamination by urine in which the drug was easily detected. In dogs when given by mouth hexyl resorcinol was absorbed throughout the small intestine, and in therapeutic doses in man it did not appear in any body fluid except the urine, the cerebrospinal fluid giving negative findings at the time when the urine was positive. Previous references to the therapeutic use of hexyl resorcinol have appeared in our *Epitome* columns (February 7th, 1925, para 146, and March 7th, 1925, para 240).

246 Serum Treatment of Scarlet Fever

T PONTANO (*Il Policlinico*, June 1st, 1925, *Sez Med*, p 265) has found that the serum of convalescents from scarlet fever, the serum of normal individuals, and normal horse serum are equally efficacious in scarlet fever when injected intravenously. The mechanism of all three serums appears to be identical as far as can be judged from the effects. The clinical picture following intravenous injection of a large quantity of serum is as follows: shivering, rise of temperature, hypotension and nervous symptoms such as depression or restlessness, and diffuse pains. This condition soon subsides and is followed by a rapid fall of temperature accompanied by a temporary or permanent recovery. Pontano considers that the effect produced indicates protein therapy and not a specific action of the serum. Owing to the stimulus supplied by the serum the organism becomes freed from the waste products resulting from the disintegration of the tissues due to the morbid agent, and the discharge of these products causes the feeling of improvement, or actual cure if the fall of temperature coincides with spontaneous recovery.

247 R H GRAHAM (*Journ Amer Med Assoc*, July 11th, 1925, p 95) gives an account of the prophylactic treatment by the unconcentrated Dochez serum of 27 persons exposed to scarlet fever. Of these patients, 21 developed serum disease ranging from slight urticarial eruptions to generalized oedema, and 6 showed signs of anaphylaxis within the first hour. The size of the dose did not appear to influence the reaction. Immunity was established in twenty-four cases treated on the day of exposure to infection. Serum injected the second day after exposure did not protect two patients out of three. Graham adds that therapeutic injections seemed to give little relief, in one advanced case no improvement followed the administration of 40 c cm of unconcentrated serum, and there was an immediate serum reaction with very marked oedema.

248 Treatment of Infantile Tetany

C O GUILLAUMIN and R A TURPIN (*Bull Soc de Ther*, April 8th, 1925, p 104) state that the investigations which they have been making for more than a year have led them to the conclusion that a disturbance of the acid base equilibrium of the plasma is responsible for latent and well developed tetany. Their results confirm the hypothetical views of Freudenberg and György as to alkalosis in tetany. The physico-chemical disturbance of the plasma seen in infantile tetany was also found during the stage preceding the attack in experimental tetany due to removal of the parathyroids, or that obtained by voluntary and prolonged hypopnoea. Experimental and clinical observations on the action of calcium chloride and inhalations of gaseous mixtures rich in carbon dioxide and ammonium chloride showed that the administration of these substances was followed by the production of marked acidosis and a rapid subsidence of clinical symptoms. In three cases similar results were obtained by the action of nitra violet rays. LESVE (ibid, p 103) states that these researches throw a new light on the pathogenesis

of spasmodic and tetany. In place of the vague idea of hypocalcaemia there is now the theory of a diminution of ionized calcium in the blood, and of an acid base disequilibrium in the blood with a definite tendency to alkalosis. The drugs which are successful in infantile tetany, such as calcium chloride and ammonium chloride, restore this equilibrium and increase the amount of ionized calcium. He adds that this mode of action of violet rays is complicated and almost mysterious. They appear to act, not only on the composition of the blood, but also on the general condition, by the agency of the nervous system, and on the secretion of the endocrine glands. Actinotherapy also has a simultaneous curative effect on rickets, which is so frequently associated with spasmodic tetany.

249 Treatment of General Paresis by Pooled Salvarsanized Serum

J G MARTHEUS (*Urol and Cut Rev*, July, 1925, p 403) records his observations on fifty eight cases of general paresis which had been treated at the Dayton State Hospital, Ohio, since February, 1920. The clinical findings were verified in each case by laboratory tests. At the end of this five years' period 43 per cent of the patients were still living, 20 per cent were outpatients and able to follow their usual occupations. In the three years previous to the opening of the clinic for the study and treatment of these cases the average duration of a case of general paresis was ten and a half months. As the result of treatment the lives of 43 per cent have been prolonged above any previous record in the hospital. The method used by Martheus consists in intravenous injection of nearsphenamine, followed next day by intraspinal injection of pooled serum fortified by arsenamine. The details are as follows. Half an hour after the patient has received an intravenous injection of arsenamine 45 to 60 c cm of blood are drawn from a vein in the arm into dry sterile 15 c cm centrifuge tubes, which are placed in the ice box for several hours and then centrifuged for ten minutes. The serum is poured off into other sterile centrifuge tubes and again centrifuged until all the red cells are excluded. Serums from twenty to twenty five patients who have received intense intravenous treatment are poured into a common beaker and thoroughly mixed, 10 c cm of this serum is poured into sterile tubes and put in a water bath at 56° C for half an hour to inactivate it. One hour before the patient is given an intraspinal injection the serum is fortified by the addition of arsenphenamine. After completion of a combined intravenous and intraspinal course of treatment mercurial fountains or mercury perchloride intravenously and potassium iodide by mouth are given for a month. After a rest of two months the patient receives intravenous injections of nearsphenamine followed by a few intraspinal injections as his condition requires.

Anaesthetics

250 Renal Irritation following Novocain Anaesthesia

R MORAN (*Zentralbl f Chir*, August 1st, 1925, p 1711) reported in 1915 the occasional occurrence of renal irritation after novocain adrenaline anaesthesia. He found that 5 to 10 per cent of his patients had albuminuria, seldom more than 0.5 per cent, with a few hyaline and granular casts, and blood corpuscles. In 1918 Flory found slight albuminuria in 6 per cent of patients after novocain anaesthesia in half of these cases casts were present. Yet Flory denies that novocain irritates the kidneys, as his remaining patients, some of whom had received large doses, were free from albuminuria, as were also three rabbits who were injected with very large doses. Moran concludes that although novocain is a renal irritant it does not produce a permanent lesion, and therefore he does not consider it necessary to abandon a valuable anaesthetic.

251 Local Anaesthesia in Abdominal Surgery

C F NASSAU (*Amer Journ Surg*, Anesth Suppl, July, 1925, p 81) considers that in many of the operations on the abdomen now generally performed under general anaesthesia the use of local anaesthesia results in comfort and lessened danger to the patient. The method is specially indicated in old people and for such operations as strangulated hernia in persons over 60, the anaesthetic risk is said to be reduced in the case of those suffering from organic diseases such as tuberculous, diabetes, and chronic renal or cardiac trouble. Its use was attended with much less liability to nausea and vomiting than is the case with a general anaesthetic, the shock of major operations was reduced, and there was less liability to complications in convalescence. Nassau states that the mode of administration depends upon the site of operation, direct local infiltration being all that is needed for slight conditions. Field block is indicated for minor opera-

tions and in combination with other types of infiltration for major operations so as to surround the operative field by an anaesthetized area. In nerve block the injection is made directly into the nerve or the neighbouring tissues. He finds that 0.5 per cent novocain solution, with or without adrenaline according to the nature of the operation, gives the most satisfactory results. He adds that good technique is essential. A wheel should be used in the skin through which the needle is inserted at right angles and the tissues infiltrated with a steady continuous flow. In operations upon the abdominal cavity through intraperitoneal anaesthesia must also be obtained.

252 Blood Pressure in Spinal Anaesthesia

W W BABCOCK (*Current Researches in Anesthesia and Analgesia*, August, 1925, p 222) comes to the following conclusions: (1) The fall in blood pressure with spinal anaesthesia is greater than with any known vasesthetic. (2) The vascular hypotension is especially dangerous to obese, asthenic, starved, shocked, anemic, or intubated patients, or those with myocardial degeneration. (3) With the loss in pressure in the coronary arteries and the stimulus of the sympathetic system the heart may cease beating. (4) The hypotension is better borne by the young and robust than by the aged and asthenic. (5) With the root anaesthesia blood in the sympathetic system in the dura mater, drugs acting on the central nervous system are valueless, and only drugs with a peripheral pressor influence are of value. (6) The drugs used should stimulate the heart, contract the vessels, and increase the pressure in the aorta and coronary arteries. (7) Adrenalin given intravenously is the most powerful antidote we have against the hypotension of spinal anaesthesia. (8) Spinal anaesthesia should not be employed if the blood pressure cannot be continuously watched during the period of anaesthesia.

253 Tongue Support in General Anaesthesia

BECKER (*Deut Zeit f Chir*, July, 1925, p 345) remarks that the usual manoeuvre for preventing the tongue slipping back in deep anaesthesia—namely, pressing forward the angles of the lower jaw with the thumbs—is inapplicable in operations on the neck, and in any case is productive of after discomfort to the patient. Anyone, he says, may convince himself by pressing at the point indicated that it is sensitive and as for forcible opening of the jaws and pulling the tongue out, that may damage the incisor teeth and give the patient a sore tongue for days. Becker's device is an elevator bent with the convexity forwards, so as to arch over the nose. The lower end rests inside the mouth, below the lower incisors and against the maxilla, farther up the shaft touches the upper incisors—not the upper lip—which act as a fulcrum. The upper extremity of the instrument, opposite the patient's forehead, is easily controlled by a finger of the hand in which the anaesthetist holds his mask. It is claimed that surprisingly little pressure is sufficient to keep the jaw and tongue well up, even in a resistant subject, that absence of the lower incisors or alveolar atrophy is no obstacle, and that the freedom of the anaesthetist's hands is enhanced.

Obstetrics and Gynaecology.

254 Tubal Pregnancy after Insufflation

LAURENTIE and MOUSSALI (*Bull Soc d Obstet et de Gynecol de Paris* 1925 No 6, p 492) reports the case of a woman, aged 30, who had been sterile since a gravely infected labour thirteen years ago. Insufflation of the Fallopian tubes by Rubin's method showed permeability with a pressure of 140 mm of mercury and was followed during a few days by pain in the abdomen and shoulder. The patient did not menstruate during the twelve weeks following the test, and during the third month there was abdominal pain, with obstinate constipation, some irregular haemorrhage, and considerable general weakness. Physical examination led to a diagnosis of extruterine pregnancy, and operation showed a large intraligamentary haematocoele from rupture of the gravid left tube, chronic inflammatory changes were noted in the tube of the opposite side. Uterine pregnancy following Rubin's insufflation has been reported in not a few instances, but no other case of tubal gestation seems to have been noted. The authors remark that their case is not to be regarded as contraindicating the use of a valuable therapeutic and diagnostic measure.

255 Treatment of Abortion

S KOBRIANSKY (*Canadian Med Assoc Journ*, August 1925, p 789) discusses the treatment of abortions as regards (1) prophylaxis, (2) when threatened and (3) when inevitable. In prophylaxis the constitutional and local causes require treatment, and in the idiopathic cases absolute rest in bed is

Blood and Tissue Changes in Cancer
 (Journ Trop Med an... the blood

259 **Blood and Tissue Changes in Cancer** *Ann. Trop. Med. and Hyg.*
J. A. SHAW MACKENZIE (*Journ. Trop. Med. and Hyg.*,
August 15th, 1925, p. 297) discusses the blood and tissue
changes in cancer with reference to diagnosis and treatment.
Studies with lipase, the fat splitting ferment of the pancreas,
show that when small amounts of the serum of healthy
people were added to pancreatic juice or extracts the fat
splitting action was increased, whereas when serum from
patients with sarcoma or carcinoma was added the action was
decreased, pointing to a deficiency of the fat splitting activity
present in normal serum. On improvement or recovery the
serum regained its normal or increased power. Carcino-
matous serum and extracts showed a separation of a thermo-
stable coenzyme which activated inactive lipase, but less in
degree as compared with normal serum and tissue extracts.
Shaw Mackenzie suggests that this would seem to correspond
to the "specific factor" from virus suggested by Gies
researches. The author states also that the difference
between normal and cancerous blood is associated with
defective enzyme action in the tissues, and especially with
defective tissue lipolysis, and that improvement and apparent
recovery from cancer are associated with increase of lipolytic
activity in the tissues. With a view to the restoration of
physiological balance and control Shaw Mackenzie recom-
mends treatment by the pancreatic coenzyme and other acti-
vators of lipase, with its normal fatty acid protective pro-
ducts, such as sodium oleate, and serum. Intravenous injections
of carcinomatous tissues and serum. Intravenous solutions
of 1 to 3 c.c. of 1 per cent sterile sodium oleate solution
weekly have been reported to be beneficial in some forms
of cancer. Though no clinical conclusions can as yet be
drawn from the use of normal, carcinomatous, and other
pathological tissue extracts, auto serums have given en-
couraging results, two inoperable cases apparently recovering
though in one case there was a recurrence after nine years of
good health.

260 The Action of Disinfectants in the Body
(Centralblatt für Bakteriologie, July, 1925, p. 28)

260
The *Centra* f *Bail*...
R NODAKE (Centra f *Bail*...
formed some experiments on animals to test the tissue
action of certain substances when injected 0.2 cm of a
His general technique consisted in injecting 0.2 cm of a
1 in 2 dilution of a twenty four hour broth culture of a staphylo
cocci into the subcutaneous tissue of the abdominal wall
of a mouse. Directly afterwards 1 cm of a given dilution
of the disinfectant to be tested was injected in fractional
doses around the site of infection. This was repeated on a
number of different animals, using varying dilutions control
animals, which had been infected with staphylococci, were
injected with simple saline solution. Following on the second
injection two of the mice were killed, a piece of tissue cut out
of the infection site, and streaked on serum agar plates.
After twenty four hours the other mice were similarly dealt
with. The plates made from the mice killed directly after
infection showed a heavy, confluent layer of growth. If this
plates made from the mice killed after twenty four hours
varied according to the efficacy of the disinfectant. If this
proved inert, then a confluent growth resulted as in the
controls. If it proved active, the number of the colonies on
the plate was greatly reduced. The two disinfectant which
were tested were typhaine and rivinol, of these the former
had little or no effect in a 1 in 2,000 dilution. Rivinol on the
other hand, was shown to be active even at a 1 in 20,000
dilution. In this concentration it was able to kill off a certain
proportion of the staphylococci in the tissues. Used in a
1 in 2,000 dilution the number of colonies was reduced to
about ten. Similar results were obtained in guinea pigs
when a 1 in 1,000 dilution was employed. Further experi
ments showed the activating effect of temperature on the
disinfectant. If the animals were killed after injection and
placed in the ice chest for twenty four hours before examina
tion large numbers of organisms were still present in the
tissues. For this reason the author recommends that the
disinfectant should be injected in a solution that has been
warmed to 37° C.

Post-encephalitic Parkinsonism June, 1925, p 403
the pos

251 Histopathology of Post-encephalitic Parkinsonism
L B HOLTMAN (Bull Johns Hopk Hosp, June, 1925, p 403),
as the result of the study of twelve cases showing the post-
encephalitic Parkinson's syndrome, comes to the following
conclusions (1) There is evidence of moderate cell degenera-
tion in the corpus striatum with an intact globus pallidus
(2) There is a severe and profound destruction of the sub-
stantia nigra (3) Focal necroses are found in the cerebral
cortex both in the cells and in the fibres (4) There is
evidence of definite but very slight inflammatory changes
(5) There is very little glia increase

Uterine Prolapse

256 N A SPIEGEL *Arch f Gynkol*, July 25th, 1925, p 823)
relates that of 138 women suffering from prolapse of the
uterus in addition to other ailments, no fewer than 129 had
more or less laborious occupations, among which he includes
the duties of the lower class of housewife. Three examina-
tions by other authors, of nearly 300 cases, yielded even
higher proportions. Spiegel is inclined to incriminate par-
ticularly hard work in a half stooping position long duration
he thinks less important, for many of his patients worked
only a six or eight hour day. He adds that large scale
retreats of a civilian population carrying its property, as in
war time, were peculiarly productive of uterine prolapse.
After a review of the rather contradictory pathological
anatomy of this ailment, he suggests that the greater liability
of multiparae may be plausibly ascribed to their exertions in
tending a large family. As regards prophylaxis he recom-
mends that no feminine occupation should involve moving
a heavier weight than 65 lb

257 **Rectal Ether Analgesia in Childbirth** (1925, p 256)
J A HARRAR (*Amer Journ Med Sci*, August, 1925, p 256)
has given up the typical twilight sleep—namely, scopolamine
and morphine pushed to the degree required for perfect
amnesia—because of the depressing effect upon the child.
With the rectal ether analgesia he now recommends he does
not claim that the labour is quite painless, but great relief
from suffering is obtained. When labour is well established
the rectum is cleared with a soap enema and an ether in
oil introduced after an intramuscular injection
of morphine and magnesium sulphate has been given. The
woman is then kept quiet in a darkened room with cotton
wool in her ears, mainly for the suggestive effect. In half an
hour another injection of magnesium sulphate is given, this
time without morphine. Usually fifteen minutes after the
ether is given it may be detected in the patient's breath, and
slight excitement begins, drowsiness and light sleep follow.
The instillation may be repeated once, or even twice. The
author claims uniform good results in 2 000 trials, and that
the method suits home or hospital practice in about 70 per
cent of all labours.

258 **Foetal Prognosis in Hydramnios** (1537) states that 193 cases of hydramnios were treated during the last thirty years at the Breslau Universitäts Frauenklinik, of these 27 occurred in primiparae. Twin birth was so frequent that the number of children was 237. The total mortality among these was 50 per cent—among the twins 70 per cent, among the others 44 per cent. This high mortality is attributed (1) to the frequency of premature labour—60 per cent of cases, (2) to the frequency of abnormal presentations—10 per cent podalic, 22 per cent vertex presentations, (3) to the frequency of operative delivery which was necessary in over one half the cases, (4) to the high number of foetal malformations, especially in the head, (5) to the comparative commonness of intra-uterine foetal death and about 3 per cent were noted during the acute stage. As to the prognosis, only 50 per cent were fatal. On the other hand about 3 per cent of chronic thrombopenia in mends puncture of the bladder performed eighteen patients recovered so that the remote anaesthetic and another from subphrenic abscess. He adds that concludes that splenectomy should not be performed in the acute stage of thrombopenia even as a palliative. He adds that that it is quite justifiable in the chronic stage, and that excellent results

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

The Dick Intracutaneous Test

BROWN (*Brit Journ Child Dis*, July September, 1925, records his observations on 487 cases of the common infectious diseases—namely, scarlet fever, diphtheria, whooping cough, measles, German measles, and chicken pox—in the performed the Dick test. His conclusions are as follows: (1) The Dick test is an index of susceptibility and immunity to scarlet fever. (2) A well marked positive reaction in a person who has no previous history of the disease on presumptive evidence that immunity to scarlet fever is slight or absent. (3) The Dick test is a valuable aid to diagnosis, and a strongly positive skin reaction in the first eight hours should lead one to hesitate before making a diagnosis of scarlet fever. (4) When a patient with a strongly positive Dick reaction develops a scarlatiniform rash, the reappearance of the red area at the site of original inoculation confirms the diagnosis of scarlet fever. (5) Age susceptibility is highest at the pre-school age, whereas age tolerance is highest during the first few years of school life. (6) Shows that immunization, if adopted as a prophylactic measure in State medicine, should be carried out in the first years of life. (7) The well recognized fact that an attack of diphtheria increases the patient's susceptibility to scarlet fever is confirmed by the test. (8) The use of different dilutions of toxin may show widely divergent results. The use of a 1 in 6,000 dilution seems to underestimate the susceptibility, while the use of a 1 in 1,000 dilution tends to overstate the incidence. (9) A more reliable method of standardizing the toxin is necessary in order to obtain a uniformity of results. (10) Further investigations to elucidate the nature of the atypical forms of scarlet fever are necessary before a satisfactory explanation can be given of the apparently anomalous results of the test in this type of case.

Acute Leukaemia

53. DIMMEL (*Wien Arch f inn Med*, August 15th, 1925, p 1), records two illustrative cases, in a man aged 31 and a woman aged 16 respectively, remarks that the question is still undecided whether the disease described as acute leukaemia is really a leukaemia or a peculiar reaction to an infection. Engelberg, who maintains the latter view, regards all cases of leukaemia as the result of septicaemia, while most of the other haematologists consider that some at least of the cases described are examples of true leukaemia running an acute course. Dimmel himself is in favour of regarding acute leukaemia as a disease *sui generis* on the following grounds: The blood picture consists chiefly of immature and degenerated cells. The anatomical findings resemble those of chronic leukaemia apart from changes due to other causes, chiefly infection. In the severest forms of the disease with extensive leukaemic changes in the organs an infection cannot be demonstrated either directly or indirectly.

Peptic Ulcers treated by Rest

284. SMITHIES (*Journ Amer Med Assoc*, August 29th, 1925, p 674) reports the result of treating 470 patients with gastric or duodenal ulcer on the medical lines suggested by him in 1916, which aim at obtaining physiological rest. At first scarcely any food was given by the mouth, nutrient enemata were employed, and the patients were kept in bed. Gastric lavage and alkaline medicaments were found to be useless and even harmful. The average duration of retention in hospital was twenty-six days, and of confinement to bed about nine days. In 40 per cent of the patients all pain ceased within twenty-four hours of starting treatment, an additional 33 per cent obtained relief within forty-eight hours while 23 per cent required three days or more, in only 4 per cent of the cases were opiates necessary. Hyposecretion of gastric juice occurred in no more than 17 per cent of the patients, and was stopped in less than four days. Of the whole group of patients 361, or 77 per cent, appeared to have been cured, recurrences took place in 66 cases, and it is suggested that in some of these an operation may subsequently be necessary.

Encephalitis Lethargica in Children

285. H. S. REICHEL (*Arch of Ped*, May 1925, p 292), who records 23 cases in children aged from 23 months to 13 years, states that a history of an acute infection or an acute stage is by no means necessary for a diagnosis of lethargic encephalitis. The disease is protean in its manifestations and should be

kept in mind in all cases showing paralyses, especially of the cranial nerves, myotonus, or otherwise unexplained changes of character, with or without the lethargic complex. Paralysis in the child in the great majority of cases seems to be due to lethargic encephalitis only. Owing to the close resemblance of many of these clinical pictures to those produced by brain tumour, infantile paralysis, severe chorea, degenerative constitutional disease of the central nervous system, tuberculous meningitis, dementia praecox, and psychopathy, no one symptom can be regarded as conclusive. The diagnosis must be made partly on the combination of complexes and partly on the history and progress of the case. To a limited degree the examination of the cerebrospinal fluid may help, especially the sugar content.

266

The Teeth and Tuberculosis

C. LIMA (*Revista dos Curios*, No 11, 1925, p 71) states that the tubercle bacillus often invades the organism through a carious tooth, as has been shown by the work of von Puquet, Engel, Hettenberg, Cook, Morgan, Gautier, and many others. Experimental proof of this has recently been furnished by Mendel Joseph of Paris, who made experiments on monkeys and rabbits. The technique of inoculation was as follows: The right upper central incisor and a left lower molar had holes drilled into them, and a platinum loop containing tubercle bacilli from a culture of bovine tuberculosis was introduced. Ten days after inoculation marked congestion of the gums was noted round the infected tooth. On the twentieth day there was an aggravation of the local condition, and the lesions had spread to the corresponding zone of the other incisors. In the lower jaw there was a collection of pus resembling an ordinary gumboil, but showing a pure growth of tubercle bacilli. The animal died in the fifth week much emaciated and with symptoms of violent dyspnoea, and the autopsy revealed generalized tuberculosis. In other animals which were inoculated showed enlargement of the submaxillary, cervical, and tracheo-bronchial glands. Lima adds that these experiments indicate that the campaign against tuberculosis requires the co-operation of the dental surgeon. Care of the teeth, which is indispensable in the adult, is of urgent necessity in the child owing to the high degree of receptivity of the vascular dental pulp for tuberculous infection at this age.

Surgery.

267

Surgical Treatment of Angina Pectoris

S. P. PEDOROFF and **K. P. SAPOSCHKOFF** (*Zentralbl f Chir*, August 26th, 1925, p 1937) recommend resection of the depressor nerve in angina pectoris. They have collected 27 cases of resection of the cervical sympathetic, 13 other cases in which the depressor nerve was divided, and 3 cases of simultaneous resection of the depressor nerve and of the sympathetic trunk. They describe six variations in the origin of the depressor nerve, and state that it may arise from the vagus, from the main trunk of the external laryngeal nerve, or from its external branch, there may be a double origin from the vagus and sympathetic trunks. In about half the cases the depressor nerve was found to spring from the main trunk of the superior laryngeal nerve or from its external branch. The authors state that these variations necessitate an incision extending from the tip of the mastoid along the inner border of the sterno-mastoid to the level of the lower border of the cricoid, and a careful dissection of the anterior triangle of the neck. In searching for the depressor nerve it often happened that aberrant motor nerve bundles were divided, but this did no harm. Pedoroff found it quite easy to resect the ganglion nodosum of the vagus and the lower half of the superior cervical ganglion of the sympathetic, and also, as recommended by Hoffer, the descending branch of the hypoglossal nerve. He also found it possible to avoid any injury to the vagus or the superior laryngeal nerve in the course of the operation when searching for the depressor nerve. The authors describe an operation on a man, aged 56, who suffered from frequent and severe attacks of angina pectoris, the dyspnoea was so great that he could not speak when walking. The depressor nerve, which arose from the outer root of the superior laryngeal, was easily found, it was resected, together with the lower half of the superior cervical ganglion of the sympathetic, and the ramus descendens hypoglossi. No laryngeal complication occurred after operation. Nine months later the patient had had no

recurrence, he had gained weight and had no dyspnoea on exercise. He had previously had constant pain below the left scapula, but that had now disappeared entirely, as had also a transient left ptosis, and reddening and swelling of the left cheek. The authors agree with Bruning that it is necessary to divide the centripetal sympathetic branches, but they do not think it justifiable to resect the entire sympathetic trunk and all the cardiac branches of the vagus together with sympathectomy of the carotid and vertebral arteries. The total resection of the sympathetic trunk, including the stellate ganglion, is considered by them an unnecessarily severe operation.

Broncho biliary Fistula

268 P. PÉTRIDIS (*Bull et Mém Soc Nat de Chir*, July 4th, 1925, p 751) records a case of broncho biliary fistula in a patient aged 28, who had been treated medically for perforated duodenal ulcer eight months previously. He was now found to have a dull area on the right side of the chest which on exploratory puncture yielded a large quantity of sero sanguineous fluid. He later expectorated a bile stained fluid with a fetid smell. On opening the chest wall a large abscess was found lying above the diaphragm, it contained a single gall stone. No communication could be found through the diaphragm passing to a subphrenic abscess. The abscess was packed, and after draining bile for some weeks subsequently closed. It appears that in the first attack the patient had an acute cholecystitis due to a calculus. There was a suppurative perforation of the gall bladder accompanied by a suppurative pneumonia. The abscess then traced through the diaphragm and carried the gall stone and later communication became encysted in the pleural cavity and the passage of a bronchus, giving rise to the symptoms described. Robineau, commenting on this case, states that the passage of a biliary calculus through the diaphragm is rare—it usually passes into the intestine, below the liver, or in front of the kidney. He adds that the successful result of the operation makes the case one of unusual interest.

Thrombo angitis Obliterans

269 D. PERLA (*Surg, Gynecol and Obstet*, July, 1925, p 21) gives an analysis of a study of forty one cases of thrombo angitis obliterans, no etiological factor could be found, and syphilis did not occur in any of the cases. Tobacco or infections do not appear to play any part in the second. All the cases occurred in males, and usually in the second or third decade. Perla states that the process appears to be one of primary thrombus formation in the peripheral vessels and is distinct from atherosclerosis. The disease may be considered as a prolonged chronic infection characterized by acute exacerbations. It usually starts in the right lower extremity, and the most important physical sign is the absence of pulsation of the onset of gangrene. Gangrene usually develops within two to five years after the onset of symptoms. All four limbs may be involved in the disease. Death is generally due to an intercurrent infection, though thrombo angitis obliterans of the aorta and coronaries may occur. The disease must be distinguished from other causes of gangrene, principally Raynaud's disease, arterio sclerosis, and syphilitic endarteritis. Perla has little doubt as to its infectious nature, which is suggested by the inflammatory reaction, though no etiological organism has yet been found. The present treatment of the disease is, he adds, unsatisfactory.

Anal Fistulae and Tuberculosis

270 W. A. FANSLER (*Journ Amer Med Assoc*, August 29th, 1925, p 671) discusses the vexed question of the relation of tuberculosis to anal fistulae. Giant estimated that 10 per cent of all rectal fistulae were tuberculous. Hartman gives the percentage as 50, Dudley as 14, Gabriol as 20, and so on. Fansler insists that the diagnosis of a tuberculous fistula should not be made on the discovery of tubercle bacilli unless tuberculous lesions higher up the alimentary canal can be excluded. He takes as the criterion of diagnosis the fact that tuberculous lesions can be rightly regarded as logical appearance of fistulae cases can be 15 per cent of primary in fistulae and that probably only 15 per cent of fistulae in tuberculous patients are due to Koch's bacillus. He adds that the occurrence of rectal fistulae in patients who are under weight should be regarded as a definite warning of the presence of pulmonary tuberculosis, or of a tendency to it. A most careful general examination should therefore be made and be repeated periodically if negative results are obtained at first.

Therapeutics.

271 Rashes produced by Veronal and its Congeners G. CAUSSADE, A. TARDIEU, and J. LACAPÈRE (*Bull et Mém Soc Med des Hop de Paris*, July 9th, 1925, p 1042) point out that the dermatoses following the administration of veronal and luminal in about 5 per cent of patients deserve recognition, on account of the errors of diagnosis and treatment to which they may give rise. In the case of a woman, aged 25, who attempted suicide by diallyl malonyl urea, after she had recovered from the acute symptoms of intoxication, followed by rose red erythema, pruriginous and very polymorphic, affecting the left knee and left groin. It disappeared rapidly and was followed by a slight and transient desquamation. The authors state that these eruptions, being pruriginous, are often symmetrical, ephemeral, and very polymorphic, are capable of simulating all the exanthemata. A second case of dermatitis due to a 1½ grain dose of luminal was characterized by an extensive morbilliform erythematous eruption, which did not affect the face. There were mild toxic symptoms, headache, and nausea, but the patient continued to take the powders for about ten days, finding that they relieved her headache and insomnia. On the eleventh day after she had taken 17 grains a morbilliform eruption appeared which became confluent over the elbows and knees, on the seventh day of the eruption there was pruritus and itching of the arms and face, coinciding with a transient and slightly furfuraceous desquamation which entirely disappeared on the next day.

272 G. MILLIAN (*Bull et Mém Soc Med de Paris*, July 23rd, 1925, p 1090) records a case of erythema occurring on the ninth day after taking luminal. The author states that this type of erythema following the use of luminal and its allies usually sets in on the ninth day, and he describes it as infectious but non-toxic. Millian found that (a) in venereal disease chills these rashes were epidemic in patients treated with "914" or "606," the eczematous patients remaining immune. (b) Unvaccinated infants in the St Louis Hospital, though untreated by "914," acquired the rash. (c) The rash often took the form of rubella with characteristic glandular enlargement. (d) The polymorphic character of the rash seemed to indicate non-specific biotropisms and are not indicative of colloidoclastic shock. The author believes that these rashes belong to the group of biotropisms and are not indicative of colloidoclastic shock. He adds that after fifteen or twenty days immunity is regained, and the rashes do not recur.

273 Treatment of Rickets by Irradiated Milk B. KRAMER (*Amer Journ Dis Child*, August, 1925, p 195) reports a series of eight children suffering from rickets in whom the administration of irradiated milk produced healing in every case. Improvement was manifest by the end of the third week of treatment, and was very marked a week later. The ages of the children ranged from 5 to 39 months, the majority being less than 2 years. The diet consisted of milk irradiated by the mercury vapour quartz lamp, orange juice, and a cereal. The quantity of milk required for twenty four hours was poured into a large shallow dish, and was irradiated at a distance of two feet for not more than two hours. The milk acquired a peculiar taste, but little difficulty was experienced in persuading the children to drink it. With one exception, all the children gained weight during the period of treatment. In two cases investigated it was shown that there was a marked increase in the retention of calcium and phosphorus in the blood during the period when the milk was being irradiated.

Cibalgin

274 G. FLATAU (*Med Klin*, August 21st, 1925, p 1273), after trying cibalgine on fifty patients for more than six months, finds it valuable for limiting or replacing morphine and morphine derivatives. It has, he says, a combined analgesic and hypnotic effect, without habit forming or other undesirable secondary action. Its chemical composition is stated as dimethylaminoethyl dimethylpyrazolone dihydrochloride in solid or liquid form, by the mouth or parenterally. He finds that an intramuscular or intravenous injection of morphine advantageously replace a hypodermic injection of morphine. Intractable neuralgia is said to be its special field of application, but the author gives instances of benefit resulting from its use in the lightning pains of tetanus and in spinal haemorrhage, he has also had favourable reports from others in cancer, dysmenorrhoea, etc. Relief of pain is claimed for the smaller doses, and hypnotic effect for larger ones. The author asserts that the patient does not need to be kept under observation when taking this drug.

275 Vaccines in Whooping-cough

SOUTHBY (*Med Journ of Australia*, July 4th, 1925, p 11) has employed a mixed vaccine containing in each cubic centimetre 1,000 million Boidet Gengon bacilli, 500 million pneumococci, and 250 million *M. catarrhalis*. Four injections were spread over a period of two weeks, commencing with a dose of 1/2 c.c. and then increased to 1 c.c. and 2 c.c. respectively. Southby's series comprised 112 children, who were divided into two groups, one of which, consisting of 74 patients, was treated with vaccine, while the other, consisting of 38 patients, served as controls. The ages, duration of illness, and severity of the paroxysms were approximately similar in the two groups. Both children above and those below the age of 2 years showed a greater proportion of improvement, as regards the frequency and severity of the paroxysms, under vaccine treatment than those who had no vaccine treatment. The vaccine treatment, however, did not appear to have any effect in shortening the disease, except in very young babies, in whom it had a slight effect.

276 Ultra-violet Rays in the Treatment of Neuralgia

P. TARCHINI (*Raggi Ultravioletti*, June, 1925, p 176) records twelve cases in patients aged from 14 to 76 of neuralgia following herpes zoster successfully treated by ultra violet rays. The technique was as follows. The affected region was exposed to the direct action of the rays emanating from a quartz lamp. If the region to be irradiated was extensive a larger reflector was employed, the lamp being kept at a sufficient distance so that the irradiation might be uniform. If the region was circumscribed the rays were concentrated on the part affected. Tarchini states that the irradiation should be applied not only to the region of the terminal ramifications of the affected nerves but also to the region of the ganglia supposed to be affected. The treatment should be given every day or every other day, and last from half an hour to an hour and a half at a time according to the state of the patient. Radiation should be continued until the neuralgia and the skin lesions are cured, ten to fifteen days, as a rule, being required. Usually, however, the patient experiences improvement, especially as regards the pain, directly after the second or third sitting.

Neurology and Psychology.**277 Work in the Treatment of Mental Disease**

V. KUTORGA (*Medicina*, June-July, 1925 p 385) who records fourteen illustrative cases in patients aged from 20 to 45 suffering from chronic paranoia, dementia praecox, and hysteria, maintains that making the patient work is one of the most valuable methods in the treatment of mental diseases especially in chronic stages of schizophrenia and so-called functional neuroses. The only drawback to the method is that the patient does not possess any initiative. During the revolution in Russia the economic condition of the hospitals and asylums was very bad. Starvation was prevalent, and there was an almost complete absence of fuel, so that the patients in this respect were left to their own resources, and the medical attendants were completely helpless. In the Wsiech Skorbjaschtschik Hospital at Leningrad several patients, including some severe chronic cases, were given an opportunity of obtaining food by their own efforts. The results of this regime were, contrary to expectation, remarkably favourable, the general condition and activity showing a considerable improvement.

278 Amyotrophy in Epidemic Encephalitis

WINNER (*Presse med.*, July 8th, 1925, p 912) discusses the relations existing between amyotrophic lateral sclerosis and epidemic encephalitis. In the course of epidemic encephalitis he has observed seven cases with amyotrophy, which presented the clinical features of amyotrophic lateral sclerosis, namely, exaggeration of the reflexes, inflexions, Babinski's sign, and a slowly progressive course. J. TROMENT (*ibid.*) states that epidemic encephalitis is capable of producing a syndrome closely resembling amyotrophic lateral sclerosis with progressive muscular atrophy, a combination of diminished and exaggerated reflexes, fibrillar and fascicular contractions, glossolabio laryngeal paralysis, and a fatal issue within three years. In a case of the kind which TROMENT had observed there was an undoubted initial attack of epidemic encephalitis, the patient presented a subfebrile temperature, and, lastly, intravenous injections of urotropin, though they did not completely arrest the disease, caused a partial diminution of the amyotrophy and had a definite action on the temperature. TROMENT adds that it remains

to be seen whether the *post mortem* lesions in such cases differed or not from those of amyotrophic lateral sclerosis properly so called.

279 The Manic Depressive Syndrome.

J. MACPHERSON (*Med Journ of Australia*, June 13th, 1925, p 618) holds that the manic depressive syndrome depends upon an underlying hereditary temperamental disposition, of which the various symptoms constituting the malady are merely the outward phenomena. He considers that for a case of neurasthenia to be diagnosed as belonging to the manic depressive group it must manifest the features of depression, anxiety, suicidal tendency, gastro-intestinal disturbance, periodicity, and alternation. The depression is deeper than the loss of the ordinary feeling of enjoyment of life, and is associated with a psychomotor retardation, due, he considers, to some interruption at the cortical level of the reflex psychomotor arc. Periodicity is one of the most characteristic features, most patients exhibiting attacks of depression or of exaltation at intervals which may be regular or irregular. Alternation of these two states was manifested unmistakably in about 34 per cent of his patients, and he believes that it is actually more frequent. He considers that this syndrome is of more common occurrence among the general population than is generally supposed, the patient themselves are unaware of the significance of their symptoms and the diagnosis made is often "overwork," "neuronal breakdown," "neurasthenia," or "hysteria." The underlying condition is, he believes, irremediable in the present state of our knowledge, and the attacks appear, run their course, and end spontaneously. The treatment recommended includes rest in bed, the promotion of sound sleep, alleviation of the painful sensory symptoms by drugs, steadying of the vasomotor mechanism, and attention to the gastro-intestinal disturbances. In the early stages of an impending attack he believes that suggestion under a slight hypnosis may abort it, but when the sensory disturbances have become acute he finds that suggestion is useless until the distress has been allayed by other means.

Obstetrics and Gynaecology.**280 Maternal Eclampsia and Infantile Mortality**

L. NEUGARTEN (*Zentralbl. f. Gynäkol.*, August 29th, 1925, p 1938) discusses the injuries that may be inflicted upon mother and child in the process of delivery. Schwartz and Siegmund have reported more or less definite injuries to the brain substance which must have occurred at birth, such as microscopic punctiform haemorrhages with the formation of cavities and scars, these may be localized or diffuse, and the lesions may be peripheral or central. The children of mothers who suffered from eclampsia are stated to show a higher proportion of such injuries. Esch has estimated that 40 per cent of these children die before or during birth, as the direct result of visceral injuries, especially haemorrhages, and necrosis of the liver, kidneys, suprarenals, and brain. Hannes believes that foetal asphyxia during birth accounts for the higher percentage of idiocy among these children, and that when they survive their power of resistance to infectious and other diseases is materially lessened. Neugarten gives particulars of thirty cases of children of eclamptic mothers: these children succumbed in infancy or early childhood to bronchopneumonia, epidemic diarrhoea, whooping cough, diphtheria, and tuberculosis, meningitis.

281 Carcinoma of the Cervix treated with Radium

LILLIAN K. P. FARRAR (*Amer. Journ. Obstet. and Gynecol.*, August, 1925, p 205) describes the treatment of primary carcinoma of the cervix uteri by radium alone in 195 patients during the past six years. The procedure was that 100 mg. of radium salt in a glass capsule contained in a silver tube was enclosed in a brass tube 1 mm. in thickness. This was inserted into a rubber tube, the open end of which was tied with two strands of silk attached to two strands drawn through eyelets in the brass tube. After sterilization in alcohol the ends of the silk were tied to eighteen inches of 1/4 inch gauze preled into the cervical canal if sufficiently patent, and then fastened to a two yard strip of 2 inch gauze. After the tube had been placed against the carcinomatous growth in the cervix, one strand of silk threaded on a needle was passed through the cervix to ensure the radium remaining *in situ* the vagina being tightly packed with the wide gauze to keep the bladder and rectum as far from the radium as possible. Before the radium was placed in position pieces of tissue were removed with a punch for examination. The author states that preliminary general treatment should be given in the form of tonics and rest, or of blood transfusion.

in the case of anaemia. The patients were allowed to sit up as soon as possible, and daily douching with potassium permanganate was started the day after the radium had been removed, and after discharge from hospital supervision of the housing conditions of each patient was considered important. The initial test dose consisted of 100 mg left in the cervix for twenty-four hours with needles of the vagina, bladder, or rectum was involved. In women under 30 the tube was left in position for thirty to thirty-six hours. Subsequent dosage depended upon the amount of healing and cicatrization seen six to eight weeks later, and until complete cicatrization with marked contraction of the tissue had occurred the patient was not regarded as having had sufficient radium. It is pointed out that repeated doses may be necessary. Three years later 74.1 per cent of the operable patients were living and 43.6 per cent of the inoperable.

282 G. G. WARD and LILIAN K. P. FARRAR (*Journ Amer Med Assoc*, July 18th, 1925, p. 159) publish a statistical report of the treatment of cervical carcinoma by radium over a period of six years. They use the classification of pelvic cancer suggested by H. Schmitz (see *Lipitone*, January 31st, 1925, para 126). Of 17 patients with primary cervical carcinoma treated by radium alone 9 were living after five years or longer—a percentage of 52.9. In 31 cases of operable cancer treated by radium alone 21 patients lived for three years or longer.

The authors recommend a test dose of radium before, or at the time of, initial dose of radium should be a test dose to ascertain the degree of reaction of the malignant growth and the normal tissues. The subsequent dosage should be just sufficient to inhibit the tumour growth and to produce scar tissue which will occlude the blood vessels and arrest the cancer. They stress the importance of regular monthly supervision by the surgeon so as to ensure that treatment is continued as long as necessary, and consider that hysterectomy with its consequent risk of opening up the cicatricial barriers to the spread of the disease, should be avoided. They support this conclusion by a statistical comparison of the results of treatment by surgery, radium, and combined radium and x-rays in eleven clinics.

283 Postclimacteric Haemorrhage and Ovarian Tumours

R. MEYER (*Zentralbl f Gynäkol*, July 25th, 1925, p. 1662) has investigated the frequency of postclimacteric bleedings and uterine hyperplasia in association with ovarian tumour. Moulouguet Doléris has recently reported seven cases of uterine haemorrhage (with five instances of endometrial hyperplasia and four of mucous polypus) in patients who suffered, after the menopause, from ovarian tumours, mostly benign. Meyer finds that in the great majority of cases of malignant disease of the ovaries in aged subjects the uterus is strikingly small, and remarks that in cases of benign ovarian tumour the womb is seldom examined pathologically. Seven only of about 500 cases of endometrial hyperplasia in Meyer's pathological material occurred in women past the menopause; each patient had an ovarian tumour, which arose in three cases from connective tissue cells and in four from follicular epithelium. Meyer does not accept the view of Moulouguet Doléris that the endometrial hyperplasia is caused by trophic influences consequent on pressure by the ovarian tumours on the nerves at the hilus; he thinks that the association of the ovarian and uterine phenomena requires further investigation.

Pathology.

284 The Excretion of Sanoecrysin

H. HANSEN (*Læge Tidsskr* for Jaeger August 20th, 1925, p. 725) records investigations made at the Bispebjerg Hospital in Copenhagen into the fate of sanoecrysin in the body. After giving an account of the technique of the quantitative analyses of gold according to the system devised by Peterson, Goeb, and Morley, he gives the results obtained in sixteen cases treated with sanoecrysin. The examinations of the blood, pleural effusions, sputum, urine, and faeces for gold showed that from 15 to 25 per cent of the total amount excreted was demonstrable in the faeces. Most of the excreted gold was found in the urine. The sputum contained only a trace of gold. Ten minutes after an intravenous injection of sanoecrysin 45 per cent and after twenty-four hours 75 per cent had disappeared from the blood. But even twenty-four hours after an injection much more gold was still circulating in the blood than would be there if the gold were evenly distributed in the fluids of the whole body. It would

therefore seem that if at this stage sanoecrysin occurs in the plasma as sanoecrysin its ability to diffuse out into the organism must be limited. Hansen finds that as this supposition does not tally with Neelgaard's statements as to the diffusion of sanoecrysin in the body, it may be that the gold has formed in the blood a new combination with the proteins of the blood which alter its properties of diffusion for gold in the urine and faeces of patients who had discontinued sanoecrysin treatment for a month and a half to eight and a half months showed that gold was still definitely demonstrable. Yet none of the five patients concerned had suffered from renal disease before the treatment was started. The author concludes that the injected sanoecrysin rapidly changes its composition, and that the gold, like other heavy metals, is excreted very slowly and is, therefore, capable of causing serious metal poisoning. In this connection the author refers to the stomatitis and colitis which have been observed in the course of sanoecrysin treatment; three cases have sometimes terminated fatally, and may be due rather to metallic poisoning than to the liberation of tuberculous toxins.

285 Serum Diagnosis of Typhoid Fever

V. VANNI (*Il Policlinico*, Ser. Prat., July 6th, 1925, p. 9-2) describes a modification of Vidal's test, which, though slightly more complicated than the original method, possesses the following advantages: (1) The reaction appears some what earlier than that of Vidal. (2) The test can readily be performed with cultures which have become apparently unagglutinable. The test is performed as follows: Blood is collected in a sterilized tube, a drop of serum is allowed to separate and placed in a test tube containing 2 to 3 cm of sterile broth, to which a loopful of an agar culture of typhoid bacilli is added at the same time. Another test tube, which serves as a control, containing the same quantity of broth, is inoculated with the typhoid culture without the addition of the serum. The tubes are then placed in the incubator at 37°C for twelve hours. If the reaction is positive the contents of the tube are only slightly turbid and an abundant agglutinated typhoid bacilli is found. If the reaction is negative the fluid is uniformly turbid, as in the control tube. From his experience of a hundred cases Vanni is convinced of the diagnostic value of this reaction inasmuch as it precedes Vidal's reaction by two or three days, appearing immediately after a positive blood culture has been obtained, and is positive even when the strains of typhoid bacilli have become unagglutinable. Zeri has recently seen a case in which death was due to intestinal haemorrhage, when Vidal's test was negative, but the reaction described was positive.

286 The Varieties of *B. melitensis*

In a critical consideration of the Brucella group E. BURDET (*Arch Inst Pasteur de Tunis*, July, 1925, p. 2-7) discusses the relationship between *B. melitensis*, *B. paramelitensis*, and *B. abortus*. It is known that cases that are clinically indistinguishable from Malta fever and that have a positive blood culture do not always give a positive agglutination reaction. The proportion of such cases seems to vary in different countries; in Tunis it amounts to about 25 per cent. The reason for this, according to Burnet, is to be sought in the different antigenic types of the infecting organisms. The author has studied twenty-eight strains isolated from human patients and from goats suffering from *melitensis* infection, and has found that by agglutination and by absorption of agglutins they fall into two distinct types, which he names Type I and Type II. Though most easily distinguished by specific agglutination they were shown to differ in other ways. For example, Type I possessed a stronger agglutinating power when tested on the rabbit than Type II. In type I in similar doses into two series of rabbits it was found that the serums prepared against Type I had a considerably higher titre than the serums prepared against Type II. If suspensions of the two organisms were heated to 55°C those belonging to Type I remained stable, whereas those belonging to Type II flocculated—some in five to ten minutes, others not till twenty to forty minutes. Moreover, Type I was rarely agglutinated by normal human serum. Type II was frequently so agglutinated, often up to a titre of 1 in 100 or 1 in 150. Burnet thinks that it is evident that the two types are clearly distinguishable from one another, but the difference is almost entirely in antigenic one, no difference in pathogenicity to animals exists between them. The third component of the Brucella group, *B. abortus*, falls by agglutination into Type I but its pathogenic properties serve to distinguish it from *B. melitensis*. The diagnostic importance of this study is, Burnet claims, that it indicates the desirability of using strains of both types in testing the patient's serum.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

287 **Morgani Adams Stokes Syndrome in the Young**
M R CASTEX, J J BERETERYDE, and R L RAMIREZ (*Arch Mal du Coeur*, September, 1925, p 561) state that many cases have been recorded of young patients with usually normal pulse, but who at variable intervals have syncopal or epileptic attacks accompanied by slowing of the pulse, electrocardiographic tracings of these are rare. They give details of such a condition in a lad, aged 16, together with tracings that were taken. They think that there is obviously some excitation of the vagus, and probably also faulty conduction of nervous impulses, but that the exact pathogenesis has been insufficiently studied. Merely mentioning gross predisposing causes such as congenital syphilis, they conclude on clinical and experimental grounds that partial or complete heart block occurs, this comes on in transitory attacks and is of abdominal vagus origin. The immediate exciting cause is given as constipation, or, rather, distension arising from absorption of intestinal toxins, the remote action on the heart is probably determined by a predisposition of that organ to blockage. This predisposition is, they think, evidenced by the abnormal character of cardiac tracings taken between the attacks, and entails a bad prognosis, although the intensity of the attacks may be lessened by treating the constipation.

289 **Well's Disease in Holland**

W SCHUFFNER and O RUXS (*Nederl Tijdschr v Geneesk.*, August 29th, 1925, p 1020) state that since the first case of Well's disease described in Holland by Gondsint, Hammer, and Wolff (*ibid.*, 1925, 1, p 430), they have had the opportunity of examining two fresh cases, one of which came from Rotterdam and the other from Krommerie, in a man aged 37 and a woman aged 60 respectively. In two of the three cases the disease developed after a fall into a ditch, the incubation period being nine days in one and eleven days in the other. The third patient was a lighterman on a canal swarming with rats. The onset in all three cases was sudden with pain in the head and limbs, especially the calves and thighs, and severe malaise. In two patients the jaundice appeared on the fourth day, and in one on the fifth day, reaching a high degree in all. In two cases a severe relapse occurred on the sixteenth and eighteenth days respectively. Two of the three cases proved fatal—an unusually high mortality, which was not exceeded even in Japan, and may have been accidental or due to the fact that mild cases escaped notice. In the epidemic recently reported at Burg by Körner (see *Epidemic*, August 22nd, 1925, para 120) not a single case was fatal. In all three cases the leptospira was isolated—in one case after the patient's death on the ninth day from the liver, in one case from the urine, and in the third from the blood. The diagnosis in each case was confirmed by inoculation of guinea pigs and the serum test.

289 **Small-pox in Twins at Birth**

J A MARTIN (*Journal Amer Med Assoc* July 25th 1925, p 268) reports the case of a woman, the mother of four children who during a very severe attack of small pox gave birth to twins—a boy weighing 7 lb and a girl weighing 6 lb. Both were born in the papular stage of the disease. The boy, who had only twenty or thirty papules at birth, had a very severe attack, while the girl, who had ten or fifteen lesions, had rather a mild attack. At the time of publication the mother had recovered, and it seems probable that the babies, whose lesions were in the first stage of desiccation, would also recover.

289 **The Variations in Frequency of Mixed Chancre**

HUDELO and RABUT (*Presse med.*, August 29th 1925, p 1153) state that mixed chancre—first described by Rollet, whose centenary was recently celebrated at Lyons (see *JOURNAL*, November 22nd 1924, p 981, and January 31st, 1925, p 229)—is liable to considerable variations in frequency. The incidence of 2 per cent given by Puche and Fourmeur and of 6 per cent given by Rollet has been regarded by many writers as too low, especially since the war, when the development of syphilis in persons suffering from chancroid has appeared to be unusually frequent. Gougeot in 1912 stated that mixed chancre was much commoner in Paris than chancroid, and Crucher who used to teach before the war that every soft chancre should be suspected of syphilis, maintained before the Académie de Médecine in 1916 that it was exceptional

for a soft chancre to remain as such. In September, 1924, Vanderlind published statistics showing that mixed chancre constituted 58 per cent of all soft chancres and 38 per cent of all venereal chancres. On the other hand, Thibierge and Legrain in 1921 asserted that mixed chancre was not so frequent as was supposed, and their view is confirmed by the present authors, who among 173 cases of soft chancre treated at the Hôpital St. Louis in 1924 found only 23 examples of mixed chancre, or a proportion of 1 in 7. Their experience thus indicates a diminution in the frequency of mixed chancre, at least in Paris. This diminution cannot be explained by a parallel fall in the incidence of chancroid, which has actually increased in Paris since 1919. On the other hand, there is no doubt that there has been a considerable fall in the number of cases of syphilis since 1919, which accounts for the diminished frequency of mixed chancre.

281 **Non gonorrhoeal Urethritis**

A CASTELLANI (*Journal Trop Med and Hygiene*, July 1st, 1925, p 250) classifies non gonorrhoeal urethritis under three headings: (1) traumatic, (2) urethritis associated with animal parasites, protozoa or higher, (3) urethritis associated with fungi. He does not believe that the various cocci and diptheroid bacilli sometimes held responsible are more than secondary invaders. The fungus forms are the most important practically, he thinks, and he cites an illustrative case in which an abundant purulent urethral discharge, due to the fungus *Monilia*, was cured within ten days by irrigations with a solution of mercury perchloride 1 in 20,000, and a mixture containing potassium iodide, sodium bicarbonate, glycerin, and syrup of tolu.

Surgery.

292 **Compressed Fracture of the Spine**

M H ROGERS (*Boston Med and Surg Journal*, September 10th, 1925, p 494) records the results of eight cases of compression fracture of the spine without paralysis that were under treatment during 1924. Sufficient time, he thinks, has now elapsed to discuss the effects of this type of injury on the resumption of occupation. The psychological problem of industrial compensation did not introduce any complication into these cases, and all the patients seem to have been anxious to return to work as soon as possible. The treatment given was six weeks absolute recumbency, followed by complete fixation in a plaster cast or leather jacket for a further six weeks. Increasing freedom was then allowed gradually, a back brace being kept applied, and some work was started as soon as possible. In the present series of cases an average of six months elapsed before the symptoms disappeared, though many patients were at work before the end of this period. On examination after treatment scarcely any lysis or restriction of movement was observable. Rogers finds that when restriction of movement is a prominent symptom it is generally due to secondary changes, such as hypertrophic overgrowth in and about the fracture. He adds that the object of the immediate fixation, which is continued after the first symptoms of pain have disappeared, is to prevent the secondary changes which were so common previously. Radiological examination several months after the injury showed that in every case there was narrowing of the body of the injured vertebra. This appearance was not, as a rule, manifest in the x-ray photograph taken immediately after the injury. The narrowing evidently increased in spite of complete fixation, but without affecting the clinical results. Rogers insists that recumbency is an important part of the treatment, and that a jacket by itself will be insufficient in many cases. He adds that before the patient is given up wearing all braces and supports for at least a month without pain or weakness.

293 **Post operative Sequels of Gall bladder Disease**

W C CARROLL (*Minnesota Med.*, September 1925, p 583) discusses the symptoms which may follow gall bladder operations, even though properly and skillfully performed, with careful exploration and in the absence of organic lesions of the stomach, duodenum or appendix. Foci of infection in the nose, mouth and throat should be excluded, and constipation be corrected by diet and saline enemas. Carroll points out that an old syphilitic infection may sometimes

be concerned, and that posterior root pains have often been mistaken for organic abdominal disease. The Wassermann reaction of the blood and the spinal fluid should be ascertained in all doubtful cases. Painful scars will, he adds, usually yield to hot applications and massage or diathermy. Local heat and immobilizing the lower part of the chest will remove symptoms due to neuritis or myositis, the result of too vigorous pulling on the retractor during the original operation. Pain occurring deeper in the abdomen, or perhaps referred to the back, may be the result of adhesions about the duets, or to constipation or angulation of the common duct, these conditions usually require further surgical treatment. Abdominal tenderness may be a difficult symptom to relieve, but, in the case of scars with keloid tendencies, x rays or radium will often be beneficial. Heat, massage, and alcohol injections are useful when pinching of the small nerve filaments in the scar tissue has occurred. Very often the only post-operative symptoms referable to the stomach and are due to alterations in the acidity of the gastric juice, together with pylorospasm. In the case of the liver, diagnosis is usually made by the x rays, and it may be distinguished from adhesions obstructing the pylorus by a further x-ray examination after the administration of atropine. Jaundice beginning or recurring some time after the operation may be due to the formation of a new calculus in the duct, stricture or bonding of the duct by adhesions, carcinoma of the duct, or disease in the head of the pancreas. Epigastric pain or discomfort may be caused reflexly by such pelvic conditions as a large cystic ovary or an adherent retroflexion. Carroll remarks that in many cases the persistence or recurrence of symptoms is due to the fact that early operative treatment has not been possible, and thus adjacent structures, such as the pancreas, have become involved secondarily. He adds that pancreatitis very commonly follows chronic cholecystitis and clears up only very slowly after cholecystectomy, thus keeping up the symptoms for which the patient has received surgical treatment. Hepatitis may also be caused and act in the same way.

294 Torsion of the Omentum

D. POLLOSSON and H. COMTE (*Lyon Chir.*, July August, 1925, p. 513) describe an unusual case of torsion of the great omentum. A man, aged 62, had a right inguinal hernia which had been present for fifteen years and was controlled by a truss. He had recently noticed a swelling in the right inguinal region and serotum, and had suffered from frequent attacks of epigastric pain. The serotal swelling was diagnosed as a new growth of the testis accompanied by enlarged lumbar glands. On admission to hospital a mass was found in the right iliac fossa, it appeared to be connected with the serotal swelling. Laparotomy showed that the condition was one of torsion of the great omentum. The circumstances of the case whereby the omentum was fixed by its attachments above, while below it was adherent to the hernial sac, rendered it liable to torsion. With regard to the diagnosis of the condition the chief feature was the continuity between the abdominal tumour and the contents of the hernial sac, and traction on the abdominal tumour was transmitted to the testis. The authors add that this feature alone should enable a diagnosis to be made. The omentum was transected, ligatured, and removed at the neck where it was twisted, castration was performed and the hernial orifice closed. The patient made a satisfactory recovery.

295 Diet after Gastro-enterostomy and in Recurrent Gastric Ulcer

A. JAROTSKY (*Zentralbl. f. Chir.*, August 22nd, 1925, p. 1876) holds that a strict dietary is most necessary in cases of gastro-enterostomy, it will prevent much pain and lessen the danger of hemorrhage or perforation in cases of recurrent gastric or duodenal ulcer. At first milk, broth, and eggs are forbidden because they increase the hydrochloric acid in the gastric juice. The diet is restricted to vegetables cooked in butter or boiled in water without salt. Milk products, such as cream, cheese, and curdled milk, are prohibited, butter is said to be a good substitute for milk, having in small bulk a high caloric value, and patients are given half a pound daily. As a substitute for meat, vegetable soups (cabbage, beet, carrot, turnip) cooked with water and butter but without salt, are given. If this diet is well borne boiled potatoes, apples, carrots, and other vegetables are added to the list. The vegetables are passed through a sieve or mince machine and are served with butter. If the patient still remains free from pain the dietary is further extended to include minced outlets with potato puree, rice, barley, gruel, sugar, honey, fruit syrups or purees of apples, apricots, and plums. No fluid other than water is permitted, alcohol, condiments and tobacco are strictly forbidden. The author claims that this dietary not only relieves dyspeptic symptoms but the diagrams show that when gastroparesis is present it is greatly relieved.

Therapeutics.

296 Novarsuroil as a Diuretic

H. OERTING (*Minnesota Med.*, September, 1925, p. 592) gives an account of his investigation of the diuretic value of novarsuroil, a commercial mercurial preparation to which previous reference has been made (*Epitome*, April 25th, 1925, para. 413). Oerting records five cases in which the drug was very successful and five cases of failure. He believes that novarsuroil is a most valuable remedy for certain conditions, he recommends a dosage of 1/2 to 3 c.c. of the 10 per cent neutral solution of the drug supplied, and prefers the intramuscular to the intravenous route for its injection. An interval of three to seven days is allowed to elapse between injections. He agrees that renal oedema, nephritis, and enteritis are absolute contraindications, and thinks that the chief use of novarsuroil is in cases of inadequate cardiac compensation, in cardio-renal cases with fair functional activity, and in the treatment of the oedema and ascites due to cirrhosis of the liver, carcinoma, pleural effusion, and tuberculosis. Too large a dose may, he finds, bring on head-ache, salivation, nausea, diarrhoea, and pyrexia, but the diarrhoea, which seems to be the most serious complication, is stated to be easily controllable by bismuth and opium.

297 N. M. KIRTH, C. W. BARRIEP, and MARY WHELAN (*Journ. Amer. Med. Assoc.*, September 12th, 1925, p. 793) report a series of twelve cases of nephritis with oedema treated by ammonium chloride and novarsuroil. Ammonium chloride was given by the mouth in doses ranging from 5 to 16 grams each day, for a period of three to eighteen days. Novarsuroil was injected intramuscularly and intravenously in doses of 0.5 to 2.5 c.c. It seemed to be more efficient as a diuretic after the patient had taken sufficient ammonium chloride to render the urine decidedly acid. No untoward symptoms followed its use, but a preliminary intramuscular injection of 1/2 c.c. was always given as a test. In one case in which careful dieting and ammonium chloride had failed to produce diuresis, both chlorine and sodium being retained, the administration of novarsuroil brought about a prompt and large excretion of water and of both chlorine and sodium. The authors have found that this remedy, even if previously ineffective, will produce diuresis after the ingestion of ammonium chloride. They believe that the best therapeutic results in cases of nephritis with oedema are obtainable by a combination of diet, ammonium chloride, and novarsuroil.

298 The Value of Spinach

H. LECLERC (*Précis méd.*, September 12th, 1925, p. 1223) points out that spinach is relatively rich in nitrogenous substances, in hydrocarbons, and in iron sesquioxide, which last amounts to 3.3 per cent of the total ash. It is thus more nourishing than other green vegetables. Leclerc considers that it also has claims to form part of the diet in anaemia, not only on account of the contained iron, but also of the chlorophyll. Chlorophyll is known to have a chemical formula remarkably similar to that of haemoglobin, and it is stated that the ingestion of chlorophyll will raise the haemoglobin of the blood without increasing the formed elements. The plant contains from 10 to 20 parts per 1,000 by weight of chlorophyll. During the war wine fortified with spinach juice (1 in 10) was given to French soldiers weakened by haemorrhage. The author adds that this vegetable is contraindicated in patients with a tendency to gravel, because it is rich in oxalates. It is usually well digested, the percentage of cellulose present is only 0.87.

299 Treparsol in Amoebiasis

C. LEANDU (*Arch. de gastro-entérol. y nutrición*, May, 1925, p. 14) records cases of acute and chronic amoebic dysentery treated by treparsol, which is the formic derivative of meta-amino-pyruvic phenyl arsenic acid. The advantages of the preparation are said to be (1) Its high arsenic content, whereas novarsenohenzol contains only 20 per cent of metallic arsenic and stovarsol 27.2 per cent, treparsol contains 28.7 per cent. (2) A slower and more regular elimination of the drug than that of other arsenical preparations. Examination of the urine shows that the elimination begins on the first day of administration of the drug and becomes complete in three days. Its administration may be prolonged indefinitely with safety. (3) Its local and general action. Treparsol is broken up into soluble salts in the intestine and exerts a direct action on the parasites. Moreover, its action on the intestinal mucous membrane and its passage into the liver are an argument in favour of its being able to act on the lesions of hepatic amoebiasis. Lastly, the favourable action of arsenic on the general condition should also be taken into consideration, as dysenteric patients are often debilitated and anaemic. In acute amoebic dysentery treparsol

may cause a rapid disappearance of the symptoms and the anæsthesia. The author states that it is best to employ it with emetine hydrochloride, either concurrently or alternately. In the first method 8 cc of emetine hydrochloride is injected the first day in a freshly prepared solution, on each of the following six days 12 cc, and on the eighth day 8 cc. At the same time a tablet of 25 cc of trepanol is given morning and afternoon for the first four days in a little water. At the end of the course a tablet of trepanol is given for four days. In the second method, which Lindholm prefers, after eight days' treatment with emetine hydrochloride, four tablets of a grain of trepanol are given for the first four days of each week for a period of four weeks. This dosage is calculated for persons weighing 95 lb. In thin individuals three tablets are sufficient. The dose for children under 4 years is 10 cc, from 10 to 15 50 cc, and for persons above that age 75 cc to 1 gram, according to their weight and height.

300

The Use of Iodine in Goitre

I. H. LAHEY (*Boston Med and Surg Journ*, September 10th, 1925, p. 487) mentions the possibility of harm resulting from iodine treatment in certain thyroid disorders, a point referred to in the *Epitome* of September 19th, 1925 (part 221). While agreeing that the daily administration of 1 grain of sodium iodide for one week out of every six months, or the use of iodized table salt, has been shown to be of great value, and to have no injurious results, yet these are only to be recommended in regions where the iodine content of the drinking water is low and goitre is endemic. The employment of iodine in nodular or adenomatous goitre has been found to be very injurious, and non-toxic adenomas have been converted into the toxic form. Lahey urges, therefore, the necessity of care in determining carefully the type of thyroid tissue present before iodine is given for any considerable length of time, and that in no case should it be given if nodules can be felt in the goitre. He has now been using Lugol's solution (Liquor iodi, B. P., 1885) for twenty months in patients with exophthalmic goitre or primary hyperthyroidism as a preliminary to operation, and finds that post-operative thyroid reactions have thus been almost completely abolished. He finds it necessary, however, to stress the point that Lugol's solution is not a cure for exophthalmic goitre apart from operation. Another danger mentioned is the possible presence of thyroid toxicity in a border-line case, without goitre, exophthalmos, and other typical symptoms. Lugol's solution having been administered for some weeks operative treatment in such cases may prove disastrous. It is therefore necessary to bear in mind the intensity of the thyroidism prior to the use of Lugol's solution when determining the extent of operative treatment. Since using Lugol's solution in the clinic Lahey has observed a higher percentage of myxœdema following subtotal thyroidectomy than was the case previously. He believes that this is because the type of thyroid tissue remaining after thyroidectomy in patients who have had Lugol's solution is much less active than that remaining in patients who have not received this solution.

Dermatology.

301 Dermatitis produced by Chromium Compounds

H. J. PARKHURST (*Arch Derm and Syph*, August 1925, p. 253) calls attention to the occurrence of industrial dermatitis in the manufacture of blue prints as showing that erythematous vesicular and small papular dermatitis may result in susceptible persons from contact with potassium bichromate. He records the case of a girl, aged 19, employed in the process of blue printing, in whom a typical dermatitis venenata occurred on a diffusely erythematous and oedematous background on the forearms, wrists, the backs of the fingers, and the front of the neck, accompanied by itching and burning. While at work she was almost constantly in contact with a solution of potassium bichromate, and it was found that if she rinsed her hands every half hour in sodium bisulphite solution and then in running water, drying them subsequently, she remained free from dermatitis, neglect of this precaution resulted in recurrence. Parkhurst points out that such dermatoses may occur in industries involving the use of chromium compounds—such as tanneries, printing, wool cotton and "aniline blue" dyeing and the manufacture of Swedish safety matches and coloured glass. The risk occurs also in the "carbon process" in photography, among those handling cloth from which the bichromate used in dyeing has not been completely removed, and in sandpapering wool stained with bichromates. As a preventive measure Parkhurst suggests that where blue printing is done by

hand frequent rinsings with a saturated solution of sodium bisulphite and then with water should be adopted, or that the workers should wear rubber gloves.

302

Pemphigus

G. W. WENDE (*Arch Derm and Syph*, June, 1925, p. 782) records his experience in ten cases of the treatment of pemphigus with 0.065 gram iron cacodylate administered intravenously, and subcutaneous injections of 1.5 cc of a 3 per cent solution of coagulum on alternate days for several weeks. Three of his patients were adolescents, three in middle life, and four in old age. A clinical cure resulted in 62.5 per cent of the cases, with improvement in all. Wendé thinks that while the results might be the effect of injectin, a foreign protein and are unlikely to be coincidental with natural periods of remission of the disease, the prompt and prolonged relief afforded by the treatment gives it a prominent therapeutic value. The most striking cures were seen in a man, aged 75, with erosions from ruptured bullæ in the mouth and on the tonsils and scattered bullæ over the face, ears, trunk, and limbs, and in a woman, aged 66, in whom the disease affected the mouth, pharynx, and vagina.

303

Ringworm of the Scalp in Adults

H. FOX and R. W. FOWLERS (*Amer Journ Derm and Syph*, April, 1925, p. 445) report three cases of ringworm of the scalp in negroes aged 45, 26, and 36 years respectively. The lesions in two cases consisted of bald patches with broken hairs and slight scaling, and in the third of a lesion. Microscopical examination was positive in the hairs from the first two cases, and in the scales from the lesion case. *Microsporum audouinii* was grown from one case, and *Microsporum lanosum* from another. The authors have collected from literature 50 other cases of ringworm of the scalp in adults, whose average age was 33. Of 48 patients in whom the sex was stated 32 were females and 16 males, 25 of the cases were reported in England, 10 in France, 7 in the United States, 4 in Italy, 2 in Austria, Russia, and Australia, and 1 in Egypt. In 7 cases the lesion was a kerion, in the other patients the disease consisted of single or multiple patches, mostly non-inflammatory, which were smooth or scaly, with or without broken off hairs. Cultures were made in 29 cases. In 6, including 2 of the authors' cases, a *Microsporum* was obtained and in 21 a trichophyton. In one *Lepidomorphyton inguinale* was found, and in another an organism regarded as *Sporotrichum burmanni*. A source of infection was suggested in 16 cases. In 10 of the women the disease was doubtless due to contact with children, most of whom were suffering from ringworm, 2 patients had been infected by animals (horse and calf), one was a hat salesman who was accustomed to try all hats on his own head, and another had suffered from ringworm of the nails for seventeen years. In 3 patients the disease had existed since childhood or adolescence. In Japan ringworm of the scalp in adults is by no means so rare as in Europe or America. Of 678 cases of tinea tonsurans seen by Mine and Onuma at the University of Tokyo from 1901 to 1910 120 were in persons between 16 and 60, and 63 in persons over 21 years of age. The causes of the immunity in adults to ringworm of the scalp has not been discovered, but is probably due, as Sabouraud and others suggest, to some change in the soil at puberty which is unfavourable to the growth of the fungus.

Obstetrics and Gynaecology.

304 Ovarian Teratoma with Premature Puberty

R. W. HARRIS (*Surg, Gynecol and Obstet*, August, 1925, p. 191) reports the case of a girl who weighed 6 lb at birth and grew at a normal rate until she was 4 years of age. At the age of 5 years and 10 months she weighed 58 lb and was 49.8 inches tall, her weight and height being those of an average girl of 9 years of age. She was 20 lb above the average in weight and 8.3 inches taller than the average girl of the same age. When she was aged 5 years and 12 days she had a menstrual period, which was followed by six other periods of the twenty-eight day type, each lasting a week and profuse and painful in character. After the first period the breasts grew larger, the areolæ darkened, hair appeared in the axillary and pubic regions, and the whole body developed rapidly and symmetrically. At the time of the third period a small abdominal tumour was found which in the next six months grew to such a size that the patient had the appearance of being pregnant at full term. Pregnancy was suggested by the largeness of the breasts and abdomen by the missed periods, by the ease with which a vaginal examination could be made, and by nausea and vomiting, which were caused by toxic absorption and the large size of

the tumour. The normal uterus was easily palpated apart from the tumour, and there was no lactation. On laparotomy a large tumour of the right ovary was found, without any point of origin or glandular metastases. The right ovary and tube and appendix were removed and uneventful recovery took place. During the subsequent ten years the patient's mental and physical growth was normal. The tumour, which weighed 4 lb 4 oz, was composed of two masses of solid tissue separated by two large cysts. The larger part of the growth presented the appearance of adenocarcinoma showing in some places solid nodular masses of carcinoma with areas of necrosis. The tumour also contained embryonic lung tissue, neuroglia tissue, tissue resembling the gastro-intestinal tract, islands of cartilage, bones, and dermoid cysts with hair, sebaceous, and sweat glands.

305 Menstruation and Blood Pressure

M. L. LAWRENCE DILLHAIR (*Le Scalpel*, September 12th, 1925, p. 970) concludes as the result of systematic research that during the menstrual period the minimal blood pressures alter little, but on the whole tend to move in an upward direction. With regard to the maximum pressure three types are distinguished. In the first of these there is a rise between, a decline before, and a maintained fall during, the period. The second type differs from this only in showing a high level during the flow, while in the third type the lutemestrial rise is particularly rapid. The pressure is likely to be at its lowest at the period, but menstrual periods in the same woman were found to have individual differences. As special factors acting on the circulation during menstruation the author enumerates the following. The direct loss of blood is scarcely significant, but pure nervous reflexes originate in the follicle, the ovary, and in the various mucosae, the sensory part of the arc is the sympathetic. Nervous reflexes are also evoked by internal secretions ("chemical messenger"), to these are attributed cardio-vascular and vasomotor reactions. The pure nervous reflexes also act on the circulation, and the author thinks that the interplay of the two, complicated by the patient's disposition, gives rise to the above results.

306 Etiology of Pre-eclamptic Toxaemia

E. CARY (*Surg., Gynecol. and Obstet.*, August, 1925, p. 194) discusses the etiology of pre-eclamptic toxaemia from a clinical aspect and concludes that a toxic substance, or substances is elaborated during pregnancy which may cause eclampsia, such substances being probably an early split product of the protein molecule. He thinks that there is more than one source of this toxin, and that it may enter the maternal circulation from autolysis of degenerating placenta, from absorption through the large intestine of split products of bacterial origin, or from primary foci of infection. He believes that in eclampsia the power of the circulation to neutralize these toxins is diminished so that they can produce injurious effects. From the work of Obata the conclusion is drawn that eclampsia is an intoxication by placental poison made possible by a lowered neutralization capacity of the maternal blood. Cary has extracted a substance from placental tissues freed from maternal blood which was toxic to guinea pigs in 2 c.c. doses injected intraperitoneally, which appears to indicate that a substance is produced as the result of autolysis in the normal placenta which will cause eclamptic symptoms. He concludes that foci of infection other than the placenta may also be concerned, and that the symptoms are the result of an accumulative action.

Pathology.

307 Bender's Stain for Tubercle Bacilli

K. A. JENSEN (*Ugeskrift for Læger*, August 13th, 1925, p. 710) has tested at the Serum Institute in Copenhagen Bender's modification of the Ziehl-Neelsen method of staining tubercle bacilli. Bender's modification (accounts of which he published in 1921 and 1922) differs only from the Ziehl-Neelsen method in that he uses as a counterstain a 1 per cent aqueous solution of picric acid for half a minute. In his more recent publication in 1922 he recommended the use of equal parts of absolute alcohol and an aqueous solution of picric acid for counterstaining, and he claimed that his modification facilitated the distinction between genuine tubercle bacilli and other acid fast bacilli. Jensen is much impressed by the value of this modification, which is a great help to examiners who are apt to confuse red with blue colours and which shows up tubercle bacilli clearly, even when the field is crowded with cells, the diffuse yellow background not hiding a single tubercle bacillus. Jensen examined the sputum of 200 cases, employing both the original Ziehl-Neelsen method and Bender's modification.

thoroc. The former gave positive results in 39 cases, the latter in 43. The total time taken to find the tubercle bacilli in the 39 cases was fifty-six minutes, and in the 43 cases it was only eighteen minutes. In all but one of the 43 cases tubercle bacilli were found within five minutes of looking for them, whereas among the 39 Ziehl-Neelsen cases there were 5 in which tubercle bacilli were not found till they had been looked for for over five minutes. Jensen accordingly claims that Bender's modification not only gives positive results in more cases than does the Ziehl-Neelsen method, but it does so in a much shorter time.

308 Heat produced by Reactions of Antigens with Antibodies

S. BAYNE JONES (*Journal of Immunol.*, July, 1925, p. 563) has opened up a new field of chemical reactions between the differential microcalorimetry consists of two silvered vacuum thermos flasks enclosed in an insulated box, in one flask is placed the experimental fluid, in the other the control fluid. The flasks are then arranged differentially by placing one junction of a thermocouple in each flask, the terminals of the couple are connected to a galvanometer through a special potentiometer. In this way the current generated by differences in temperature at the junctions of the thermocouple can be measured in terms of microvolts. One of the drawbacks to this type of investigation in immunological methods is that the amount of reacting substances cannot be expressed gravimetrically, but this is possible the only alternative is to state the volumes in immunological units. For diphtheria toxin the author has used the L₁ unit of Glenn and Oehl, based on the work of Ramon, designating that amount of toxin which is required to cause complete flocculation of one unit of antitoxin. Studying the heat produced by the reaction between one unit of diphtheria antitoxin and one L₁ unit of toxin the author found that 0.0645 gram calories was liberated. The heat was evolved rapidly at first, and gradually slowed off, till after about an hour it ceased altogether. Studying the heat produced in the agglutination reaction, he found that a somewhat different curve was obtained. The reaction in question occurred between 190 c.c. of a saline suspension of typhoid bacilli and 10 c.c. of an agglutinating serum having a titre of 1 in 3,200. During the combination of the agglutinin and agglutino-gen heat was evolved, the maximum being reached after one hour. After this the curve fell somewhat, but commenced to rise again at four hours and reached its maximum at five hours, this second phase of heat production corresponded to the flocculation of the bacteria. In all, just over 40 gram calories of heat were liberated. From these experiments it appears that both the toxin-antitoxin and the agglutinin-agglutino-gen reactions are exothermic.

309 The Blood Platelets in Scarlet Fever

O. T. BONCIU (*C. R. Soc. de Biologie*, May 29th, 1925, p. 1453) studied the blood platelets in forty-six cases of scarlet fever in children aged from 5 to 16 years, with the following results. (1) Typical uncomplicated scarlet fever. During the incubation stage the number of platelets showed an obvious diminution, the number varying between 175,000 and 200,000. At the onset of the disease the number was below or slightly above normal (190,000 to 300,000). On the appearance of the eruption there was a sudden increase in the number of blood platelets, which became double or triple what it was at the onset. The height of the curve was reached during the first days of desquamation or on the preceding day. The number of platelets remained the same for some days during the second week and then began to fall, but very slowly, for even during the fourth week it was as high as 560,000 to 630,000 and values above the normal were found until the sixth or seventh week. The highest numbers found in simple scarlet fever varied between 720,000 and 950,000 in only two cases were they as high as 1,200,000 and 1,420,000. (2) Complicated scarlet fever. The number of platelets did not appear to be affected in these cases. In only one case, which was complicated by proctitis, was there a marked rise—namely, from 375,000 to 910,000. (3) Hyper-toxic forms. Like Aynaud, Bonciu found an intense thrombocytopenia in these cases. In three patients the number sank below 100,000. The lowest figures were 47,000 to 49,000 and were usually found on the day before death. Bonciu concludes by saying that the blood platelets undergo important numerical changes in scarlet fever which are in no way connected with the changes in the other elements of the blood. The diminution in their number during the incubation period as well as in the hypertoxic forms of scarlet fever confirms the view of Gowers that the blood platelets play an early and active part in the defence of the system, as they attack the foreign elements in the blood and disappear with them in the struggle.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

310 Tetany in Serum Disease

R. HOPMANN (*Klin Woch*, September 17th, 1925, p 1810) remarks that serum disease, experimental anaphylaxis, hypersensitivity, bronchial asthma, and certain other conditions are now recognized as nearly allied phenomena, though the nature and composition of the exciting agent is as yet uncertain. He reports a case in which serum disease supervened after antidiphtheritic serum, and a prominent symptom was tetany, the fingers being so cramped that the hands resembled paws. Rigidity of the muscles of the upper extremity to passive movement, heightened galvanic muscular excitability, and a positive Chvostek's sign were also present. In other cases he has found the galvanic excitability raised, the cathodic closure contraction in particular being of a characteristic tetanoid kind; he quotes from the literature only one case of coincidence of tetany and positive Chvostek's sign with serum disease, but more than one where increased electric excitability was found. The question, Hopmann thinks, is thereby raised whether derangement of the calcium potassium balance of the organism, which is regarded as a cause of increased electrical reaction, must not be concerned also in the phenomena mentioned above. He concludes that an initial alkalosis ushers in the electrical excitability, and that then acidosis follows, accompanied by a rash.

311 Constipation and Disease

A. C. JORDAN (*Med Journ and Record*, September 16th, 1925, p 328) describes seven cases of disease in which no progress was made until the presence of intestinal stasis was detected and appropriate treatment adopted. Synovitis of the knee occurring in a lad, aged 18, and preceded by repeated attacks of nasal catarrh, was cured within a fortnight after the chronic constipation had been overcome. An x-ray investigation with bismuth brought to light an elongated pelvic colon, a dropped transversus colon, distension of the gall bladder, and tight pyloric spasm, all of which had been previously unsuspected. Similar conditions were found in an apparent case of tuberculosis of the knee in a girl of 16, in asthma in a lad of 17, and a boy of 6, in a case of what appeared to be paralytic agita in a man aged 40, and a case of bronchial catarrh in a girl aged 7. The treatment recommended includes colloidal kolin, liquid paraffin, and belladonna, the use of a Curtis belt, daily massage and exercises, rest in bed before and after lunch, saline douching of the large intestine, and general rest and dietetic treatment. Jordan emphasizes the need for the use of x-rays and bismuth in diagnosing the cause of intestinal stasis, and adds that when there is a link producing constant tight spasms it must be freed by surgical treatment.

312 Apical Percussion in Pulmonary Disease

E. LADECK (*Wien Klin Woch*, September 17th, 1925, p 1039) finds that the slight degree of apical dullness present in early phthisis can be cleared away either by making the patient inhale deeply three or four times or if he coughs forcibly once or twice. Some physicians have stated that massage of the two apices brings back the dullness, but this, after trial, he cannot confirm. It is known that coughing will clear up a moderately obscured pulmonary field as seen radiologically, and the author states that, on screening those patients in whom dullness persisted after cough, there was likewise persistence of shadow after coughing. The most plausible explanation is, he thinks, that a diseased apex usually contains many small atelectases, which through exaggerated respiratory movements become expanded and aerated. In testing for this sign various possible fallacies must be remembered. The dullness of established disease is fixed, and thoracic asymmetries, fleshy or skeletal, have to be considered. In the absence of these, Ladéck ascribes to this sign a definite practical value, since it is easy to detect and can be quickly elicited.

313 Pulmonary Haemorrhage

F. M. ROTTENGER (*Amer Journ Med Sci*, September, 1925, p 420) believes that increased permeability of vessel walls is a frequent cause of pulmonary haemorrhage. He maintains that the great majority of such haemorrhages are not due to ulceration of vessels, rupture of aneurysmal dilatations, or injury to capillaries, since they are usually associated with weather changes, acute respiratory infections, or the

menstrual cycle, they often occur in the early morning hours, and are usually small in amount, persisting over several days with a tendency to recurrence. Recent investigations in biophysics and study of the physiology of the circulation seem to afford a rational explanation for such types of haemorrhage. Pottenger asserts that acute infections of the lungs tend to produce their greatest effect where the tissues are already injured by tuberculous disease, while weather changes, which affect all body tissues, react more particularly upon such injured tissues, and the increased activity in local tuberculous processes which occurs at the menstrual cycle is accompanied by increased permeability of the vessel walls.

314 Beri beri from a Diet of Raw Starch

E. J. KEPLER (*Journ Amer Med Assoc*, August 8th, 1925, p 409) reports a case of beri beri occurring in a coloured woman, aged 28. After a miscarriage, followed by severe vaginal bleeding, she had been recommended raw starch as a therapeutic measure, and, influenced by a superstition that this substance had a cosmetic value, she partook freely of it and gradually acquired a fondness for it. At the end of two years the habit had increased to such an extent that she was consuming from 1 to 2 lb daily, with a consequent diminution of food. Her health remained fairly good for four years, when the clinical picture of peripheral neuritis, with myocardial failure, developed. Marked improvement followed treatment with autolysed yeast, the peripheral neuritis gradually subsided and the patient was able to resume her housework.

315 Fungous Infections of the Lungs

A. CASTELLANI (*Military Surgeon*, August, 1925) describes the various forms of bronchomycosis, or infections of the bronchi and lungs, associated with the presence of fungi in the sputum. He states that the symptoms are similar whichever fungus is concerned. In mild cases there are signs of slight bronchitis, with mucopurulent expectoration, and in severe cases the patient presents the symptoms of tuberculosis, with hectic fever and blood stained expectoration. The prognosis varies according to the type of fungus. Milder cases may heal spontaneously, but the severe type may end fatally. The treatment recommended is potassium iodide in large doses (30 grains three times a day), with creosote.

Surgery.

316 Infiltrating Tumours of Brain

C. A. ELSBERG (*Amer Journ Med Sci*, September, 1925, p 324) discusses the diagnosis and treatment of infiltrating tumours of the cerebral hemispheres, with special reference to a new surgical procedure, whereby an attempt is made to lessen the number of major exploratory operations for supratentorial new growths by means of improved diagnosis between meningeal growths and subcortical infiltrating growths. He points out that valuable data can be obtained by studying rolograms of the ventricles into which air has been injected, since there appears to be a definite relation between the location of the tumour, the amount of distension of the anterior, posterior, and inferior horns of the contralateral ventricle, the degree of indus changes in each eye, and the disturbances in function on both sides of the body. By such means he states, it may be possible to define the position of an otherwise unlocalizable growth and to distinguish between meningeal and subcortical tumours. Instead of the major operative procedure of turning down a large osteoplastic flap in suspected subcortical tumours, Elsberg advises a primary short scalp incision under local anaesthesia, with the removal of a button of bone, and a small incision into the dura to allow the passage of a blunt brain puncture needle—a procedure similar to that for exploring a suspected brain abscess. Through such an opening the subdural space can be explored and, if firm resistance is felt, pointing to the presence of a meningeal tumour, a large osteoplastic flap can then be made. If no resistance is felt, the brain substance should be explored for the presence of a tumour, cyst, or abscess, if the cavity of a cyst is entered it should be aspirated and filled with air. Should no resistance be encountered, portions of brain tissue obtained by aspiration should be preserved for examination. A careful record being made of the direction and depth from which these portions were obtained the further procedure would depend upon the result of x-ray and laboratory findings.

317 **Varicose Veins and Flat foot**

G NOBL and F REMENOVSKY (*Wien Klin Woch*, August 27th, 1925, p 960) conclude that there is a strong coincidence observable in over 60 per cent of cases of tenderness to varicosity and flat foot. They believe that the two conditions do not stand to one another in the relation of cause and effect but are joint results of a common constitutional fault—namely, a weakness of the walls of the veins in one case and of the bones, ligaments, and muscles in the other. Stress and strain bring this multifiform weakness to light. They add that in some instances club foot may be the direct result of varicose veins, being caused by the induration and contraction of the skin, and that the action of similar complications may cause joints to become ankylosed. Another etiological sequence suggested is perlostitis and a peculiar form of bone atrophy following the chronic inflammation and ulceration of the skin found with varicose veins. In the case of other malformations, such as genu valgum and hallux valgus, no such associations with venous varicosity have been traced by the authors.

318 **Cervico medullary Tumour**

J FAVILL, D E FAXON, and D A PALMER (*Journ Nerv and Mental Dis.*, September, 1925, p 279) report a case of cervico medullary tumour occurring in a previously healthy woman, aged 29. Commencing on the left side of the body, generalized weakness gradually progressed until, four months later, she was helpless and had lost all power of movement below the neck. At times she had general pain, which was worst in the back of the neck, there was numbness of the arms and legs, and once a sensation of choking. There seemed to be no difficulty in swallowing, no disturbances of mentality, vision, taste, smell, or hearing, and no nausea, vomiting, tremors, spasms, convulsions, or abnormal involuntary movements. The respiration was intercostal in type. The liver, spleen, and kidneys were not palpable, but there was retention of urine. All muscle power was absent, and both extremities were markedly spastic on passive movement, the fingers were held in flexion with the thumbs flexed and adducted. There was considerable atrophy of the small muscles of the hands, throat, upper chest walls, and deltoids, and there was a lesser degree of atrophy in the lower extremities. All reflexes were exaggerated, except the abdominal, which could not be obtained, and there was a bilateral Babinski response. The cranial nerves and eyes were normal. The Wassermann reaction was negative and the spinal fluid normal, the cervical spino showed no abnormality on x-ray examination. No Kernig's sign developed, but during the last week of life peculiar sensory phenomena occurred, with difficulty in swallowing and excessive salivary secretion. The necropsy revealed an endothelioma the size of a hen's egg opposite the lower portion of the medulla in a right temporo lateral position beneath and adherent to the dura, it projected through the foramen magnum and pressed upon the medulla and upper cord. Notes are given of two other cases recorded in the literature. Special attention is drawn to the presence of atrophy of the upper extremities resulting from lesions exerting pressure well above the levels of the cord which supply the arm muscles, this must have resulted from some mechanical injury to the anterior roots, since the anterior horn cells at these levels were microscopically normal. The authors add that such injury might have resulted from torsion of the cord, or traction upon it when the tumour met the resistance of the foramen magnum, or from a direct tearing when the dural sac became displaced by the growth of the tumour.

319 **Abdominal Surgery in Diabetes**

D F JONES, L S MCKITTRICK, and H F ROOT (*Journ Amer Med Assoc*, September 12th, 1925, p 809) discuss in detail the special measures necessary when abdominal operation on diabetic patients are to be performed. They deprecated ether as an anesthetic, and recommended nitrous oxide or ethylene and oxygen when local or spinal anaesthesia is inadequate. They warn against the danger of depleting the glycogen content of the body to a dangerous extent, and think it desirable to relax insulin treatment so that there may be a little glycosuria at the time of the operation. Unless the operation is imperative it should be delayed until acidosis is controlled, and the authors find that testing the urine for diacetic acid affords a sufficiently adequate criterion in this respect. They consider that giving large doses of insulin is both unnecessary and unwise, since danger of hypoglycaemia is incurred. The post-operative treatment should include a double measure of watchfulness as compared with a non-diabetic case: the urine should be tested for sugar and diacetic acid at three or four hour intervals and insulin administered subcutaneously in accordance with the results obtained. At least 50 ounces of fluid should be given during the first twenty-four hours after the operation.

carbohydrates should also be administered. The authors conclude by stressing the importance of early operation in diabetic cases, since these patients do not react to pain or infection as do non-diabetics, and so grave complications may develop unnoticed.

Therapeutics.320 **Quinidine Sulphate in Auricular Fibrillation**

R A JAMESON (*Canadian Med Assoc Journ*, August, 1925, p 782) states that in 50 to 60 per cent of patients with auricular fibrillation the normal rhythm can be re-established by the oral administration of quinidine sulphate. He has used it during the last four years in forty-nine cases, thirty-one of these patients showed at least one of the signs of cardiac failure, such as oedema, passive congestion of the lungs, or hepatic enlargement. All had some limitation of cardiac reserve—the majority to a marked degree—and the previous duration of fibrillation ranged from a few days to about six years. A preliminary course of digitalis was given in most cases, though not concurrently with the quinidine. Jameson thinks, however, that the combined administration would allow the ventricular rate to be more readily controlled and obviate the tendency to an increased rate which occasionally occurs when quinidine is being given alone. The initial dose was 3 grains, and, if no toxic symptoms followed, it was increased gradually to the fourth or fifth day when the maximum dose of 25 to 30 grains might be given in each twenty-four hours. The best results seemed to be obtained from small doses of 3 to 4 grains, given at three-hourly intervals throughout each twenty-four-hour period. Of the forty-nine patients so treated twenty-six reverted to the normal rhythm, though fibrillation tended to reappear after some weeks, yet it was possible in cases where the normal had been re-established to maintain it by small daily doses of quinidine. Jameson urges the importance of carefully selecting the cases for treatment. The most important contraindication is, he thinks, a high degree of myocardial damage.

321 **Treatment of Meningococcal Septicaemia**

L MERLE (*Bull et Mem Soc Med des Hop de Paris*, July 2nd, 1925, p 1004) records a case of meningococcal septicaemia in a boy aged 15, accompanied by meningitis, arthritis, and iridocyclitis. Although antimeningococcal serum had a good effect upon the meningitis, the septicaemia was unaffected. An auto vaccine, prepared from the blood culture, was then injected. The temperature immediately fell, and, apart from loss of sight in the right eye, complete recovery followed. Merle believes that the eye might have been saved if a filtrate of a culture of the causal organism as Besredka recommends had been used as a dressing and as an intraocular injection with or without evacuation of pus from the anterior chamber.

322 **The Principles of Prescribing**

K SCHÜBEL (*Deut med Woch*, September 4th, 1925, p 1480) laments that, owing to the copious introduction of pharmaceutical specialties, the art of prescribing is on the wane. This is causing harm, he thinks, because therapeutic success sometimes depends upon a particular combination, to be found only by experiment. Certain points still require attention, and he remarks that the degree and duration of the effect of medicinal treatment are important, as also are habit formation and the possibility of cumulative action. Moreover, absorption from the stomach, intestines, and the rectum is essentially different from absorption after parenteral administration. Water solubility does not always mean ready absorption, on the contrary, some substances not water soluble are so readily affected by the juices of the body as to be quickly absorbed. Schübel points out that anaphylaxis is a danger after certain therapeutic measures, and often depends upon the tissues being deficient in calcium. Again, the state of the circulation seriously affects the action of drugs. With a failing heart not much result can be expected in an emergency except from intravenous injection. On the other hand, the danger of accumulation is enhanced in constipation, when the kidneys may be the only excretory organs available, if renal discasos exists, the risk is thereby increased.

323 **Yatren-Casein in Surgical Tuberculosis**

P BECK (*Wien Klin Woch*, August 20th, 1925, p 937) reports the following results. Of 18 patients with surgical tuberculosis treated with parenteral injections of yatren casein, 2 were cured, 5 much improved, 4 made better, 3 were unaltered, and 4 got worse. Treatment was then stopped, and in the ensuing eight months three further cures ensued. Almost all the patients who got worse were young subjects.

with tuberculous cervical glands, Beck thinks that they were overdosed, and states that no more than 1/10 gram should be given in a single injection. Yation is a preparation of iodoxy quinoline sulphonic acid. The rationale of the method is stimulative, and Beck describes in some detail the signs of an optimum reaction to an injection, which include rise of temperature. The intervals between injections should never be less than eight days, but the fitting dosage in each case is determined rather by varying quantity than frequency. He adds that no other specific treatment should be employed simultaneously with yation casein, and that caution is necessary with the dosage in order to avoid too strong focal reaction. Thus there is some risk of causing tuberculous glands in the neck to break down and discharge, the author deprecates this being brought about deliberately.

323

A Valerian Preparation

M NIENDORF (*Med Klin*, September 18th, 1925, p 1431) suggests that the first drug to be tried in such conditions as insomnia, neurasthenia, and dysmenorrhoea is valofin. This is stated to be a preparation of valerian root, infusions of which have been recommended in the treatment of excitement conditions, it is prepared by the Helfenberg firm in Dresden. Niendorf finds that on the stomach and intestine it has a sedative and carminative action, it tastes well and smells of peppermint. The dose is given as half a teaspoonful in water, or, for children, 15 to 20 drops, which, in one dose in the evening, has been found to relieve the restlessness of the milder forms of bronchopneumonia and gastro enteritis. Mixed with syrup the drug is recommended as a harmless prescription for night terrors in small children and for laryngismus stridulus. Previous valerian infusions contained bitter principles and impurities, but valofin, in which is present the active body, or etheric oil, of valerian root, is said to be free from these, and can therefore be given continuously.

325

Treatment of Trichinosis

J S GROVE (*Journ Amer Med Assoc*, August 1st, 1925, p 349) discusses the various methods of treatment that have been recommended for trichinosis. In addition to thorough evacuation of the gastro intestinal canal, glycerol, serum from convalescent animals, antonin, asphenamin, and other remedies have been tried with indifferent results. Grove gives clinical details of a case in which a woman, aged 35, was successfully treated by small doses of antimony and potassium tartrate. Intravenous injections of a freshly prepared 2 per cent solution in distilled water were given every second or third day in the proportion of 3 to 4 c cm for each 10 lb of body weight, the dose was gradually increased. Rapid improvement resulted, and within a week the patient was discharged cured. In this particular case the larvae were demonstrable in the blood stream. Grove adds that this treatment is not entirely free from danger, care must be taken to prevent the drug entering the surrounding tissues, as it produces intense pain and a tendency to inflammation and necrosis. He believes that the maximum effect of the drug is obtained before the parasites become localized in the muscles, early and diligent scrub, therefore, should be made in suspected cases for the larvae in the blood stream and spinal fluid.

Diseases of Children.

323

Haemorrhage in Early Infancy

C I T EAST, F COVE SMITH, and F O T STRANGE (*Brit Journ Child Dis*, April-June, 1925, p 128) report the clinical histories and post mortem findings of three cases of haemorrhage in early infancy. The first case, which occurred in an infant aged 14 days at the time of death, was characterized by bleeding from the rectum and vagina since birth. No haemorrhages were found in the skin, but four purplish areas resembling piles were noticed at the anus. Haemorrhages were found under the pleura, on the surface of the liver on the right side of the peritoneal cavity and pelvis in the bladder, cervix, and fundus uteri. In the second case death occurred on the second day of life after passage of a large quantity of blood per rectum. The intestine was found to be full of blood as far as the duodenum, in the first part of which an ulcer was discovered. Several erosions were also present in the gastric mucous membrane. The third case, which occurred in a child aged 6 weeks, was apparently one of Henoch's purpura. The abdomen was opened but no intussusception was found, and the child died shortly after the operation. At the necropsy haemorrhage was found in the coils of the intestine, behind the peritoneum, and in the lung. There was also abnormal bleeding from the lung. The authors remark that it is very unusual to find Henoch's purpura so early in life,

and suggest that its occurrence at this age links up the purpura of later life with crises of haemorrhagic disease in the newborn.

327

Lipodystrophia

VINCENT COATES (*Brit Journ Child Dis*, July-September, 1925, p 194) defines lipodystrophia as a disease especially liable to affect children from 5 to 8 years of age, in which there is a loss of subcutaneous fat of the face, neck, thorax, arms, and abdomen without assignable cause or gross symptoms of ill health. In females there is also an increase of subcutaneous fat below the iliac crests. Many theories have been advanced to explain the fat dystrophy. Syphilis, taberclosis, malnutrition, and abnormal fat metabolism can be excluded. Tests of pituitary disorder have been negative. As regards the thyroid gland, exophthalmic goitre in one instance, a tumour of the gland in another, and myxoedema in a third have been noted. The other endocrine glands cannot be incriminated. Parkes Weber suggests that there is a disturbance of the vegetative nervous system resulting in a redistribution of fat in the subcutaneous tissues analogous to that of pigment in the skin in vitiligo. Several cases have been reported following immediately on specific infectious diseases. The course of lipodystrophia can be divided into an active stage lasting from a few months to four years during which the disease is progressive, and a final stage in which there is a permanent cosmetic disability. With the exception of the case reported by Napoleon Boston no claim has been made of a cure or even of an arrest of the condition. Coates records two personal cases in boys aged 7½ and 7¾ years, and has collected all the previously reported cases in tabular form.

328

The Spinal Fluid in the Newly Born

M H ROBERTS (*Journ Amer Med Assoc*, August 15th, 1925, p 500) has studied the spinal fluid in 423 newly born negroes. Bilirubin was found present in every case, and it persisted until the ninth day, it was intensified if jaundice supervened. Roberts considers this condition physiological, and not necessarily indicative of intracranial haemorrhage. He found that the degree of coloration had no relation to the character of the labour or the condition of the child at birth, but, whereas in large full term babies the fluid was only slightly tinged, there was invariably marked pigmentation in premature infants, small full term babies, and twins. The condition is, he thinks, to be associated with the destruction of red blood cells which occurs during the first few days of life. Roberts reports also that intracranial haemorrhage in the newborn is of common occurrence, even in normal labours, but symptoms only appear in severe cases. He doubts the likelihood of later and permanent disabilities resulting from these haemorrhages.

Obstetrics and Gynaecology.

An Accessory Fallopian Tube in Tubal Pregnancy

F C VAN TONGEREN (*Nederl Tijdschr v Geneesk*, July 11th, 1925, p 257) reports the discovery of an accessory Fallopian tube in a woman, aged 39, who had been married for several years and had had two normal labours without any miscarriages. She was admitted to hospital with the diagnosis of ruptured extrauterine pregnancy. On laparotomy a rupture was found in the left Fallopian tube close to the isthmus. The tube was removed and complete recovery took place. On examination of the put removed a small tube 2 to 5 cm long was found on the lower aspect of the anterior part of the larger tube, which was 10 cm in length. It was impossible to pass a fine sound from the small tube into the lumen of the larger one. Microscopical examination of the Fallopian tube in the neighbourhood of the rupture showed distinct decidinal changes and portions of chorion, so that the diagnosis of ruptured extrauterine pregnancy was confirmed. Abnormal development of the Müllerian ducts may, as Webster has shown, be responsible for extrauterine pregnancy, as the ovum is supplied with a favourable nidus in the tube. Hoffman has reported a case of tubal pregnancy in which two accessory tubes were found, and in nine other cases of extrauterine pregnancy he found more or less distinct maldevelopment.

330

Peristalsis in the Fallopian Tube

ACCORDING TO R DRYOFF (*Centralbl f Gynakol*, August 22nd, 1925, p 1890) Coiner in 1923, was the first to demonstrate and register peristalsis in the Fallopian tubes of animals, the transport in them of corpuscular elements towards the uterus had previously been proved experimentally. Tubal peristalsis in the sow has recently been recorded cinematographically by Acl. Convincing evidence of the occurrence

of peristaltic movements in the human Fallopian tube has hitherto been lacking, in the present communication Dryoff publishes radiograms taken after the introduction (not under pressure) of oil into the human uterus. The spiracles and ampullae characteristic of peristalsis are visible, it is clear, however, that the direction of the waves is such as to convey the oil from the uterine to the ovarian extremity, whence it escapes into the pelvis. Flaskamp and the present author have also demonstrated and recorded peristaltic movements in the excised surviving human oviduct, the waves travelled towards the uterine end.

331 Anaemias of Pregnancy and the Puerperium

R. C. LARRABEE (*Amer. Journ. Med. Sci.*, September, 1925, p. 371) gives clinical notes of 17 cases of severe anaemia, which were classified on the basis of the blood pictures, the anaemia occurred during or shortly after pregnancy, and was attributable to the pregnancy itself and not to complications. Seven of these patients showed the blood picture of severe secondary anaemia, the average haemoglobin percentage being 35. The anaemia was not progressive, and they improved under treatment after delivery. Four patients were not transfused, transfusion was adopted in the other three to hasten recovery or to give greater safety for operative interference. In eight cases the blood picture was of the pernicious type. The disease was insidious in onset and slow in development, and the general condition of the patients was grave. Four patients recovered after transfusion, but of the four who were not transfused three died. In one case there was an aplastic blood picture with great reduction of platelets, and without any evidence of red corpuscle regeneration, the patient died in spite of transfusion. One atypical case in which repeated transfusions had failed ended in recovery after splenectomy. Larrabee considers that patients of the secondary anaemia type tend to recover under treatment with iron and arsenic, and that most of those with more severe anaemia recover, and may even go through subsequent pregnancies without recurrence if treated by transfusion, a single transfusion sufficed in most cases. As regards the advisability of emptying the uterus, the author does not consider it justifiable in mild cases of the secondary type, in the severer types the treatment in each case must be decided on its merits, having regard to the nature and severity of the anaemia, the stage of pregnancy, and the viability of the foetus.

Pathology.

332 The Site of Production of Agglutinins

D. VANNUCCI (*Lo Sperimentale*, June, 1925, p. 379) has made some experiments on dogs and rabbits to determine the site of production of agglutinin. In most of his work he injected a typhoid vaccine killed by heat into animals by various routes, and the agglutinin titre resulting from this antigenic stimulation was measured daily. In some animals a splenectomy was performed after the injection. He also examined histologically the spleen and bone marrow of certain animals. The results are briefly these. Injection of the vaccine intravenously into rabbits gives rise to a titre of between 1 in 5,000 and 1 in 6,000, injection into the cranial artery gives a titre of 1 in 5,000, injection into the mesenteric vein one of 1 in 3,000, and injection into the mesenteric vein of a rabbit, the spleen being removed forty-eight hours later, gives a titre of 1 in 2,000. From these results it appears that the highest titre is obtained by intravenous injection, using a systemic vein, if, on the other hand, a splenic vein be chosen, the resulting titre is considerably lower. It is also clear that splenectomy diminishes the reaction of the animal to the antigenic stimulus. Experiments in dogs gave somewhat similar results, thus the highest titre was obtained by injection into the femoral artery—even higher than into an ear vein. Splenectomy performed forty-eight hours after the intrafemoral injection diminished the agglutinin response, likewise after injection into the ear vein. Histological examination of the spleen showed that within forty-eight hours after the injection of typhoid vaccine great congestion and often haemorrhages appeared, followed later by oedema and cellular changes. The bone marrow showed congestion and, sometimes, small haemorrhages. After reviewing the work of other authors on the subject of the site of agglutinin formation, Vannucci concludes that it is the haemopoietic organs—particularly those parts which actually are engaged in forming the blood cells—that are responsible for agglutinin formation. The facts that splenectomy diminishes the agglutinin response, and that profound histological changes occur in the blood-forming organs after injection of the antigen, seem to be the reasons for this conclusion. The liver and kidneys, he considers probably excrete a considerable amount of antigen soon after its injection, this explains why injection by the mesenteric vein gives rise to a lower

titre than injection by a systemic vein. Finally, Vannucci is inclined to attribute the fall in the curve of agglutination which occurs ten days or so after injection to excretion of antibodies by the liver and kidneys.

333 Streptococcus haemolyticus in Scarlet Fever

OLGA BONCIU (*C. R. Soc. de Biologie*, August 14th, 1925, p. 722) examined twenty cases of scarlet fever, taking two throat swabs from each—one on the first day of the illness, the other a week after defervescence and making a blood culture at the same time. From eighteen of the patients she recovered *Streptococcus haemolyticus*, either at the first or the second examination, from the throat, and from two of them she recovered the same organism from the blood. She then tested the agglutinating capacity of the blood serum of convalescents. All the nine serums that she examined agglutinated haemolytic streptococci of scarlatinal origin to a high titre, while having a much poorer action on haemolytic streptococci of non-scarlatinal origin, and on *Streptococcus viridans*. Rabbit serums prepared with the haemolytic scarlatinal strains agglutinated these strains to a high titre, but had little action on streptococci of non-scarlatinal origin. Rabbit serums prepared against non-haemolytic streptococci of scarlatinal origin had little effect on haemolytic strains of scarlatinal origin.

334 The Cerebro spinal Fluid in Malaria

R. MONTELEONE (*Il Policlinico*, Sez. Med., September 1st, 1925, p. 470) states that since the cerebro spinal fluid is a valuable index of the changes in the cerebro spinal axis and its coverings it naturally follows that the fluid should show more or less marked changes in malaria in which nervous symptoms are remarkably frequent. In previous observations of the cerebro spinal fluid in malaria only those forms of the disease have been studied in which there were marked clinical signs of nervous disturbance, when it was found that the fluid generally showed an increase of pressure, excess of albumin, high percentage of urea, and frequently lymphocytosis. Monteleone examined the cerebro spinal fluid in about 50 cases of various forms of malaria and found that the results differed according to the stage of the disease. In the apyrexial forms of chronic malaria the fluid was perfectly normal. In the acute stage the changes were the same whatever the type of fever. In no case was there any change in the appearance or colour of the fluid, nor was there any formation of a reticulum or massive coagulation. The first change of interest was an increase of pressure which was closely associated with the rise of temperature, the pressure increasing as the temperature rose and falling as the fever subsided. The amount of albumin was almost always within the limits of the normal, though sometimes there was an increase in cases of pernicious malaria. An increase in the quantity of reducing substances was constant during the malarial paroxysm. Hyperglycaemia which was the first sign to appear and the most persistent, sometimes amounting to 1 per mille. The Wassermann reaction was always negative, even in those cases in which it was positive in the case of the blood serum. Cytological examination showed that red corpuscles were frequent, this finding being probably due to the haemorrhage caused by the passage of the needle. Lymphocytosis was occasionally seen but was not common.

335 Ultra violet Light and the Mineral Metabolism in Lactation

In a preliminary communication J. B. ORR, H. E. VAGET, and J. M. HENDERSON (*Biochem. Journ.*, No. 4, 1925, p. 569) report that irradiation of lactating goats by the carbon arc lamp reduces the loss of calcium from the body. Precautions were taken to ensure that the exact intake of calcium and phosphorus for each dry should be known (it may be noted that the appetite improved and the ration was increased from the sixth day of irradiation onwards), and the collection and analysis of excreta were continued for a total period of fifty-four days. From the thirteenth to the thirty-fourth day the animal was irradiated for four hours a day at a distance of 4 ft., about a sixth of the animal's body being exposed to the rays at a time. These experiments are quoted. In the first, under the influence of irradiation an average negative balance of 0.24 gram a day was changed to a positive balance of 0.16 gram, in the second a negative balance of 0.41 gram was reduced to 0.20 gram, and in the third a negative balance of 0.26 gram was reduced to 0.01 gram. The gain in calcium absorption and retention was almost entirely accounted for by reduced excretion in the faeces. Thus, under the influence of irradiation, there is either increased absorption from the intestine or decreased excretion into the intestine. The authors incline, with Telfer, to the belief that the calcium of the faeces is chiefly, if not entirely, unabsorbed residue, and suggest, therefore, that irradiation by the carbon arc lamp, like the administration of oils, causes an increased absorption of calcium from the intestine.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine.

336 The Probable Causes of Lateral Decubitus

I. DAUTOLO (*Bull. delle Sci. med.* July August, 1925, p. 257) states that there are numerous relations between the decubitus assumed by an individual and his digestive apparatus. While the right lateral decubitus favours the passage of the gastric contents through the pylorus (Serres d'Ues) this position, according to Wotfge, should not be adopted until one and a half hours after a meal, so as to prevent the passage of incompletely digested food into the duodenum. On the other hand, the left lateral decubitus, though it prevents this occurrence, may if prolonged cause dilatation of the stomach, especially in weakly persons. The prone decubitus, though it interferes with the movements of the thorax and organs contained therein as well as with the gastric movements, favours the passage of solids and gases through the intestinal canal, so that this position is sometimes recommended in cases of excessive meteorism. The most suitable decubitus for the liver is the right lateral, because in this position the organ rests on the solid surface provided by the inner aspect of the ribs and the muscular intercostal spaces of the diaphragm, and the flow of bile is more active, whereas in the opposite decubitus the liver, by slipping over to the left, drags on its ligaments and interferes with the stomach. In the supine decubitus the liver may press on the inferior vena cava. As the result of examination of several hundred cases in his father's oto-rhino-laryngological clinics at Bologna, Dautole found that the lateral decubitus was much the most frequent, and that the left, though not as common as the right, was not much less frequent. He found, moreover, that the lateral decubitus, whether left or right, and whatever the sex, was usually associated with a stenosis of the nasal fossa on the same side. This stenosis was due most frequently to hypertrophy of the inferior turbinal bone or to a pronounced angulation of the septum with a spur, and then in decreasing order of frequency to slight deviation of the septum with a spur and hypertrophy of the turbinates, with simple deviation of the septum, and finally to simple deviation of the septum only. In exceptional cases the lateral decubitus was associated with an imaginary sensation of diminished capacity in spite of a considerable amplitude of the nasal fossa.

337 The Jugular Pulse in Aortic Insufficiency

L. LOMBARDI (*Chiese e Circolazione*, August, 1925, p. 337), who has made a careful study of the jugular pulse in a case of aortic insufficiency in a man aged 37, has come to the following conclusions: (1) In aortic insufficiency with unstable compensation the jugular pulse, as was to be expected, varies according to the efficiency of the heart's action. (2) In the stage of failing compensation as shown by oedema, dyspnoea, and so on, tracings show that the various waves are barely indicated or differ only slightly in height from one another. The aortic wave is high in comparison with that of the ventricular, and the wave *h* appears, which is an expression of overdistension of the right ventricle. In the stage of moderate compensation the ventricular wave is still fairly low, but the aortic wave is more vigorous. The *h* wave has now disappeared, showing that the aortic contraction has become more energetic, and that the ventricular distension has been relieved. (3) In the stage of more or less complete compensation the distance between the waves *a*, *c*, and *v* and their size appear to be about the same as in the normal plethogram, and the *c* wave exceeds all the others in height, thus showing the vigorous contraction of the left ventricle.

338 Recovery in Pulmonary Tuberculosis

G. B. WEBB (*Journ. Amer. Med. Assoc.* September 19th, 1925, p. 867) points out that before the introduction of serial radiological examinations of the chest it was generally held that pulmonary tuberculous deposits undergoing healing were replaced by fibrous or calcified structures. It has now been shown that actual absorption of lesions may occur. He gives five case histories, illustrated by radiographs, to show that massive exudative tuberculous lesions have been absorbed, and he adds that some of the illustrations appear to indicate that caseous residues were replaced by apparently healthy lung tissue. In some cases the absorption of lesions was associated with a complete disappearance of riles. In other cases riles remained, possibly owing to a bronchiolectasis. He emphasizes the point that rest in pulmonary tuberculosis

should be prolonged for many months after the temperature and pulse have become normal and the sputum has disappeared. He found by his radiological examinations that tuberculous deposits generally started to clear up after six months of rest, but were not completely absorbed until after two or three years of rest. He believes that recurrence in pulmonary tuberculosis is often due to the fact that prolonged and complete rest has not been continuous, nor of sufficient duration.

339 Etiology of Pellagra

ACCORDING to R. S. MILLER (*American Med.*, April, 1925, p. 211), pellagra is due to an enzyme deficiency which disturbs the sugar metabolism, and he maintains that patients suffering from this disease need dextrose. He believes hypertrophy of the parotid glands to be a more constant sign than hitherto supposed, and that it represents a compensatory hypertrophy to replace a definite deficiency elsewhere, possibly of the pancreas. He suggests that the failure to reduce carbohydrates efficiently to their end products is responsible for the intractable diarrhoea associated with pellagra, and attributes the emaciation to the failure in glycogen production and the deficiency in its storage. A connexion is traced between the incidence of pellagra and the scarcity of dextrose-containing foods in such countries as Egypt, Italy, and America. He believes that the simplest way to remedy the deficiency is to supply such foods to all who are poor, engaged in hard manual labour, or exposed to cold and exhaustion. The relation between the consumption of maize products and pellagra is, he thinks, explicable by the inferiority of this cereal to all others, both in its original and in its cooked state, the dextrose content being very small.

340 The Sign of the Cutaneous Folds in Scarlet Fever.

C. BIFULCO (*Studium*, September 20th, 1925, p. 273) states that among the signs which have a considerable though not absolute importance in the diagnosis of scarlet fever is that described by Pastia. This observer in 1910 stated that he had found in 94 out of 100 cases a continuous linear exanthem of a more or less bright red colour on the flexor fold of the elbow. This exanthem, which was not found by Pastia in any other toxic or infective eruption, was in early sign, as it appeared at the beginning of the eruptive period and was present when all other signs were absent, persisted throughout the eruptive period, and sometimes could be found in the form of hyperchromic pigmentation after the scarlatiniform rash had faded. Bifulco in 1916 found Pastia's sign in 95 per cent of his cases of scarlet fever, and declared that not only did it bear no relation to the severity of the attack, but that it was also present in other eruptive fevers. Montefusco, who found it present in all cases of scarlet fever and absent in erythema scarlatiniforme, typhus, haemorrhagic small pox, and pelios rheumatica, attributed considerable diagnostic importance to the sign. Bifulco investigated it in 136 cases of scarlet fever, and found it constantly present, both at the onset of the disease, including cases in which the rash was ill marked, and also in those in which it had faded, when the sign was present in the form of intense pigmentation. Bifulco found the sign also present in measles, but not in any other eruption such as serum rashes or erysipelas. He also observed that the sign was present, not only at the fold of the elbow, but also in all the flexor folds where the skin was delicate, such as the popliteal space and groins. The cause of the phenomenon as of the Rumpel-Leede sign, is to be found in vascular hypotonia, which as the result of pressure or spontaneously, gives rise to hyperaemia or punctate haemorrhages.

341 Signs of Low Arterial Tension

A. DUMAS (*Journ. de med. de Lyon* September 20th, 1925, p. 527) describes the typical patient with low arterial tension as being in the prime of life with a recent history of mental and physical lassitude. Other symptoms are palpitation and extra systole following exertion (alleged) vertigo, and pains in the legs or a sensation of the heart beating down there. The pulse is rapid, irregular and with extra systolic intermissions. It is of low tension but the minimal figures are hard to determine. Oscillometry shows a good amplitude which in view of the low tension implies excess. The apex beat is rather violent, in the fourth or fifth space, and gives on palpation the suggestion of a thrill. There may be a functional systolic bruit, replaced in late stages of the disease by a true mitral incompetence murmur. The second sound—

whether pulmonary or aortic is not stated—is usually accentuated. Dumas thinks that these signs afford evidence of cardiac retraction and compensatory effort in face of an arterial laxity the strain of which is felt especially in diastole.

312 Banti's Disease

A. P. PONS (*Rev. med. de Barcelona*, August, 1925, p. 126), who records six illustrative cases in patients aged from 16 to 49, states that, in addition to an essential Banti's disease for which the most careful clinical examination is unable to detect a definite cause, there exists a syndrome with an identical clinical evolution and probably similar anatomical lesions, which is produced by well known causes, especially syphilis. During the period of hepatitis with cirrhosis the ascites secondary to portal hypertension may be absorbed spontaneously and the peritoneum may remain free from effusion for a long period, which is not a frequent occurrence in ordinary hepatic cirrhosis. The practical conclusion to be drawn from this fact is that operation is advisable and improvement is likely to occur even in the third stage of Banti's disease. Pons regards sclerosis of the Malpighian corpuscles in the spleen as one of the most typical lesions of Banti's disease. Clinically it is manifested by an abscess or only a slight degree of leucocytosis following injection of adrenaline, so that Malpighian sclerosis and absence of reaction to adrenaline form the most important complex in Banti's disease.

Surgery.

343 Abdominal Endoscopy

O. E. NADEAU and O. F. KAMPMEIER (*Surg., Gynecol. and Obstet.* September, 1925, p. 259), impressed with the practical possibilities which endoscopy of the abdomen offers in diagnosis, treatment and physiological investigation, describe their technique. At a point 3 cm. to the right of the umbilicus the skin and deeper tissues down to the peritoneum are anaesthetized with a 1 per cent novocain solution. A spinal puncture needle and obturator are passed through the abdominal wall until the peritoneum is pierced, and, after removal of the obturator, rubber tubing is attached to the needle and to a foot air pump. A short piece of glass tubing containing sterile wool for filtering the air is interposed near the needle end of the tubing. After sufficient air has been introduced into the peritoneal cavity to raise the abdominal walls from the underlying bowel the spinal needle is withdrawn, and along its track the trocar is pushed with its flexible cannula made of thin spiral steel spring covered with a sheath of rubber with a calibre fitting the tube of the cystoscope. After removal of the trocar a metal cap with rubber diaphragm is screwed on to the cannula, and through this the endoscope is introduced. It is claimed that the liver, gall bladder and ducts, and the anterior surface of the stomach and first part of the duodenum can be examined, in the lower abdomen can be seen the uterus, tubes, ovaries, bladder, and sigmoid, as also the appendix when it is not retrocaecal or hidden by adhesions. Practical familiarity with cystoscopic examination and an accurate knowledge of the normal and pathological appearance of organs are essential.

344 Appendicitis in a Femoral Hernia

W. F. K. GOUWE (*Nederl. Tydschr. v. Geneesk.*, September 12th, 1925, p. 1247) reports the case of a woman, aged 45, who was suddenly seized with severe pain in the right groin, abdomen and back. She gave a history of having had some vague abdominal pain during the preceding months and about six weeks previously had noticed a small swelling in the right groin, to which she had paid no further attention. On examination a small round swelling the size of a cherry was found in the situation of the femoral ring. It was very tender on pressure, and did not increase in size on coughing or bearing down. There was no typical tenderness at McBurney's point. The rectal temperature was 101° F., the pulse was normal. The diagnosis was either an inflamed lymphatic gland or inguinal hernia with slight symptoms of strangulation. In accordance with the first diagnosis she was confined to bed and treated with jalap for three days, but without any change in her condition resulting. A surgeon was then summoned, who made a diagnosis of strangulated omental hernia. On operation a right femoral hernia was found, its contents consisting of the gangrenous extremity of the appendix 3 to 4 cm. in length, lying in a sac full of pus. The rest of the appendix which was in the abdomen and 5 to 6 cm. long was healthy. Complete recovery followed appendectomy. It could not be determined whether the appendix had become accidentally infected after being some time in the hernial sac or whether it had become infected by being strangulated in the hernia.

345 Treatment of the Appendix Stump

J. J. MALO FI (*Annals of Surgery*, August, 1925, p. 250) discusses treatment of the appendix stump after removal of the organ. There are two essentially different ways of treating the stump—namely, the ligature and drop method which leaves the stump free in the peritoneal cavity, and the inversion or burying method. The author states that the first procedure has been used satisfactorily in a large number of cases. The advantages are its rapidity and ease, its adaptation to all cases, and the lessened percentage of faecal fistulae. It has been urged against this method that mucosa will not unite with mucosa, but it has been found that the ligature brings scrota into contact with serosa which causes firm healing, and there has been no case of post operative peritonitis. Maloney considers that any method of burying the stump in the caecal wall is unphysiological and unsurgical, and is followed by a greater percentage of complications and sequelae. By the method described the operation is more easily performed, with lessened mortality and morbidity rate.

346 Facial Bolls

R. MORIAU (*Deut. Zeit. f. Chir.*, September, 1925, p. 45) reports that of 103 cases of facial boil admitted to hospital 10 per cent died, and over 60 per cent had the boil on the upper lip. He remarks that a facial furuncle is initially no more serious than any other kind, but that as the facial muscles, which are attached to skin, become irritated reflexly, boils on the face are not allowed to rest, and so are easily extended into the canine fossa or into the inner angle of the orbit. Infection spreads by the veins, with or without thrombosis and phlebitis of the larger ones, the lymphatics have little to do in this respect. An unfavourable course is indicated by severe septic phenomena, with progressive thrombosis of the larger facial venous trunks, and formation of metastatic abscesses in the lungs, heart muscle, and kidneys. Moriau adds that for such cases no treatment expectant or operative, avails at all—the infection is too strong. The metastases may be fatal some time after the original boil has healed. In milder cases the most important thing is to keep the inflamed tissues at rest, silence must be enjoined and only liquid food be taken.

347 Diaphragmatic Hernia.

C. A. HEDBLON (*Journ. Amer. Med. Assoc.*, September 20th, 1925, p. 947) reports on the study of 378 cases of diaphragmatic hernia in which operations were performed. In about two-thirds of the civilian patients in whom the etiology was established the hernias were due to a penetrating wound or to rupture of the diaphragm by sudden increase in the abdominal pressure. In a large number of cases the diagnosis was unsuspected until the operation, though the symptoms had been present for many years. Hedblom suggests that a history of a penetrating wound of the lower thorax, of crushing, of collision, or of a fall, should give rise to the suspicion of diaphragmatic hernia in cases in which the diagnosis is doubtful. For differential diagnosis he recommends radiography of the thorax after administration of an opaque substance in a meal, though this examination may fail if there is a spontaneous temporary reduction or a failure of the opaque substance to enter the extruded portion. An exploratory operation is recommended after a positive diagnosis, even if the symptoms are slight, since very often obstruction develops, this complication more than doubles the post operative mortality, and limits the possibility of rupture of the hernia, necessitating secondary operations. Exploratory laparotomy is preferable if the cause of the obstruction is doubtful or has been shown to be parasternal. In cases due to a recent wound, with prolapse of omentum through the hernia, thoracotomy provides the most direct approach, and may be combined with a transdiaphragmatic exploration for injury to the abdominal viscera. In ordinary cases thoracotomy has yielded a somewhat lower mortality than laparotomy, and a larger proportion of successful closures. In more than 90 per cent of the patients operated upon no sac was present, thus obviating the objection that thoracotomy carried the risk of the development of an operative pneumothorax. Hedblom recommends the suture of the hernial ring if possible, since covering the hernial opening with an abdominal viscus has frequently resulted in recurrence of the hernia. A few large or recurrent hernial openings have been successfully closed by fascial or muscle transplants. After the operation, whether by thoracotomy or laparotomy, the air should be aspirated from the pleural cavity after this has been closed. Recurrences following rupture of diaphragmatic hernias were reported in about 5 per cent of the cases. The operative mortality was mainly due to the lateness of the operation in the presence of obstruction, to shock, and to respiratory failure.

Therapeutics.

318

Treatment of Rickets

S ROSENBAUM (*Monatsschr f Kinderheilk*, September, 1925, p 547), who remarks that it is particularly difficult to determine the success of treatment in rickets, selected as a criterion the occurrence of calcification in the long bones, which were examined at fortnightly intervals by skiagrams of the extremities. He examined 30 children, whose ages ranged from 12 to 20 months. Each method was tried on three or four patients, the duration of the trial being twenty-eight days. During this period the most successful treatment—namely, the mercury vapour quartz lamp—always produced calcification. The Hanau or Jesonek lamp, employed daily until marked pigmentation was obtained, invariably caused definite calcification after twenty-eight applications, and in half the cases at the end of a fortnight, the result corresponding with those obtained by Hildschinsky and most of the other observers. As soon as any other method proved inefficient, irradiation with the mercury vapour quartz lamp was applied to determine whether the case would respond at all to treatment. Mechanical stimulation of the skin by the combination of mustard plasters, massage, and gymnastics failed to cause calcification within twenty-eight days. Normal sunlight applied by exposure ranging from ten minutes to an hour proved efficacious, though it was not so satisfactory as the mercury vapour quartz lamp. Injection of blood which had been irradiated by the quartz lamp had no effect in the four cases in which it was tried, although twenty-eight intramuscular injections in doses of 5 c.c. were given. Rosenbaum comes to the conclusion that at present the mercury vapour quartz lamp is the only cure for rickets which is liable to be effective in a relatively short time, apart from natural sunlight, the therapeutic and prophylactic properties of which are limited by climatic conditions.

349 Glucose in the Treatment of Hyperemesis Gravidarum

P TITUS (*Journal Amer Med Assoc*, August 15th, 1925, p 488) gives directions for the procedure of treating hyperemesis gravidarum by glucose. He maintains that the therapeutic dose for an adult of average size is 50 to 75 grams, and that smaller doses than this are without effect. The substance must be chemically pure, and be given in a hypertonic solution, preferably about 25 per cent. Single injections are said to be safer than a continuous flow, but they should be repeated about two or three times daily. Titus reports favourable results in a series of 328 cases of hyperemesis treated by such intravenous injections or by a diet very rich in carbohydrates. He believes that glucose administration gives rest to the liver action and promotes the storage power of the hepatic cells, while at the same time it remedies the carbohydrate deficiency in the body which Titus believes to be the cause of the hyperemesis. He has not obtained any benefit from a combination of insulin and glucose treatment.

350 Prophylactic Treatment of Measles and Scarlet Fever

J BRATTER (*Polska gazeta lekarska*, September 13th, 1925, p 788) reports very favourable results obtained by prophylactic milk injections in patients exposed to infection from measles or scarlet fever. In 6 cases measles is believed to have been prevented by two injections of 1 to 2 c.c. of milk at intervals of five days in children of the ages of 19 months to 10 years, whilst in 14 other cases scarlet fever was similarly averted. Bratter adds that this prophylactic therapy is to be preferred to the correlative treatment of infectious diseases by parenteral administration of proteins.

351 Treatment of Syphilis by Bismuth

E MATEESCU (*Paris Med*, September 19th, 1925, p 233) gives an account of the treatment of 342 cases of syphilis in all stages by a combination of arsenic and bismuth named "bismysol" which he refers to as a new preparation. He states that this remedy is non-toxic, does not give rise to complications, and causes no local reactions of any kind, while removing syphilitic symptoms and converting a positive Wassermann reaction into a negative. Starting with an initial dose of 10 cg., he increases it rapidly until an amount of 10 to 15 grams has been given, without any unpleasant phenomena resulting, even in the most severe cases. Mateescu reports that in his cases the temperature remained normal, and, though polyuria occurred, no albumin was present or evidences of renal infection. No digestive trouble followed, even in the treatment of syphilis of the nervous system, when large doses were employed. In no case did the positive Wassermann reaction reappear after treatment, and no return of the disease was found though re-examinations were made at intervals of six months. The number of injections given to each patient was between fourteen and

twenty-four. Stomatitis only occurred in 10 per cent of the cases, and was severe in one only of these, in which there was an additional infection with fusiform bacilli. Mateescu gives short reports of six cases to illustrate his conclusions.

352. Calcium and Potassium Chloride in Arterial Hypertension

W L T ADDISON and H G CLARK (*Canadian Med Assoc Journal*, September, 1925, p 913), as the result of treating 45 patients, report that calcium and potassium chloride will produce a decided fall in blood pressure in a large percentage of cases of hypertension, with corresponding improvement of the patient's symptoms. The dose of calcium chloride ranged from 90 to 180 grains daily, and blood pressure readings were taken each week. If at the end of a month no fall in pressure had occurred potassium chloride in the same doses was substituted for calcium chloride. All the patients had an initial systolic pressure of 170 mm. of mercury or more, and the diastolic pressure ranged from 84 to 152. Of the 45 patients so treated, 26 reacted well with calcium chloride, and 6 with potassium chloride, the blood pressure being reduced and oedema disappearing. The results were better during the summer than in the winter. The main objection to calcium chloride was the gastro-intestinal disturbance, but it was found that a glass of milk taken after the calcium chloride relieved this. There appeared to be some slight possibility of producing symptoms of an inorganic acidosis, and the authors, therefore, insist that these salts should not be taken except under medical supervision.

353 Medicinal Use of Oxygen

C W GREENE (*Journal Amer Med Assoc*, August 29th, 1925, p 645), in a critical discussion of the value of oxygen in health and disease, states that air containing more than 60 per cent of oxygen may produce pulmonary inflammation by local action. He considers that oxygen administration has no physiological or clinical value in cases of haemorrhage, anaemia, or circulatory deficiencies, but that it may save life in pulmonary obstructions, oedemas, or other conditions in which the process of oxygen absorption is retarded, or the haemoglobin saturation of the pulmonary blood is incomplete. The experiments of Stadie with an oxygen chamber in grave cases of pneumonia showed how rapidly all symptoms could be alleviated, and also that there is a close correspondence between the blood oxygen content and the degree of respiratory and circulatory stress. In devising methods of giving oxygen Greene points out that face masks should be avoided, and the patient surrounded by an atmosphere enriched with oxygen. This can be effected by oxygen chambers, and, in ordinary practice, by tent devices. By experimental work Greene claims that it has been shown that in nitrous oxide anaesthesia the degree of anaesthesia depends less on the presence of nitrous oxide than on the deprivation of oxygen with its consequent action on the nervous system.

354 Dochez's Scarletinal Antitoxin

C L THENEBE (*Boston Med and Surg Journal*, September 10th, 1925, p 497) states that since his previous paper on this subject (*Epitome*, August 22nd, 1925, para 136) he has used Dochez's scarletinal antitoxin in 42 additional patients, with results similar to those previously recorded. In 32 cases the antitoxin was given intravenously and in 10 intramuscularly. There were no deaths. No patient who received unconcentrated antitoxin intravenously developed a chill; 7 had a chill, 5 of whom had concentrated antitoxin intravenously and 2 intramuscularly. Two received intramuscularly concentrated and unconcentrated antitoxin respectively, these two patients were both sensitized to horse serum when the injection of antitoxin was given. Fifteen of the 42 patients developed serum rashes 8 of them having had serum intravenously and 7 intramuscularly. The serum sickness was in some instances extremely severe. Thenebe's conclusions are as follows: (1) Unconcentrated antitoxin is the safer procedure for intravenous administration. (2) Concentrated antitoxin is the safer procedure for intramuscular administration. (3) The earlier the antitoxin is administered, the dosage being adequate, the less the incidence of complications. (4) Intravenous injection of antitoxin causes the earliest fall in temperature. (5) The quantity of antitoxin administered does not seem to affect the incidence of a chill or the development of a serum rash. (6) Further study is needed to prove the presence of bactericidal properties in the antitoxin, the serum probably representing an antitoxin only.

355 Ether in the Treatment of Asthma

S FAZIO (*Stadium*, September 20th, 1925, p 276) states that ether acts principally on the respiratory system and is eliminated like all volatile substances, by the respiratory tract. This suggests that its action is twofold—namely, partly on the pulmonary parenchyma and the respiratory

mucous membrane with which it comes in contact, and partly on the nervous system as shown by the sleep which it causes when given in large doses. Although the cause of the disease is obscure the author thinks it probable that asthma is due to a deep seated anatomical change in the alveoli or bronchial mucous membrane. He recommends that either should be given in asthma as in whooping cough, not by inhalation, when it would be diluted with air and therefore only superficial in its action but by intramuscular injection, the dose varying according to the age of the patient.

Radiology.

3.5 Radiological Diagnosis of Pulmonary Malignancy

P. KEELEY (*Brit Journ of Radiol*, September, 1925, p 333) remarks that, while the possibility of making a correct diagnosis in pulmonary malignancy from the clinical symptoms is poor fairly characteristic pictures can be obtained by radiography. He suggests the following classification while admitting the impossibility of distinguishing between benign and malignant growths or between carcinoma and sarcoma, from the x-ray plate. Primary sarcoma and non-malignant growths are, he adds, so rare in comparison with primary carcinoma that the matter is not of great importance. He describes six types of pulmonary neoplasms. The first type is the pneumonic form of bronchial carcinoma in which the affected lobe appears as a moderately dense shadow, which is invariably sharply limited by the interlobar fissure. The shadow is rarely dense enough to obscure that of the ribs, and lessens in intensity towards the apex and the lateral wall thus distinguishing it from tuberculosis which is, however, invariably present as a complication. His second type is the hilum form of bronchial carcinoma. In this the hilum is very dense and five or six times its normal size. It appears as a semicircle from which fine greyish wavy striations pass into the lung like a woolly infiltration. His third type is the nodular form of bronchial carcinoma in which large, rather sharply outlined, nodules appear on one side of the thorax, communicating with the hilum by thin or thick dense shadows. The fourth type is the cavernous which though exceedingly rare, should be suspected if one large solitary cavity in one lung is present. Fine striations may be seen running from it to the hilum. The fifth type is the metastatic in which the deposits may be isolated or disseminated. Finally, in disseminated carcinomatosis of the lungs the nodules, if of lymphogenous origin, appear a little larger than ordinary tubercles, and are arranged in relation to a fine network structure over both lungs. In sarcomatosis the nodules are large and the netlike lymphatics do not appear.

357 The Deglutition Method in Bronchial Skiagraphy

While studying the radium treatment of oesophageal carcinoma K. NATHAN and M. SEGALITZER (*Zentralbl f Chir*, July 11th 1925 p 1534) encountered a case in which after preliminary local anesthetization of the pharynx and larynx the patient swallowed a suspension of barium, and it was found that the liquid had entered the trachea and larynx instead of the oesophagus. The entire bronchial tree became visible, but the fluid was coughed up immediately by the patient and no complication followed. Local anaesthesia had abolished the laryngeal reflex, producing a transient paralysis of the laryngeal muscles. In other cases similar results were obtained owing to an ulcerating oesophageal carcinoma perforating the trachea but the filling of the bronchi was never followed by aspiration pneumonia or any other untoward result. The authors therefore recommend the following method of filling the bronchial ramifications with a barium suspension or lipiodol solutions. After thorough disinfection of the teeth and mouth a swab of cotton wool, saturated in a 10 to 15 per cent cocaine solution, is applied to the pharyngeal wall and glottis by long curved forceps. When anaesthesia is complete the patient is placed behind the fluorescent screen and slowly swallows the lipiodol or other solution. In most cases the fluid passes directly into the trachea and thence into the bronchial tree, and when in sufficiently small quantities can be seen entering the bronchioles. By adjusting the position of the patient the flow can be guided to any part of the lung desired. The authors add that when the fluid is introduced cautiously it seldom causes irritation and coughing during the examination though shortly afterwards the greater portion is coughed up, a little fluid may remain in the alveoli but will be finally absorbed. The authors claim that this method is widely applicable is not followed by any serious ill results, and that by watching the filling of the bronchi the flow of liquid can be directed and stopped as required.

358 X-Ray Treatment of Infected Tonsils and Adenoids
J. H. WESLEY (*Journ of Radiol*, June, 1925, p 221), who records ten illustrative cases in patients aged from 8 to 52, remarks that very many people object to surgery for the removal of tonsils, but readily consent to x-ray treatment as it is painless and leaves the throat in a normal condition instead of inducing the state of chronic pharyngitis following an operation. Patients past middle life and those debilitated by some chronic intercurrent disorder such as valvular disease with loss of compensation, arterio-sclerosis, diabetes, nephritis, gout, and advanced forms of rheumatism, are unsuitable cases for operation and are successfully treated by x-rays. The object of x-ray treatment of infective tonsils is the complete removal of all diseased tissue from the throat, leaving the parts in their normal condition and with permanent relief from the disease. During the last two years Wesley has treated a number of cases of infected tonsils by x-rays with good results. Most of the recurrent cases have been in children, probably on account of the large amount of lymphoid tissue in the tonsils of younger subjects and the consequent poor contraction of the fibrous stroma. Eight applications were given, with an interval of a fortnight between them.

Ophthalmology.

359

Cysts of the Iris

R. E. WRIGHT (*Brit Journ Ophthalmol*, September, 1925, p 454) describes a method of dealing with a cyst of the iris which he employed with great success in the case of an Indian woman. From a study of the literature of the subject he came to the conclusion that the great difficulty in dealing with these cysts was to get rid of the cells lining the cyst in their entirety. He decided that if he could fill the cyst with pure carbolic acid and then wash it out again he would accomplish his object. This he proceeded to do in the following manner. Two sharp syringe needles, one slightly larger in bore than the other were introduced into the cyst from opposite directions subconjunctivally. The needle with the smaller bore was connected with a syringe filled with normal saline solution. The one with the larger bore was connected with a syringe and the contents of the cyst were aspirated by means of it. The syringe was then detached from the needle, filled with a few minims of pure carbolic acid, and reattached the carbolic acid was thus introduced into the cyst. Then saline solution was introduced into the cyst by means of the syringe attached to the needle with the smaller bore and the carbolic acid was removed by the other syringe. This procedure was repeated several times until there was no more carbolic acid in the cyst. The needles were then withdrawn, syringes washed and a pad and bandage were applied and six months later the cyst had completely disappeared.

350 Acute Dacryodermatitis caused by Focal Infection

M. L. FOSTER (*Arch Ophthalmol*, September, 1925, p 450) describes a case of acute dacryodermatitis, a somewhat rare condition, the etiology of which is usually not very clear. In the present case, however, it would appear that the teeth were quite definitely to blame. A man, aged 27, woke one morning with intense pain in the left eye. On the bulbar conjunctiva two red vascular bands were found, which extended upwards and outwards to the fornix. On exerting the lid a red tender mass presented in the region of the accessory lacrimal gland. Hot fomentations were applied, and during the next few days the pain and swelling subsided. On the sixth day, however, a relapse occurred. An x-ray photograph of the teeth revealed abscesses at the roots of the two left upper incisors. These were extracted and a remarkably rapid improvement in the condition of the eye followed. There was no recurrence.

351

Sclerotic Scleritis

S. B. MURKIN (*Amer Journ Ophthalmol*, August, 1925, p 630), describes a case of this condition in which the unusual factors were the length of time the iron had remained in the eye before removal. The marked sclerotic changes which had occurred the successful removal of the foreign body after great difficulties, and the remarkably good visual recovery of the eye. The condition had been unrecognized from the first, and it was not until four months after the date of injury that an x-ray photograph was taken revealing the cause of the trouble. Extensive degenerative changes had taken place in the eye and the foreign body was so firmly encapsuled that it would not respond to a giant magnet. Eventually it was removed by means of a scleral opening and the introduction of a small hand magnet. The patient's vision is now 20/40, and is stated to be improving.

Obstetrics and Gynaecology.

352

The Ovarian Hormone

S LOEWE (*Zentralbl f Gynaekol*, August 1st, 1925, p 1735) ranges himself with those who believe that it is possible to prepare from the ovary a hormone having specific effects on the female genital organs, he also furnishes an explanation for the scepticism with which clinical observers have regarded the results of administration of tablets of dried ovarian substance. Experimenting on mice, rats, and guinea pigs, he has confirmed the finding of Doisy and Allen that subcutaneous injection of ovarian extracts into castrated female animals produces an oestrus which lasts from one to five days, according to the dose, and the intensity of which is susceptible of fairly accurate measurement by microscopical examination of secretion withdrawn from the vagina. Other results of the injection are an increase in size of the genitalia of young animals and an increase in size of the nipples in the male. These three signs constitute, according to Loewe, a triad whose presence is essential as evidence of activity in ovarian extracts. He has found that oral administration also of ovarian extract constantly induces the phenomena described, the dose required, however, is twenty times greater than for subcutaneous administration. Taking into consideration the body weights of man and of the laboratory animals which he has used, Loewe calculates that to secure a marked therapeutic effect in the human subject would necessitate the administration of about 250 grams of dried gland, corresponding to enormous numbers of the ordinary tablets of commerce. Ovarian extracts from one animal are effective when injected into other species. The hormone appears to be present in small amounts in the circulating blood of the human female. ZONDEK and ASCHHEIM (*ibid*, p 1701), in a report to the Vienna Gynaecological Congress of June 1925, describe a series of experiments in which portions of animal and human ovaries were transplanted between the thigh muscles of castrated mice. The action of the ovarian hormone was indicated by the occurrence of oestrus. They report that the hormone is absent from the germinal epithelium, the stroma, and the primary follicles, but present in the mature follicle and its fluid. The hormone is demonstrable up to the time of menstruation but is absent from the post-menstrual corpus luteum. The noteworthy finding was made that the hormone, far from being in abeyance, was present in increased amounts during pregnancy. Oestrus in the mouse occurs after implantation of human as well as of animal ovary. Implants of liver, spleen, pituitary, thyroid, thymus, parathyroid, and suprarenal substances had negative results, the hormone appeared to be present, however, in human placenta.

353

Menstrual Crises in Pregnancy

G REVELLI (*Riv d'Ostet e Ginecol Pratica*, August, 1925, p 349) reiterates the suggestion, formerly advanced by Bossi and others, that during pregnancy, at times corresponding to the suppressed menses, general and local (uterine) phenomena occur which are due to ovulation, and which are of importance in connexion with medical supervision of the early months of gestation. Clinical evidence of the continuance of ovulation during pregnancy is found in cases of coexisting uterine and extrauterine gestations of different ages, in the continuance of menstruation during pregnancy in one horn of a bicornuate uterus, and in the fact that in a certain number of cases of uterine pregnancy a menstrual flow occurs during the early months before decidua fusion is complete. Revelli believes that careful inquiry would show that the earliest signs of abortion appear (as in a number of cases recorded in the present paper) on a day exactly corresponding with that on which in the absence of pregnancy menstruation might have been expected to commence. He states also that even when there is no foetal danger it is not uncommon for pregnant patients to experience, beginning on the day of the suppressed menstruation, pains in the lower abdomen accompanied by an aggravation of the vaginal discharge of pregnancy. At this time the contractility of the uterus is increased, and fatigue or coitus is especially dangerous. The practical conclusion to be drawn is that, alike in the interests of foetus and mother, it is important to enjoin repose during these "menstrual crises."

354

Degeneration of Uterine Fibromyomata

L SEED (*Surg, Gynecol and Obstet*, September, 1925, p 333) finds that gross degeneration occurs in about 13 per cent of uterine fibromyomata. During the year 1923, 200 cases of such gross degeneration were studied, and it was classified as hyaline in 24 cases, oedematous, cystic, or myxomatous in 80, red degeneration with total necrosis in 33, calcification in 39, infected, subserous, and interstitial in 3, and

submucous in 13. In 5 cases there was a thrombotic sinus, 1 was tuberculous, and 2 fibroepitheliomatous. Seed states that oedematous, cystic, and myxomatous degenerations are all part of the same pathological process, which is probably due to a gradual diminution in the blood supply. He found no special clinical symptoms in these cases. "Red degeneration" is the term he applies to an aseptic necrobiosis characterized by fatty degeneration, thrombosis, and extravasation of red blood cells and pigment. He adds that the condition is a "red infarction" due to a sudden complete vascular obstruction, chiefly of the venous system, and ending in fatty necrosis. In these cases local pain and tenderness were found, together with a mild toxæmia, but the occurrence of symptoms depends on the size of the tumour and the acuteness of the necrosis. Calcification occurred in two forms—namely, peripheral decomposition in a totally necrotic fibromyoma, and a homelike formation scattered through the tumour. The author adds that there is little evidence that the degeneration of fibromyomata has any toxic effect on other organs.

355

Absorption from the Vagina

G D ROBINSON (*Journ Obstet and Gynaecol of the British Empire*, Autumn Number, 1925, p 496) describes an investigation designed to provide experimental evidence as to whether the human vagina possesses the power of absorption. He finds definite evidence that potassium iodide and sodium salicylate are rapidly absorbed and are found in the urine one hour after being placed in the vagina. Quinine, cane sugar, and phenol red were similarly absorbed from the vagina and excreted by the kidneys, though the process was less rapid. In the case of glucose it seemed probable that absorption occurred, but that oxidation was so rapid that its detection was rendered impossible. Methylene blue was apparently not absorbed, or only in very small quantities. Clinical evidence of the absorption of quinine was also obtained.

356

Corrosive Sublimate Poisoning by the Vagina

C HOLTERMANN (*Zentralbl f Gynaekol*, September 19th 1925, p 2133) has found records of ten cases of poisoning by corrosive sublimate introduced in tablet form into the vagina. Amounts varying from 0.25 to 3 grams, inserted as anteconceptional, antisyphilitic, or abortifacient measures, or in one case accidentally, proved lethal (in from one to three weeks) in seven of these cases. Local necroses and ulcers were invariably present, especially in the posterior vaginal wall, in two cases they were so extensive as to lead respectively to vaginal colic fistula and to sloughing of the uterus. The symptoms of mercurial poisoning from the vagina do not differ from those of poisoning from the stomach or uterus or from intravenous injection, they consist chiefly of nephritis, stomatitis, and haemorrhagic colitis, with terminal uræmia. Since the poisoning is due to absorption of mercuric albuminate from the necrotic patches, immediate removal from the vagina of any remains of the tablets is of great importance, apart from local clearings of the mouth and vagina, treatment is in general expectant, although intravenous injections of grape sugar solution have been recently recommended. In a case described by Holtermann half of a 1 gram tablet was inserted in the morning, and tenesmus, diarrhoea, and melæna occurred the same night. Albumin was found in the urine on the second day, stomatitis and gingivitis were noted on the sixth day, and the patient, who had herself douched the vagina with salt solution at the appearance of the first symptoms, had completely recovered in three weeks.

357

Intraperitoneal Haemorrhages of the Non pregnant Uterus

A SOLMARU (*La Gynecologie*, September, 1925, p 509) states that it is now admitted that apart from ectopic pregnancy, there are other intraperitoneal haemorrhages of genital origin that occur in women. These haemorrhages can flood the peritoneal cavity or form ante or post uterine haematoceles. The pathological conditions of the uterus which produce them may be congenital, traumatic neoplastic simple, inflammatory (acute or chronic), or specific inflammatory such as those of syphilis and tuberculosis. The commonest cause of tubal haemorrhage simulating extrauterine pregnancy is, according to Solmaru, ordinary chronic inflammation constituting a haemorrhagic pyelitis. Rupture of the tubes results in intraperitoneal haemorrhage which may flood the peritoneal cavity, but much more often, indeed nearly always, collects in the form of a haematocele. The differential diagnosis from ectopic pregnancy is impossible clinically; it can only be made by a thorough microscopical examination of all the uterine and ovarian elements, and also of the clots and membranes, with multiple sections, to exclude the presence of foetal and placental fragments.

Pathology.

368 Action of Radium Emanation on Tetanus Toxin

R FERROUX and S MUTERMILCH (*C R Soc de Biologie*, August 14th, 1925, p 608), exposed tetanus toxin to the various emanations from radium, and estimated the dose of each of these that was necessary to destroy its toxicity. The particular toxin used was one containing 10,000 minimal lethal doses for a mouse of 15 to 20 grams. The toxin was submitted to the action of the rays, then diluted a thousand times, and 1 cc of this dilution—that is, 10 M L D—was injected into one of the hind feet of a mouse. A control mouse was injected with the same dilution of a non irradiated toxin. Having determined that the toxin could be destroyed by radium, they examined the action of each of the different emanations—alpha, beta, and gamma. The total amount of radiated energy was measured by the quantity of emanation destroyed during its action on the toxin, and was expressed in millicuries or in microcuries. First the action of the beta and gamma rays together was studied. It was found that to alter the toxin so that a 1 in 1,000 dilution was no longer fatal to a mouse 0.9 millicurie was required for an exposure of twenty four hours, or 0.6 to 0.7 millicurie for an exposure of forty eight hours. The gamma rays acting alone were successful in a dose of 9 millicuries after forty eight hours. The alpha rays acting practically alone were successful in a dose of 15 microcuries after forty eight hours. Further work showed that the longer the time during which it was allowed to act the less was the dose of emanation required. The greater the concentration of the toxin, the greater was the amount of emanation required. Thus to destroy the toxin at 1 in 1,000 required 0.9 millicurie when beta and gamma rays were acting together, to destroy the toxin at 1 in 500 more than 1 millicurie was required, and for the more attenuation of the pure toxin 9 millicuries were required. In another paper in the same issue (p 611) S Mutermilch and R Ferroux state that they found it impossible to destroy the toxic group without simultaneously destroying the antigenic group of tetanus toxin. Radium would therefore seem to differ from the majority of physical and chemical agents, which usually act first by destroying the toxic group and leaving the antigenic group intact.

339 Experimental Achylia

K GLAESSNER (*Klin Woch*, August 20th, 1925, p 1635) states that the diminished secretion of acid and ferments in the stomach associated with an acute febrile disease has long been known, as is shown by Beaumont's observations on the stomach of Alexis St Martin in 1835. The question arises whether the diminution of gastric secretion is due to fever or to toxic causes. Clinical experience shows that gastric secretion may be unaffected in spite of the presence of high fever, as in many cases of malaria, septicaemia, and typhoid fever, while, on the other hand, no febrile morbid processes, such as chronic nephritis, may reduce gastric secretion. Glaessner has recently carried out a number of experiments to determine whether it is possible to influence gastric secretion by intravenous injections of bacterial toxins such as typhoid vaccine, gonococcal vaccine and tuberculin or by chemical agents such as nuclein, phlogetan, and vaccineum. He found that fever alone did not produce any definite change in gastric secretion, as was shown by injection of nuclein, vaccineum, and phlogetan. Gonococcal vaccine produced a slight effect, although no fever occurred. On the other hand, typhoid vaccine and tuberculin were extremely active, the effect lasting in the case of tuberculin for weeks, and in the case of typhoid vaccine soon diminishing.

370 Endocrinology of the Corpus Luteum

G SCHICKELE (*Gynecol et Obstet*, August, 1925, p 97) finds that before puberty and during pregnancy the Graafian follicles remain underdeveloped, but nevertheless control calcium and carbohydrate metabolism. The changes of puberty are set up when the internal secretion of the ovary is established. This is attributed to the elements of the growing follicle, as are the phenomena of rut in animals. In the rabbit it has been found that the early stages of pregnancy cannot go on in the absence of the corpus luteum. Schickele does not, however, consider it probable that the retrogressive changes following non conception in the lower animals or menstruation in primates depend upon the later evolution of the corpus luteum, although coinciding with it. The thecal glands also attain their maximum size during pregnancy, and shrink in the non gravid female and it is possible, the author thinks that these and other follicular elements may act by interplay. He maintains that Intermittent opotherapy is working in the dark, because the active principle of the corpus luteum remains unisolated.

774 F

371 The Serum Flocculation Reaction after Hydrotherapy

Z GORECKI and P DEMANT (*Polsha gazeta lekarska*, September 27th, 1925, p 831) have investigated the flocculation of the blood serum in 38 cases of different diseases, before and after the patients had been submitted to such therapeutic measures as cupping, enemas, and baths. They found that none of these treatments caused flocculation of the serum in patients whose colloidal balance had been stable previously. They report that this balance, however, may be easily disturbed by such treatments in cases where this disturbance is known to have occurred previously, the equilibrium being restored in mild cases, while in serious ones the disturbance will be increased.

372 The Serological Specificity of Pneumococci

In a previous paper Avery and Heidelberger showed that in the cellular substance of the pneumococci there were two bodies present—one a carbohydrate and the other a protein, both being intimately concerned with the serological specificity of the organism. O T AVERY and H J MORGA (*Journ Exper Med*, September, 1925, p 347) now report further work on these bodies. They show that from pneumococci of Types 1, 2, and 3, three different polysaccharides can be isolated, each chemically distinct and serologically type-specific. These non protein substances, though they react in very high dilution with serums prepared from whole pneumococci, are quite unable to give rise to antibodies on injection into animals. Besides the polysaccharides, it is also possible to extract a nucleic protein. This substance, when injected into animals, gives rise to a serum which contains neither type specific agglutinins nor precipitins. In fact, it fails to react either with the extracted polysaccharide or with whole pneumococci. But when added to nucleic protein extracted from either of the three types, or from type 4, it forms a precipitate. In a subsequent paper O T AVERY and J M NEILL (*ibid*, p 355) state that they have found that a serum containing agglutinins for the homologous type and precipitins for the type specific carbohydrate can only be prepared by the injection of whole cocci. If the organisms are broken up in any way so that the protein is devoid of formed elements, and then injected into animals, the resulting serum is devoid of type specific antibodies, it contains merely a non specific protein precipitin. It is concluded that in the whole cell the specific carbohydrate substance must be joined in some way with another body which confers antigenic properties upon it. With rupture of the cell this linkage is broken, so that the free carbohydrate fraction, though still retaining its property of reacting with type antibody, is itself no longer capable of initiating the formation of this same antibody.

373 The Function of the Great Omentum and Peritoneum

W GORDSCHMIDT and W SCHLOSS (*Monatsh Klin Woch*, September 10th, 1925, p 1006), having observed that in laparotomies a fluid in young persons a clear fluid frequently appears in the omentum in the course of the operation, examined twenty healthy dogs for the presence of this phenomenon, thirteen were puppies and seven adult animals. All the puppies, on some of which laparotomy was performed several times, showed a secretion of omental and peritoneal fluid, while none of the seven adult animals yielded any appreciable amount of omental or peritoneal fluid, although some underwent repeated laparotomies. The fluid obtained was tested for its bactericidal and phagocytic properties as well as for its digestive action on gelatin, smears were also made of the surface of the omentum for cytological examination. The results were as follows: (1) While the omental fluid possessed hardly any bactericidal power, the peritoneal fluid had a distinctly bactericidal action, though it might not be developed until after the third laparotomy. All the cases in which the peritoneal fluid showed a bactericidal action after the third laparotomy were in dogs which at this stage did not have any omental secretion. (2) After the first laparotomy, and still more after the second, the omental fluid showed an active phagocytic action, which was also present, though in a less degree, in the peritoneal fluid. After the third laparotomy the phagocytic action of the omentum began to decline, while that of the peritoneum increased. (3) The digestive action of the omental fluid reached its height after the second laparotomy, whereas the peritoneal fluid did not appear to possess any digestive power. (4) A smear of the omentum directly after it had been exposed showed firm threads almost exclusively some time later polymorphonuclear leucocytes appeared and a few large lymphocytes with pale protoplasm and a deeply staining rounded nucleus. Subsequently the polymorphonuclear leucocytes disappeared. It is stated that the significance of these findings will be discussed in a subsequent paper.

Medicine.

374 Acute Polymyositis with Polyarthritides

II SAETHRE (*Norsk Mag f Laegevid*, September, 1925, p 966) records a case, in a girl aged 16, of Heine Medin's disease in which the usual type of peripheral motor paralysis was combined with joint affections and severe and persistent spontaneous pain in the limbs. The patient was admitted to hospital five weeks after the sudden onset of complete paralysis of the lower limbs and marked paresis of the right hand, especially affecting the thumb. During the first week of the disease there had been moderate fever. On admission to hospital there was complete paralysis of both lower limbs apart from very slight flexion of the fourth and fifth toes of the right foot, with hypotonus, reaction of degeneration in the muscles, and loss of the tendon and cutaneous reflexes. There was weakness of the lower abdominal muscles and right triceps and pronounced paresis of the right hand with marked atrophy of the intrinsic muscles. There was no affection of the cranial nerves apart from very slight horizontal nystagmus. Superficial sensation was quite normal. There was excessive hyperaesthesia on deep pressure on the paralysed muscles. There was marked stiffness of the neck and upper part of the dorsal vertebral column with tenderness of the spine. There was no paresis of the cervical or dorsal muscles. The right elbow and right hip joint were swollen, and passive movements were very painful and limited to a few degrees. The proximal joint of the right thumb could not be moved passively, and the joint line was very tender on palpation. Both shoulder joints and the right knee were slightly affected. The patient complained of spontaneous pain of a continuous boring character in the right thigh and leg. The Wassermann reaction was negative in the blood and cerebrospinal fluid. Under salicyl medication the joint affections gradually improved and disappeared in nine to ten weeks after the onset, but the spontaneous pain lasted for seven months and often needed narcotics. The motor paralysis showed no improvement. Saethre regards the unusual symptoms as attributable to a meningeal affection and the joint manifestations as of haematogenous origin and due to the virus of poliomyelitis. The possibility of a spinal form of epidemic encephalitis had also to be considered.

375 Diagnosis of Lead Poisoning

F. HEIN DE BALSAC, E. AGASSE LATONT, and A. FEIL (*Presse Méd*, September 19th, 1925, p 1249), in view of the importance of accurate and early diagnosis of lead poisoning, especially in cases of "latent plumbism," when local symptoms are present but the patient's general health is as yet unaffected, discuss the three classic signs of plumbism: the "blue line" at the margin of the gums, haemophilia, and the presence of lead in the urine. In a previous report by two of the present authors (*Epitome*, August 4th 1923, part 90) the value of the blue line was stressed, but the authors now state that it is generally considered to be an uncertain sign, while the detection of basophil erythrocytes and of lead in the urine requires special apparatus and technical skill. Teleky stated in 1923 that weakness of the extensors of the fingers and wrists was an early and reliable sign of plumbism, especially when the weakness was unilateral. The present authors find, however, that there are many factors, such as osteoarthritis and prolonged heavy manual labour, which may vitiate the results, and that "Teleky's sign" is unreliable. This sign was absent in 58 per cent of patients with a blue line and in 27 per cent of those who had lead colic. They conclude, therefore, that the most valuable sign of lead poisoning is the presence of haemophilia, and they recommend periodical systematic examination of the blood of all workers in lead.

376 Malaria in Italy

A. LUSTIG (*Rev Sud Amer de Endocrin*, etc, August 15th, 1925, p 503) states that 12 per cent of the population of Italy (37,276,378 in 1923) are resident in malarial zones, and are therefore exposed to infection. A study of the mortality shows that 490 per million died of malaria in 1909, before the legislation relating to quinine (1900-1) while the subsequent mortality declined until it reached 57 per million in 1914. During the war period, and especially during the outbreak of influenza, there was a recrudescence, the mortality being 237 and 325 per million in 1917 and 1918 respectively. On the cessation of abnormal conditions the death rate fell to 78 per

million in 1923. The malarial mortality is not uniform throughout Italy, but two distinct districts may be distinguished in this respect—namely, one in the north and centre, where the disease is mild, and the other in the south and islands, where it is severe. The region most severely affected is Sardinia, where the campaign against malaria has been less successful than elsewhere. The incidence of the disease is best shown in the army and staff of the State railways, where prophylactic measures are carefully carried out and accurate statistics are most likely to be obtained. In the army the number of cases fell from 41.93 per cent in 1900 to 3.77 per cent in 1914, and the number of primary cases was reduced from 36.25 to 2.79 per cent during the same period. In the State railways staff improvement was shown by a fall from 24.65 per cent in 1906 to 6.03 per cent in 1914, the incidence of the primary cases falling from 6.47 to 0.38 per cent during the same period. The decline of malaria in Italy may be attributed to various factors, especially to drainage of swamps, social welfare schemes, economic improvement in the rural population, and appropriate legislation. In this connexion the following statistics are of interest. The consumption of quinine has increased from 188 g per 1,000 inhabitants in 1903-4 to 632 g in 1922-23. The subsidies voted have increased from 90,210 l in 1905-6 to 2,751,000 in 1923, and the amount spent on drainage at the beginning of 1920 has risen to 500 million lire.

377 Syphilis diagnosed as Tuberculosis

E. LIEK (*Klin Woch*, September 24th, 1925, p 1872) believes some of the successes of modern tuberculous therapy, in which iodine often figures largely, to be due to the fact that some of the patients are suffering from syphilis, and recalls Calot's finding at Betch sur Mer that out of 347 children sent in as cases of bone or joint tuberculosis, 68 had only congenital syphilis. Liek gives illustrative instances from his own practice. A girl, aged 19, was about to have enlarged cervical glands removed in the belief that they were tuberculous. A preliminary trial of x-rays caused a peculiar rash to come out in the neighbourhood of the treated area, thus arousing suspicion. Examination revealed a primary sore on the labium majus, and eight days later a secondary rash appeared over the body. Another patient, a man with a negative Wassermann reaction, had antituberculous treatment for years from a dermatologist for a rash on the face which was later cured by salvarsan. Liek adds that measures to improve the general health deserve more attention in the treatment of syphilis.

Surgery.

378 The Sequels of Gastro enterostomy

D. C. BALFOUR (*Annals of Surgery*, September, 1925, p 421) reminds us that of all operations for benign lesions of the stomach or duodenum gastro enterostomy has the widest range of usefulness. The results, however, are not perfect, and in certain cases a secondary operation, which usually includes the uncoupling of the anastomosis, may be required. Balfour reviews the result in 343 cases where this became necessary. In 131 cases the gastro enterostomy appeared to have been unnecessary in view of the return of the symptoms for which it was performed, the effect of the operation, and evidence that some extragastric condition was responsible for the symptoms. In 212 cases the primary operation appeared to be really indicated, the results were unsatisfactory owing to an imperfect anastomosis, an overlooked intra-abdominal disease, or a recurring ulcer. The most important cause of failure was the recurring or jejunal ulcer, which occurred in 5 per cent of the cases. Balfour states that where medical treatment fails to relieve the symptoms a secondary operation is advisable. Stomatal ulcer is characterized by the severe pain after food its localization on the left side and lower than the usual ulcer pain. When a secondary operation becomes necessary the anastomosis may be disconnected alone or combined with a pyloroplasty or gastro duodenostomy. Sometimes a partial gastrectomy may be best. To disconnect the anastomosis the incision is freed from the anastomosis from behind forwards by finger dissection. The stomach and intestine are then clamped and the anastomosis cut through with scissors. The jejunal opening is closed transversely with the stomach sutured, and the opening in the mesocolon closed.

favourable effect, whereas others, such as Freund, Hennig, Benice, Croom, Roberts, Hutchinson, Raymond, Sérénus, and Strümpell, have observed the first appearance or aggravation of Graves's disease during pregnancy. Of 98 cases of Graves's disease associated with pregnancy collected by Nowak and Seitz 60 per cent showed an aggravation of their condition due to pregnancy, and 40 per cent no change or a slight improvement. Zondek not infrequently saw aggravation of the symptoms follow abortion, and Kocher also regards induction of abortion as injurious in Graves's disease. All writers, however, are agreed that the symptoms may become so much aggravated by pregnancy that induction of abortion becomes imperative. Both Jülich's patients were examples of this kind. Considerable improvement, both in the symptoms and signs, followed the induction of abortion.

392 Septic Infection after Chl birth

I W BELUGIN (*Russkaya Klinika*, May, 1925, p 627) finds as the result of *post mortem* examinations that peritonitis is more frequent when abortion occurs in advanced pregnancy and in premature births than in early abortion and in full term births. Only very rarely did the infection spread by direct dissemination in the blood or into the peritoneal cavity without any localized infection. Parametritis, and especially salpingitis, were found to be complicated more often by peritonitis than by generalized sepsis. In almost half the fatal cases the infection spread into the peritoneal cavity, the commonest route being that of the Fallopian tubes, and next in frequency that of the lymphatic channels both of the uterus and parametrium. Simple peritonitis was found relatively seldom (14 per cent), usually it was accompanied by general sepsis, which was of the type of septicaemia rather than of pyaemia.

393 The Diagnosis of Syphilitic Stillbirth

J T TAYLOR and J FOREST SMITH (*Journ Obstet and Gynaecol of the British Empire*, Autumn No. 1, 1925, p 474), while agreeing that the discovery of the *Spirochaeta pallida* in the foetal tissues remains the only direct evidence of syphilis as the cause of stillbirth, point out, however, as the result of comparing definite syphilitic cases of stillbirth with non syphilitic cases, that certain signs are of great value in diagnosis. They find that syphilis is indicated by enlargement of the spleen, a splenic weight of over 0.45 per cent of the body weight being indicative of syphilis. The presence of chondro epiphysitis is also suggestive, as is a positive Wassermann reaction in the mother, especially if this persists some weeks after the puerperium. The authors state that a negative maternal Wassermann reaction does not exclude syphilis of the foetus. In the absence of maceration of the foetus, and if full term is reached, syphilis is contra-indicated. They add that no diagnostic evidence could be obtained from the length and weight of the foetus or the relative weights of the liver, kidneys, and placenta.

Pathology.

394 Influenzal Meningitis

DURING the course of about one year V SCHNIDER (*Ann de l'Inst Pasteur*, September, 1925, p 769) has examined seven cases of influenzal meningitis occurring in children aged from 9 months to 4 years. All but the oldest patient died. A study of the morphology of the bacilli isolated from the brain, the meninges, the throat, and from other situations, showed extreme variability, but as this variability was a feature of all the strains it was not possible to use it as a basis for classification. A similar variation in their virulence was also discovered. Some strains when injected intraperitoneally into young guinea pigs of 120 to 180 grams proved fatal in a dose of one third of a blood agar culture, others failed to kill in a dose of less than two to three cultures. Death occurred generally in from twelve to twenty-four hours. From the character of the lesions found at *post mortem* examination—a sero-purulent exudate into the peritoneum, congestion of the suprarenals, haemorrhagic foci in the lungs, small haemorrhages into the brain, and absence of splenic enlargement—it would appear that death was due rather to intoxication than to a true infection. Nevertheless cultures of the abdominal viscera, of the blood, and of the brain were positive. The lethal dose of the bacilli killed by heat or by ether was two to three times that of the living bacilli, but the lesions produced were identical. Rabbits were found to be susceptible to subdural injection into the cranial cavity. The strains recovered from the meninges showed no greater virulence than those from the respiratory passages. Complement fixation was unsatisfactory owing to the anti-complementary property of the bacilli. By agglutination it was found that the strains behaved with irregularity, some

agglutinating to titre, others to half titre, and others not at all, with the same serum. No constant difference was found between the respiratory and meningeal strains.

395 Growth and Persistence of Filterable Viruses

T M RIVERS and LOUISE PEARCE (*Journ Exper Med*, October, 1925, p 523), while attempting to produce chicken pox in rabbits, discovered a filterable transmissible pathogenic agent, which they named Virus 111. Injected intratesticularly into rabbits it caused lesions in the cornea, skin, and testicles, and led to the development of an immunity against subsequent infection with the same material. Though first regarded as bearing an etiological relationship to varicella, it was later found to be indigenous to rabbits. The interest of this virus lies in its close connexion with an epithelial tumour of rabbits which the authors have been studying. This tumour, when inoculated into the testicle, gave rise to a large primary lesion, followed in about 60 per cent of cases by metastases and in 20 to 40 per cent by death. It has been propagated at monthly intervals through a series of at least ten rabbits at a time, these rabbits are known as "stock tumour rabbits". The observation was made that these animals were immune to injection with Virus 111, and on further inquiry it became evident that the tumour was actually infected with the virus. Despite the immunity of the rabbits the virus multiplied in the tumour and survived for at least eight weeks. If, however, the virus was inoculated into a normal rabbit it apparently died out in less than a month. The inference is that the virus is able to multiply more easily in the tumour cells than in the cells of a normal rabbit. Whether the virus is essential for the propagation of the tumour is obviously a question of the first importance. The evidence so far acquired seems to the authors to be against this possibility, for a tumour has been obtained that is apparently free from the virus. Similar findings are reported on the ability of the vaccine virus to grow in this rabbit tumour. In a normal rabbit the virus lives for at most five weeks, in a stock tumour rabbit it can live for at least nine weeks. Summing up, it may be said that Virus 111 and the vaccine virus multiply in a transplantable rabbit tumour, that they are carried along with the tumour through an indefinite series of transplants, and that they survive longer in the tumour than in the testicles of normal rabbits.

396 The Glucose Content of Normal Urine

G S LUND and C G L WOLF (*Biochem Journ*, No 4, 1925, p 538) find themselves in agreement with Greenwald and his co-workers and Host that glucose is not present in normal urine, and thus are opposed to the views of Benedict and Osterberg. Lund and Wolf believe that the manometric method furnishes at present the most sensitive and selective means for detecting the presence of glucose in the urine, the reaction depending on the fermentation of glucose by yeast with the production of carbon dioxide. They used the larger differential manometer of Barcroft with mechanical shaking. In over a dozen samples of normal urine a positive pressure in the manometer was never obtained, though the addition to normal urines of a quantity of glucose equivalent to a concentration of 0.05 per cent showed a rise of 30 mm in the manometer after the addition of yeast. In another case, where glucose was excreted by the kidneys in such small amount that it could scarcely be detected by Benedict's reagent, a rise in the manometer of 131 mm was obtained.

397 Nitrogen Metabolism in Cancer

LABBE and MOUZAFFER (*Rev de Med*, No 5, 1925, p 321), in a short summary of the literature relating to the excretion of amino acids in cancerous subjects, note that most of the investigators found the excretion to be raised. The present authors have estimated the urinary content of ammonia and amino acids in 31 patients, 20 of whom had carcinoma of the alimentary tract, 3 of the liver, and 8 had other cancers. The outstanding feature of these comparative analyses was that the nitrogen totals were much higher in the case of the liver growths than in the others, whereas the amino aciduria was very little raised above the normal, though not enough so, the authors think, to fulfil the hopes of previous workers that this estimation might have some diagnostic value in suspected cancer. But the high totals, in hepatic metastases, of products indicating incompletely metabolized nitrogen, seem to them to point to functional derangement of the liver. To confirm this possibility they tested the hepatic insufficiency by estimating the degree of urobilinuria and diacetic acid. The results of this test were positive in the hepatic cancer subjects, and negative in the other cancer cases, with a few isolated exceptions, such as a high figure favouring hepatic insufficiency being found in a woman with uterine cancer. The conclusion reached is that amino aciduria points to functional liver disturbance, not to cancer.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine.

333 Pseudo Hermaphroditism

R V LOPEZ and J G SÁNCHEZ LUCAS (*Arch de med, cir y esp*, September 19th, 1925, p 529) state that while there are not more than six or eight cases of true hermaphroditism on record in which the presence of both sexual glands has been proved by histological examination, numerous examples have been reported of pseudo hermaphroditism—that is to say, individuals with the external genitals of one sex and the internal genitals of the other. According to Pozzi, pseudo hermaphroditism may be divided into two groups—namely, androgyneids, or women who appear to be men, and gynandroids, or men who appear to be women. The latter, of which the present authors' cases are examples, are the more numerous. They state that, as might be supposed, the genital glands of pseudo hermaphroditism are always in an atrophic state. Their three patients appeared to be women and sought advice for a supposed inguinal hernia. The first patient, who was aged 34, had well developed mammary glands, normal distribution of adipose tissue, and absence of hair on the face. The only unusual feature was the absence of hair on the external genitals. The supposed hernia was a swelling in the right groin the size of a small orange, and situated immediately beneath the skin. The vagina was only 4.5 cm long ending in a cul de sac without any uterine, the labia majora and clitoris were normal. In the second patient, aged 22 years, a testicle was found with a round ligament. No further examination of the genital organs was made. The third patient was a married woman, aged 28, with feeble mammary development. There was no uterus and the vagina was of ordinary size, doubtless owing to sexual congress. An operation was performed for double inguinal hernia and two testes were found. The specimens in the three cases were similar. The testis in each case was surrounded by a fibrous capsule, and on section presented the appearance of the normal organ. On microscopical examination a great abundance of interstitial cells was found, especially in the first two cases.

339 Sequels of Endemic Goitre

F A COLLIER (*Boston Med and Surg Journ*, September 17th, 1925, p 545) thinks that the importance of the cardiac damage in endemic goitre has been insufficiently appreciated. He finds that definite cardio-vascular damage appears in at least 25 per cent of patients with hyperthyroidism and in a smaller, but appreciable, percentage of those with normal metabolic rates. Hyperthyroidism caused by endemic goitre was found to increase in frequency in the age periods from the latter part of the third decade to the fifth and sixth, when at least a third of the cases showed it. Collier considers endemic goitre a precancerous lesion, with a malignancy incidence of at least 3 per cent. It causes many minor mental changes, and in patients with a psychopathic inheritance may give rise to mental abnormality. He reports that the goitre contains colloid and adenomatous elements the former predominating in early life the latter after the age of 25. He states that these changes are progressive and constant and will give rise to symptoms within measurable times. He therefore concludes that the removal of adenomatous goitres should be recommended in individuals over the age of 25.

400 The Epidemiological Importance of Diphtheria Carriers

J A DOULL and H LARA (*Amer Journ Hyg*, July, 1925, p 508), in a study of 758 clinical cases of diphtheria in Baltimore, found that of 2,799 family contacts who did not receive prophylactic injection of antitoxin, 59, or 2.1 per cent, contracted the disease later than one and not later than thirty days after the onset of the primary case. On the other hand, in 4,665 family contacts of 1,044 child carriers of diphtheria, only 14 cases were reported within thirty days of the discovery of the carrier. After making necessary allowances for differences in age distribution of the two groups of contacts, the authors estimated that the risk of attack was ten times as great for contacts of clinical cases as for those in similar association with known bacterial carriers. Comparison of the attack rates in families of carriers with the prevailing attack rates in the general public of the city indicated that during the first month after discovery of the carrier the attack rate in the family contacts was considerably higher

than would be expected in a random sample of the city's population of the same age distribution, whereas in subsequent months no such excess was indicated. The authors conclude that the families of known bacillus carriers incurred a risk of developing clinical diphtheria which, though small, was appreciably higher than that incurred by otherwise comparable families in which such carriers were not known to exist.

401 Diabetes Insipidus and Simple Polydipsia

R BAUER (*Wien Arch f innere Med*, September 25th, 1925, p 201) concludes, after investigation of the urine and blood concentration and thirst tests, and also by excluding hysteria, that at present there is no definite means of diagnosis between these two affections. "Cerebral" diabetes insipidus is caused by derangement of the hypophysis system which regulates diuresis, metabolism, and concentration of blood and of urine. The site and character of the derangement dictate the nature of the change produced, which is why cases of diabetes insipidus are so variable. Some of the cases called idiopathic diabetes insipidus are really nervous or hysterical polydipsia, others might preferably be called cerebral, because of the frequency with which a history of head injury is present. No lesion may be demonstrated, but that of itself does not exclude a minute trauma of the brain. This variable nature of diabetes insipidus increases the difficulty of diagnosis and unless and until one succeeds in curing a patient by the only means hitherto effective—namely, suggestion—the case must retain the unsatisfactory label of idiopathic diabetes insipidus.

402 Relapses in Measles

I H GOLDBERGER (*Amer Journ Dis Child*, July, 1925, p 55), believes that relapses in measles undoubtedly occur, though rarely. He maintains that the appearance of only one symptom, such as the rash, does not warrant a diagnosis of measles, but considers the reappearance of Koplik's spots definitely diagnostic. He reports three cases in which the relapses were as severe and lasting as the original attacks. The relapse followed the original onset after intervals of twenty five, eighteen, and seventeen days, which intervals Goldberger considers too sufficiently short to entitle the cases to be considered relapses rather than second attacks, thus disagreeing with Vergely (*Epitome*, August 15th, 1925, para 94).

Surgery.

403 Gangrene of the Transverse Colon

A DZIŁOSZYŃSKI (*Zentralbl f Chir*, September 19th, 1925, p 2121) states that gangrene of the transverse colon, first described by Laennec in 1832, has occurred after various abdominal plastic operations, such as gastro-jejunostomy and removal of succum of the head of the pancreas. Necrosis of the colon may follow ligation of the middle colic artery or of any of its principal branches, even when skillfully performed, it may be a sequel of operations for malignant disease involving the greater curvature of the stomach or the pylorus, or of large resections of the mesocolon without ligation of its blood supply. Dziłoszyński reports the case of a woman, aged 23 whose mother had died from pulmonary tuberculosis, and whose sister was then suffering from the same disease. In September, 1922, the patient had duodenal ulcer, for which an antecolic gastro-entostomy was performed. She made an untroubled recovery and was discharged on the twenty-fifth day. A year later she was admitted for peptic jejunal ulcer. This was resected and Kieulcin-Vidulich's gastro-jejunostomy and Braun's entero-anastomosis were performed. An abscess of the abdominal wall occurred after the operation, and the patient was discharged three months later with a small persistent fistula above the umbilicus for which she was readmitted six months later. In June 1924 the fistula was explored the infiltrated abdominal wall was adherent to two inflammatory swellings of the mesocolon each as large as pullet's eggs, within which old ligatures were found. The middle colic artery was carefully isolated and preserved, and the two omental swellings were excised between double ligatures. The artery was pulsating when the wound was closed. For a few days the patient's evening temperature rose to 100–102. Then necrosis of more than three inches of the transverse colon occurred and a large faecal abscess was opened. After three months treatment it was possible to

make a side to side anastomosis between the ileum and descending colon. The result was very satisfactory, and four days later faeces were passed per anum. Two months afterwards is the final operation for closure of two colic fecal fistulae was performed, and the patient made a good recovery. The author thinks that the case is of interest on account of the number of operations performed, the occurrence of necrosis although the middle colic artery was not ligatured, and also because no other case of recovery after such gangrene appears to have been recorded.

404 Hallux Valgus

E. PAYR (*Centralbl f Chir*, October 10th, 1925, pp 2289 and 2292) considers that hallux valgus is due to constitutional causes and that badly fitting boots are of only secondary etiological importance. He states that the majority of these patients, though asthenic, are heavily built and often obese, and that this constitutional debility induces the flat foot which is so often associated with hallux valgus. When the plantar arches begin to give way the whole skeletal structure of the foot is thrown out of alignment, the ligaments, subjected to abnormal stresses, become stretched and partially atrophied, and hallux valgus gradually develops. Secondary osteitis of the head of the first metatarsal, often increased by the pressure of a chronic infective bursitis, occurs and produces irregular bony thickening. This causes stretching of the internal lateral ligament of the metatarsophalangeal joint and displacement of the extensor tendons. Payr recommends a free exposure of the capsular ligament by a vertical incision over the extensor tendons, their sheaths are opened and the tendons are drawn inwards by a retractor. A large flap of the capsular ligament is reflected to expose the head of the first metatarsal and the base of the proximal phalanx. The lateral ligaments are resected and any cystosides or bony irregularities, as well as the pathological bursa, are removed. The capsular and skin incisions are then sutured, the great toe is forcibly adducted, and the wound is dressed, a tongue depressor serving as a splint for the great toe. The dressing is removed after forty eight hours, on the eighth day massage is started with warm water or hot air baths, and the patient begins to walk on the tenth day.

405 Duodenal Feeding in the Treatment of Gastric Ulcer

G. RAFFAELLO (*Rif Med*, September 7th, 1925, p 841) reports a case of gastric ulcer in a man, aged 34, successfully treated by duodenal feeding. The man suffered from "burning" gastric pain, blood was present in the gastric content, and there were clinical signs of partial pyloric stenosis. After a diet of partial pyloric stenosis with a dietetic and medical treatment he had a duodenal sound on a diet calculated to give 2,000 calories a day, this amount was arrived at by estimating the ratio of the weight to the skin area and reckoning the daily caloric loss per kilogram of weight and square decimetre of surface. The patient, weighing 70 kg, was given every day a meal of milk, bread, and egg, totalling 70.58 grams, and on the balance of gain and loss it was found he was 0.45 gram to the good. The meal was divided into three parts and given very slowly, the patient being kept in the right lateral decubitus so as to avoid regurgitation into the stomach. He was also given 10 grams of histamin substrate. From the outset the results were satisfactory, and at the end of a month the patient was taking food naturally without any discomfort and his general condition greatly improved. Frequent examination of the stomach contents never indicated an acidity greater than 1.37 per 1,000.

406 Functional Capacity of the Sutured Heart

E. HERSH (*Russkaya Akhika*, May, 1925, p 750) reviews 48 cases of heart sutures after wounding, in the light of permanent results and with regard to their functional capacity. The patients were operated upon in the Obshchov Hospital in Leningrad in the years 1903 to 1921, of the 48 cases 15 (31.25 per cent) recovered, while 33 died. The author also includes in his investigations 107 continuously observed cases in the literature. He states that suture of cardiac wounds yields 77 per cent excellent results, 22 per cent relatively good and only 1 per cent failures. Re-examinations with a view to working capacity showed that 79.3 per cent regained full capacity. The general health was found good in 89 per cent of the re-examined cases. He adds that wounds of the arteries produced hardly worse permanent effects than those of the ventricles, while ligation of the peripheral and descending branch of the coronary arteries had no injurious results upon the function of the heart. In the first few days after the suture had been performed there appeared a dry pericarditis, which with mediastino-pericarditis were the most frequent post-operative sequelae. Lost operative costal fistulae were found to be very chronic.

Therapeutics

407

Treatment of Coli Bacilluria

E. TANT (*Brussels Medical*, September 27th, 1925, p 1441) emphasizes the point that all patients who suffer from *B. coli* infection of the urinary tract have chronic constipation, which requires to be dealt with as part of the treatment. Roux has shown that the caecum and ascending colon are most important foci of infection, whereas stasis from the splenic flexure downwards is less serious on account of the desiccation of the faeces and the destruction of intestinal flora in these regions. The absorption of *B. coli* is particularly rapid during attacks of diarrhoea, this indicates the danger of treatment by violent purgation, which irritates the intestinal mucosa and opens the doors for the passage of *B. coli*. Bar and Vidal have shown that the infection is conveyed by the blood stream. In some cases the infection remains latent, in others it may attack any part of the urinary tract from the kidney to the urethral meatus. The most thorough clinical and radiological examination of the alimentary canal is as important as that of the urinary tract, but before attributing the infection to intestinal stasis it is very necessary to determine whether there is any cause of urinary stasis—urethral stricture, prostatic hypertrophy, vesical calculi or diverticula, renal calculus or hydronephrosis. As regards details of treatment, Tant recommends that the patient's diet should be that of acute colitis—temporary deprivation of all animal albumins and substitution of a carbohydrate diet. At the same time, stasis should be relieved by mild laxatives and any eutroptosis corrected by a suitable belt. When the urinary infection is acute, urinary antiseptics and general symptomatic treatment are indicated. In the sub-acute infections the same treatment should be prescribed, combined (in cases of pyelonephritis) with injections of 3 per cent silver nitrate or 20 per cent collargol solutions. Vincent reported that vaccine therapy was not only useless, but in some cases aggravated the condition. Serum therapy is sometimes useful in chronic suppurative pyelonephritis. Hydrotherapy has been found to be a valuable adjuvant treatment in many chronic cases.

408

X-ray Treatment of Whooping cough

H. K. FAER and H. P. STRUBLE (*Journ Amer Med Assoc*, September 12th, 1925, p 815) refer to the papers by Leonard on the treatment of whooping cough by x-rays (*Epitome*, November 29th, 1924, para 424, December 20th, 1924, para 491) and report the results of a study based on equal numbers of control and test cases. A series of 44 consecutive children in the prodromal stage of whooping cough formed the material for the study, 22 being treated by x-rays and 22 by antipyrin. It was found that the disease ran its average longer course in the irradiated series than in the controls. The authors conclude that x-ray treatment is without true beneficial effect upon whooping cough, and ascribe the occasional temporary exacerbations or inhibitions of attacks following x-ray treatment to psychic disturbance. Effects of greater extent or duration such as have been previously claimed for x-ray treatment are most probably apparent rather than real, and represent normal fluctuations in a highly variable disease.

409

Prophylactic Vaccination against Measles

P. ANNECCHINO (*La Pediatria*, September 15th, 1925, p 1005) reports a successful attempt to prevent the spread of measles. After a case of measles had appeared in an orphanage the author injected 41 children on three alternate days with 2 c.c. of a standardized vaccine prepared from the organisms recovered by Caronia. Eight children who had previously had measles were not injected. None of the 41 who were treated developed measles, although they were not isolated from the child who had measles. In 2 cases a slight febrile reaction followed the injection, but in the others there was no local or general reaction.

410

Ophotherapy of Diabetes Insipidus

H. ROTHMANN (*Med. Ann.*, October 29th, 1925, p 1535) records the use of testicular extract in the treatment of two male patients suffering from diabetes insipidus, in one case pituitary seemed to increase the symptoms. Testicular extract relieved in less than a fortnight the thirst, hunger, and headache, increased the weight, and lessened the quantities of fluid intake and of urine excreted. In one case an intake of 8,500 c.c., the urine measuring 8,300 c.c., was reduced in a fortnight to 6,200 and 5,700 c.c. respectively. Three months later return of sexual potency was reported by the patient, but the headaches were rather worse. Abdeihalden's combined hormone preparation was employed to begin with, but was soon discontinued in favour of testicular extract.

311 Gentian Violet in the Treatment of Thrush

H K TABLER and L B DICKIE (*Journ Amer Med Assoc*, September 19th, 1925, p 900) advocate the local application of a 1 per cent aqueous solution of gentian violet in the treatment of thrush. They have used this remedy in a series of 15 cases in infants, the number of applications being one in 4 cases, two in 5 cases, three in 5 cases, and nine in 1 case of a feeble, premature infant, with a particularly heavy infection, who received two applications daily. Complete disappearance of visible lesions resulted and though in three instances they reappeared after a few days, yet in each case a further single application of gentian violet proved finally effective. In one case slight regurgitation of food followed treatment, but was not repeated, and may have been coincidental. The cases treated occurred in the course of a mild epidemic, and prophylactic treatment with gentian violet was given to nine uninfected infants, none of whom required thrush.

312 Barium Chloride in the Stokes Adams Syndrome

A E COHN and S A LEVINE (*Arch Intern Med*, July 15th, 1925, p 1) describe the use of barium chloride in three cases of the Stokes Adams syndrome. The amount of barium chloride given was half a grain three times a day, and the treatment was only commenced after general therapeutic measures and the administration of epinephrin had failed to ward off attacks. In each of the three cases the patient was rapidly rendered free from attacks. The authors observed also that the barium salt increased ventricular irritability and prevented the long asystole. They suggest that this success should encourage others to try barium chloride in this condition. The drug was given by the mouth.

Diseases of Children.

313 Malnutrition in Cleft Palate

J A FOOTE (*Amer Journ Dis Child*, September, 1925, p 343) points out that much of the malnutrition in infants with cleft palate is due to partial starvation. The increased effort required for sucking causes early fatigue, so that only from a third to three quarters of the normal amount of food is taken, and, as a rule, the younger the infants the less is the amount. The increased and prolonged muscular action in sucking tends to widen the cleft, and the author believes that the resulting fatigue, together with an insufficient caloric intake, explains the malnutrition commonly found in these infants. Since internal obturators are unsatisfactory in preventing air from the nose entering the mouth through the cleft, Foote, after collaborating in experiments with C Gerhart, a dental surgeon, recommends a strip of dental rubber dam, 2 by 4 in., with tapes at each end so that it can be stretched and applied over the nostrils with its lower edge over the lip and nipple. By this means air, which might enter through the nose and cleft, is effectively excluded from the mouth, the necessary air for respiration is given by lifting the upper edge over the nose between sucking contractions, while older children learn to breathe through the mouth between the suckings. Pressure tracings showed a considerable rise in negative pressure in the bottle when this contrivance was used, and clinical evidence indicated a larger fluid intake with less fatigue. The best results were obtained when bare lip was not present, or when this had been repaired, the method was found to be of little value in premature infants with weak sucking reflex, and in those old enough to resent the nasal occlusion.

314 Cerebro spinal Fever in Infants

1 MOGILNICKI (*Arch de med des enf*, August, 1925, p 476) states that among 117 cases of cerebro spinal fever admitted to a children's hospital at Lodz, Poland, from January 1st, 1922, to January 1st, 1925, 85, or 72.6 per cent, were in the first year of life, 11 in the second year, and 21 in children aged from 2 to 14. Of the 85 infants only 51 were admitted in the first week of disease, 17 in the second, and 17 at later periods. The patients were often sent in with an erroneous diagnosis of typhoid fever, pyelocystitis, or pneumonia. Other observers especially German writers, state that the incidence of cerebro spinal fever in the first year of life is much lower—namely, 17 per cent (Göppert) and 12 to 17 per cent (Kassowitz). The onset of cerebro spinal fever in infants differs considerably from that in the adult and older children, in whom it is sudden, with shivering, vomiting, headache, and rigidity of the neck and limbs. High fever is present from the first, and in most cases (60 to 70 per cent) herpes labialis. In infants, on the contrary, an onset with convulsions, high temperature, and vomiting is rare. The disease usually begins insidiously without meningeal symptoms or

herpes. Some patients show manifestations of respiratory disease, which are followed later by meningeal symptoms. Of the 85 cases treated by serum 29, or 34 per cent, made a complete recovery, in 10 it was incomplete, and 46 died—a mortality of 54 per cent. Of 51 in whom treatment was commenced in the first week 24, or 47 per cent, made a complete recovery, 22, or 43 per cent died, and 5 made an incomplete recovery. Of 17 admitted in the second week only 3 made a complete recovery, and of 17 admitted during the third, fourth, and subsequent weeks only 2, or 11.8 per cent, recovered. Mogilnicki's conclusions are as follows: (1) Cerebro spinal fever is a disease especially frequent in early infancy. (2) The symptoms in infants differ as a rule from those seen in adults, but nervous excitability and abnormal tension of the fontanelles are almost always present. (3) Lumbar puncture is required for diagnosis. (4) Polyvalent serum should be given intraspinally as soon as possible, and an attempt should then be made to identify the type of organism, when the corresponding strain should be employed. (5) When the results of intraspinal serum treatment are unsatisfactory, intraventricular administration of the serum should be attempted. If there is still no improvement vaccine treatment should be combined with serum therapy. (6) The earlier specific treatment is begun, the better are the results.

315 Vaccine Treatment of Typhoid Fever in Children

A TUDÖS (*Jahrb f Kinderheilk*, September, 1925, p 24) employed Caroma's vaccine in the treatment of 19 cases of typhoid fever in children. Although this number is not sufficiently large to justify a final conclusion to be made as to the value of this method, Tudös thinks he is warranted in publishing his results. The patients were admitted between the sixth and twelfth days of disease. The vaccine was used only in severe cases. Intramuscular injection was useless, whereas intravenous injection produced remarkable results. In some instances the patient's temperature became normal after a single injection of 0.5 c.c., and recovery appeared to follow within twenty-four hours. If the vaccine was given within the first ten days the fever subsided after a more or less marked transient rise, the toxic symptoms disappeared, appetite returned, and the general condition improved. All these results are, he thinks, in favor of regarding Caroma's vaccine as specific for typhoid fever. No dangerous symptoms were ever observed, so that the method is apparently suitable for severe cases. Various theories have been put forward to explain the action of the vaccine. The simplest explanation seems to be that the toxins introduced by a parenteral route stimulate a more intense production of antibodies.

Obstetrics and Gynaecology.

316 Treatment of Eclampsia

H M VON MEGERSHAUSEN (*South African Med Record*, September 12th, 1925, p 387) remarks that the treatment of eclampsia is chiefly concerned with the elimination of toxins and the control of the fits. Special treatment of the plegnancy itself is not advised, induction of labour and Caesarean section is not recommended owing to the mortality statistics, and the only operative procedure favoured is the use of low forceps with a fully dilated os during delivery. For the control of the fits veratrine may be effective in mild cases, but for routine use he prefers hypodermic injections of 1/4 or 1/2 grain of morphine according to the frequency of recurrence. The injections should be repeated at half-hourly intervals until the fits are controlled; he has never found it necessary to give more than 1 1/2 grains in all. In order to eliminate the toxins the stomach should be well washed out with sodium bicarbonate solution and 2 oz of castor oil with 3 minims of clove oil left in it. This should be followed by efficient colon lavage. Each lavage should occupy about three quarters of an hour, 3 gallons of soap and water being used, this should be repeated every six hours until labour is advanced. The author believes that this colon lavage is a most important part of the treatment, and adds that on these lines the mortality of eclampsia has been reduced to 22 per cent.

317 Sterility in the Female

C. H. H. WILKINSON, *Obstet and Gynaecol of the British*

tion of the test capable of being applied in an out-patient department. It is necessary to ascertain first that the husband's semen is normal, that the adnexa and cervical canal are healthy and that the examination is made at a clear interval between two menstrual periods. Two nights before the test glycerine plugs

are inserted against the cervix. The patient is placed in the Trendelenburg first position, and the vulva, vagina, cervix, and lower cervical canal are dried with swabs and painted with iodine. With a volsella fixing the cervix, and after the two first dilators of a series have been passed through the internal os, a tapering hollow uterine dilator, the third in the series with the opening at the tip, is inserted and the bulb of a Juno's chloroform inhaler attached. The vagina is then filled with sterile saline solution and pumping of air slowly commenced until the reservoir bulb is filled and its net is under tension. If the tubes are patent the reservoir slowly deflates, and upon resuscitation over the tubes air can be heard passing through their fluted openings. When obstruction exists its site can be detected by the injection—after a week's interval to allow for the absorption of the air—of lipiodol through the uterine tube connected by a short length of rubber tubing with a Record syringe, the vagina being packed with gauze to prevent leakage during the radiological examination. A radiogram is taken as soon as pain is felt, since this is the result of tension and indicates that the lipiodol has reached the seat of obstruction. Forsdike considers that these two methods provide valuable data when estimating the advisability of an operation for sterility, since by their use the side and site of any obstruction can be accurately detected beforehand.

418 Pregnancy after X-ray Treatment.

E. GAUJOUX (*Bull. Soc. d'Obstet. et de Gynecol. de Paris*, No. 8, 1925, p. 589) records the case of a woman, aged 27, who was treated for large multiple uterine myomata by nine applications of x-rays at monthly intervals. Severe dermatitis followed, and menstruation became somewhat less profuse. Five years later the patient was delivered spontaneously of a recently deceased foetus, and the three myomata which were still present became rapidly smaller during the puerperium. The myomata had enlarged three years later when the patient was again pregnant this pregnancy, in spite of the existence of a marginal placenta praevia, terminated in the extraction by forceps of a live child weighing 9 lb. 10 oz. At least ten other observations have been recorded of normal pregnancy and delivery following x-ray treatment for uterine myomata, and it has been proposed to treat amenorrhoea and ovarian hypofunction by small doses of x-rays. On the other hand, a number of cases of abortion and foetal death have been reported and there is experimental evidence that the developing trophoblastic cells and oocytes are particularly sensitive to x-rays.

419 Caul flower Cervical Carcinoma.

E. O. SCHOCH (*Centralblatt f. Gynäk.*, September 26th, 1925, p. 2204) describes cauliflower cervical carcinomas as being macroscopically well defined of all sizes up to that of a child's head, very fleshy with everted edge and scirrhous base. During the last six years he has studied 91 microscopically proved cases of this condition in his radiological department. Excluding 3 patients who were not treated and 7 who attended irregularly, 13 were stated to have been cured (17 per cent), and 63 died from cancer within five years. Of the remaining 5, 2 were lost sight of and 3 died of intercurrent affections. The well known influence of age was apparent of 20 women under 39 years of age only 1 was cured. The number of times the woman had been a mother seemed to possess no prognostic significance. The factor of a poor social status was evident in the patients and still more so in the list of deaths. Schoch attributes this to the fact that richer patients came earlier for treatment. Of the patients who died, the average length of life from the beginning of treatment was fourteen months. About 14 per cent of the patients gave a family history of cancer.

Pathology.

520 The Action of Radium on Protozoa and Filterable Viruses.

R. BRUYNOGHE and A. DUBOIS (*C. R. Soc. de Biologie*, September 30th, 1925, p. 849) exposed a suspension of *Leishmania tropica* to the action of 4 mg. of radium enclosed in a platinum cell 1/5 mm. in thickness for twenty-four hours, and then inoculated it along with an unexposed control on to a culture medium. Similar growths were obtained in each case. The action of 10 mg. of radium for sixty hours caused a delay of one week in the growth of the organism. For complete sterilization an exposure of 4 mg. for seventy-two hours was required. A similar sterilizing effect was produced by radium emanation acting in a dose of 5 millicuries for sixty-two hours in a closed space. The same observation was made that though both the radium and the radon rendered the organism incapable of multiplying on a nutrient medium, they failed to destroy

its motility. With *Trypanosoma inopinatum*, a free parasite, the same results were obtained. The ability to grow on an artificial medium and the ability to infect frogs were both destroyed, but the motility remained intact. Again, with *Spirochaeta uterohaemorrhagiae* the results were similar. 8 mg. acting for twenty-six hours rendered the spirochaete incapable either of growing *in vitro* or of giving rise to disease in the guinea pig, but did not interfere with its motility. The authors conclude that the action of radium on protozoa and spirochetes consists essentially of interference with their power of division. In another paper in the same issue (p. 852) R. BRUYNOGHE and LE FEYRE DE ARRIC report their experiments on the action of radium on the filterable viruses. The suspension to be tested, either of the rabie, the encephalitic, or the herpetic virus, was diluted 1 in 100 or 1 in 1,000 times, and divided into two portions, of which one was exposed to radium emanation in a dose of 5 millicuries for about forty-eight hours. Both portions were then injected intracerebrally into rabbits. It was found that the irradiated suspensions were in each case unable to give rise to disease, whereas the control suspensions uniformly killed the animals in three to seven days. It would appear, then, that the filterable viruses are characterized by a similar susceptibility to the action of radium emanation.

521 Lactic Acid in Diabetes.

J. A. COLLAZO and I. LEWICKI (*Ann. de Med.*, August, 1925, p. 153) have investigated the percentages of glucose and lactic acid in the blood of diabetics under varying conditions of fasting, the ingestion of cane sugar, and insulin administration, control tests were made also on healthy subjects and on non-diabetic patients. The authors report that insulin always has the same effect on the lactic acid content of the blood whether the carbohydrate metabolism is normal or deranged, its action being analogous to that of glucose. They consider that this proves that there is no essential difference between carbohydrate metabolism in diabetes and non-diabetics. They find also that the presence of lactic acid in fasting men or animals is not increased by insulin and do not agree with some other investigators that reduction in the blood sugar after insulin is accompanied by increase in the lactic acid, but, on the contrary, that the latter is often diminished. They conclude that (1) among non-diabetics and diabetics when fasting the mean ratio of lactic acid in the blood is practically the same—in the former group 14.2 mg. per cent, and in the latter 15.9, (2) the ingestion of cane sugar produces an excess of lactic acid in the blood both of diabetics and non-diabetics, this occurs to a greater extent in the former, in whom the increase appears earlier and persists longer, (3) the ingestion of cane sugar and the simultaneous injection of insulin produces an increase of lactic acid in the blood in both diabetics and non-diabetics, (4) in both men and animals insulin given alone usually, but not always, diminishes the amount of lactic acid in the blood. The authors consider their conclusions of special value in view of the increased attention paid to lactic acid as a factor in the metabolism, not only of carbohydrates, but also of albumins and fats. They add that lactic acid plays a part in the synthesis of carbohydrates, and possibly also in that of fats and albumin, and may, therefore, be considered as an intermediate product linking up these three.

522 Action of Disinfectants on Bacteria.

H. GHOSH (*Indian Med. Gazette*, September, 1925, p. 423) describes the investigation of the action of weak solutions of germicidal agents on certain bacteria. His general technique was to add a given amount of disinfectant to a twenty-four hour broth culture of an organism—such as *Staphylococcus aureus*, *B. proteus*, *B. pyocyaneus*, *B. coli*, or *B. shigae*—to incubate the mixture, and to plate out 0.1 cm. quantities at intervals. It was found that up to a certain dilution of disinfectant all the organisms were killed and the plates remained sterile. Once, however, this dilution was exceeded the results became unexpectedly irregular. Instead of a few organisms surviving for an hour or two and then dying, it was found that plates made after one hour gave a growth, plates made after three to five hours were sterile, and plates made after twenty-four or forty-eight hours gave a growth. This phenomenon was encountered on the border line of disinfectant and antiseptic action—that is, in a dilution of about 1 in 1,000 of iodine in potassium iodide, 1 in 100 of potassium permanganate, and 1 in 1,000 of optochin. The explanation that the author advances is that probably most of the organisms are destroyed by the disinfectant. A few, however, that are more resistant, though not actually killed, are sufficiently attenuated to be deprived for a time of their power of multiplication, they pass into a condition of "shock" and, hence, when transplanted to a suitable medium they fail to divide. Later this shock passes off and the organisms regain their power of growth.

EPITOME OF CURRENT MEDICAL LITERATURE.

[THE BRITISH
MEDICAL JOURNAL]

71

Medicine.

423

Arterial Hypertension

F. WAGNER (*Med. Klin.*, October 16th, 1925, p. 1575) remarks that although little is certain about hypertension, yet it is undisputed that there are cases connected with vascular and renal lesions, and characterized by great constancy of high blood pressure, for which there is an anatomical basis. There are also hypertensive patients who do not show the complications just mentioned and in whom the blood pressure is by no means so invariably high. Between these two seemingly opposed types—"anatomical" and "essential"—which it may be concluded that hypertension is a disorder of the blood vessels themselves, having in its early stages only functional signs and symptoms, but later giving a clear anatomical and pathological picture. Its origin may be traceable to the cerebral vasomotor centre and to the vegetative nervous system. The difficulties of research are increased by the fact that the vegetative nervous system is in the closest reciprocal relation with all the organs of the body, and especially with the endocrine glands. Treatment, therefore, remains symptomatic.

424

Prognosis in Arterial Hypertension

C. SOLE P. DOPFF (*Revista Med. de Barcelona*, September, 1925, p. 278) states that the vascular changes accompanying arterial hypertension are of greater prognostic value than the hypertension itself. Cerebral haemorrhage, the most common accident in hypertension, is due to degenerative changes in the walls of the cerebral vessels. Nevertheless, hypertension, even if not the primary cause of the haemorrhage, determines its extent, the higher the degree of hypertension, the worse the prognosis. The presence of arterio-sclerotic lesions in the retinal vessels points to the same condition in the cerebral arteries, and many patients with retinal arterio-sclerosis die in consequence of cerebral lesions. The coincidence of retinal changes with renal insufficiency is of grave prognosis, since it indicates the likelihood of death before long. The author considers that the renal affection is the effect and not the cause of the hypertension. The prognosis is worse when renal insufficiency is complicated by permanent high pressure. The latter is no longer supposed to be a symptom, but rather the most important cause of generalized vascular sclerosis. Therefore systematic examinations of the diastolic rather than of the systolic pressure should be made in order to reveal arterial hypertension. The early appearance of hypertension as well as its rapid increase and persistence indicate a serious condition, and the cessation of good health so often accompanying hypertension does not imply that the disease is mild. The arterial pressure gradually increases with advancing age. When hypertension is associated with peripheral vasoconstriction, the oscillometric index being small, the fatal type cerebral haemorrhage is usually due to anaemia, but in the plethoric type cerebral haemorrhage is generally the cause of death. In either case a prognostic factor of the highest importance is furnished by the condition of the heart. Diminution of the functional capacity of the left ventricle manifested in frequent attacks of angina pectoris, the presence of a gallop rhythm, or any other sign of insufficiency, is of grave significance.

425

Chorea Insaniens

O. H. PETTY and H. W. SCHAFER (*Journ. Amer. Med. Assoc.*, September 26th, 1925, p. 973) report a case of chorea insaniens, with recovery, in a girl aged 12. Her previous history included many attacks of tonsillitis, after the most recent attack the joints became painful and swollen. Seven days later choreiform movements started and increased in severity until her admission to hospital nearly two months after the onset of the illness. She was then delirious, with opisthotonos and contortions movements. She was unable to talk, but could utter shrill cries. The temperature was 106° F. The tonsils were enlarged, but not actively inflamed, there were no skin eruptions or subcutaneous nodules. The heart and joints were apparently normal. Large doses of hypodermics were required to produce physiological effects, and as much as 60 grains of barbitol and 81 grains of morphine were required to induce a few hours of sleep during the first four days, 71 grains of pralopin were given during the next four days, and barbitol in small doses controlled the choreiform move-

ments during the later days of the illness. Luminal and the bromides appeared to have little effect. For three weeks the girl was fed with large amounts of fluid by a stomach tube passed through the nose. The patient made a complete and rapid recovery, the temperature had returned to normal after thirty days in hospital, and she was discharged on the fortieth day. Six months afterwards she was leading a normal life and showed no signs of chorea. At no time during the illness was there any evidence of valvular disease.

426

Prophylaxis of Scarlet Fever and Measles

G. CARONIA (*Il Politecnico*, Sez. Prat., September 28th, 1925, p. 1357) finds from the statistics of the Italian Ministry of Health that there is an annual average of about 150,000 cases of measles with about 9,000 deaths and of about 25,000 cases of scarlet fever with 3,500 deaths. These figures, which underestimate the truth, because all cases are not notified, apply to Italy only. Scarlet fever affects about 30 per cent of all children, and measles nearly 100 per cent. In the course of two years 105 sanitary offices in 105 various centres (asylums, schools, and communes where epidemics were prevalent) have performed prophylactic injections with a vaccine prepared from the organism regarded by Caronia and Di Cristina as the specific cause of scarlet fever. About 7,000 children who had been exposed to infection were inoculated, and only about 2 per cent contracted the disease, the number of deaths being very low. In the city of Trieste alone, where a severe epidemic of scarlet fever occurred, 800 persons, consisting almost exclusively of children under 14, were inoculated with the vaccine, and none developed the disease. As regards measles, 539 who had been exposed to infection were inoculated with a vaccine prepared from the organism regarded by Caronia as the cause of the disease. None of the children had previously had measles and only 10 cases, or less than 2 per cent developed it. The method of inoculation consists in three injections, on alternate days of 2 cc. of a well developed culture, to which 0.5 per cent of carbolic acid has been added. The injections, which are given intramuscularly, do not cause any febrile reaction apart from exceptional cases, and produce only a slight local reaction.

Surgery.

427

Treatment of Acute Appendicitis

T. BRATRUD (*Minnesota Med.*, October, 1925, p. 634) finds that statistics from the most efficient hospitals still show the mortality of acute appendicitis as being 5 to 10 per cent. The cause of this high death rate is late diagnosis and delayed operation. Every case should be submitted to operation as soon as possible within the first forty-eight hours. After this period opinions differ. One group advises laparotomy and finds, another group recommends operation at once. Bratrud believes that more lives will be saved by conservative treatment after forty-eight hours. Some patients coming too late for operation may require gastrostomy or simple drainage and may then make a satisfactory recovery. In cases with a localized abscess operation is delayed till the abscess clears up. The incision advised is that over the outer edge of the rectus muscle. Drainage is employed where the appendix is black or green and in the presence of pus. The wound is strapped (wounds healed better by this method than when sutures were employed). Interoostomy is performed in the presence of peritonitis and gives gratifying results. Bratrud adds that if patients were operated upon within the first twenty-four hours there would be no deaths from appendicitis or its complications.

428

Vertebral Epiphysitis

J. BUCHMAN (*Journ. Bone and Joint Surg.*, October, 1925, p. 814) calls attention to vertebral epiphysitis as a cause of spinal deformity. The syndrome previously described by Andre Delbarye, appears between the ages of 10 and 21 and its onset may or may not be accompanied by slight fever. Pain and tenderness over the vertebral spines, the bodies of the laminae vertebrae and the iliac crests are associated with spasm in the muscles of the back and limitation of movement in all directions. Anomalies of position, form and tenderness are found in the superior and inferior epiphyses of ossification. The condition may explain many deformities of adolescence which result in kyphosis and scoliosis. Of

65 cases of so called idiopathic posterior and lateral curvature examined by Buchman 54 (83 per cent) gave evidence of epiphysitis. That the epiphysal involvement is primary and not secondary to the deformity is proved by the fact that it existed in three cases in which there was no clinical evidence of deformity. Buchman found that normally the superior and inferior vertebral epiphyses appeared at about 11½ years of age, and he concludes that any marked deviation from the time or order of appearance, and the presence of tenderness with abnormal x ray findings, are pathological and constitute a disease entity which manifests itself between 10 and 21 years of age, and is characterized by fatigue, head ache, and tenderness. Radiography shows that the epiphyses are enlarged, "moth eaten," frayed, and indistinct, while the intervertebral spaces appear cloudy, mottled, and irregular. Later the affected parts of the spine appear as a continuous fused mass. While the etiology is unknown, evidence seems to favour the belief that it may be due to a low grade infection, while stress and strain may be additional factors in the production of the secondary deformity.

429 Micturition in Two Stages

O MERCIER (*Journ d'Urol*, August, 1925, p 97) points out that while micturition in two stages is usually regarded as a characteristic symptom of diverticulum of the bladder, this condition may also occur in cases where the inter ureteric bar in the bladder is hypertrophied. He thinks that the mechanism of its production is probably somewhat similar to that seen in the case of bladder diverticulum. The hypertrophied muscular bar, combined with active contractions of the bladder produced during micturition, results in a depression where urine collects, and is later evacuated at a second act. For this to happen it is necessary that the muscular bar should be well developed and the bladder contractions should be well marked. The author adds that if the bar is not hypertrophied the obstacle is not sufficient to produce a depression to retain the urine. Where this condition is well marked a cavity is formed which may always contain a certain amount of residual urine. The diagnosis is easily made by a cystoscopic examination. A case is described in a patient, aged 71 years, in whom the condition was relieved by removal of the prostate.

430 Paratyphoid Cholecystitis

A LOWENTHAL (*Deut med Woch*, July 24th, 1925, p 1234) records two cases of cholecystitis occurring in the course of paratyphoid fever in a husband and wife respectively. Laparotomy followed by cholecystotomy was performed in each case, when peritonitis and cholecystitis were found and paratyphoid B bacilli were isolated from the bile. The man had suffered from enteritis in 1914 during the war, he may possibly have been a paratyphoid carrier since and so infected his wife. On the other hand, the woman, who had suffered from gall stones since her last confinement three years previously, may have infected her husband. In both cases the gall bladder, in which the formation of calculi had taken place, was the *locus minoris resistentiae* which led to the development of severe cholecystitis and peritonitis. In both cases paratyphoid B bacilli were found, not only in the pus in the gall bladder, but also repeatedly in the bile obtained by a biliary fistula. Both patients made a complete recovery. Cholecystotomy was chosen as the operation as it allowed the best possible drainage from the infected bile ducts, as well as a determination of the duration of infection by the possibility of bacteriological examination.

431 The Surgical Risks of Diabetes

A GUERRA and R PEREZ DE LOS REYES (*Rev med year de la Habana* August, 1925, p 469) state that of 385 cases of diabetes admitted to the Massachusetts General Hospital 14 per cent required operation (Fitz), while Joslin's figure was 11 per cent among 903 cases. Phillips estimates the operative mortality in diabetes at 36.37 per cent if there has not been any preparation before the operation, and at 17.7 per cent when the patient has been specially prepared. Fitz classifies diabetic patients into two distinct groups from the surgical standpoint—namely, (1) those whose lesion is related to diabetes and (2) those in whom the lesion is not connected with it. The first group includes cases of diabetic gangrene, furunculosis, carbuncle, and according to Berlmann affections of the bile ducts, pancreas and thyroid. The chief cause of the high operative mortality in diabetes is infection. In a group of 45 cases operated on at the Massachusetts General Hospital 20 who had gangrene or other acute infection showed a mortality of 50 per cent, whereas the mortality was only 12 per cent among 25 in whom there was no infection. The study of recent literature shows a progressive diminution in the operative mortality among diabetic patients, so that at present it is almost the same as that of the non diabetic. The factors in the fall in the mortality are the

following: (1) Pre operative treatment, which consists in freeing the patient from sugar and acidosis by a saltable regimen. (2) Judicious choice and administration of the anesthetic, nitrous oxide and oxygen, or a local anesthetic, being the best. (3) Correct operative technique, especially avoidance of shock, and rigorous asepsis. (4) Appropriate post operative treatment.

Therapeutics.

432 Dietetic Treatment of Peptic Ulcer

A JAROTZKI (*Presse Méd*, September 26th, 1925, p 1228) bases his dietetic treatment of peptic ulcer on the researches of Pavlov and his school. He rigorously bans milk, as its cream clots in the stomach, the passage of the least quantity into the duodenum causes a closing of the pylorus (Pavlov), and it excites an abundant secretion of gastric juice (P Chugue). In order that the stomach may have rest he feeds his patients on egg albumen and butter, given separately, the former fixes hydrochloric acid and excites no gastric secretion, it is given in the morning, without salt, and is not beaten up. Commencing with the albumen of one egg a day, the patient increases his ration by another one each day to a maximum of ten. The meal of butter, also without salt, is given at 3 p.m. Butter has a high calorie value, and, like all fats, inhibits the secretion of gastric juice. The ration is just under an ounce the first day, increasing by two thirds of an ounce daily to a maximum of 6 ounces. The author stresses the fact that the white of egg and the butter should be given separately, as a mixture of the two is retained in the stomach for many hours and excites a free flow of gastric juice (Piontkowski, Gordceff, etc.). Further, he forbids water altogether—by the mouth, as an enema, or as a saline injection. This is the treatment for serious cases, and is continued for eighteen days. Then soups, prepared with rice, pearl barley, semolina, and purées of vegetables, such as potato, carrots, cabbages, and turnips, with butter, but no salt, and passed through a sieve, are given with the afternoon meal of butter. The cereals may be sweetened and given with purées of fruit, such as apples and plums. In less serious cases rice soup is given with the afternoon meal from the beginning.

433 Spinal Drainage in Early Poliomyelitis

J C MONTGOMERY and W C C COLE (*Journ Amer Med Assoc*, September 19th, 1925, p 890) suggest that early and rapid subarachnoid drainage is a valuable therapeutic measure in poliomyelitis. In a series of cases they performed lumbar puncture as soon as the diagnosis was made, and if there was a definite increase in pressure of the fluid (with or without increase in the cell content) it was repeated at intervals of twelve or twenty-four hours until the pressure had definitely subsided. In sixteen cases lumbar puncture was performed not later than the third day, and in six cases between the fourth and the tenth days. In the first group paralysis only occurred in one patient and consisted of no more than a slight temporary weakness of the palate. In the second group paralysis occurred in all except one, and was permanent in four patients. The authors therefore emphasize the importance of beginning this treatment early. They give clinical details of their five cases. They add that marked improvement of the symptoms always followed the treatment, there was invariably cessation of vomiting and diminution of hyperaesthesia and rigidity of the neck and spine. This improvement was also apparent in four other cases in which the punctures were only begun in the second week of the illness, and after paralysis had already appeared. In two of these cases the paralysis was permanent, in one it disappeared, and in the fourth it was definitely lessened.

434 Silver Nitrates in Gonorrhoea

H HAXTHAUSEN (*Ugeskrift for Læger*, September 17th, 1925, p 815) has carried out experiments *in vitro* and has compared the clinical results obtained with various silver salts in the treatment of gonorrhoea with a view to determining their relative values. The experiments were made on a bouillon gelatin ascites culture of coliform bacilli, the capacity of silver salts to diffuse to a certain depth and arrest the growth of the culture being determined for each salt in various concentrations. In the case of silver nitrate it was found that the diffusion depended in a curious way on the concentration of the solution, the diffusion of concentrated solutions dwindling from a maximum to a minimum when the concentration was reduced to about 0.25 per cent. When the concentration was further reduced, the diffusion increased, decreasing with still further dilution. After discussing the possible explanation of this phenomenon the author notes that certain other silver preparations, such as protargol, behaved in the same way as silver nitrate, whereas complex

silver salts, such as argyrol, showed a diffusion capacity that increased directly with the concentration of the drug. At the optimum concentration of each silver salt it was found that silver nitrate had the most penetrating effect. The clinical investigations consisted of comparing the results obtained in 50 cases of early uncomplicated gonorrhoea treated with silver nitrate, in 50 similar cases treated with protargol, and in 50 similar cases treated with albugin in the Rigshospitalet in Copenhagen. This comparison also resulted in favour of silver nitrate, and the author concludes that this salt is superior to the numerous other silver preparations which have been recommended during the past thirty years as substitutes in the treatment of gonorrhoea.

435 Actinotherapy in Syphilis

P. RAVALT, BASCH, and LAMBLING (*Ann de Derm et Syph*, August September, 1925, p. 518) recommend the application of ultra violet rays in combination with the usual chemotherapeutic treatment in syphilis. Although there is no acceleration of the disappearance of the clinical symptoms and alteration of the blood reaction, this combined treatment exerts nevertheless a highly favourable influence upon the general health. The administration of eosin or methylene blue before irradiation was found to increase the therapeutic effect of the latter. The cerebro spinal reaction seemed also to change more rapidly under the combined treatment. The authors are careful to add that actinotherapy alone, even if intensified by photodynamic substances, while benefiting the general health, does not take the place of specific treatment.

436 Risks of Iodine Treatment in Graves's Disease

F. REDLICH (*Monatsh. f. Hoch*, October 8th, 1925, p. 1102) recalls that iodine in the form of burnt sponge was used for goitre even in Greek days. With the growth of more exact observation a number of facts have been collected which are unfavourable to the use of the drug. Results have generally been best when the dose was smallest. For the last century the drug has been used systematically, and it has been recognized that administration of iodine, even a singleunction, may cause enlargement of the thyroid, and a serious increase of the symptoms. A few patients have derived benefit from iodine treatment, but the claims of Plummer and others that such favourable cases can be detected before the start of treatment have received very little confirmation. It is improbable, too, that iodine has value as a pre-operative measure. Redlich adds that a source of error worth remembering is giving potassium iodide for suspected syphilis to a patient with a slight goitre. He cites one such case in which serious loss of weight ensued, necessitating prolonged rest in bed.

Radiology.

437 Dyes in Cholecystography

R. B. WHEELER and I. K. BOGAN (*Boston Med and Surg Journ*, October 8th, 1925, p. 676), following other workers, have given intravenous injections of sodium tetraiodophenol phthalein in 20 cases of suspected gall bladder disease. This drug, excreted by the liver cells, increases the visibility of calculi, and the procedure is apparently harmless. They found that the gall stones might be usually distinguished from renal calculi and from calcified lymph nodes. The emptying time of the gall bladder could be determined, and the authors suggest that delay may indicate disease. The dye occasionally failed to appear in the gall bladder, pointing to disease in the tract or obstruction of the duct, though it is added that such failure is perhaps likely to occur if the drug be given by the mouth instead of intravenously. The authors believe it possible for a large low gall bladder to exert sufficient traction on the common duct to produce symptoms simulating gall bladder disease.

438. Transcerebral Ionization in Late Hemiplegia

G. BOUFFIGUON (*Paris Med*, October, 1925, p. 280) claims to have had good results with this treatment in cases of hemiplegia with contracture. He places the positive pole, moistened with a 1 per cent solution of calcium chloride in distilled water, on the closed eye on the side opposite to the hemiplegia, and the negative pole, moistened with pure water, on the neck at the occipito vertebral junction. He uses at first a current of 2 to 3 milliamperes, raising it in two days to 4 to 5 milliamperes, which is his maximum. Treatment is continued for thirty minutes at a time, and is given six times in the first week and three times in each of the second, third, and fourth weeks. It is interrupted then for three weeks. The author states that he has seen contractures diminish, movements performed that were previously impossible, aphasia considerably improved, crises of Jacksonian epilepsy disappear, and in certain cases a lessening of the

exaggeration of reflexes. In specific cases he has found it preferable to use an iodine ion. Faradism of the muscles opposing those involved in the contracture is further claimed to be of value as an adjuvant.

439 Radium in Angioma Cavernosum

O. N. FRAZIER (*Acta Derm et Syph*, October, 1925, p. 505) reports a case of angioma cavernosum in a baby, 4 months old, in whom the condition appeared a few days after birth and rapidly enlarged. Occurring most frequently on the face or scalp, the lesion appears as a soft elevated subcutaneous tumour with frequently a superficial naevus vasculosus in the overlying skin. In the case recorded the tumour was situated at the left side of the nose and extended over the inner half of the left eyebrow, lid, and cheek, and upon to the forehead, it was very soft, with an ulcerated area at its lower outer quadrant. Radium treatment was applied 90 mg of radium element being placed in four tubular applicators (two containing 25 mg. and two 20 mg.) and fixed at 2 cm. from the surface of the skin so that the rays might enter at different angles. The 25 mg. applicators were screened with 1 mm. each of silver, brass, lead, and hard rubber, while each of the 20 mg. applicators was composed of two 10 mg. needles screened with 0.4 mm. of an alloy of which the density was 8.7, and 1 mm. each of brass, lead, and hard rubber, the surrounding area being protected by 1 mm. of lead with 1 cm. of gauze between the lead and the skin. One single exposure of twenty three hours was given. No visible superficial reaction occurred, but the angioma, after three weeks, gradually decreased in size, and eight months later had completely disappeared. Beyond some scarring, the cosmetic result was very good, with but little deformity of the nose, and there was no evidence of any damage to the eye.

Obstetrics and Gynaecology.

440 Post climacteric Metrorrhagia and Ovarian Cancer

J. SCHIFFMANN (*Zentralbl. f. Gynäkol*, October 3rd, 1925, p. 2229) says that although metrorrhagia is well known as a danger signal yet the particular connection with ovarian cancer is insufficiently appreciated. The reason assigned for this are lack of textbook mention and the slight and temporary character of the flow, which stops when the ovarian tumour gets bigger. The author quotes five cases to show that even if the patient seeks advice at the time of the bleeding nothing is detected even if uterine tissue be excised for examination, a precautionary hysterectomy is naturally of no avail. Glöckner and Lippert, the two first writers to call attention to this symptom, reported the following figures. Of 635 cases collected there were 31 patients who had return of the menstrual flow long after the climacteric, of these 31, uterine tumour, innocent or otherwise, was found in 8 and of the remaining 23 no fewer than 14 patients had ovarian malignant disease, mostly carcinoma. It is suggested that the pathogenesis of the haemorrhage is comparable with that of carcinoma of the ovaries of female children, which is known sometimes to induce menstruation and premature sexual development, the initial effect of the tumour formation being the stimulation in some way of the function of the organ affected.

Diabetes and Pregnancy

H. HENFBERG and G. BRÜCKEL (*Gynecol et Obstet*, 1925, xii, 1, p. 72) state that fewer than 1 per cent of diabetic women are capable of becoming pregnant. Their general wasting, the impregnation of the tissues with sugar and the sexual frigidity arising from then complaint are all general conditions favouring sterility. Locally there is a progressive sclerosis of the ovaries and not infrequently chronic atrophic endometritis. Menstruation is completely absent in about one half of diabetics. Diabetes in pregnancy must be distinguished (1) from lactosuria (2) from alimentary glycosuria, which is transitory, easily controlled, and uncomplicated by polydipsia or polyuria, (3) renal glycosuria—a benign affection without hyperglycaemia, but sometimes associated with minor crises of acidosis. There must be some reserve in the prognosis of these forms, for occasionally benign glycosurias of pregnancy are followed during later gestations or in the non gravid state by the development of rapidly fatal diabetes. True diabetes in pregnancy leads in about one half of cases to death before or within a few months after term, the prognosis, however, is probably more hopeful since the discovery of insulin. The authors relate the case of a primipara, aged 22, who suffered from grave diabetic symptoms with incipient coma and air hunger, vigorous insulin treatment from the eighth month brought about rapid improvement but the foetus was born dead after spontaneous labour. Three months later the nurse was free from sugar and acetone

442 Primary Lymphoblastoma of the Ovary

G. PETTA (Il Policlinico, Sez. Chir., September 15th, 1925, p. 437) records the sequel to a case previously reported (*ibid.*, January 15th, 1924) in a girl, aged 18, who was operated on for lymphoblastoma of the left ovary on February 10th, 1923. The tumour was of the size of a foetal head and weighed 1,700 grams. The right ovary and paratortic glands were found to be normal at the time of the operation. The patient left hospital in excellent condition on March 6th. On June 2nd she was seized with severe pain in the left lumbar region, and subsequently rapid loss of flesh and asthenia developed. When she was seen in August a hard swelling was found on palpation of the abdomen connected with the lumbar vertebrae. Under radiological treatment the swelling became less and the pain was relieved, but in May, 1924, the swelling and pain increased, and the lower limbs became swollen. Death followed in June, and the autopsy showed a tumour in the right ovary the size of a large orange, metastases in the retroperitoneal and mediastinal lymphatic glands, and multiple nodules scattered throughout the peritoneum and pleura on the right side. Microscopical examination showed that the growth was a lymphoblastoma. The case illustrates the great malignancy of primary lymphoblastoma of the ovary. The evolution of the disease was rapid, the duration being eighteen months from the onset of the first symptoms in December, 1922.

443 Puerperal Septicaemia

W. D. GATCH, H. M. TRUSLER, and J. L. OWEN (*Journ. Amer. Med. Assoc.*, September 19th, 1925, p. 834) point out that patients with septicæmic conditions such as those arising from infection during labour will frequently recover if they can be kept alive during the first few days of the illness. Post partum sepsis, even though treated conservatively and complicated by pulmonary infarcts and peritoneal involvement, is not necessarily fatal if the primary bacterial invasion is not overwhelming. They therefore view with some scepticism the alleged curative effects of gentian violet and mercurochrome. As a result of experimental work they find that a large dose of either drug injected during a grave infection may hasten death, though in smaller doses a temporary inhibition of bacterial activity is produced, thus assisting the natural resistance. They therefore advise caution in prescribing these remedies in puerperal sepsis.

Pathology.

444. Infection of Various Sugars in Insulin Hypoglycaemia

D. CALTABIANO (Il Policlinico, Sez. Med., October 1st, 1925, p. 489), as the result of experimental work, concludes that in insulin hypoglycaemia the administration of glucose has a specific effect: it suppresses very rapidly the nervous phenomena due to the hypoglycaemia, and the free sugar level in the blood is raised. On the other hand, no benefit was found to follow the intravenous injection of saccharose, maltose, or lactose during convulsive crises produced by insulin; this form of administration being used with the view of promoting rapid absorption and a high concentration. The author attributes this to their transformation into glucose such a transformation under normal conditions, but it is prevented by the presence of insulin. When these sugars were injected in the hypoglycaemic, but not yet convulsive phase, they were found to delay for about an hour the outbreak of convulsions, and hence the fatal termination.

445 Streptococcal Virulence

T. D. BECKWITH and E. J. ROSE (*Journ. Infect. Dis.*, September, 1925, p. 277) claim to have correlated the virulence of a haemolytic streptococcus to rabbits with its rate of multiplication in nutrient media and its susceptibility to heat. A certain strain of streptococcus has been maintained over a period of five years in two different ways. One portion, known as the stock culture, has been subcultured on blood agar slopes; the other, known as the passage strain, was passed monthly from rabbit to rabbit by intrapleural injection. After the death of the animal in four or five days the pleural fluid was withdrawn and kept in a sealed tube, a twenty-four hour broth culture inoculated with this was used for the next injection. By comparing the growth of the two strains in plain broth it was found that the passage strain grew more rapidly than the stock strain. Thus after twenty-four hours the number of viable bacteria in the former was 264 million per cubic centimetre, in the latter only 165 million. The two strains were tested for their virulence to rabbits by intrapleural injection of a twenty-four hour broth culture. Of the passage strain less than 300 organisms sufficed to kill, of the stock strain even 165 million failed to

kill. Thus the passage strain grew more vigorously in broth and was over half a million times more virulent than the stock strain. On the other hand, the stock strain proved to be considerably more resistant to heat. Whereas it was not killed by 65°C in half an hour the passage strain was killed by the same temperature in fifteen minutes. A series of experiments showed that the stock strain had a thermal death point about 5°C higher than that of the other. Both strains exhibited the same susceptibility to disinfectants. The authors consider, therefore, that they have established a positive correlation between vigour of growth in vitro and virulence to rabbits, and a negative correlation between virulence to rabbits and susceptibility to heat.

446 A Chinese Antiscarlatinal Serum

T. H. TSEY and P. Z. JING (*National Med. Journ. of China*, August, 1925, p. 224) report the preparation of an antiscarlatinal serum in a way different from that of Dochez and Dick. The Chinese antigen consists of a saline suspension of the washed whole bacterial bodies of haemolytic streptococci recovered from the throats of scarlet fever patients. Twelve doses of dead cultures were used first in immunizing the horse, and were followed by fourteen doses of living cultures of gradually increasing amounts. To test the serum a virulent strain of haemolytic streptococcus isolated from a case of erysipelas was used, and it was found that one-fifth of a cubic centimetre of the serum protected a mouse against a thousand times the fatal dose of this organism. In the same issue (p. 219) S. P. CHEY reports favourably on the clinical use of this serum, which he finds has a decidedly curative effect in severe cases of scarlet fever, preventing life and warding off serious complications. The serum was not tried in mild cases, but the valuable results obtained in the more severe types were so striking that this preliminary publication of the results was thought advisable.

447 Blood Groups and a Persistent Wassermann Reaction

A. STRASZYLSKI (*Arch. Hoch.*, October 8th, 1925, p. 1952) reports that it has been made that an inheritance of is linked with inheritance of one of the four blood groups. He is convinced that there exists a correlation between the blood group and the rate of disappearance of a positive Wassermann reaction in patients under treatment for syphilis, and confirms a previous statement by Amsel and Halber to this effect. In a series of syphilitic patients collected by Straszylski the Wassermann reaction remained positive in 43 per cent in the case of one group, whereas in another the corresponding figure was 25 per cent. It is admitted that further investigation is required before final conclusions can be drawn.

448 Antidiphtheritic Immunization

C. ZOELLER (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, August 6th, 1925, p. 1216) has found that very young guinea pigs are not so easy to immunize against diphtheria as older ones. Two different litters were taken. In one the animals weighed from 70 to 90 grams in the other from 150 to 230 grams. Each animal was given two injections, at a fortnight interval, of 0.5 c.c. of anatoxin three months later each animal was tested by the injection of a lethal dose of diphtheria toxin. Though none of them succumbed, the young animals in the first litter showed a characteristic local lesion, whereas the older animals in the second litter showed no local lesion at all. From this it would appear that immunization of young animals is more difficult than that of older animals. In England, Glennie and his collaborators have made similar observations. To immunize young guinea pigs they found that twenty successive injections of diphtheria toxin were necessary for older animals thirteen sufficed. Zoeller remarks that if the same finding is true of children it will be important to ascertain the best age for immunization.

449 The Blood Platelets in Banti's Disease

N. ROSENTHAL (*Journ. Amer. Med. Assoc.*, June 20th, 1925, p. 1887) considers Banti's disease a definite clinical entity and finds that there is a marked alteration in the blood platelets, and that there is a marked present and in their functions. He distinguishes two forms of the disease. In the first, the thrombocytopenic group, the blood platelets are diminished after splenectomy there may be a temporary increase followed by a return to approximately normal. Diminution of the platelets appears to be associated with haemorrhages. In the second group, termed "thrombocytæmic," the platelets are in normal or subnormal numbers before splenectomy, but after this operation they show an enormous and permanent increase. This increase is associated with repeated thrombosis. The results from splenectomy are stated to be very good in the first group, but in the second very little improvement is obtained. He therefore recommends the examination of the blood platelets as a means of prognosis in Banti's disease.

Medicine.

450

Brachial Neuralgia

C LOIX and J A CHAVANY (*Journ de Med et de Chir Prat*, September 10th, 1925, p 618), describing the various brachial neuralgias, remark that rheumatic, or essential, neuralgia has many points of resemblance to sciatica—it often has a preparatory phase of flying pains, stiff neck, and general malaise followed by sharp pains. The preparatory phase rarely lasts more than forty-eight hours. When the neuralgia is well established the aspect of the patient is often characteristic. The pain may be spontaneous or provoked, the slightest movement will excite the pain, and its character is very much the same as that of sciatica or zoster. Its severity usually decreases after four or five days, but the pain may last for five or six weeks. The distribution of the pain is along the arm, especially on the external aspect, and the attacks sometimes come on slowly and disappear slowly. Hyperaesthesia is common, also paraesthesia, especially of the index finger or thumb, which persists after the acute phase has passed. The painful points described by Vallery, although often present, are sometimes not clearly defined. Mobility is unaffected, but the muscular power is much reduced, the reflexes are not much altered. Stiffness of the neck is felt, with pain on lateral pressure of the cervical column and on turning the neck on the sound side. Sometimes brachial neuralgia sets in with apoplectic form suddenness. In addition to essential neuralgia the authors describe various symptomatic forms, such as post-traumatic (often associated with a burning pain and glossy skin), pressure of tumours on bone, syphilitic, diabetic, encephalitic, zoster, Pott's disease, axillary tumours, reflex, and neuropathic. Treatment depends largely on the cause of the neuralgia. In the acute stage morphine may be necessary, heat is usually beneficial.

451 Remission of Diabetes Mellitus in Children

A HEINYAN TROSEY and H HIRSCH KAUFMAN (*Klin Woch*, October 15th 1925, p 2016) record the case of a girl, aged 14, who was admitted to hospital in November, 1924, in deep diabetic coma. Benefit was obtained from insulin, but large doses did not remove all the sugar and acetone from the urine, while on the other hand the general condition was too poor to allow the diet to be reduced drastically. Later with a diet of 1,250 calories and 110 grams of carbohydrate the insulin was reduced, and the child was discharged with the urine clear and a gain in weight of 4½ lb. after a seven weeks' stay. Insulin and the dietetic treatment were continued at home. In the following March the child was readmitted for a slight recurrence which soon yielded to a little more insulin. At the end of the month the urine was clear. In the absence of insulin treatment or definite diet restriction, a condition persisting to the present time, during which pubertal changes and great bodily development occurred. The impression derived from this and a similar case incline the authors to attribute the final good result to islet stimulation from the general endocrinological interplay of puberty. In other cases reported young children with catarrhal jaundice have developed severe diabetes, which soon disappeared after a little insulin temporarily, or even with diet restriction only. They agree that more investigation is needed to define the bearing of these observations upon prognosis and the question of spontaneous cure of diabetes in children.

452 The Vital Capacity of the Lungs in Pneumonia

J H ARNETT (*Journ Amer Med Assoc*, September 26th, 1925, p 986) has estimated the vital capacity of the lungs in thirty-two cases of pneumonia, examinations being made, both before and after the crisis, during periods in some cases of as long as four hundred days. He found that the vital capacity was greatly reduced early in the disease, and states that a reduction to less than 50 per cent is a valuable diagnostic point. As a rule the greatest reduction occurred shortly before the crisis, and he therefore thinks it possible to predict the advent of the crisis by this method. After the crisis in cases of uncomplicated lobar pneumonia the vital capacity was found to increase rapidly, but not always steadily, for about five to ten days, averaging 131 c.c. a day, in bronchopneumonia the daily rise was about 112 c.c. In cases of delayed resolution and empyema, however, the average daily rise was only 87 and 41 c.c. respectively. Arnett therefore believes that the routine estimation of the vital capacity in pneumonia would enable early information

to be obtained of the occurrence of these complications. After the primary rapid increase in the vital capacity the rate was found to slow down. Some patients regained their normal capacity in about 150 days, while others took 1 year, in many cases, however, the previous normal is probably never reached.

453

Chorea

L BABONNEIX (*Journ de Med et de Chir Prat*, September 10th, 1925, p 609) discusses the nature of chorea, and concludes that, while a rheumatic chorea does exist, some choreas are really manifestations of encephalitis lethargica, probably the chorea of pregnancy is of that nature. The anatomical lesions are very much the same as those found in encephalitis, so that, apart from the preceding history, it would not be possible to distinguish the two forms of chorea by an anatomical examination alone. The movements in rheumatic and encephalitic chorea are more or less similar, but in rheumatic chorea there is a previous history of rheumatic pains which is not found in encephalitic chorea, and in the latter there are associated symptoms, such as ptosis, paresis, myoclonus, and salivation, which are not present in rheumatic chorea. The sequelae are also different—endo carditis in the one case and mental or Parkinsonian symptoms in the other. As a rule there is no difficulty in distinguishing the two types.

454

Encephalitis following Measles

J BONABA (*Arch Lat Amer de Ped*, No 6, 1925, p 858), who records an illustrative case, remarks that nervous complications are not frequent in measles, encephalitis in particular being a rare event. Although some textbooks mention measles as one of the chief causes of encephalitis, Bonaba states that on closer study it will be found that this acute exanthem is rarely responsible for the cerebral condition, as is shown by the fact that among 62 cases of encephalitis reported by Comby in 1921 there were only two following measles. Bonaba's case was in a girl, aged 13, who three weeks after an attack of measles developed generalized convulsions, most marked on the right side and followed by right hemiplegia and aphasia. The hemiplegia gradually subsided, leaving only a slight hemiparesis, and the aphasia slowly improved. It was impossible in this case to incriminate arteritis, arterio-sclerosis, thrombosis, embolism, or haemorrhage, which are the usual causes of hemiplegia at other age periods, but are rare in childhood.

Surgery.

455

Resection in Gastropotosis

B MARTIN (*Zentralbl f Chir*, October 3rd, 1925, p 2226) claims that gastropotosis is due to stretching of the cardiac portion of the stomach. The majority of these patients are debilitated, and consequently the gastric musculature loses its elasticity and its contractile power to a considerable extent. The abnormality may commence at puberty and is not necessarily associated with a pendulous abdomen. Martin traces the origin of gastropotosis to an embryonic defect. The alimentary canal is divided, morphologically, into three portions: the first part terminates at the junction of the cardiac and pyloric portions of the stomach, the second part at the junction of the pylorus and duodenum. The upper end of the first part (pharynx and oesophagus) has a powerful musculature, while the lower end—that is, the cardiac portion of the stomach—is relatively thin and weak. Martin finds that in gastropotosis there is a definite contrast between the cardiac and pyloric portions, the musculature of the latter (including the pyloric ring) being much stronger than that of the cardiac portion, this is but an exaggeration of the differentiation common to the stomachs of all vertebrates. He gives diagrammatic illustrations of two types, which he calls "cachalot stomach" and "hare stomach", in the former the cardiac portion forms a thin vertical flask-shaped sac, while the pyloric portion is a rather thick and narrow tube. In the "hare stomach" type the cardiac orifice is close to the commencement of the pyloric portion, while the thin cardiac part forms a balloon-like sac to the left of the oesophagus. He recommends resection of the cardiac part, when thinned and dilated, and appendix diagrams showing the position of a test meal in stomachs before and after resection.

954 B

462 **Treatment of Impacted Fae** 25
F. PICCININO (*Rinascenza medica*, October 1st, 1925, p. 445,
who records an illustrative case in a man aged 26, musician,
that electro galvanic irrigation of the intestine with the battery
employed in very many cases of intestinal obstruction, has
never failed when the obstruction was due to impacted faeces.
The only instruments required are a battery, a galvanometer,

an irrigator, and a metal sound. The method is indicated in intestinal obstruction following obstinate and prolonged constipation, paralysis or paresis of the intestine secondary to compression or lesions of the spinal cord, falls on the abdomen or on the buttocks with lesions of the conus or cauda equina, or in other cases of severe disease of the spinal cord such as tabes or disseminated sclerosis. In short, he believes that, apart from cases in which there is obviously an anatomical obstruction, electro-galvanic irrigation of the intestine is always indicated in intestinal obstruction, even in doubtful cases. As the treatment is harmless it is worth while making trial of the method, which may avert a dangerous operation. As a general rule in cases of obvious or suspected myelopathy associated with intestinal obstruction the irrigation may be repeated with success and without ill effects for several days. It is particularly in lesions of the conus and cauda equina that systematic irrigation on alternate days has proved successful and rendered the use of purgatives needless.

463 The Action of Quinine and Cinchonine on the Heart

G. MELDOLESI (*Chronic circolazione*, September, 1925, p. 353) studied the action of quinine and cinchonine in a series of twelve healthy adults who showed no organic or functional disorders of the circulatory system. The drugs were given intravenously in doses of 0.25 and 0.30 g. per kilo of body weight. The results were as follows. Both drugs had a decidedly exciting action on the cardiac activity, the mechanism of their action being twofold. During the first stage they act by stimulating the sympathetic, increasing in particular the activity of the formation of stimuli and the tone of the myocardium, while their action on excitability and conduction is appreciable only in exceptional cases. In the second stage they act directly on the heart, causing a remarkable improvement in the circulation, which is shown by improvement in the quality of the pulse, by causing a slowing in the frequency of the cardiac contraction and an increase in the myocardial contractility and tone. The action of quinine is exercised particularly on the ventricular activity, while the action of cinchonine is extended to the auricles as well, but while the tonic action is very pronounced in the case of quinine it is practically negligible in the case of cinchonine.

Dermatology

Lupus Erythematosus

464 N. DYSON, *Id. + Tox. Derm. and Syph.*, October, 1925, p. 401. of lupus erythematosus by treating ointment and 8 cases with streptococcal ointment. A positive reaction was obtained in 68 per cent of those tested with tuberculin ointment and in 35 per cent of those tested with streptococcal ointment. Another group of cases did not react locally to either human, bovine, or streptococcal toxin, and autogenous streptococcal vaccines produced no change in the lesions, though in one severe constitutional symptoms were produced. Dyson concludes that the lesions are sensitized to certain bacterial toxins, and, should further investigations prove that these reactions are specific in individual cases, he considers that it would be justifiable to regard the toxin to which it reacts as the same as that which originally produced the sensitization. A. M. H. GRAY (*ibid.* p. 406), discussing the etiology of lupus erythematosus concludes that the disease is a definite clinical entity and an infective disease due to the local activity of a specific micro-organism, but that there is not sufficient evidence to show that this organism is the tubercle bacillus. Since tuberculosis is a common accompaniment of lupus he regards the latter as either predisposing to tuberculous infection or as lighting up pre-existing tuberculous infection, tuberculous subjects may be specially liable to contract it. He points out that streptococcal infection is a frequent terminal manifestation, especially in acute cases, and may also complicate the less severe types.

465

Cancers of the Skin

S. LABORDE (*Journ. de Radiol. et d'Electrol.*, September, 1925, p. 385) states that the methods of treatment of cancer of the skin differ in accordance with their histological type and clinical aspect. He divides these cancers into three principal types: the spino-cellular, the baso-cellular, and the intermediate. He distinguishes also a 'naevic' form, which requires treatment by electrolysis rather than by radiotherapy. While the baso-cellular tumours are particularly radio-sensitive, the spino-cellular type is radio-resistant. Darier and others have considered that the latter class is unsuitable for radiotherapy, although some authors now hold that spino-cellular epitheliomata are as radio-sensitive as those

of the baso-cellular type, or even more so. This recent view appears to Laborde to be incorrect, as, apart from the early lymphatic invasion and the rapid extension of the tumour, which render the spino-cellular cancers unusually serious, it is certain that they require a more stringent technique and more accurate dosage than any other epitheliomata of the Malpighian layer—they offer greater resistance to the radium emanations. A small spino-cellular epithelioma is more easily cured than an extensive infiltrating tumour of the baso-cellular type. Laborde gives details of extensive cancers of the intermediate and spino-cellular types. In a case of the first occurring on the face of a woman, aged 74, the introduction of radium needles and the application of radium to the skin resulted in cure. A spino-cellular epithelioma on the posterior surface of the right ear of a man, aged 75, who had previously been treated with x-rays without benefit, was similarly removed by radium. The author, recognizing the difficulty of curing these tumours when they have become in some sense resistant to x-rays, insists on the importance of the histological examination as a guide to prognosis. When previous irradiation has damaged the stroma of the neoplasm, the scar tissue then produced is often only temporary; the appearance of these tumours, either resistant to treatment or exhibiting local recurrences, is almost always the same—a chronic atonic ulcer, with or without necrotic areas indicating connective tissue deficiency and feeble attempts at cicatrization. On the contrary, when the stroma remains healthy, treatment is effectual in the majority of cases, in spite of previous irradiation of the tumour. Laborde adds that x-ray dermatitis may be improved considerably by applications of radium. The hyperkeratosis and the painful fissures disappear completely after the application of radium emanation through a moderately thick filter. Papillomata which exhibit signs of commencing malignancy and epitheliomata when still limited in extent may, he states, be cured definitely by the same method in from six to eight days. The treatment of metastases in the lymph nodes necessitates the use of considerable quantities of radium closely applied to the contours of the part by means of some carefully moulded plastic material.

466

Recklinghausen's Disease

H. SCHNEIDERMAN (*Arch. Derm. and Syph.*, October, 1925, p. 483) reports four cases of Recklinghausen's disease which, in his opinion, fail to reveal any evidence of that endocrine deficiency which some dermatologists have recently suggested as being its cause. He believes that the disease is to be attributed to some embryonic disturbance in the ectoderm, and that there is a distinct hereditary factor in the majority of cases. He is also of opinion that more evidence of heredity could be obtained if it were not for the low intelligence of many of these patients and their ignorance about their relations. He explains the association of endocrine disturbances with Recklinghausen's disease as being due to the whole nervous system being attacked and to the skin and other organs being predisposed to tumour formation. The endocrine glands may thus be attacked simultaneously, either by some structural or functional nervous disturbance, or by tumour formation. He believes that the disease starts as a developmental defect of the ectoderm, and he draws support for this etiology from Halsey Bagg's experimental production of deformities in embryos by the application of physical and chemical agents. Schneiderman, therefore, deprecates the incrimination of the endocrine system in this disease, and advises further biological study of the hereditary and developmental factors.

Obstetrics and Gynaecology.

Uterine Fibromyomata

467 J. G. CLARK and F. B. BLOCK (*Amer. Journ. Obstet. and Gynecol.*, October, 1925, p. 560) discuss the treatment of uterine fibromyomata based upon the study of 422 cases treated either by operation or with radium. They hold that either form of treatment should be undertaken by gynaecologists familiar with both, so that hysterectomy can be immediately undertaken if, on examination under anaesthesia, some contraindication to irradiation not previously discovered presents itself. Such contraindications are, in their opinion, tumours larger than a four months pregnancy, those complicated by adnexal disease or causing pressure symptoms for which irradiation would be too slow in its action to afford quick relief, those of rapid growth, large submucous tumours, and, with few exceptions, patients under 35 years of age. In their hands the mortality from radium treatment has been nil, and satisfactory results were obtained in 90 per cent of the cases after one treatment. In those cases requiring operation the authors conclude from a study of the literature

that myomectomy is attended by no higher mortality than hysterectomy, and the fact that it may be followed by pregnancy in a sufficient number of cases warrants its adoption in young women, especially when the growth is single and intramural or subperitoneal. Should hysteromyomectomy be decided upon, the authors consider that the vaginal route is unsuitable except in very rare cases in which the tumour is small with an associated prolapse, and they strongly advocate the abdominal route with a subtotal hysterectomy unless the cervix is badly diseased. In their experience carcinoma does not develop in the retained cervical stump with sufficient frequency to warrant risking the higher mortality and morbidity which they consider the total operation entails. In their series no death occurred after operation in uncomplicated cases, and in complicated cases the mortality was 3 per cent, the end results were satisfactory in about 95 per cent of the cases, the mortality and morbidity being usually due to complications.

468

Phlegmasia Alba Dolens

E COUDERT (*Journ de Méd et de Chir Prat*, October 10th, 1925, p 701) discusses the etiology of phlegmasia alba dolens, and concludes that immobilization should be commenced at the earliest opportunity, if possible before the clot has fully formed, and when only such symptoms as untoward temperature, quickened pulse, and slight cramps and pains in the legs exist. The leg should be supported evenly on a broad cushion of chaff which stops short of the heel, this is thus raised to 6 or 7 inches above the bed, the foot being kept at right angles to the leg. Should the phlebitis incommence, the limb should be surrounded by a layer of wadding, which is not changed unless severe pain supervenes, in which eventuality hot compresses can be applied twice or thrice a day, good nursing is needed to minimize movements of the limb. Since the lochia will not have ceased, and the patient will require enemas, and in view of the fact that she will remain in bed for six weeks at least it is much better to obtain an invalid's bed with mechanical facilities. Immobilization lasts three weeks, after which, if all symptoms have abated and the oedema does not increase, passive movements may begin with light massage, avoiding the course of the veins. This must be discontinued should the symptoms recur. No active movement is allowable before the thirtieth day, and the patient should not sit up until ten days later. The oedema does not decrease much until walking begins.

469

A Round Ligament Operation

G L CARRINGTON (*Surg, Gynecol and Obstet*, October, 1925, p 507) describes a round ligament operation for the surgical cure of uterine displacement in selected cases. After referring to the numerous procedures already in vogue he calls attention to those occasional cases in which the round ligaments are so attenuated as to consist of only a few strands of muscle fibre covered by a fold of peritoneum. Notes of a case are given in which, when performing a Simpson suspension, one of the round ligaments was torn in two in an attempt to bring it outside the peritoneum for suture to the rectus sheath. With an Anspach round ligament needle passed through the rectus sheath and the anterior surface of the broad ligament the free end of the proximal half of the torn ligament was drawn through and sutured to the rectus sheath and the distal half then sutured to the anterior surface of the uterus, the two halves were then sutured together where they lay parallel and in close proximity to each other. The procedure was then repeated upon the ligament of the other side. By this means a double round ligament support and a double peritoneal support is obtained, giving to the uterus practically the combined support of a Simpson and a Coffey suspension. The procedure can be varied by carrying the distal portion through the broad ligament and suturing it to the posterior surface of the uterus, thus performing a sling operation combining a form of the Simpson and Baldy Webster operations.

Pathology.

470

Detection of Hepatic Insufficiency

V C CRIADO and J C MELENDRU (*Arch de méd, cir y esp*, September 26th, 1925, p 583) describe a test based on experimental work at the Institute of Physiology of Borno University. They concluded that (1) If rats poor in carbohydrates were given large quantities of fat a small increase in carbohydrates occurred in these animals. (2) Administration of fat was followed by an elimination in the urine of acetone, diacetic acid, and beta oxybutyric acid. (3) The elimination of acetone was in inverse proportion to the increase in carbohydrates. (4) If carbohydrates in the form of saccharose were added to the fat administered a consider-

able increase occurred in the carbohydrates, out of proportion to the quantity of sugar administered, and coinciding with this increase the elimination of ketone bodies entirely ceased. As the result of these experiments and those of Embden and his collaborators on the origin of acetone and its place of production the authors concluded that a fairly high percentage of the fat in the organism undergoes metabolism in the form of carbohydrates, that the site of this transformation of fat into carbohydrates is the liver, and for this transformation to be effected the liver must contain a small quantity of glycogen, without which incomplete transformation gives rise to the formation and elimination of ketones. They have therefore devised the following test. Fat administered in the form of fresh butter in doses of not less than 130 grams combined with carbohydrate in the form of bread, and the urine is examined for the presence of ketones as determined by Lieber's test. Positive results were obtained in some cases of obvious disease of the liver, and in one where a hepatic affection was probable, whereas in four healthy individuals the test was negative.

Immunity of the Thyroid Gland to Tuberculosis

S R GLOYNE (*Journ Path and Bact*, July, 1925, p 451) has conducted a series of experiments on various animals with a view to discovering whether any reason can be given for the apparent immunity of the thyroid gland to tuberculosis. He refers to the well known fact that in man the thyroid gland only rarely is so infected, and finds that even in the guinea pig it is difficult to produce thyroid lesions experimentally. It is further shown that thyroid substance has no bactericidal effect on tubercle bacilli either *in vitro* or when used therapeutically in infected guinea pigs. It was found that the high resistance to tuberculosis of albino rats and axolotls was not reduced by thyroid feeding. Gloyne obtained no evidence to support the suggestion that has been advanced that the thyroid gland had any antitoxic action in tuberculous infections, or that it was in any way associated with the development and progress of tuberculosis. He considers it possible that the anatomical position of the thyroid gland protects it from this infection, and he instances the relative immunity of the heart and voluntary muscle. In all these cases, he adds, this immunity may be explained conceivably by histological considerations.

Leptospira icterohaemorrhagiae.

E W WALCH and G B WALCH SORSDRAGER (*Nederl Tydschr v Geneesk*, October 3rd, 1925, p 1535), as the result of the examination of rats (*Mus decumanus*) at Baltimore for the presence of *Leptospira* came to the following conclusions: (1) of this organism in rats microscopic as tests as to its on animals should be performed. (2) of this organism in rats microscopic as tests as to its on animals should be performed. (3) The development of agglutinins and lysins in the serum of experimental animals cannot be used to determine whether the injected material from a rat contains leptospirae of little virulence. (4) No leptospirae were found in a Berkefeld filtrate of leptospirae even after concentration on an agar filter. (5) Leptospirae were found in Berkefeld filtrates of cultures. (6) Leptospirae were frequently found in *Lovaditia* sections of the livers of guinea pigs which had died with all the symptoms of spirochaetosis icterohaemorrhagica, but in which no leptospirae could be found on dark field illumination. (7) While the above facts militate against the existence of a granular phase, it cannot be altogether excluded.

Diaplyte Tubercle Vaccine

J S C DOUGLAS, J W EDINGTON, and F W SIMSON (*Journ. Path and Bact*, October, 1925, p 633) produce evidence that in guinea pigs the diaplyte vaccine introduced by Dreyer is without beneficial effect on the progress of tuberculosis. Guinea pigs were infected by the subcutaneous injection of 0.01 mg. of a human strain, and either before, simultaneously with, or after the infection the animals were given weekly doses of diaplyte vaccine, made from the same strain as that used in provoking the disease. The dose of vaccine given was 0.1 mg. of the extracted bacilli. The animals were weighed daily, and their average life was the same as that of control unvaccinated infected animals. No marked difference was found between the two sets of guinea pigs, but in one batch the average survival time of the vaccinated animals was 138 days of the controls 160 days. No difference was found post mortem between the extent of the lesions in the two sets of animals. The authors conclude that the diaplyte vaccine given in the doses indicated, whether prophylactically or curatively, is of no value in combating tuberculosis in guinea pigs.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine.

474 Atypical Tabes Dorsalis

A. L. BENNETT (*Amer Journ Med Sci*, October, 1925, p. 538) calls attention to the incomplete or atypical (*forme fruste*) type of tabes dorsalis which in gastric crises sometimes leads to errors in diagnosis and the performance of unnecessary abdominal operations. The chief sources of error appear to be that cases with crises are usually not typical, that examinations are incomplete with failure to realize that the root pains of cerebro spinal syphilis may simulate almost any abdominal lesion, and that the spinal fluid is not examined with sufficient frequency. In most cases spinal fluid examination will settle the diagnosis. Notes of a case are given in which five major abdominal operations had been performed in various hospitals without relief until a bilateral chordotomy for section of the antero lateral columns was performed. Gastric crises occur in from 10 to 20 per cent of all cases of tabes dorsalis, and reliable reports indicate that needless operations are performed at least once through mistaken diagnosis in more than 10 per cent. In approximately half the early cases the classical signs of tabes may be absent when abdominal pains are present. The knee jerks are normal or increased in at least 25 per cent of early cases, and about 10 per cent remain atypical throughout the course of the disease. Bennett urges that a complete history should be obtained, and careful neurological and spinal fluid examinations should be made in cases presenting the slightest diagnostic doubt, and in order to decrease the frequency of unnecessary operations upon tabetics be considers that the possibility of an atypical form of tabes as the cause of recurrent abdominal attacks should be impressed upon the surgeon.

475 Meningitis due to a Mixed Infection

L. APPELBAUM (*Arch of Ped*, September, 1925, p. 607) records a case of meningitis in a male infant aged 7 months, who was taken suddenly ill with a high temperature followed by convulsive seizures and attacks of projectile vomiting. When the child was first seen by Appelbaum, after the illness had lasted three weeks, there was marked rigidity of the neck with retraction of the head and mild optic neuritis in both eyes. The diagnosis lay between epidemic cerebro spinal meningitis and tuberculous meningitis. By lumbar puncture 35 ccm of cloudy fluid was withdrawn under increased pressure. The fluid showed a great increase of cells, which were mostly polymorphonuclears. Gram negative cocci were found in the smear, and on cultivation proved to be meningococci. Some improvement followed two injections of anti meningococcal serum, and no organisms were found in the smear, but a twenty four hours' culture showed a Gram negative bacillus which by its morphological and cultural characteristics and the agglutination reaction proved to be the paratyphoid B bacillus. In spite of intraspinal injections of a mixed vaccine of both meningococci and paratyphoid B bacilli the child became progressively worse and died. No mention is made of a necropsy.

476 Problems associated with Diphtheria

VERNEUVE (*Rev de Laryngol, d'Otol et de Rhinol*, October 15th, 1925, p. 651) recalls how, between 1884 and 1894, the discovery of the diphtheria bacillus was followed so rapidly by the preparation of the toxin and then by the antitoxin, with the production of a remarkable series of successful results, that it was thought that little more remained to be done. Since that time, however, certain problems have arisen which complicate what appeared to be a very clear issue. Diagnosis is still a matter of difficulty. In a true case it is essential to begin treatment at once, and yet undesirable to give unnecessary injections. It is dangerous to wait for the twenty four hours necessary to isolate the organism, and the diagnosis has to be made on clinical observation, hence elaboration of technique is to be avoided. The method of injecting the antitoxic serum requires some consideration. Absorption by the intradermic method is the slowest, by the subcutaneous route it is quicker, and the intravenous administration reaches the maximum of rapidity. On the other hand the elimination of the antitoxin varies in the same order as the absorption. The maximum concentration of the antitoxin in the blood occurs at once by the intravenous method, in about twenty four hours by the intramuscular route, and in about three days by the intradermic method. The intravenous method

is advised when the patient is in a serious condition owing to delayed diagnosis or a very acute infection, while the other methods can be best employed in cases of a lower grade of severity. The dose required is another matter of difficulty, and depends to a large extent on the clinician's estimate of the severity of the infection. This is inexact, and the resulting doses given vary from 2,000 units in many cases to such enormous doses as 100,000 units, given by Danish clinicians. Anaphylaxis is an accident of some importance, and is said to be due to the presence of serum albumin and englobulin, the actual antitoxin being a pseudo globulin. Scrums have been prepared from which the two forms have been removed by fractional precipitation. The administration of suprarenal extract definitely neutralizes the toxin, and its use is becoming more frequent in the treatment of diphtheria. Another difficult problem is set by the carrier, especially one who has a diphtheritic ulcer deep in his nasal cavity, here the Schick test is of value, but must be confirmed by the laboratory tests and cultures. The treatment of paralysis is another difficult problem, and very early injections of antitoxin appear to act as a prophylactic, but later when the paralysis is established they have no effect. Some authorities give intradural injections in the early stages of paralysis, but there is said to be grave risk of anaphylaxis in this procedure.

477 Nervous Complications of Varicella

P. GALLI (*La Pediatria*, July 1st, 1925, p. 681) reviews the literature and records two cases in a boy aged 5 and his sister aged 2 years, who within a week after the onset of varicella developed symptoms of acute cerebellar ataxia. The boy, in whom the symptoms were most pronounced, suffered from vomiting and vertigo, and presented an ataxic gait and slight nystagmus, while the girl had an ataxic gait only. In both cases these symptoms entirely disappeared in the course of a fortnight. The cerebro spinal fluid was normal. Acute alcoholic intoxication, meningitis, and astasia abasia could be excluded, and Galli attributes the condition in both cases to the toxins of varicella, which gave rise to the syndrome of acute cerebellar ataxia.

Surgery.

478 Lymphaticostomy for Peritonitis

C. H. WHITEFORD (*Brit Journ Surg*, October, 1925, p. 302) discusses lymphaticostomy—the operation of exposing and draining temporarily the cervical portion of the left thoracic duct—in the treatment of peritonitis. This operation aims at preventing the blood stream from receiving bacteria and toxins from an inflamed peritoneum and intestines. In Costan's procedure under general or local anaesthesia a 3 inch incision is made along the lower posterior border of the left sterno mastoid muscle, and the jugular vein is rolled forwards to expose the thoracic duct. This is tied with catgut close to its termination, a narrow strand of rubber being passed into it through a half inch incision in its long axis. In order to preserve the lumen of the tube and to provide a method of stopping the escape of chyle through the fistula without further operation, Whiteford recommends using a cannula retained in the duct by a half tied catgut ligature round it, this ligature can be completely tied after the cannula is removed should it be necessary to stop the escape of chyle, or if unwanted it can then be removed. Permanent or prolonged obliteration of the duct appears to accentuate the risk of a flow from the fistula, causing death by starvation and the preservation of the lumen is important in order that the chyle may be permitted later to resume its original route. Costan, who first performed the operation in 1922 considers that it is indicated in secondary peritonitis as an adjunct to local treatment, when symptoms of continued septic absorption persist after abdominal operation, and in primary peritonitis especially due to pneumococcal infection. A COOKE (*ibid*, p. 309) gives four case reports in which the operation was performed for general peritonitis. Assuming that it is of value when a general peritonitis is of such severity as to warrant its performance, in addition to the removal of the cause he points out that between the extremes of a moribund patient and one in whom the prognosis is good under ordinary methods of treatment there is a fairly large class, in which the mortality may be ranged as over 10 per cent, for whom the operation may afford a chance of recovery.

479 Disarticulation at the Hip Joint

V SANCHIS PERPINA and R DIAZ SARASOLA (Madrid) (*Zentralbl f Chir*, October 17th, 1925, p 2338) describe the stages of their method of disarticulation at the hip joint as follows. An assistant extends and slightly adducts the hip joint, the surgeon divides at one stroke the skin, fascia, and muscles down to the inner aspect of the joint capsule. The skin incision extends from the tuber ischii to a point two thirds of an inch below and to the inner side of the centre of the groin, the pectineus, inner part of rectus femoris, all the adductors and the obturator externus are thus divided. The blood vessels are seized with artery forceps and ligatured. The capsule of the hip joint is opened, the head of the femur is luxated, and the ligamentum teres is divided, if intact, as well as the Y ligament. The femoral vessels are seen at the upper and outer angle of the incision, these are divided between double ligatures and the remainder of the front of the capsular ligament severed. The next step is section of the posterior portion of the capsular ligament and of the soft tissues, disarticulation being completed by cutting the attachments of the muscles to the trochanters and shaft of the femur. Finally an outer flap is cut sufficiently long to permit retraction of about two inches. The authors claim that this method is superior to Verneuil's operation, both in regard to safety and the ease and rapidity with which it can be performed. As the important blood vessels are identified and secured at each stage of the operation the loss of blood is very slight. The long posterior flap gives a good covering to the tuber ischii, the upper limb of the scar being parallel to and $1\frac{1}{2}$ inches below the groin, and the lower shorter portion being over the divided adductor muscles, freedom of the scar from any pressure is ensured.

480 Chronic Appendicitis

H BARDY (*Finsha Loharsallshapets Handlingar*, June, 1925, p 562) has studied the after histories of those of his hospital patients who, though they suffered no acute attacks of appendicitis, had certain vague signs and symptoms which, by a process of exclusion, led to the removal of the appendix. Between 1902 and 1921 there were 45 such cases operated on, and as many as 40 of the patients were women. The after histories of 24 were obtained, and it was found that as many as 20 were completely rid of their symptoms. Among these 20 cases there were 4 in which the appendix was linked, 7 in which it contained faeces, 3 in which it showed adhesions, 1 in which it was attached to a mobile caecum, 1 in which its mesentery was short, 1 in which its serous lining was injected, and 3 in which no marked changes could be found. A classification of these 20 cases, according to their most prominent signs and symptoms before operation, showed that there were 13 patients who complained of abdominal discomfort, which was most marked in the right side and greatest after exertion. There were 4 who complained of dyspeptic and nervous symptoms, and 3 who complained of pain in the lower abdomen. In 14 cases there was a record of slight tenderness on deep palpation. The author concludes that there exists a chronic form of appendicitis which is not punctuated by acute attacks, and that the most common symptoms are a sense of discomfort in the right abdomen, tenderness on deep palpation, and that appendicectomy rids such

Therapeutics.

481 Treatment of Congenital Syphilis in the Infant

M PINARD (*Presse Med*, October 17th, 1925, p 1379) states that in treating infantile syphilis inoculation still holds its place. Blue ointment or calomel ointment may be used. The suckling is also affected by drugs given to its mother, for vomiting may occur regularly in the child on the day the mother is given salvarsan. This intermediary treatment is not, however, to be depended upon. Mercury lactate is the best drug for oral use, arsenic being risky unless under careful supervision. Up to the age of 3 months the daily dose of 1 in 1,000 solution of mercuric lactate may be 12 drops per kilogram of body weight, after 3 months, 10 drops. Rectal medication is convenient, although Pinard adds, no radical treatment can be thereby effected. By injection the benzoin or bimodide of mercury may be given, but arsenic is much more active than either or than bismuth. Neosalvarsan is given in slowly increased doses, eight or ten injections, followed by a three weeks' interval. The final doses should not be less than $1\frac{1}{2}$ cg per kilogram of body weight. If no contraindication exists intravenous administration is best being the least painful and the internal jugular and epitrochlear veins are recommended for the injection. Absorption by this method is some hours quicker than by any other.

482 Vaccine Treatment of Whooping cough

G J BLOOM (*Arch of Ped*, August, 1925, p 485) has employed vaccines in the prophylaxis and curative treatment of whooping cough since 1912. Out of 383 cases immunized only 4, so far as he knows, developed the disease. The routine employed is as follows: (1) A mixed vaccine is prepared containing 8,500 million bacteria, of which pertussis bacilli number 5,000 million and influenza bacilli 3,500 million. (2) The vaccine is given within ten days after it has been prepared. (3) 1 c cm is given on alternate days for three doses, then 1 c cm every second year if the complement fixation test justifies it. (4) In cases of marasmus, congenital syphilis, bronchial asthma, convalescents, and infants under 1 month of age half the specified amount should be given. For therapeutic purposes a vaccine not more than one month old should be used, one prepared within ten days being best. The initial dose should be a maximum one, and subsequent doses of the same amount should be given provided there is no marked reaction, a reduction of $1\frac{1}{4}$ c cm is then made in the succeeding dose. (5) The injections are given on alternate days until the more pronounced symptoms are subsiding. (6) The number of doses should not be limited, but as many should be given as are indicated in a particular case. No examples of anaphylaxis were seen, and only a few cases of reaction with fever seldom exceeding 102° and lasting only a few hours. The local reaction was trivial. (7) Usually no drugs were given in association with vaccine treatment, but in a few instances they were prescribed to facilitate sleep. Out of a series of 374 cases 286 were cured within twenty days, and 317 were discharged within thirty days. The patients were given from two to six doses, the average being four doses for each case. The only deaths which occurred in a series of 458 cases were one from thymic asthma and one from tuberculous meningitis. No other case of tuberculosis had developed in the series.

483 Treatment of Hypertrichosis.

E SAAFIELD (*Dermatol Week*, October 24th, 1925, p 1565) finds diathermy superior to electrolysis in the treatment of hypertrichosis. He uses an insulated needle holder (with or without a contact breaker) and therefore a rubber glove is not required. By means of an amperemeter in the circuit it is possible to ensure accuracy in the dose and thus to avoid unnecessary pain. Saafield uses a circular metallic electrode 5 cm in diameter, which is applied to the front of the neck or to the upper part of the chest wall. After the passage of the current for two or three seconds the hair can be removed with epilation forceps, while electrolysis requires the passage of the current for fifty to sixty seconds before the hair follicle is destroyed. The pain produced by diathermy is trifling, and the author adds that patients who have been subjected to both methods of treatment prefer diathermy.

484 Sodium Chloride in Bromism

J SLEVENSON (*Arch of Derm and Syph*, October, 1925, p 525) has used sodium chloride in the treatment of skin eruptions due to the retention of bromides in the body, and reports that, if given in appreciable amounts, intravenously or by mouth, the excretion of bromides is hastened. This action, he states, is not due to diuresis, but to the chloride replacing the bromide by mass action. He gives once a day a dose of 60 grains of sodium chloride in salol coated tablets. The skin eruptions and the other manifestations which owe their chronicity to the slow excretion of the bromides clear up rapidly. He adds that nephritis is a contraindication to this treatment, and suggests that conditions of iodism might be benefited similarly.

485 Antiseptic Baths in General and Cutaneous Diseases

L COLANGELO (*Il Morgagni*, September 20th, 1925, p 1192) states that the drugs employed for antiseptic baths are potassium permanganate in doses of 5 to 6 grams for adults and half as much for children, hydrogen peroxide neutralized with sodium carbonate, sulphate of copper, or zinc in doses of 15, 25, or 50 grams per bath, zinc chloride, iron sulphate, and sublimate in doses of 5 to 10 grams for adults and 1 to 2 grams for children. The duration of the bath is fifteen to twenty minutes, the temperature ranging from 89° to 93° F. Antiseptic baths are particularly indicated at an early stage of general diseases, especially in the eruptive fevers. In varicella a potassium permanganate bath (5 to 6 grams per bath) is useful in all stages of the disease, and should be continued until the epidermis is restored to its normal condition. The same may be said of antiseptic baths throughout the course of scarlet fever and rubella. In typhoid fever antiseptic baths may prevent the occurrence of cutaneous complications due to pyogenic and other microorganisms. The baths are also of value in erysipelas, especially the migratory form. In skin diseases antiseptic baths are useful for purposes both of prophylaxis and treatment.

In pyodermit baths containing potassium permanganate, copper or zinc sulphate, or sublimate, have a remarkable effect. In case an antiseptic bath is most suited for the chronic and puriginous lesions, especially in cases of secondary infection due to pyogenic microorganisms. In psoriasis they are indicated for preventing pyodermita. In exfoliative dermatitis, accompanied by pruritus and nervous symptoms such as insomnia, antiseptic baths produce relief and finally a cure. In burns of a superficial and extensive character potassium permanganate baths are suitable. In frost bite local baths are indicated, containing 5 per cent solution of calcium chloride.

Laryngology and Otology.

486 Paroxysmal Rhinorrhoea

J FREEMAN (*Journal of Laryngol and Otol*, September, 1925, p 561) describes the peculiar sensibility of the nasal mucosa of certain people to proteins of various nature—egg albumen and grass pollen being two common examples. He has been able to sensitize his own and his colleagues' nasal mucosa to various proteins and to produce attacks of rhinorrhoea at will. In cases of hay fever he has found that injection of the pollen into the dermis only produces local symptoms, but by giving pollen in the food, vomiting, diarrhoea, and giddiness were induced. He injected pollen into a vein and produced massive urticaria, headache, and asthma, but only a moderate amount of rhinorrhoea. If the serum of a sensitive man is injected into the subcutaneous tissues of a healthy man the overlying area of skin will become sensitive for some weeks. Sensitivity is sometimes hereditary, and Freeman reports two families which illustrated this most clearly. He considers that protein sensitivity is the most important factor in paroxysmal rhinorrhoea, but he recognizes that there is a nervous element and that traumatic and pathological conditions in the nose may have a part in causing the disease. A BROWN KELLY (*Ibid.*, p 563), discussing the condition from the clinical point of view, states that hypertrophic conditions of the turbinates and mucosa, the formation of polypi and such conditions have usually been present for some time before the onset of the paroxysmal attacks, but in some cases these may not appear until the rhinorrhoea has been in force for some time. He finds that in a large proportion of the cases there is a marked hyperaesthesia to touch and other stimuli. J. Adam considers that asthma and hay fever may be caused by toxæmia, by errors in diet, and by abnormal conditions in the nose, such as deflected septum. Treatment should aim at removing all sources of toxæmia and abnormalities and at instituting a healthy régime in the patient's life. Margaret Ford has followed up over two hundred patients with asthma upon whom operations had been performed. She found that removal of tonsils and adenoids (tubotomy), and submucous resection of the deflected septum were followed by the best results. Removal of nasal polypi and of adenoids was productive of only very moderate results, and cauterization was particularly disappointing.

487 Ear Infections due to the Enterococcus

A. P. MISSORICI (*Arch Ital di Otol, Rinol e Laringol*, September, 1925, p 555) reports a case of otitis due to the enterococcus, which has been found in cases of peritonitis, meningitis, urethritis, septicæmia, and other conditions. A man aged 48 complained of pain in one ear and was found to have a bulging and swollen drum, which was incised. Shortly afterwards the other drum underwent the same changes and was also incised. These followed a most profuse mucopurulent discharge with swollen drums and some stenosis of the external meatus. As there were no signs of abatement, and examination of the pus showed the presence of the enterococcus an autogenous vaccine of this organism was given, the dose being gradually increased from 25 to 300 million organisms without any improvement. From the fortieth day injections of 500, 800, and 1,000 million were administered, with very rapid amelioration and cure, the discharge ceasing and the tympanic membranes healing. Calceoli and Vaglio published three cases which began as enterococcal otitis the first developed thrombosis of the cavernous and the inferior petrosal sinuses, the second a localized meningitis and a thrombosed lateral sinus, and the third a diffuse meningitis and a thrombosed sinus. Citelli has also described a case of otitis due to this organism which was complicated by a thrombosed lateral sinus and septicaemia. Missorici points out the very severe nature of the infections caused by this organism, and refers to the possibility of it lying dormant as spores. He states that the presence of the organism may be readily detected by the agglutinating power of the patient's serum and confirmed by direct culture.

488 Disturbances of the Otolith Apparatus in Ear Disease

G. TENAGLIA (*Arch Ital di Otol, Rinol e Laringol*, May, 1925, p 257) states as his experience after observing many cases that disturbance of the otoliths occurs more often and more markedly in acute lesions, and particularly in acute exacerbations of chronic lesions, whether the exciting condition be inflammatory, traumatic, or toxic, and that the disturbance persists as long as the acute condition is present. The signs are more usually connected with the otoliths of the saccule and are associated with some loss of hearing, while affections of the otoliths of the utricle are associated with some disturbance of the function of the semicircular canals. It has been shown that the operations and other treatment which remove the cause of vestibular irritation also terminate the subjective symptom of vertigo and the past pointing phenomena, these signs must thus be classed as reflexes to irritation of vestibular origin, it being a well known fact that the cristae of the ampullary ends of the semicircular canals are stimulated by movement and not by the position of the head. The disturbances of the "lapillae," or otoliths of the utricle, can be estimated by the deviation of the forefinger in the past pointing tests in the horizontal plane, and the disturbances of the "sagittae," or otoliths of the saccule, by the deviation of the finger in the sagittal plane. The author remarks on the great value of these tests in the localizing of lesions in the labyrinthine portion of the ear.

Obstetrics and Gynaecology.

489 Syphilis in Pregnancy

J. N. NATHANSON (*Sury, Gynecol and Obstet*, September, 1925, p 322) found evidence of syphilis in 29 per cent of 413 pregnant women (in only 2 of the 413 was a clinical history of syphilis obtained), this figure agrees with the evidence of other investigators. As the result of careful study of his cases and of the literature he comes to the following conclusions. He believes that Colles's statement that it is possible for a mother to bear a syphilitic infant without herself showing any signs of the disease, and that she is immune to infection by her own child is neither proved nor disproved, although the maternal theory of infection appears to be the more likely. A positive Wassermann reaction in the mother during pregnancy does not necessarily mean that the child will develop syphilis. A positive Wassermann reaction in the blood and the umbilical cord should not be made the sole basis for diagnosis of syphilis in the newborn, and routine microscopic examination of the placenta for evidence of Frankel's disease affords more conclusive evidence of syphilis. Nathanson agrees that pregnancy may cause definite alterations in the course of maternal syphilis, although the mechanism of this is at present obscure. He thinks that syphilis is of little importance in the production of abortions or miscarriages during the first two thirds of pregnancy, but is a most prominent cause of premature births and stillbirths in the last third. He adds that syphilis cannot be regarded as a specific cause of congenital malformations or of monstrosities.

490 The Blood Changes in Pregnancy

J. E. R. McDONAGH (*Journ Obstet and Gynaecol of the British Empire*, Autumn Number, p 512) has investigated the changes occurring in the blood during pregnancy, and concludes that the toxæmias of pregnancy and of the puerperium are due to physical changes in the protein particles in the plasma. He says that the protein particles become dehydrated in pregnancy, and since similar changes occur in certain pathological conditions of the female generative organs and are not with a slight degree during menstruation, the primary cause would appear to be maternal and not foetal. These changes may account for a positive Wassermann reaction appearing in a pregnant non-syphilitic woman. They are not pathognomonic of pregnancy since they are also produced by anaesthetics, the changes responsible for eclampsia are the same as those causing uraemic and diabetic coma. When these changes are of slight degree some of the protein particles merely lose their adsorbed constituents (electrolytes, salts, sugar, amino nitrogen, and fat) and pass into true solution. In other cases these particles either increase in number as much as to occasion gelation or else they grow in size agglutinate, and become precipitated. The author accordingly classifies the toxæmias of pregnancy under three headings: (1) hyperemesis gravidarum, due to an excessive number of protein particles in the plasma (gelation), (2) eclampsia occasioned by many of the protein particles going into solution while others collect in the renal and cerebral capillaries (gelation by distention), (3) the toxæmia caused by the

The Etiology of Mumps

295

1. KERMORGANT (*Compt rend hebtt de l'Acad des Sci*, April 27th, 1925, p 1293) states that the infective power of the buccal secretions of mumps patients has long been known. Troussens, Rilliet, and Gueneru de Vussy even suggested the possibility of a localization of the mumps infection in the buccal mucosa in the form of stomatitis or tonsillitis. Experimental proof of the presence of the virus in the saliva of mumps patients has been furnished by Gruenta (1908), Mervyn Gordon (1914), and Wollstein (1916-18). Kermorgant employed the virulent material obtained by lavage of the buccal cavity with saline solution in preference to serous fluid from the parotid of the organism. The centrifugized could be obtained with its virulence already attenuated by the defensive reaction of addition of normal saline in the dose of 1/10 ccm into monkeys. The incubation period of seven days by inflammation of the submaxillary and lacrimal glands and a marked meningeal reaction accompanied in the material and inoculation of a mixture of the medium consisting of horse serum diluted to a fluid of normal saline solution showed the symbiosis of *M. simius* with bacterium and a spirochaete. Inoculation of all the 1/10 ccm of the culture produced a disease with all the characteristic features of mumps—namely, bilateral parotitis, inflammation of the submaxillary glands, orchitis, and a meningeal reaction. Inoculation of the testis of a rabbit or monkey with 1/10 ccm of the culture produced, after an incubation of twenty four to forty eight hours, an orchitis which never ended in suppuration, but always in sclerosis. The spirochaete factor in the etiology of the experimental disease was also confirmed by its constant presence in the glandular lesion, the presence in the serum of endotoxin in culture. Lastly, the presence in the serum of endotoxin affords further confirmation. One attack of the infection conferred immunity on animals and Kermorgant has been able to vaccinate rabbits by injection of cultures of spirochaetes of attenuated virulence.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

396 Typhus in Children

A MEZBOURLAN (*Arch de méd des enf*, September, 1925, p 558) states that in 1917 an epidemic of 885 cases of typhus occurred at Ouzoun Keupru, a small town on the Balkan railway line leading to Gallipoli, 84, or 19.15 per cent, were in children under 16. The male sex was most affected, 53 being boys and 31 girls. Infants aged a few days or months were affected as well as older children. Although the disease may occur in children of any age, the symptoms are slighter and more transient in infancy, when larval and abortive attacks are almost the rule. Moreover, it must not be forgotten that in epidemic times an indisposition or transient fever in infants is often attributed by the parents to a chill, bronchitis, or gastro-intestinal upset, whereas it may be really a mild attack of typhus. In older children from the age of 5 to 12, and still more so from 12 to 16, Mezbourlan almost always found, as in adults, a fever of fourteen days' duration, with a period of onset lasting three days, a fastigium of seven or eight days, and a period of decline of two or three days. Contrary to what is the rule in infectious diseases such as measles, scarlet fever, and typhoid fever, the temperature in typhus is no guide to the prognosis. A relatively mild form may kill the patient, while an attack accompanied by a high temperature may end in resolution on the fifteenth day. Another peculiarity of the disease in children is an attenuation of the principal symptoms in the puerile and anaemic, and their aggravation in big children with a strong constitution. In contrast with the eruption in adults, the rash in children aged from 5 to 16 is pink, morbilliform, or of a scarlatinal tint, and of short duration. Ecbymotic and purpuric eruptions are very rare. Delirium, somnolence, hebetude, the typhoid state, and restlessness may occur in the typhus of children, but are less pronounced than in adults.

397 Scalp Ringworm in Adults

V BORKOWSKI and F KRZYSZTAŁOWICZ (*Ann de Derm et de Syph*, October, 1925, p 597) say that while favus of the scalp is not rare in adults, ringworm in most countries undoubtedly is. Ringworm of the beard state the authors, whose experience is drawn from a Warsaw clinic, is not uncommon. One form of scalp ringworm in adults presents lesions partly on the hairy scalp, partly on the uncovered skin. These lesions may be seen as rings of vesicles which disappear spontaneously, but usually suppuration is observed. The fungus responsible is that one which in children develops colourless partly among the hair, partly on smooth skin. Ordinary scalp ringworm will vanish spontaneously at the age of 15, as the region affected then seems to become a medium unfavourable to the fungus, such change being possibly due to the action of the newly elaborated genital hormones. According to Sabouraud, however, some strains of fungus can persist after puberty. In three years the authors saw four women with scalp ringworm, the patients ranging in age from 40 to 65 years. As they were all Jewesses, prevented from emigrating by reason of their ailment, the authors think that in this class of the population the lesions under notice may not be very rare.

398 Leptospirosis Icterohaemorrhagica

J SAILER (*Amer Journ Med Sci*, September, 1925, p 332), who records two illustrative cases, states that leptospirosis icterohaemorrhagica, or Weil's disease is probably not uncommon, as many cases of icteric jaundice may be mild forms of this affection, and possibly myositis without jaundice and accompanied by intestinal manifestations may also be due to the leptospira. Confirmation of suspicions can easily be obtained by examination of the blood by dark field illumination. Blood examination may be positive as late as the tenth day, as in one of Sailer's cases, but should be performed as soon as possible. In the early stage guinea pigs should be inoculated with the patient's blood and later with the sediment of the urine, collected as aseptically as possible. The leptospirosis of guinea pigs is characteristic. An emulsion of the liver of a guinea pig dying of or killed during the disease will infect other guinea pigs, and the leptospira can be maintained indefinitely. The cases recorded by Sailer, which occurred in men aged 51 and 44, were of special interest as being the first cases occurring spontaneously to be recognized in Philadelphia and its environs.

399 Familial Dercum's Disease

G O BOLTON (*Nederl Tijdschr v Geneesl*, September 26th, 1925, p 1433), who records an illustrative example, remarks that adiposis dolorosa or Dercum's disease rarely occurs in several members of one family. Von Koczynski has given a description of a family in which the members for four generations showed a painless obesity which became converted into a painful lipomatosis at the time of menstruation. Bolton reports four cases of Dercum's disease in two generations, all occurred in women, the male members of the family being entirely unaffected. As a general rule the syndrome is much commoner in women than in men. Not infrequently alcoholism plays an important part in the aetiology, and usually the symptoms first appear in women at the menopause. Bolton's cases were unusual in that there was no history of alcoholism, and that the disease appeared long before the menopause, when the patients were 35 or 36 years of age. It is only rarely that the disease begins in childhood, as in the case reported by Hale White in this JOURNAL (December 2nd, 1899, p 1533).

500 Meningitis caused by B paratyphus B

M B BRADY (*Arch of Ped*, August, 1925, p 550) records a fatal case of meningitis in a female child aged 13 months, in whom the disease commenced with slight gastro-intestinal disturbance. Lumbar puncture gave issue to turbid fluid under considerable pressure from which a single bacillary strain was isolated. It formed red and grey in glucose broth, and neither acid nor gas in a lactose medium. Agglutination reactions with *B paratyphus B* serum was positive in dilutions up to 1 in 2,700. There was no autopsy. Meningitis due to *B paratyphus B* is a rare disease. Brady has been unable to find a similar case in English literature, but has collected eight cases of paratyphoid meningitis reported by French or German observers. One of these was due to *B paratyphus A*, six to *B paratyphus B*, and in one the type was not differentiated.

Surgery.

501 Carcinoma of the Colon and Rectum

J FRIEDENWALD and L J ROSENTHAL (*Med Journ and Record*, October 21st, 1925, p 447), discussing the diagnosis of carcinoma of the colon and rectum, remark that it is only by most painstaking investigations, aided by proctoscopy and x-ray examinations, that cancer of the colon and rectum can be recognized sufficiently early to afford a reasonable expectation of radical cure from operation. A progressive secondary anaemia and an irregular type of temperature may be early signs, and symptoms of gastric disturbance with absence or diminution of free hydrochloric acid may occur in early cases together with local and general abdominal discomfort with pain and colic. Constipation, sudden or gradual in onset, is frequently the earliest sign, and this, combined with the presence of occult blood in the stools, in a patient over 40 years of age is very suggestive of carcinoma of the colon and rectum. An x-ray examination often affords the only means of making an early diagnosis, and this, together with procto sigmoidoscopy, should never be neglected in all chronic bowel disturbances. Symptoms of obstruction the presence of a palpable mass, the discharge of blood stained mucus and pus and oedema are among late manifestations. It is stated that in carcinoma of the gastro-intestinal tract a characteristic blood sugar tolerance curve exists differing from that seen in carcinoma of other regions, this may be of value in the differential diagnosis between carcinoma and other gastro-intestinal diseases. The difficulties and importance of early diagnosis are evident seeing that in the authors' opinion operation offers the only cure, and that only when an early diagnosis has been made.

502 Brunnerian Tumours of the Stomach

E POZZI and R PILAZZO (*Rev Sua Amer de Endocrin*, September 15th, 1925, p 598), who record two illustrative cases, state that these tumours were first described by Hyem in 1899 under the name of Brunnerian polypadenoma because they assumed the type of Brunner's glands. They have hitherto been reported only in France, where seven cases have been published, no example having been recorded in English or German literature. The disease pursues a slow and insidious course, and does not attract attention until

the formation of a tumour has manifested itself. It is not exceptional for the growth to undergo carcinomatous degeneration. Menetrier has described two forms—namely, a polypoid form and a form *en nappe*. In the polypoid form there are a number of excrescences varying in number from a few to a hundred, distinct in form and shape, scattered over any part of the mucous membrane, but most abundant in the neighbourhood of the pylorus. In the form *en nappe* the growth extensively invades the mucous membrane, which it thickens, and gives rise to large folds which may attain four or five times the normal size. The growth presents all the features of a benign tumour, the glandular hypertrophy never passing beyond the limits of the mucosae. The authors first case occurred in a man aged 62, in whom the disease had lasted for two years, being characterized by epigastric pain and vomiting. A diagnosis was made of carcinoma of the stomach. Laparotomy was performed and a tumour was found involving the pylorus and antrum, which were resected and an anastomosis was established. Recovery followed. The peritoneum showed considerable thickening of the mucous membrane, and a microscopic examination presented the appearance of normal Brunner's glands, apart from a marked lymphocytic infiltration. The second case occurred in a man aged 40, who had suffered for fifteen years from gastric disturbance, which had increased considerably during the last four months. Laparotomy was performed and the findings and outcome were similar to those of the first case.

53 Post operative Pulmonary Complications

C. RAUSCHE (*Deut. Zeit. f. Chir.*, October, 1925, p. 349) has studied the treatment of pulmonary complications following surgical operation by injections of the blood of the patients. In a series of 348 operations 36 instances of pulmonary complications occurred, most of these were in men, and it is suggested that this greater frequency is attributable to their occupation being mining. In 23 of these 36 cases the treatment used was that of blood injection, the remaining 8 patients being treated by ordinary methods in order to serve as a control. The conclusions reached after this and other similar investigations were that, while blood injection after an operation had no prophylactic value against bronchitis or other pulmonary complications, yet used for treatment this method seemed to favour total defervescence. Rausche reports also that the rapid mortality from pulmonary complications was less than in the previous year when no patients received this special treatment and the difference was even more in favour of the patients treated in this way as compared with others. The duration of illness seemed to be shortened also. The author ascribes the effect of the injected blood to stimulation of metabolism and of the sympathetic system as a result of the introduction into the system of protein substances, which, under these conditions, acted as foreign bodies.

54 Diaphragmatic Hernia in a Child cured by Gastrotomy

J. ABADIE (*Bull. et Mem. Soc. Nat. de Chir.*, October 24, 1925, p. 868) records an unusual case of diaphragmatic hernia in a child apparently cured by a simple operative procedure. The patient, a girl aged 2½ years, had the symptoms of a left-sided pleurisy simulating a pyo-pneumothorax, but without any elevation of temperature. This was confirmed by the clinical signs present. Radiography showed what appeared to be free fluid in the thorax with an extensive pneumothorax above it. To confirm or modify the diagnosis the child was given a bismuth meal which was easily followed down the oesophagus into the abnormal pocket, the remainder of the meal passing on into the stomach. The diagnosis of a trans diaphragmatic hernia of the stomach was then made. The difficulty of treatment and the severity of a transthoracic operation was explained to the parents, who at first refused operation. Later, as the child's condition became worse, with marked vomiting, emaciation, and severe epigastric pain it was decided to try the palliative effect of a simple gastrotomy to enable the child to take nourishment and to improve her condition for a more radical operation at a later date. Under general anaesthesia a laparotomy was performed and the stomach was drawn down as far as possible into the abdomen. When as much of the organ as possible had come down the stomach was fixed and a gastrotomy performed. The post-operative course was uneventful. Radiograms showed that the stomach had returned above the diaphragm and the reduction of the hernia appeared permanent. The cardiac orifice returned to its normal position. Abadie considers that the case is of exceptional interest as showing how such a satisfactory result was obtained by a very simple operation.

Therapeutics.

55

Treatment of Syphilis

BERNARD (*Bruzelles Medical*, October 4th, 1925, p. 1457) advises routine examination of the cerebro-spinal fluid in all cases of syphilis. In 200 cases he found that simultaneous treatment with arsenic and mercury gave much more favorable results than arsenic alone. These 200 patients were of various ages and in different stages of the disease. In almost every case the Wassermann blood reaction had been negative for at least six months, but on examination of the cerebro-spinal fluid it was found that only 82 patients gave negative results, in the remainder the spinal fluid gave evidence of abnormality. Bernard observes that this high percentage of positive or suspicious reactors who showed, nevertheless, no other syphilitic lesions indicates the inadvisability of pronouncing any patient "cured" after a single negative Wassermann test of the blood. He states however that he defines as abnormal every cerebro-spinal fluid, whether the Wassermann reaction is positive or not, which contains more than two lymphocytes per cubic millimetre and more than 0.25 percent of albumin. Bernard's tables show a considerable predominance of normal spinal fluids among patients who have received combined treatment, as compared with the number of those who received arsenobenzols alone. Of 175 patients 99 were treated by arsenic alone and 76 by both arsenic and mercury simultaneously or alternately. Of the 93 patients the spinal fluid became normal in 14 whereas of the 76 patients it became normal in 59. Bernard believes that insufficient treatment with arsenic alone is responsible to a great degree for meningeal recurrences. He adds that recent investigations appear to indicate that silver, mercury and bismuth have a retarding effect upon arsenical preparations. In his treatment he mixes the arsenobenzol and mercurial solutions in a Levy Biog syringe and injects the mixture intravenously.

56 Chemotherapy of Tuberculous Skin Diseases

G. NOBL (*Wien. Klin. Woch.*, October 23rd, 1925, p. 1197) reviews the success of copper preparations in lupus. Unfortunately the same success has not attended the use of gold preparations. A combination of potassium, gold and cyanogen recommended by Koehl and von Behring as stopping the growth of tubercle bacilli in dilutions even of 1 in a million, was found to be greatly impaired in efficacy by contact with the serum globulin of the blood. Then the action of gold as a dilutor of the cellular excretions while theoretically advantageous in facilitating access to the tuberculous area, necessitates much caution in its use. The mixture of a gold preparation and tuberculin failed in lupus. Another gold preparation, aurocyanan was too toxic and irrsolgan was therefore prepared on the lines of a soluble blood it was found practically inert in lupus vulgaris and also in lupus erythematosus as was also the case with a later modification triphal. A regards arsenobenzol enough evidence has not yet been obtained but the probability is that its action, possessed by many gold salts as a capillary poison, will far outweigh any therapeutic effect.

507

Sanocrysin Treatment of Tuberculosis

A. von BORSCHOFF (*Insta. Talar. Allst. d. Chir. Harar*, 1925, September, 1925, p. 785) has treated at the Annamela Sanatorium 49 cases of tuberculosis, all but 2 of which were pulmonary, since December 1924. By August 15th the treatment, or at any rate a series of injections, had been completed in 49 cases. The initial dose was usually 0.5 gram, the second and third doses given after an interval of three or four days, were 0.75 or 1 gram and the fourth and subsequent doses were 1 gram at 10 intervals of a week. The cases were thus classified: (1) Five fatal cases which were hopeless at the beginning of the treatment. (2) Two cases in which the disease was limited to a small area of the lungs but was of an exudative pneumonic character. In both cases the treatment had to be discontinued because of the rapid progress of the disease. (3) Four cases all of which seemed more or less suitable for the treatment but which responded to it with such serious complications that it had to be discontinued. In one of these cases the treatment proved fatal, probably on account of metallic gold poisoning. (4) Twenty-nine cases including 2 of tuberculous adenitis, in which it was possible to complete the treatment of five to ten injections. In one of the 27 cases of pulmonary tuberculosis a pneumothorax area of infiltration broke down and a pneumothorax had to be induced. In 9 cases no appreciable benefit could be demonstrated and in 17 cases marked improvement effected the sputum diminishing or disappearing altogether. Bacilli and tubercle bacilli often ceased to be demonstrable.

they did not disappear in every case, and in some cases they reappeared. All except one of these 17 patients were afebrile at the completion of treatment, although only 5 of them had been so before its commencement. The author concludes that, with the present dosage, salicylism is a very dangerous drug for the tuberculous, it is contraindicated in advanced and exudative pneumonic cases, but in comparatively early cases, with or without fever, and with a comparatively good general condition, salicylism often effects a recovery, the rapidity of which can only be compared with that of the surgical treatment of pulmonary tuberculosis.

508 Gentian Violet in Chorea and Encephalitis

J. W. FISHER (*Journal of Nerv and Mental Dis*, October, 1925, p. 376) has obtained good results in chorea and encephalitis by giving intravenous injections of gentian violet. To a boy, aged 6, with subacute endocarditis and early chorea, 8 c.c. of a 1 per cent solution of gentian violet was given intravenously. Marked improvement followed, and three weeks later a second similar dose was given, after which he had no more fever but improved rapidly in every way. No other treatment was used. In three cases of encephalitis after typhoid fever cerebral symptoms developed in the third week of the disease, and in each case one injection of a 1 per cent solution of gentian violet was given intravenously—3 c.c. to a girl aged 6, 10 c.c. to a boy aged 17, and 10 c.c. to a girl aged 11. Definite improvement was apparent in eight to thirty-six hours. This improvement was maintained, and in the last two cases the speech and mental reactions became normal within a week. In the first patient it was noted at the end of six months that, though her speech was still very slow and her enunciation imperfect, she was otherwise normal. No febrile or other reaction followed the injection of the drug, which was entirely non-toxic in the dosage used. The author advocates further trial of this drug in similar obscure infections.

Neurology and Psychology.

509 Flexion Paralysis of Spinal and Cerebral Origin

A. GORDON (*Journal of Nerv and Mental Dis*, October, 1925, p. 354) records four cases of paralytic flexions of the extremities. Brubinski described the following symptom group in 1911: flexion of the lower extremities caused by contractions, increase of the defence reflex, absence of exaggeration of the knee jerks or else their total abolition, without anatomical lesions in the pyramidal tract. The "defence reflex" consists of retraction movements which can be brought out by stimulating the skin of the dorsum of the foot, the foot promptly enters into a dorsal flexion, the leg flexes over the thigh, and the thigh over the pelvis. Relaxation and return to the original position follow. Brubinski's cases were due to compression of the spinal cord. In the present author's series one case was caused by compression of the spinal cord, and three were of cerebral origin, the clinical picture in the latter group being confined to one side of the body. The flexed attitude of the limbs might appear at the onset or develop later in the course of the disease. The defence reflex was always exaggerated, and the tendon reflexes either diminished or abolished. The plantar reflex might be extensor throughout (Marie Foix), at first flexor or later extensor (Alajouanine), absent or extensor (author). Gordon believes that flexion paralysis is very probably due to an extrapyramidal involvement while extension paralysis is a purely pyramidal affection. There are mixed cases, in which the latter is subsequently transformed into the former, such a transition being of grave prognostic omen, as it points to an extension of the lesion.

510 The Brain in Mongolian Imbeciles

A. GANS (*Nederl Tijdschr v Geneesk*, August 22nd, 1925, p. 922) states that the brain in Mongolian imbecility possesses all the features of the Chinese brain described by Kappers, but in a more marked degree—namely, a pointed extremity of the base of the frontal convolutions, an inclination towards each other of the temporal lobes, a short corpus callosum, of which the posterior end is directed downwards like a hook, and a gaping condition of the Sylvian fissure, leaving the island of Reil exposed. All the peculiarities so connected with brachycephaly. Wilmarth, as long ago as 1890, stated that the pons cerebellum, and medulla oblongata in Mongolian idiots were too small. Gans also found that the weight of the cerebellum of the Mongolian idiots which he examined was below the normal. He made a microscopic examination of the brain of Mongolian idiots, commencing with the cerebellum, pons, and medulla, because he always found them under weight. In two cases fibrae tectonicæ externae aberrantes were present, and in very many cases there was a large inclusion cerebelli posterior. In four cases in which he

examined the cerebellum microscopically he found a peculiar formation consisting in a nodule of nervous tissue which was principally composed of gray matter, but also contained cortical fibres. It was always situated in the same place on both sides medial to the flocculus, and he therefore gave it the name of tuber flocculi. In the microscopical sections of the cases examined it was visible to the naked eye. The nodule consisted of islands of the cerebellar granular layer, surrounded by the cerebellar molecular layer, with a few Purkinje cells both in the granular and molecular layers. In van Gieson preparations these cells had almost the same form as those of the cerebellum. Gans thinks that this nodule has been described before under the name of cerebellar heterotopia. He has found an homologous formation in the cerebellum of the chimpanzee.

511 Vasomotor Reactions in Mental Disorders

ISABELLA MCD ROBERTSON (*Journal of Mental Science*, July, 1925, p. 386) investigated the vasomotor reactions in mental disorders, with special reference to the haemoclastic crisis in 100 normal adults, 90 certified, and 275 uncertified early psychotic and neurotic patients. The haemoclastic crisis is characterized by leucopenia, lowered blood pressure in venous of the leucocytic formula, hypercoagulability of the blood, and diminution of the refractive index of the serum. It follows the ingestion of milk by patients with hepatic disease and in certain anaphylactic conditions. The test consists in noting the leucocytes and differential leucocytes and the blood pressure prior to and at twenty minute intervals after the ingestion of half a pint of milk by a patient who has fasted for five hours or since the previous night. In the normal subject there is a hyperleucocytosis, while the blood pressure remains unaltered or tends to rise. In those showing the haemoclastic crisis the phenomena reach a maximum about forty minutes after taking the milk, and this is followed by a phase of hyperleucocytosis and hypertension one and a half hours later. Robertson found that the crisis occurred in 94 per cent of dementia praecox patients, in 85 per cent of melancholics, in 75 per cent of chronic mania cases, and in over 60 per cent of early psychotics and neurotics. The leucopenia was not confined to the periphery, and it was accompanied by a comparatively slight decrease of erythrocytes. The normal subject responds to reflex cold by a vasoconstriction and to reflex heat by no alteration, while the abnormal responds to both reflex cold and heat by a vasodilatation. Adrenaline and atropine prevented the occurrence of the haemoclastic crisis, while thyroid caused its reversal in both normal and abnormal subjects. In 90 per cent of the normal subjects change of posture caused a leucocytosis, while in 87 per cent of the mentally defective a leucocytosis resulted.

Obstetrics and Gynaecology.

512 The Circulatory System in Myomatous Patients

ACCORDING TO F. STRASSMANN (*Zentralbl f Gynak*, September 19th, 1925, p. 2157), clinical and post mortem observations have established that morbid conditions of the heart, such as dilatation, hypertrophy, fatty degeneration, and brown atrophy, are present in from 30 to 50 per cent of patients suffering from uterine myoma characteristic symptoms or signs of a "myoma heart" have not, however, been established. That cardiopathy in myomatous subjects is not secondary to anaemia from menorrhagia and metrorrhagia nor due to mechanical pressure of the tumour on blood vessels and nerves is shown by the fact that cardiac weakness is present in 35 per cent of myomatous patients who have no excessive bleeding, and is equally as frequent in cases of small as in those of large tumours. That myomatous patients have a higher blood pressure than others has been found by many investigators, but has recently been denied by American writers. Strassmann has made the following observations on 70 myomatous and 70 other patients, whose circulation was carefully studied for six to twelve months. Conflicting reports regarding the influence of myoma on vascular tone may be explained by the increased blood pressure, on the average 20 mm. which is shown during the climacteric by all women, whether myomatous or not. Strassmann's findings, however, point to a considerable increase in the blood pressure of myomatous patients before the menopause, this was considerably more marked in those who did not suffer from excessive bleedings. Cardiac enlargement was present in 50 per cent of climacteric and 35 per cent of menstruating myomatous patients, as compared with 38 and 18 per cent respectively in the non-myomatous. So far from the bleedings being the cause of a "myoma heart," their effect is to diminish the vascular hypertension and cardiac enlargement. For Strassmann the "myoma heart" is completely explicable by an increase in blood pressure, due to endocrine ovarian influence.

513 Adnexal Tuberculosis

A. RICARD and H. COMBE (*Gynécologie et Obstet.*, 1925, xii, 1, p. 48) state that tuberculous disease of the Fallopian tubes and ovaries leads to acute peritoneal symptoms more often than is generally supposed, and that diagnosis is then difficult. Acute appendicitis is imitated very closely by acute exacerbations of tuberculous adnexal disease, and the true nature of the symptoms may only be made evident, several months after appendicectomy, by the clinical history and the findings at a second operation. In certain cases the acute pelvic pain, abdominal rigidity, vomiting, and marked pyrexia simulate an acute salpingitis, the tuberculous nature of the lesion is suggested in the early stages by the relatively good pulse and general condition, and later by the poor response to treatment, by repeated relapses, or by persistent fever. Tuberculous adnexal disease sometimes leads, especially in the newly married, to hypercortical symptoms which resemble those of acute gonococcal salpingitis, acute symptoms developing in the puerperium or after abortion are sometimes due, not to infection from the uterus, but to a lighting up of tuberculous foci in the adnexa. Abscess (whether in the pouch of Douglas or the iliac fossae) from tubo-ovarian tuberculosis may be acute rather than cold, and the true cause may be suspected only when a chronic fistula, faecal or otherwise, becomes established later. A mixed infection is probably present in such cases. Careful study of the history is of great diagnostic value, an antecedent dysmenorrhoea, especially preceding the menstrual flow, or amenorrhoea, which may be primary, is a sign pointing to tuberculous adnexal disease.

514 Age and the Course of Labour

G. SCHAANNING (*Norsk Mag. f. Lægevidenskab*, October, 1925, p. 1075) has studied, at the University Gynaecological Hospital in Oslo, the influence of age on 3,457 primiparae so far as the course and prognosis of their confinements were concerned. This material included only normal patients, cases of deformed pelvis, placenta praevia, premature detachment of the placenta, and other abnormality were excluded. It was found that after the age of 36 the prognosis was much improved for both mother and child. Labour had to be artificially aided in only 3 per cent of the primiparae between the ages of 17 and 20. This percentage rose to 27 for the primiparae between the ages of 31 and 35, and to 46.8 per cent for the primiparae between the ages of 41 and 45. The maternal morbidity rose from 4 per cent between the ages of 21 and 25 to 20 per cent between the ages of 36 and 40. The maternal mortality for all the primiparae was 0.17 per cent, whereas it was 1.48 per cent for the primiparae between the ages of 36 and 40. The infant mortality rose from 1.38 per cent between the ages of 17 and 20 to 12.9 per cent between the ages of 41 and 45. It was found also that the number of face and breech presentations increased with the age of the mother, and that the ratio of twin births rose from 0.82 per cent under the age of 30 to 1.66 per cent above this age. The author considers that his findings are a cogent argument in favour of extending the indications for Caesarean section in the case of elderly primiparae.

Pathology.

515 Creatinuria in Tuberculosis

J. V. LAMBEA (*La Medicina Ibera*, October 10th, 1925, p. 321) states that the creatin in the urine is derived from two sources, being partly endogenous or a product of proteolysis, and partly exogenous or originating in the meat ingested. Exogenous creatin has little effect on the total amount of creatin in the urine, which remains at a fairly constant level when the subject under observation is on a diet poor in creatin. Benedict and others have shown that fasting causes the appearance in the urine of a larger quantity of creatin than is present normally, and that the excess of creatin disappears on ingestion of carbohydrates. When pathological metabolic changes occur creatin appears in the urine. The suprarenals play a part in the metabolism of creatin, and their removal produces creatinuria. The occurrence of suprarenal degeneration, which laboratory and chemical examination has shown to be a common occurrence in tuberculosis, and the frequency of specific lesions of these glands in this disease explain the disturbances in the metabolism of creatin met with in tuberculosis. Tuberculous infection, especially in certain cases, causes intense proteolysis. Consequently galloping forms of tuberculosis are characterized by an accentuation of the phenomena of autolysis as is shown by an increase of the total nitrogen. Besides these rapid forms certain slowly advancing tuberculous affections have an action from the first upon metabolism causing a destruction

of the tissues. Acute tuberculosis increases the amount of creatin in the urine, as is shown by the fact that one of Lambear's patients eliminated 2.80 grams in the twenty-four hours and another 3.02 grams in the same period, as compared with the normal amount of 1.70 to 2.10 grams. In chronic tuberculosis the results vary. While in six out of eight cases studied by Lambear the creatinuria was fairly high, Hofmann, in an apyrexial case, found a diminution of the creatin in the urine, and in four cases examined by McClure the amount was slightly raised in some and in others was very low. In fifteen cases reported by Raphael and Liddridge there was as a general rule a slight fall, and it was the patients who had but slight fever and constitutional disturbance who eliminated amounts of creatin somewhat above the normal.

516 Tuberculosis and Vitamin C Deficiency

ACCORDING to G. MOURIQUAND, A. ROCHAUX, and L. DODDART (*C. R. Soc. de Biologie*, October 23rd, 1925, p. 901), tuberculosis in guinea pigs spreads at first much less rapidly in animals fed on a dietary lacking in vitamin C than in those fed on a mixed diet. A series of twenty-four guinea pigs was given a mixture of barley, corn, and lemon juice heated to 120°C for one and a half hours, and watched for one hundred days, by which time signs of vitamin starvation were very marked. Each animal was then injected with 10 million virulent tubercle bacilli, a similar series fed on a mixed diet received the same dose. The experimental and the control animals were carefully compared to ascertain the rapidity with which the disease advanced. For nearly three weeks after the injection the scorbutic animals continued to put on weight, whereas the controls lost steadily from the start. Moreover, judging by the extent of the lesions in the animals that were occasionally killed for examination, it was evident that the tuberculosis was spreading more rapidly in the control than in the scorbutic animals. After the twenty-third day the positions were suddenly reversed, the weight of the scorbutic animals falling quickly and the disease spreading more extensively than in the controls. The mean survival time of the scorbutic guinea pigs was fifty-five days, of the controls seventy days. Another series was injected with a very small dose of bacilli (400 organisms). The result was different, no initial delay in the spread of the disease being noticeable in the scorbutic animals, in fact from the very first the spread was more rapid in this group. The mean survival time of these animals was sixty-eight days, and of the controls ninety-six days. The effect, then, of a dietary deficient in vitamin C appears to depend to a certain extent on the dose of bacilli injected. With a moderate number the scorbutic animals exhibit a preliminary phase during which they are more resistant than normal animals, after three weeks this resistance suddenly fails, and the disease goes on apace. When only a small number of bacilli are given, the disease spreads more rapidly from the start in the scorbutic animals.

517 Neuro vaccine

H. PAIN (*Thèse de Paris*, 1925, No. 17) states that while as a rule ordinary vaccine lymph has an affinity only for the skin, it may in special circumstances acquire an affinity for the nervous system like the virus of herpes, epidemic encephalitis, rabies, and acute poliomyelitis. Lervadti and Nicolson have given the name of "neuro vaccine" to a form of vaccine virus prepared by growing it on the brain of a rabbit, and claim that it is almost as virulent for man as ordinary calf lymph and that it has the advantage of being free from secondary contamination. Pain employed this vaccine on 176 infants aged from 4 weeks to 10 months at the Farmer Clinique, Paris, with the following results: of 109 infants who could be kept under observation 91 gave a positive result, while in 18 the vaccination was unsuccessful, 9 showed severe reactions, similar to those observed with ordinary calf lymph, and in 2 the reaction was very intense. Of the 18 negative cases 8 had been unsuccessfully vaccinated with ordinary calf lymph at birth, and in 41 of the positive cases calf lymph had also been used without any result at birth. On the other hand, out of 61 children who had been inoculated with a vaccine which had been kept for a month at ordinary temperature only 46, or 75.4 per cent, gave a positive result, whereas by using a strain which had been kept in the ice chest the number of successful vaccinations was 93.7 per cent. Pain attributes the smaller proportion of successes obtained by vaccination with neuro vaccine than that obtained with ordinary calf lymph to two causes: (1) the use of strains which have grown old by being kept under unfavourable conditions, (2) the use of excessive dilutions of the vaccine. Contrary to what has been alleged by Burnet and Conseil, the investigations of Pain, as well as those made in Spain on 30,000 persons, show that neuro vaccine does not present any dangers. It can be prepared in all latitudes, as the rabbit is a prolific and ubiquitous animal.

Medicine.

518 Angina Pectoris in a Youth aged 18

S C JAMISON and G H HAUSER (*Journ Amer Med Assoc*, October 31st, 1925, p 1398) report a case of angina pectoris in a youth of 18 who was first admitted to hospital complaining of pain in the right lower quadrant of the abdomen. A tentative diagnosis of chronic appendicitis was made, but no operation was performed as the condition cleared up in a few hours. Nine days later he was admitted to the same hospital on account of agonizing pain over the whole chest and epigastrium. This pain was not referred to the arms or to any other part of the body, it was constant in presence but not in severity. He sat up in bed with the body bent for wards, his face was flushed and covered with sweat, his expression was anxious, but there were no other symptoms. There was no history of previous illness. The father had died of an aneurysm, the mother had a congenital miosis of both pupils, but no evidence of circulatory disease, and her Wassermann reaction was negative. The patient's pupils were also miosis and did not react to light or accommodation. Except for a moderate degree of rigidity of the epigastrium, physical examination revealed nothing abnormal. A diagnosis of angina pectoris was not even considered, on account of the patient's age, so he was given morphine to relieve the pain, but with little success. There was repeated vomiting of frothy mucus, and the patient died suddenly the next morning during a severe paroxysm of pain. The organs at the post mortem examination showed an acute toxic inflammation with a small abscess in the liver secondary to an infection of the appendix. The sudden death was due to changes occurring in the heart and its vessels. The heart weighed 240 grams, the coronary arteries were tortuous and rigid, and showed yellow and grey areas of sclerosis. Near the origin of the right coronary artery there was an organized thrombus which had undergone calcareous degeneration. The myocardium was light brown and of firm consistency, in some parts there was evidence of healed infarcts. The endocardium showed a few small plaques of sclerosis about the base of the tricuspid valve. Microscopical examination showed proliferating endarteritis, some of the vessels were atheromatous. The myocardium contained areas of cloudy and fatty degeneration with fibrosis and scar formation. The authors suggest that the post mortem findings in this case strongly support the belief that angina pectoris is due to changes in the coronary arteries, and to a certain extent refute the syphilitic theory of its origin.

519 Apyrexial Paratyphoid Fever

C BIFULCO (*Studium*, October 20th, 1925, p 311) states that since 1870, when the first case was recorded by Frantzel during the Franco-Prussian war, until today only about thirty cases of apyrexial typhoid fever have been reported. So far as he can ascertain, no case of paratyphoid A fever with an apyrexial course has hitherto been published. He now reports a fatal case in a man aged 56, who was admitted to hospital on about the tenth day of disease with a temperature of 97.6°, slight clouding of the sensorium, coated tongue, enlargement of the spleen, and bronchial catarrh. The serum test was negative for typhoid, positive for paratyphoid B in 1 in 50, and for paratyphoid A in 1 in 300. Death, preceded by delirium, occurred eight days after admission without the temperature having risen above 98.2°. There was no necropsy. During the first three days of the disease the temperature was 102.2°, it fell to 99.4° on the fourth day, becoming normal next day. The patient, however, remained in a state of profound asthenia, with yellowish green diarrhoea. No satisfactory explanation has yet been given for the occurrence of apyrexial enteric fever.

520 The Etiology of Herpes Zoster

M ARTON and P FORNARA (*Il Policlinico*, September 21st, 1925, p 1309) agree that there is a varicellous form of zoster, but they distinguish it definitely from the so called essential zoster. They hold that there are no good grounds for considering the latter a specific disease, and add that in any case its virus is unknown and appears to be quite distinct from the virus of varicella or herpes. They compare zoster with peripheral facial paralysis, which may be due to different causes and yet presents a similar symptomatology whatever the cause. They cannot trace any specific factor in the etiology of zoster and point out that the changes in the nerve ganglia are those of a trivial inflammatory affection.

521

Prophylaxis of Measles

E KOVACS (*Deut med Woch*, October 9th, 1925, p 1703) states that during an epidemic of measles in a children's home at Szecyed in Hungary 40 children who had never had measles were inoculated with the whole blood of adults, as recommended by Rietschel. The blood was usually taken from the mother, and in the case of motherless children from a person with a negative Wassermann reaction. The dose was 20 ccm, which was injected into the muscles of the thigh. The results were very satisfactory. Of 25 infants and 4 children injected, 21 infants and 3 children escaped entirely, 3 infants had abortive attacks in which the fever lasted only one day, and only 2 had definite though mild attacks of measles. One case was a child aged 3 years, who was not injected till the eighth day of incubation, and the other an infant of 5 months who was inoculated at the proper time. The failure in this case being due to the mother never having had measles. The injections were well borne, and in only two cases were there slight rises of temperature which lasted only two days. Kovacs comes to the conclusion that Rietschel's method is a very useful and practical one in the prophylaxis of measles.

522 Typhoid Carriers in the General Population

S W WELCH, S A DEHLER, and J C HAVENS (*Journ Amer Med Assoc*, October 3rd, 1925, p 1036) state that the incidence of typhoid carriers in various localities where the disease is not unduly prevalent has been estimated at from 0.3 to 0.8 per cent, these results having been based on a single faecal examination. The authors have made an examination of both the faeces and urine of 1,076 healthy persons, of whom 1,004 were men and 72 women, employed in the dairy industry of Alabama, 39 typhoid carriers, 13 paratyphoid A carriers, and 3 paratyphoid B carriers were found, making a total of 55 carriers, or 5.1 per cent. The incidence of faecal and urinary carriers was as follows: faecal typhoid, 21 cases or 1.95 per cent, urinary typhoid, 18 cases, or 1.65 per cent; faecal paratyphoid A, 8 cases, or 0.75 per cent, urinary paratyphoid A, 5 cases, or 0.43 per cent, faecal paratyphoid B, 3 cases, or 0.27 per cent. The high number of urinary carriers indicates the importance of examining the urine as well as the faeces in a search for carriers. The present study differs from previous ones in that not only were specimens of urine as well as of faeces examined, but that repeated examinations were made, the urine and faeces from each person being investigated an average number of two to three times.

Surgery.

523

Renal Tuberculosis

M PERSSON (*Annals of Surgery*, October, 1925, p 526) has made a clinical study of 295 cases of renal tuberculosis dealt with at Stockholm between 1890 and 1920. Of these patients 205 received surgical treatment, and all except 12 (8 operation cases) were kept under close observation after treatment for a period which was never less than three years. Perisson reports that the frequency of renal tuberculosis in men is almost double that in women, and that hereditary influences were traced in 25 per cent of the cases. Two thirds of the patients were in the third and fourth decades of life. The right kidney was affected more often than the left in the proportion of 109 to 88, and the coexistence of tuberculosis elsewhere was revealed in about half the cases, in 22.4 per cent pulmonary tuberculosis was also present, and genital tuberculosis in 15.6 per cent of the male cases. Irritability of the bladder was the first symptom in 74 per cent of the patients and pains in the kidney area in 18.5 per cent, serious haematuria appeared as an initial sign in only 5.5 per cent. Later symptoms included bladder irritation, almost invariably, and obvious haematuria. Incontinence was rare (2.7 per cent), and usually occurred in advanced disease in women and children. Pyuria was constantly present, and tubercle bacilli were found in 85.6 per cent of the cases. A palpable tumour was detected in 25 per cent of the patients, and tenderness without such a tumour in 9 per cent. Perisson notes that the condition of the bladder was correlated closely with the post-operative mortality, slight ulceration trebling the mortality while severe ulceration was present the mortality was very great (8 cases 6 deaths). The after history of patients not subjected to operation showed a mortality rate of 82.6 per

cent. Nephrectomy and kidney resection were not followed by favourable results, and all the patients with bilateral renal tuberculosis died in less than two years. The total operative mortality in nephrectomy of one kidney was 7.3 per cent, the male mortality rate being twice that of the female. Of the deaths occurring at a later date 44 per cent were due to tuberculosis of the remaining kidney, 35 per cent to pulmonary tuberculosis, 13 per cent to miliary tuberculosis, and 8 per cent to other diseases. Complete restoration to health followed operation in 57 per cent of all patients, while 5 per cent, though not cured, showed striking improvement. Peissner recommends that in nephrectomy the ureter should be ligatured and burnt off by the thermo cautery below the kidney pelvis. The stump is allowed to drop back and primary suture of the wound follows. In only 2 out of 64 cases thus treated did abscess formation occur. In women otherwise healthy the operation of nephrectomy did not interfere in any way with pregnancy and parturition.

524 **Fractures of the Lower End of the Humerus**
G. CAIRO (*Il Politecnico*, Sez. Chir., October 10th, 1925, p. 479) emphasizes the importance of making an x-ray examination both before and after reposition for the setting of fractures at the lower end of the humerus, and mentions the difficulty sometimes experienced in diagnosis in children owing to ossification. As a general rule immobilization of the joint by plaster should not extend beyond twelve to fifteen days. All manipulations must be performed very cautiously lest osteophyte vegetations or obstinate traumatic arthritis should arise. Great attention should be paid to the condition of the circulation of the fractured region before and after the application of the plaster. Reposition and fixation of the fragments are best effected under anaesthesia, the most comfortable position of the joint having been previously noted. In fractures without dislocation of the elbow should be fixed at a right angle and in comminuted fractures the lower fragment, beginning at the shoulder and ending at the wrist, splinted together with the forearm has been dislocated back, while in supracondylar fractures with a forward dislocation the elbow joint should be fixed to an acute angle. Traction must be exerted in the direction of the axis of the arm. In fractures with hyperextension, the forearm must be fixed at an acute angle in forced flexion by a plaster dressing, the joint being dislocated backwards, later by bringing the joint into a right angle, in which it should remain till union is obtained. With hyperflexion the permanent traction should be exerted to a right angle being gradually followed. The correction to a right angle being union is obtained by weights and suspension of the joint and abducted joint, the correction is also suitable for fractures with vertical or lateral dislocation of the fragments, also for comminuted fractures. The splint dressings which will keep the joint in a rectangular position. In cases which do not respond to conservative treatment operative measures become necessary.

525 **Hepatic Abscess in Scarlet Fever**
D. MASTRANGELI (*Rivista di Med.*, October 1st, 1925, p. 449) records a case of typical scarlet fever in a man, aged 32, complicated by nephritis and an hepatic abscess which rapidly healed after surgical intervention. No bacteriological examination was made of the pus. Mastrangeli excludes the idea of a primary abscess of the liver in the presence of an infection such as scarlet fever, which represents a true septicæmia and is capable of giving rise to various inflammatory lesions. He has been unable to find any other cases on record of scarlet fever complicated by hepatic abscess.

526 **Adsorption Treatment of Wounds**
O. ACKLIN (*Zentralbl. f. Chir.*, October 31st, 1925, p. 2470) has made experimental studies of the treatment of wounds infected by earth containing tetanus spores. He used various adsorbents, including colloidal aluminium salts, concentrated sodium silicate solution, and blood charcoal. The aluminium preparations were followed by healing without abscess formation and there was little or no pain. Sodium silicate treatment was followed by sepsis, but when blood charcoal was used the wound healed without suppuration or pain. Acklin concludes, therefore, that it is possible to save the life of an animal with a very virulent infection of a wound by means of purely adsorptive methods. He found that charcoal gave more favourable results than disinfectants containing chlorine.

Therapeutics.

527 **Medicinal Treatment in Mental Disease**
In their annual review of the progress in psychiatry A. BAUDOUIN and N. PÉRON (*Paris Med.*, October 17th, 1925, p. 305) discuss the use of malaria infection, and of various proprietary substances, somnifens and gardenal, in mental disease. Gardenal is said to be the French equivalent of luminal, somnifens also is a hypnotic and sedative drug. Loy injects subcutaneously into general paralytics 5 c.c.m. of blood taken in the afebrile period from a patient with active benign tertian malaria. In the general paralytic pyrexia develops in from nine to twelve hours, and after eight to ten of these attacks quinine is administered. In some cases Loy gives in addition a course of injections of novarsenobenzol. Donaggio, however, does not advise this use of arsenic. In general 30 to 45 per cent of the patients recovered sufficiently to be able to leave the asylum, but those remissions were not associated with any material change in the cerebro spinal fluid or the Wassermann reaction. Witzel and Prussak report 11 remissions and 10 deaths in 22 cases, though the deaths were not attributable to the treatment. In cases of mental excitement Cronzon and Lomairo find somnifens a useful sedative, and obtain an effect comparable with chloroform narcosis, with doses of less than 10 c.c.m. there is sleep for ten to fifteen hours, followed by a period of drowsiness during which food can be administered and the excretions passed. Better results were obtained in the intoxications and confusions than in the manic depressive psychoses. Loret, Quercy and Lancelot report a death following on the intramuscular injection of 10 c.c.m. of somnifens in a melancholic aged 65. At the necropsy an area of deep seated pneumonia was found. They suggest that the drug should be used with caution in the aged for fear of prolonged administration of the drug, also report a death thirteen hours after the intravenous injection of 10 c.c.m. After prolonged administration of the drug, by the month Flaudin finds that vertigo and lack of memory occur, which, however, rapidly disappear on withdrawal of the drug. The action of gardenal has been particularly studied in cases of epilepsy. Tiénel and Cuel describe a case of epilepsy in which the drug suppressed motor convulsions but caused maniacal excitement. Godard and Légal suggest that in the treatment of epilepsy gardenal, atropine, caffeine, and strychnine should be combined. They claim disappearance of the attacks in 22 per cent of the cases in 70 per cent an improvement in the motor phenomena, which are occasionally replaced by vertigo, and failure in only 8 per cent. Dupony and Montassut have tried the drug in anxiety states. Their method consists in giving 1 c.g. hourly, the daily dose not exceeding 0.2 gram. The results are stated to have been excellent in anxieties and obsessions, not so good in melancholias and negativisms. Mignard and Durand Saladin report satisfactory results in cases of excitement and of anxiety from the administration of a stable solution of gardenal.

Artificial Heliotherapy

528 **G. DUVE (*Le Scalpel*, October 24th, 1925, p. 1039)** reports brief details of 17 cases of various diseases treated by radiations from mercury quartz lamps. In a case of alopecia of five years' duration, after fourteen exposures, new hair appeared, thyroidin and salvarsan were also given. Another case of generalized alopecia, which had resisted various treatments, was cured after twenty six irradiations, and a patient who had had alopecia for twenty years regained normal growth of hair after thirty two exposures, thyroidin also being given. Out of four cases of acne, two gave excellent results, one was a failure, and in another there was partial improvement. Three cases of lupus were treated by general light baths and by local application of light, each showed some improvement, but none was completely cured. One infant with gonorrheal staphylococcal infection and pustular eruption recovered after two months' treatment by light baths. One case of sciatitis was completely cured after four sittings. Among the surgical cases treated were sluggish wounds, tuberculous peritonitis (improved), and enlarged glands.

529 **Ambrine in the After-treatment of Ear Operations**
T. H. STIBBE (*Nederl. Tijdschr. v. Geneesk.*, October 31st, 1925, p. 1979) states that it is well known that the difficulties in radical operations on the ear often begin only with the so called after treatment. This always requires much patience on the part of the practitioner and is generally at first extremely unpleasant for the patient. Hitherto no method has been devised to shorten the duration of after treatment or render it less painful. Stibbe claims to have

found in the French preparation ambaine a means of shortening the duration of the treatment and of diminishing the sensitiveness of the wound. This method was first introduced by Daure and Liébault, but has hitherto found no support. Ambaine, well known to medical officers during the war, is a brown coloured substance of firm consistence composed of paraffin and resin, it was originally intended for burns and accidental wounds. Before use it should be melted in a water bath at about 104° F. Unlike Daure and Liébault, Stibbe does not apply the ambaine until after the stitches have been removed on the eighth day, when it is dropped into the operation wound until the whole cavity is filled up. The dressing is removed after two days, when the wound is found to be much less sensitive, the granulations are not exuberant and bleed but little. This treatment is repeated five times every two days, at the end of which time the secretion from the wound will have almost ceased and a flaccid layer of epidermis formed.

530 Antitoxin Treatment of Scarlet Fever

F G BLAKE and J D TRASK (*Boston Med and Surg Journ*, October 8th, 1925, p 659) report on 112 cases of scarlet fever treated by intramuscular injections of Dochez's unconcentrated antitoxin. Fifty seven of these were uncomplicated cases, which were promptly cured within twelve to thirty six hours irrespective of the severity of the disease at the time of treatment. Forty eight were complicated cases, all but one of which were promptly and permanently cured of the specific toxæmia, as was shown by fall of temperature, rapid fading of rash, and prompt neutralization of the toxin in the blood. The septic complications, however, were not immediately cured, but subsided more or less rapidly according to their nature, duration, and severity. Seven were examples of post scarlatinal sepsis, and in these no demonstrable benefit was derived from the antitoxin. The authors recommend that, to be therapeutically efficient, an antiscarlatinal serum should contain at least 12,500 minimal bleaching doses of antitoxin per cubic centimetre, or be able to neutralize at least 10,000 skin doses of toxin per cubic centimetre. The amount of antitoxin required to cure scarlet fever promptly and with certainty by intramuscular injection varies from 3,000 to 12,000 units, according to the size of the patient and the severity of the disease. For the best results the full amount of antitoxin required in each case should be estimated and given at once.

531 Indications for Diathermy Treatment

F W EVERHARDT (*Journ Amer Med Assoc*, October 10th, 1925, p 1111) points out that heat transmitted by convection and conduction barely penetrates beyond the dermis, that radiant heat goes a little deeper into the tissues, but that diathermy, in which the heat results from the conversion of electricity, is a means of warming the deeper tissues, since the high frequency current passes directly from one electrode to the other and affects whatever tissue intervenes. The result of the application of heat to a part is to control muscular spasm, relieve pain, and increase the arterial flow. Everhardt has given 70,000 treatments by diathermy at the Washington University School of Medicine, and has found it to be of great value in the early stages of fracture and joint injuries, since by the relief of spasm better apposition is possible. Moreover, the increased blood supply promotes the absorption of exudates and lessens the tissue tension due to extravasated fluid. By means of diathermy he has materially shortened convalescence after fractures, and suggests its use in post-operative bone and joint conditions, acute sprain, fractures, bursitis, acute and chronic arthritis, contractures, and fibrositis. He considers that diathermy is contraindicated where there are localized pockets of pus without drainage, when there is danger of hæmorrhage, in tuberculous joints, and in suspected malignancy.

Anaesthetics.

Propylene as an Anaesthetic

L K RIGGS and H D GOULDEN (*Anaesthesia and Analgesia*, October, 1925, p 299), having studied the physiological action of propylene upon white rats, recommend its adoption as a general anaesthetic. Its potency being high, it may be administered with as much oxygen as may be desired. It was found to resemble ethylene in producing no nervous symptoms or excitement stage. It is apparently not highly toxic, since the respiratory centre resists for long periods the action of concentrations considerably greater than those required to anaesthetize. Its action is upon the respiratory centre rather than upon the heart, and a striking feature of respiratory failure induced by it was the ease with which

the animals were revived after respiration had ceased for thirty seconds. The authors add that the range of concentrations which may be used with safety is very wide, the analgesic range is relatively large, and the relaxation obtained is excellent. In the experiments upon white rats its physiological action was studied quantitatively, the various concentrations required to produce respectively analgesia, anaesthesia, and respiratory failure being measured, and it was found that a gas mixture of 70 per cent propylene, 25 per cent oxygen, and 5 per cent nitrogen induced analgesia in one minute, anaesthesia in two minutes, and respiratory failure only after sixteen to twenty minutes.

532 Anaesthesia and Eye Troubles

J BLOWFIELD (*Brit Journ Anaesth*, October, 1925, p 66) considers that eye troubles following anaesthesia have not received sufficient attention. They are almost entirely preventable, and, though usually slight and transitory, they may be serious and lead to litigation, and he thinks they have become more common since open methods of administration have tended to supplant closed methods. It would appear that acute conjunctivitis may be caused by the vapours of chloroform, ether, or mixtures of them. Frequent examination with the finger should be avoided, and during open administration the eyelids should be kept closed. Keratitis with subsequent corneal scarring is the most serious damage that is likely to occur. Experimental evidence supports the general view that anæsthetic vapour alone can scarcely cause corneal ulceration, which is due rather to some of the anæsthetic entering the eye or the cornea being abraded by the examining finger or by some part of the anaesthetist's apparatus. Such damage, however, has been attributed to the vapour when it supervened after operation upon a man with severe toxæmia. While the instillation of a drop of castor oil prior to anaesthesia, or irrigation with boric lotion afterwards, have been recommended as preventive measures, Blowfield advises keeping the lids carefully closed during anaesthesia as the surest method of averting trouble.

533 Ethylene Anaesthesia

C L HEWER (*Amer Journ Surg*, October, 1925, p 119), from observations on 120 administrations of ethylene for anaesthesia, considers that it has advantages over other anaesthetics, especially in minor operations of moderate duration. It was administered in three different ways: (1) with an in the usual gas apparatus, the nasal method being employed for prolonged anaesthesia, (2) with oxygen and partial rebreathing, by which an indefinite length of anaesthesia can be maintained on a mixture of 80 to 85 per cent ethylene and 15 to 20 per cent oxygen, and (3) with oxygen, providing for absorption of the carbon dioxide and complete rebreathing through a metal chamber containing granulated soda lime. Endotracheal administration is risky on account of the danger of explosion, and for cases in which complete relaxation is required the addition of ether is necessary. The average time of induction was one minute fifty seconds, the duration of anaesthesia from two to fifty eight minutes, and the age of the patients was from 2 to 62 years. No case gave rise to any anxiety, and in 110 of the cases ethylene or ethylene oxygen only was used. There was a marked absence of distressing after effects, and if the anaesthesia did not exceed ten minutes most patients were able to walk without assistance three minutes after removal of the face piece. Comparing it with ethyl chloride for dental extractions in children, while 75 per cent vomited after ethyl chloride no vomiting occurred in those anaesthetized with ethylene.

Obstetrics and Gynaecology.

535 Acute Appendicitis complicating Labour

D N BARBER and J R MILLER (*Boston Med and Surg Journ*, October 15th, 1925, p 720) report a case of acute appendicitis occurring in the course of labour. A primipara at full term was admitted to hospital at 8.45 p.m. with indeterminate pains which had started at 3 p.m. that day in the right lower quadrant. Soon after 3 p.m. labour pains commenced, and two hours later there was a definite sharp attack of pain, which later became constant. On admission the temperature was 98.4°, pulse 104, respirations 24, the membranes were unruptured, and the general physical conditions were normal except for abdominal tenderness, which prevented the position of the child being determined. Acute and continuous pain was localized near McBurney's point and was quite distinct from the irregular labour pains. The foetal heart was heard just below and to the left of the umbilicus. Rectal examination showed the cervix was not fully open or dilated,

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

542. Reactions following Immunization against Diphtheria

DENES (*Deut Med Woch*, October 2nd, 1925, p 1655) states that owing to an outbreak of diphtheria in a children's home at Schlenburg near Cuxhaven 44 children had the Schick test performed upon them. With 5 exceptions all gave a positive reaction. Of the 44, 31 were inoculated with toxin antitoxin, as well as 10 other children in whom the Schick test had not been performed. Of the 41 inoculated 4 showed no reaction and 3 a slight reaction, while in the rest the reaction was very marked. With two exceptions the general condition was little affected, and symptoms in the form of infiltration or regional glandular swelling were slight except in one case. The most striking manifestation was a rash which was usually scarlatiniform and generalized, including the face. In 6 cases there was a recrudescence of the Schick reaction on both arms. In two children, twins aged 2 years, the general reaction was very violent, being characterized by cyanosis, loss of consciousness, general oedema, and an almost imperceptible pulse in one case, and in the other by a generalized eruption and oedema, as well as by a feeble pulse. The reaction in both cases was an anaphylactic shock suggesting a familial congenital hypersensitivity. H. KLEINSCHMIDT (*ibid*, p 1657) states that the unpleasant reactions following injection of antitoxin as described by Denes are not unparalleled. In 1919 40 cases at Dallas in Texas developed severe reactions after immunization, characterized by fever, vomiting, and local inflammation, and five deaths took place. Kleinschmidt also refers to the six fatal cases which occurred in the home for infants and young children at Baden, near Vienna (*JOURNAL*, October 24th, 1925 p 757). In these circumstances he makes the following proposals: (1) The preparation and preservation of toxin antitoxin should be under State control. (2) A test intracutaneous injection of 0.1 cc of toxin antitoxin should be performed, even when neutral mixtures are used, in cases likely to show hypersensitivity. This phenomenon may be expected in a considerable proportion of otherwise healthy children of school age and adults, especially those suffering from tuberculosis, neuropathy, eczema, and asthma.

543. Gastro intestinal Disturbances in Neuro syphilis

M. FREMONT SMITH and J. B. AYER (*Journ Amer Med Assoc*, October 24th, 1925, p 1282) have studied the gastro intestinal symptoms in 50 cases of neuro syphilis, and find that there are various degrees of these disturbances. They range from the typical gastric crises to milder forms with only occasional vomiting, pains occurring in any part of the abdomen, or merely epigastric discomfort with or without eructations. Other forms of disturbance are diarrhoea, constipation, and rectal tenesmus. Owing to the mildness of some of these symptoms, they are often treated without any suspicion arising of neuro syphilis. The authors believe that crises are rare in the absence of other distinctive signs of tabes, of which they found pupil abnormalities to be the most common. They agree with Edsall in that they regard a negative Wassermann reaction as being of no significance in eliminating the possibility of neuro syphilis. Out of 24 cases in which barium meals were given 15 showed abnormalities, and of these only 5 were correctly attributed to some gastric or duodenal pathological condition, the remaining 10 being probably due to muscular spasm. They therefore conclude that irregularity of the pylorus and duodenum, as demonstrated by x-ray examination, is a common occurrence in neuro syphilis, although there may be no obvious pathological condition present locally. They add that such irregularities, in order to be considered as presumptive evidence of the presence of an ulcer, must be confirmed after thorough atropine saturation.

544. Endophlebitis Hepatica Obliterans

E. BÖTTIGER (*Acta Paediatrica*, October 22nd, 1925, p 144) records the case of a previously healthy girl, aged 3 years, who was taken ill with vomiting and rapidly developing ascites. The liver was much enlarged. Jaundice was not present. The ascitic fluid, which was evacuated several times, had at first a somewhat high albumin content, but gradually lost the qualities of a transudate. Guinea pigs which were inoculated with the fluid did not develop tuberculosis. No enlargement of the spleen could be detected. The other organs appeared normal. Subsequently cerebral

symptoms supervened in the form of unconsciousness, convulsions, and paralysis, and death occurred after about two months' illness. The necropsy showed that the cause of the circulatory obstruction in the liver was well marked vascular disease with formation of thrombi. It was difficult, or even impossible, to tell from the histological appearances which of the two was the primary process. In some vessels of moderate size there was isolated vascular disease without evidence of thrombosis, so that Böttiger is inclined to regard the vascular disease as primary. The condition was first described in 1899 by Chiari, who reported three cases. Since then many other examples have been reported, so that there are now 31 on record. Nothing definite can be stated as to the etiology of the disease. In the present case there was no clinical or pathological evidence of syphilis. The disease generally occurs in early and middle life. It may be preceded by indefinite symptoms or develop suddenly in the midst of good health. Jaundice is usually absent, but may be present in a slight degree. A definite diagnosis of the condition has never been made before death.

545. Rickets and Craniotabes

J. A. HÖJER (*Acta Paediatrica*, October 22nd, 1925, p 16) reviews the literature and records his observations on 70 cases of craniotabes which he found by examining 600 children in welfare centres near Stockholm. In most of the cases there was no evidence of rickets, so that Höjer was inclined to regard the craniotabes as physiological. A remarkable fact was the familial occurrence of the phenomenon, which was present in twelve children belonging to six families. Höjer therefore agrees with the older observers in regarding a constitutional thinness of the skull as the cause of craniotabes.

Surgery.

546. Chronic Pancreatitis

J. W. HINTON (*Surg, Gynecol and Obstet*, October, 1925, p 422) draws attention to the fact that acute exacerbations of upper abdominal pain occur in some patients after cholecystectomy. The explanation of these attacks is difficult, and the first impression is that a calculus in the common duct has been overlooked. Laparotomy may be performed and reveal no stone present. Hinton states that some of these attacks are due to acute exacerbations of chronic pancreatitis, and then are usually met with in the first few weeks following the cholecystectomy. Pain is present in the upper abdomen, and there may be nausea. Vomiting is usually found and persists during the attack. Jaundice, probably due to compression of the bile duct by swelling of the head of the pancreas, is quite frequently encountered in severe cases. The diagnosis is arrived at by a process of elimination, renal and biliary calculi must be excluded. Surgical treatment in these cases does not seem to cure the condition or prevent subsequent attacks. Some of the patients spontaneously recover if given the opportunity.

547. Treatment of Duodenal and Jejunal Fistulae

R. PAMPERL (*Zeit f Chir*, October 24th, 1925, p 2402) points out that in many cases of duodenal and jejunal fistulae the progressive inanition of the patient renders a radical operation unsafe, while there is usually severe excoriation and secondary infective dermatitis of the abdominal wall adjacent to the fistula, due to the escape of the gastric and pancreatic juices. This dermatitis may produce a serious secondary infection if a radical operation be attempted. He claims that in many cases his modification of the treatment suggested by Ahrens results in permanent closure of the fistula without operation. Pamperl has discarded Kehr's 'T' drainage tube, which Ahrens employs, and he now uses a piece of rubber drainage tube, cut longitudinally and with the angles rounded, it is held in position by two stout silk threads passed through the whole thickness of the rubber in its middle third. This rubber plate is passed through the fistula into the lumen of the bowel, the silk threads being secured outside the opening. A roll of gauze is then placed over the fistula and the silk threads are drawn taut and tied over this, thus closing the fistula and preventing the escape of the intestinal contents. For the prevention of dermatitis and eczema Pamperl recommends Hensner's solution of iodine in benzene and paraffin, this is applied to the adjacent skin. Lauenstein states that his best results have followed the use

of "dermatol paste"—that is, bismuth subgallate 2 per cent, zinc oxide and stearic acid 25 per cent, lanolin 30 per cent, linseed oil 18 per cent. M. KAEHLER (ibid., p. 2418) describes a similar technique which he has adopted in the treatment of these fistulae, with the exception that instead of the roll of gauze over the fistula he ties the silk threads over a piece of thick rubber drainage tube, thus securing the approximation of the bowel to the abdominal wall and sealing up the fistula. Kaeher agrees that the "rubber plate" is preferable to the "T" tube, as with the former there is a greater probability of contraction and ultimate closure of the fistula than when the "T" tube is employed.

548 Chronic Cicatrizing Parinephritis

V. J. O'CONNOR (*Journ. Amer. Med. Assoc.*, October 10th, 1925, p. 1118) reports two cases of perineal sclerosis, and states that this condition may apparently manifest itself at some considerable period after the acute perinephric infection. A chronic low grade infection following an acute illness may cause the fibrous and fatty capsules of the kidney to become replaced by a fibrous cicatricial shell. The contraction of this cicatrix about an otherwise normal kidney gives rise to pain and lowered renal efficiency. Both O'Connor's patients complained of a dull lumbar pain which did not radiate, and which was markedly increased when the daily fluid intake exceeded three quarts. There was no evidence of stone, tumour, or urinary obstruction, uretero pyelograms showed nothing abnormal. Function was deficient on the affected side, as shown by the fixed low specific gravity of the urine, the diminished excretion of urea, chlorides, and total solids, and the delayed excretion of phenolsulphonphthalein. Decapsulation of the damaged kidney relieved all pain, and normal function was completely restored later in both cases.

559 Intranasal Dacryocystostomy

J. S. FRASER (*Journ. of Laryngol. and Otol.*, November, 1925, p. 725) remarks that by the time the average hospital patient comes to the eye department for advice in cases of dacryocystitis there is usually considerable dilatation of the sac or there is an abscess in and around the sac. The old method of dilating the tear passages by stylos and threads is inefficient. The popular method of excising the tear sac is obviously far from ideal, and the patients suffer from permanent epiphora. In conjunction with his ophthalmological colleagues at the Edinburgh Royal Infirmary, Fraser has observed and operated upon 42 patients, in 5 cases bilaterally. Most of the patients had had courses of dilating and washing out the punctum and canaliculus, and 5 actually had abscesses at the time of operation. Where there was a deflected nasal septum a submucous resection was performed at the same time. The mucosa over the frontal process of the maxilla is cocaineized and a D shaped piece of the mucosa—curved side anteriorly—is completely removed from the outer wall of the nose so as to expose the bone over the sac. This area of bone is gouged away, and the sac is at once seen and often bulges into the nose. An anterior ethmoidal air cell which may be exposed has a pale pink mucosa, and can be easily distinguished from the dense bluish white tear sac. The sac is further cocaineized, the punctum is dilated, and a probe passed into the sac so as to make it hinge into the nose. The inner wall of the sac is now completely removed with scissors, forceps, or a bistoury. Difficulties commonly met with are the occasional extra thickness of the nasal process of the maxilla, and free haemorrhage when this bone is being removed. No after treatment is necessary, and in most cases the tears flow into the nose from the operation. There was complete cure in 65 per cent of the cases followed up, in the remainder epiphora persisted, and in one case continued abscess formation. In several there was, however, a patent track through to the nose, and there had been no dilatation of the sac. Fraser does not consider that patients without dilatation of the sac are likely to derive much benefit from this operation. In cases which relapse probably too little of the inner wall of the sac has been removed, this can be easily remedied at a second operation.

550 Rectal Carcinoma

SCHWARTZ and RICHARD (*La J. Med.*, October 16th, 1925, p. 1656) discuss the treatment of carcinoma of the rectum, and remark that, in contrast with cancer of the cervix, x-ray and radium treatment is very rarely successful. As a result of a study of the literature they conclude that when the condition is operable surgical intervention is always preferable. In the case of inoperable cancer surgical treatment combined with x-rays is recommended, but metastases, cachexia, or senility must be considered as contra-indications. When x-rays are employed the iliac route is best, and the irradiation of the tumour should proceed slowly and over a large area. Such irradiation sometimes renders an inoperable tumour favourable for surgical treatment.

Therapeutics.

551 Sodium Nucleinate in Lobar Pneumonia

F. DAUBENTON (*South African Med. Record*, October 24th, 1925, p. 463) records a severe case of lobar pneumonia in a woman, aged 29, successfully treated with sodium nucleinate. In spite of regular injections of camphor, lobeline, adrenaline, and digitalinatum, her condition became worse, the respirations rising to 60, the pulse to 164, with unconsciousness on the ninth day and a leucocyte count on the eleventh day as low as 5,900 per c.c.m. While apparently moribund 50 mg. of sodium nucleinate was given intramuscularly and sodium bicarbonate added to the rectal feeds. On the following day the leucocyte count rose to 9,000, the temperature was lower, and the pulse and respiration rates dropped respectively to 130 and 48, and the next day, after another injection of sodium nucleinate the leucocyte count rose to 14,000 with further improvement in temperature, pulse, and respiration. On the following day the temperature fell to normal and the patient regained consciousness, from that time her recovery was uninterrupted. Daubenton considers that so striking an improvement can scarcely be attributed to anything else than the action of the drug, and suggests its trial by others.

552 Treatment of Boils

A. BUSCHKE and E. LANGER (*Med. Klin.*, November 6th, 1925, p. 1675) state that when treating boils the first duty is to look for contributory causes, what is overlooked more often than general diseases such as diabetes is the existence of local skin conditions—prurigo, irritant eczema, pediculosis, etc.—leading to scratching and auto-infection. Attention to diet is specially necessary in the furunculosis of diabetics and of infants, the specific advantage of insulin in the former case is a little doubtful. In infants daily baths of potassium permanganate are useful. The authors recommend painting the boil with tincture of iodine or 10 per cent formalin solution, internally they favour ichthyol or salicylic. Many authors have recommended local applications such as flavins, such are of particular use in the dangerous form of furunculosis following salvarsan dermatitis. The present authors prefer sinflavin, a lately prepared colourless substance that does not stain the clothes. In isolated boils compresses are valuable, resorcin or 20 per cent spirit being added to them. Facial boils call for conservative measures and absolute rest. Lately x-rays have been supplanting surgery. If vaccines are tried they must be autogenous.

553 Specific Treatment in Cardio-vascular Syphilis

B. I. GOLDBERG (*Boston Med. and Surg. Journ.*, October 22nd, 1925, p. 768) writes to refute the impression that specific treatment of demonstrable cardio-vascular syphilis is useless, and adduces evidence to show that amelioration of symptoms may result from such treatment, especially in early cases. In quite an appreciable number of patients presenting definite evidence of cardio-vascular syphilis the Wassermann reaction is negative, so that reliance must be placed upon the other factors in diagnosis. In early cases arsphenamine or the allied arsenicals were found most valuable, but since these cases could only rarely be diagnosed with that certainty that applies in chancre or secondary manifestations Goldberg advises a preliminary course of six mercury or bismuth intramuscular injections, followed by six to ten weekly arsphenamine intravenous injections. Potassium iodide should be administered concurrently in gradually increasing doses. Should there be intolerance to arsphenamine neo-arsphenamine may sometimes be tolerated. In advanced cases, he adds, more caution is needed, and the use of the arsenicals is less general, mercury and bismuth being preferable. Standardization of treatment is to be avoided, each case being treated individually as far as possible.

554 Calot's Solution in Otitis Media.

V. FOTIADE (*Arch. Internat. de Laryngol., Otol. et Rhinol.*, November, 1925, p. 1038) holds that a discharging ear persists either owing to inefficient treatment or to the virulence of the infection. He states that a discharging ear behaves just like a fistula, and is treated like one in that the visible parts are cleaned and disinfected, whereas the unseen and deeper parts are untouched, only a small portion of the tympanum is reached by the various lotions—the attic and the Eustachian tube are left untouched. Calot's solution consists of guaiacol, creosote, and iodoform dissolved in sulphuric ether, it induces a great flow of white blood corpuscles, which are then killed, fat-splitting and proteolytic ferments being set free. At first the discharge increases in volume, becomes more yellow, and loses its fetor, as the result of diapedesis and the destruction of leucocytes and bacteria. The sulphuric ether dissolves the purulent and mucoid fluids, and the epithelium is also excited to renewed growth. Ten drops

of the solution are applied to the ear after syringing, four times daily, pressure on the tragus is applied and released alternately. In this way the fluid is introduced into the attic and the Eustachian tube, and after the first one or two treatments finds its way into the pharynx, showing that the tube has been thoroughly cleaned. Granulation tissue and polyp must be cleared away before the treatment is commenced. Of 64 cases of suppurative otitis 61 were cured by this method, the other 3 consisted of one tuberculous patient who died of pulmonary disease, while two did not continue to have the granulations removed. The hearing was almost always restored. Otitis media the vapour of the solution is blown into the tympanum by using the apparatus for thermo cautery with the solution in the container and a Eustachian catheter instead of the cautery point. Some very good results have been achieved with this line of treatment, and the author claims that it is much more satisfactory than iodized ether.

555 Treatment of Infantile Syphilis

BRUCK (*Polsha gazeta lekarsha*, September 13th, 1925, p 790) describes the treatment of syphilis in newborn infants and young children. Since the Wassermann test has not in these cases the same value as in adults, the clinical picture should be the deciding factor for the commencement of antisyphilitic treatment. Bruck commends as a routine in infants the taking of blood from the crural sinns, in restless subjects it may be taken by cupping. Intramuscular injections of neosalvarsan into the fascia lata and of mercuric chloride or bismogenol were given alternately twice a week, beginning with one or two injections of bismogenol (0.1 to 0.5 c cm) or mercuric chloride (mercuric chloride 0.2 gram, sodium chloride 0.2 gram, distilled water to 10 grams) and proceeding with neosalvarsan (0.045 to 0.075 to 0.15 c cm) as above. The treatment consisted of eighteen injections, which in cases of recurrence were repeated. The results of this therapy were generally good. Where the children were exposed to such intercurrent infections as measles, influenza, and pertussis the author employed, with very good results, prophylactic injections of a polyvalent vaccine (0.1 to 0.5 c cm according to the age and weight) together with caseosan (0.1 to 0.2 c cm) every other day.

Diseases of Children.

556 The Blood Pressure in Children

THOMAS (*Schweiz. med. Woch.*, September 24 b, 1925, p 896) reviews the literature, and records his observations with the Vaquez-Lanby instrument on the blood pressure in 627 school children, aged from 7 to 14, who were either in perfect health or had mild forms of glandular tuberculosis, goitre, and hypothyroidism. The measurements were always made in the morning between 9 and 10 on an empty stomach with the child in a recumbent position. As a general rule, the blood pressure was higher in boys than in girls. On the other hand, at the time of puberty it was higher in girls than in boys. In boys aged from 7 to 11 the differential pressure was 3.7 cm, and 3.6 cm from 11 to 14, while in girls of the same age it was 3.8 and 4.3 cm respectively. It was therefore lower on the average by 1/2 to 1 cm of mercury than that of the adult, if the blood pressure of the latter be taken as 12 cm for the systolic and 9 cm for the diastolic pressure. In the case of children with glandular or pulmonary tuberculosis sufficiently mild to allow them to attend school the blood pressure was lower than in the normal state, but only during the period 11 to 14. In goitrous subjects the blood pressure was a little higher than in subjects of hypothyroidism.

557 Post Influenzal Cardiac Dilatation in Childhood

J. LUKACS and K. WALTNER (*Monatsschr. f. Kinderheilk.*, October, 1925, p 72) call attention to a sequel of influenza which they frequently observed among school children during the epidemic of influenza last spring. After they had had an attack lasting from five to eight days accompanied by moderately high fever, and had been out of bed for several days, the children were brought for medical advice again by their parents. The complaint was that the child had not quite recovered, having still a slight rise of temperature, loss of appetite, and being easily tired and sweating on walking or other movements. On examination the child was found to have a subfebrile temperature and a coated tongue. The cardiac dullness was distinctly increased both to the right and to the left, the heart sounds were somewhat indistinct, but there was no murmur. The heart was very excitable, the slightest movement causing a considerable rise of the pulse rate. A ray examination confirmed the percussion findings,

the heart shadows being larger and broader than normal. Treatment was very simple and successful. The children were sent to bed again and the symptoms subsided. The tired feeling and sweating disappeared at once, the anorexia in a few days, and in about a fortnight the heart resumed its normal size.

558

Exanthema Subitum

J. VON BOKAY (*Deut. med. Woch.*, October 9th, 1925, p 1687), who records 11 cases in children aged from 5 months to 2 years, states that this name was first given in 1921 by Veeder and Hempelmann to a condition described by Zahorsky in 1910 under the title of "roseola infantilis." It is characterized by a sudden onset, with fever and languor lasting for four days, but there are no other symptoms, and even in cases with high fever the general condition remains fairly good. As soon as the temperature falls the characteristic eruption appears and the patients become more lively. During the febrile stage there is a characteristic blood picture consisting in a well marked leucopenia with a lymphocytosis of 80 to 90 per cent. The rash develops rapidly, reaching its height in twelve hours' time, and fades without leaving any trace in twenty-four to forty-eight hours. There is no desquamation. Morphologically the rash resembles measles. On the trunk, where it usually first appears, the rash is thicker than on the face and limbs. It is very rarely confluent. Von Bokay is of opinion that exanthema subitum is a hitherto unknown disease, usually occurring in early childhood, and of apparently infective origin but minimal contagiousness.

Obstetrics and Gynaecology.

559

Tubal Abortion

A. PONJOAN (*Ans. Medica*, October, 1925, p 118), who records 23 cases of tubal pregnancy observed in the gynaecological department of the Santa Cruz Hospital during the last four years, comes to the following conclusions: (1) It is only very rarely that the gynaecologist can diagnose tubal pregnancy during the early stage before the development of such complications as apoplexy of the ovum, tubal abortion, or rupture of the tube, as the patients do not seek advice, being either not aware of their pregnancy or regarding it as a normal one. (2) The sudden development of undoubted signs of internal haemorrhage is the chief diagnostic feature in rupture of the tube. (3) Retro uterine haematocoele is a frequent termination of tubal pregnancy, being noted in 8 of Ponjoan's cases. (4) Colpotomy is the treatment for infected haematocoele and in haematocoele of old standing in which the haemorrhagic process is definitely quiescent. (5) Expectant treatment is only justified when the patient is in a surgical ward where everything can be ready in case of a recrudescence of haemorrhage. (6) Unless the haematocoele is encysted and of very small size conservative treatment is unjustifiable. Colpotomy is indicated when the haematocoele is retro uterine, but in other cases the abdominal route should be chosen. (7) Another indication for the surgical treatment of recent haematocoele is to favour its absorption and to prevent the persistence of peritoneal adhesions. (8) The syndrome of peritoneal shock which accompanies tubal abortion or rupture is transient, and the danger of it being confused with persistence of internal haemorrhage should prevent the gynaecologist leaving the patient who is in a general condition, especially the frequency and tension of pulse, does not improve within a few minutes under treatment with caffeine and camphor. (9) Salpingostomy, removal of the tube, or unilateral ovariectomy, if the ovary cannot be isolated, is the order of conservative technique that should be followed. (10) Ponjoan has observed a case which he believes is unique in gynaecological literature, of two ruptures within a single tube.

560 Sterilization by Ligature of the Fallopian Tube

B. WASER (*Zentralbl. f. Gynäkol.*, October 17th 1925, p 2327) states that at the Zürich University Frauenklinik for the purpose of inducing sterility excision of the Fallopian tube has been abandoned in favour of the Friedmann-Madlener procedure—namely, the crushing of a loop of the tube by means of a Doyen's clamp followed by the application of a tight silk ligature. Madlener found no record of subsequent pregnancy in the 89 women (84 were married) in whom he performed this operation. At Zürich the operation has been employed 225 times since 1920, with only one subsequent conception, the abdominal route only is used. In about one-fourth of these cases sterilization was the primary object of the laparotomy, in about 40 per cent the operation was undertaken on psychiatric grounds, in about 37 per cent on obstetrical indications, and in about 10 per cent for medical reasons—chiefly pulmonary or bone tuberculosis, or cardiac pathology associated with valvular disease or hyperthyroidism.

The Fallopian Tubes and Sterility

561 S. H. GEIST and M. A. GOLDBERGER (*Surg., Gynecol. and Obstet.*, November, 1925, p. 646) have investigated the course and lesions of the Fallopian tubes with reference to their share in the production of sterility. The method of investigation consisted in the insufflation of the uterus and tubes, removed by operation, and the intramural portion of the tubes was examined microscopically. As a result they are able to substantiate the findings of Hermannstein that the intramural portion of the tube is variable. In about 40 per cent of cases the tube passes in a slight direct curve with the convexity upwards, in a few cases this curve is somewhat sharper, and in the remainder this curve is not simple and direct but tortuous, either traversing the uterine wall in a series of convolutions or its course is marked by decided angulations. The variations, they suggest, may offer a bar to the progress of spermatozoa or ova. They point out that these variations may account for the marked differences in the pressure required to obtain a positive insufflation test. They state also that a sharply kinked intramural part of the tube may result in the test being negative if the uterine muscle is contracting at the time, though a positive result occurs when the muscle is relaxed. The authors further assert that a normal tube may be patent for gas under pressure but not necessarily so for spermatozoa or ova. They conclude, therefore, that an operation designed to make patent the abdominal portion of the tube may prove clinically valueless if the obstruction is intramural, and therefore it is essential to locate the site of obstruction before performing any such operation.

An Early Sign of Pregnancy

562 T. LONNE (*Zentralbl. f. Gynäk.*, October 24th, 1925, p. 2406) describes the following sign of early pregnancy, which he has elicited in the same period as that in which Hegar's first and second signs are present. The bladder having been emptied, a bimanual examination of the uterus by light pressure on the hand steadies the anteverted uterus by light pressure on the fundus and posterior wall, while two fingers of the vaginal hand palpate the anterior wall of the uterus through the apposed anterior vaginal wall. Through the softened parts in pregnancy, fluctuation in the fluid distended amniotic cavity can be detected by the two fingers. It is claimed that this procedure is free from the danger of inducing abortion which has been said to impair the value of Hegar's signs. The sign depends on the volume of the liquor amnii exceeding that of the embryo during the early months of gestation, their respective weights, according to investigations made at Munich, are 9.1 during the first month, 5.1 during the second month, and about equal by the twelfth week.

Pathology.

Ultra filtration in Medicine and Biology

563 L. VILLA (*Arch. di Patologia Clin. Medica*, September, 1925, p. 425) summarizes the methods and the practical importance of ultra filtration—a process which is now of as much utility to the biologist, bacteriologist, and zymologist as the gravimetric balance is to the chemist. Of the three main methods that he describes, he considers that for simplicity and reliability the one invented by Bechhold, depending on the permeability of a porcelain filter with colloidal or gelatin, is the best. This has the great advantage that the filters can be sterilized in the autoclave. Moreover, by measuring the permeability of the filters to water and to air it is possible to calculate the size of the pores, rendering it possible to increase the concentration of the substance that is being filtered to the particular purpose required, and to estimate the magnitude of the particles of the substance. It is found that filtered. Thus, if gelatin be employed, it is found that to retain colloidal platinum it is necessary for the membrane to have a concentration of 2 per cent, and to retain donkey albumose a concentration of 4 per cent, and to retain hemoglobin a concentration of 10 per cent. In the separation of a chemistry ultra filtration has its uses in the separation of the split protein products, thus replacing fractional precipitation, and in the study of many protein and carbohydrate bodies. In bacteriology it can replace the old Berkefeld and Chamberland candles in the filtration of broth cultures. It can be used in the study of the colloidal nature of substances and antibodies, and in the separation of these substances from each other. Its chief value, however, is in the work on the filterable viruses. Thus Betegh has shown that the viruses of rabies, herpes, and encephalitis consist of smaller particles

than those of tetanus toxin or serum complement. It should likewise be of use in the study of the bacteriophage. Finally, in the examination of ferments it can render most valuable service. A bibliography is appended.

Diphtherial Toxaemia and Hyperglycaemia.

534 S. MIKAMI (*Tohoku Journ. of Exper. Med.*, September 18th, 1925, p. 299) adduces experimental evidence to show that intravenous administration of diphtheria toxin invariably causes hyperglycaemia in the normal rabbit, if the quantity injected is so large that the rabbit dies within twenty-four hours. The blood sugar content begins to increase immediately after injection, reaches the maximum in three to five hours, and then decreases gradually. The intoxication brings about depletion of the epinephrin storage of the suprarenal glands. The loss is small at first, is greatest about the sixth hour, and then decreases again. Double splanchnectomy is capable of arresting the hyperglycaemia as well as the epinephrin exhaustion, these are therefore of central origin. When the quantity of toxin injected is such that the rabbit, though moribund, survives for a day or more, there is not only no hyperglycaemia on the day of the injection, but twenty-four hours, or later, after the injection hyperglycaemia develops, at the same time the suprarenal epinephrin and liver glycogen diminish markedly. Double splanchnectomy does not prevent these three diminutions.

The Action of the Bacteriophage.

565 C. ZORLLER and MANOUSSAKIS (*C. R. Soc. de Biologie*, November 6th, 1925, p. 1091) deposited a colloidal sac containing live Shiga bacilli in the peritoneum of a rabbit to which had been given twenty-four hours previously 20 c.c. of Shiga bacteriophage by the mouth. The following day the sac was found to contain the bacteriophage, which had passed through the wall of the sac. This diffusion was not due to any specific affinity for the Shiga bacilli, for it occurred equally well when other organisms were substituted. To ascertain whether the bacteriophage was active in the body the authors prepared a mixture of Shiga bacilli and anti Shiga bacteriophage, and filled a number of colloidal sacs, which were placed, some in large tubes of broth in the incubator. The sacs were withdrawn at times varying from eight to twenty-four hours later. Those that had been kept in the incubator contained a fluid that was perfectly limpid, those that had been in the peritoneum contained a fluid that was turbid, *in vitro* it was found that the bacteriophage was still present in the peritoneum had been active in the peritoneal cavity, but that it would not have been within the body the strain that had been act only on a fresh strain, towards the strain that had been primarily incubated with it it had no action. It would appear, then, that while in the body the strain of Shiga had undergone some modification which rendered it resistant to the bacteriophage. Further experiments showed that if Shiga bacilli and bacteriophage were placed in sacs in the animal body the bacteriophage disappeared within a month, leaving the Shiga bacilli alone. The authors conclude that a bacteriophage that is active *in vitro* is not necessarily active *in vivo*. Indeed, the advantage seems to rest with the organism on which it acts, for either this may vary so as to become resistant, or it may survive and ultimately outlive the bacteriophage.

Relations between Herpes Febrilis and Small pox.

566 E. GILDEMEISTER and K. HERZBERG (*Deut. med. Woch.*, October 2nd, 1925, p. 1647) allude to their previous paper (ibid., January 16th, 1925, p. 97) in which they had shown that herpes febrilis could be transplanted on to the soles of guinea pigs, (2) that the herpes virus could be cultivated in passage through the soles of guinea pigs, (3) that though originally non virulent it might change so much in character during this passage that inoculation of the cornea of a rabbit might kill the animal with typical symptoms of herpes encephalitis. In the present paper the authors describe their attempt to determine if any relations existed between the cause of herpes febrilis and that of small pox. They found that between the two viruses a distinct partially specific cellular and humoral immunity could be demonstrated as follows: (1) The rabbit's cornea, which is immune to herpes, possesses partial immunity to cow pox and small pox. (2) This immunity to small pox appearing after inoculation of a rabbit's cornea with herpes has a specific character. (3) The degree of immunity to cow pox and small pox of a rabbit's cornea is shown by the amount of small pox virus which the cornea is immune to. (4) The degree of immunity to small pox is shown by the amount of small pox virus which the cornea is immune to. (5) The serum of rabbits immune to herpes is able to destroy the virus of herpes but also that of small pox. (6) Guinea pigs can have their soles completely immunized against herpes. (7) The soles of the guinea pig, which are immune to herpes, are also partially immune to small pox.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

567 Collapse in Cardiac Oedema

IVAN MAHAIN (*Arch des Mal du Cœur, des Vaisseaux et du Sang* October, 1925, p 647) remarks that the possible causes of the often serious and occasionally fatal collapse in the course of rapid reduction of cardiac oedema are cerebral congestion or ischaemia, acute cardiac dilatation due to excretion or poisoning by the sodium chloride of the absorbed fluid, and some condition like anaphylactic shock. Vaguez, while recognizing the probability of several of these explanations prefers the last. He has found that collapse occurs prior to diuresis. It is most common among aged persons suffering from renal disease, and is absent when the fluid is removed by paracentesis. He recalls the fact that in certain patients a single intravenous injection of their own serum will produce anaphylactic shock. The author reports the case of a woman aged 74, who had cardiac dilatation and severe anasarca extending upwards to the umbilical level. Several needle punctures had been made in the lower limbs and a large quantity of fluid was removed in the course of five or six days. Light days after the paracentesis of the lower limbs, when the needle punctures were about to close the patient awoke, feeling very ill with severe dyspnoea and a sense of impending death. There was intense cyanosis and the pulse was too weak and rapid to be counted. The punctures were quite dry. A subcutaneous injection of 4 mg of adrenaline was given, and in twenty minutes the dyspnoea disappeared. Nine hours later the patient felt much better and the radial pulse could be counted (130 a minute). An intravenous injection of 0.15 gram of digitalin was given and on each of the four following days 0.1 gram was administered. Thirteen days after the collapse the patient was passing 2 litres of urine daily. Theobromine and digitalis infusion were given on alternate days. At the end of thirty-three days there was no trace of oedema, the pulse had fallen to 96 but there was complete anisothymia. The urine was copious and contained no trace of albumin or of bile pigment.

568 Primary Actinomycosis of the Penis

R. W. SMITH (*Urol and Cut Review*, October 1925, p 576) reports what is apparently the first case on record of primary actinomycosis of the penis in a farmer. The organ was enlarged, oedematous, and tender, with a red streak along the dorsal veins. The inguinal glands were enlarged on both sides. Retraction of the prepuce showed a small ulcer in the sulcus, within a quarter of an inch of the os, with a hard base and slight serous discharge. Subsequently the glands in the left groin broke down and formed an abscess and ulcers formed at the base and in the middle of the shaft of the penis. The inguinal abscess was opened and several ounces of greenish gelatinous pus were evacuated. The Wassermann reaction was negative both in the patient and his wife. Injections of sodium iodide were given intravenously and iron and arsenic subcutaneously. A diagnosis of sporotrichosis was made owing to the presence of chronic multiple ulcers connected by lymphangitis. The negative Wassermann reaction, and the improvement caused by iodide. A culture, however, showed the presence of actinomyces. Treatment by x-rays and iodic light was followed by complete recovery. It was noteworthy that, though the patient continued sexual relations with his wife during the existence of the lesions, she was not infected.

569 Thrombosis of the Coronary Arteries

J. W. McNEE (*Quart Journ Med*, October, 1925, p 44) states that the thrombosis of the coronary arteries is but lasting longer and of varying degrees of severity. The free wall coloured underneath and cyanosed on the surface. Inward the cardiac hepatic, renal and pulmonary signs of heart failure. A pericardial rub (inconstant but pathognomonic), fever with increase of polymorphonuclears and abnormalities in the electrogram. The condition most likely to be confused with this syndrome is acute abdominal disease, especially if the pain be limited to the upper part of the abdomen. The course and prognosis are most variable. Many patients die at once or within a few weeks but others undoubtedly make a fair recovery and live on for a number of years. It has been shown that when the coronary obstruction increases gradually a compensatory anastomosis may be developed as with uterine occlusion elsewhere. Treatment follows the ordinary lines in angina pectoris.

570 The Endocrine Factor in Digestive Disorders

B. C. LOCKWOOD (*John Amer Med Assoc* October 3rd 1925, p 1032) considers that while the alimentary canal like the other organs of the body, is affected by disturbances in the functioning of the ductless glands the extent and frequency of its involvement has been exaggerated. Such action on the alimentary canal is possibly twofold—namely, through the sympathetic nervous system and as a result of changes in the general nutrition. Gastrointestinal disturbances are rare when the endocrine disorder is of slight degree. Lockwood finds that the stomach acidity is generally decreased in hyposecretion of the thyroid, pituitary, and suprarenals. Hyperthyroidism also tends to reduce the acid content of the gastric secretion, and absence of the hydrochloric acid is frequently found in exophthalmic goitre, together with alimentary disturbance. He adds that gastric ulcer is rare in obvious endocrine disease, for it has been observed only four times in 126 cases. The intestinal disturbances associated with endocrine abnormality are of a spastic rather than an atonic type. In gastrointestinal conditions other etiological factors should be excluded before the endocrine system is suspected.

571 Blood Transfusion

OPITZ (*klin Woch* November 12th 1925 p 2185) thinks that success in blood transfusion depends on the technique and the choice of donor. In grouping the blood samples he prefers the agglutination test to the longer hemolytic method. The blood of relatives does not appear to have any special advantage. Laboratory tests must, he adds, be supplemented by a trial injection of 10 to 20 c.c. of the blood, because haemoglobinuria sometimes occurs even though the laboratory indications are favourable. A slight use of temperature is said to be no contraindication. In children, shaving, or rubbing the skin with alcohol, will generally reveal a scalp vein. The external jugular should be avoided for injecting larger quantities of blood on account of the risk of overloading the right auricle. A sinus should also be avoided when possible. The author uses 2.5 per cent of sodium citrate with the blood, and states that keeping the blood for twenty-four hours in an ice chamber is allowable. In 200 cases observed no death followed or transmission of tuberculous. Opitz thinks that it is almost certain that the emboluses introduced continue to live and that one valuable sequel of transfusion is increase in the patient's power of resistance.

Surgery.

572 Laryngeal Carcinoma

G. TERRILLI (*Arch Internat de Laryngol Otol et Rhinol* September-October, 1925, p 897) thinks that frequency of prolapse of the ventricle of Morgagni in men partly explains the comparative rarity of intrinsic cancer of the larynx in women. Terrier concludes, however, that no hypothesis so far is based on sufficient grounds to assist in determining the etiology of the treatment. He insists on the necessity of very careful diagnosis from clinical observation and biopsy, as the results of histological examination are not always reliable. He regards laryngo-fissure as the operation of choice in doubtful cases, since it does not destroy any function of the larynx is a good method if the growth should be benign or of the squamous variety of cancer and enables an accurate diagnosis to be made. Should the growth be of the cylindrical-celled variety which is more malignant total laryngectomy is still possible. No differences of technique in treating male and female patients have yet been formulated and laryngologists are still in great doubt as to the best methods. In the light of present knowledge Terrier favours the use of radium. Intensive and deep radiotherapy must be applied with caution as in some cases an excitation of malignancy may take place or toxic absorption may be increased. So many patients refuse the mutilating operation of laryngectomy that tracheotomy and therapeutic measures are the only ones available. Terrier adds that since the resistance of the cells of women to x-rays is less than that of men this treatment is more dangerous in women. Radium can be applied by passing the tube through the mouth into the larynx or by incorporating the radium carrier in an O'Dwyer's tube. Radium can also be applied from a tracheostomy wound but in some subglottic cases a laryngo-fissure is necessary.

between pregnancy nephropathy ("pregnancy kidney") and chronic nephritis leading to severe symptoms in pregnancy is very difficult, probably the latter condition is diagnosed much more often than is justifiable. Considerable use of blood pictures, the presence of erythrocytes in the urine, and albuminuria, results, all of which have been regarded as pointing to chronic nephritis, may equally be found in cases of "pregnancy kidney." The appearance of renal signs and symptoms in the lead (unless the contrary of pregnancy nephropathy antecedent history of eclampsia or pregnancy kidney, if the current pregnancy is multiple, or if the patient is primiparous. On the other hand, it is in the early months of pregnancy as a rule that chronic nephritis is complicated by acute renal complications—recurrent nephropathies of pregnancy, however, as well as those following eclampsia in previous pregnancies or associated with hydatidiform mole are also apt to lead to acute renal symptoms during the early months after conception. Absence of haematuria and of increase in blood pressure favour a diagnosis of pregnancy nephropathy. Hypertrophy of the left ventricle points, although by no means conclusively, to chronic nephritis. The author adds that it is usually difficult to obtain trustworthy accounts of the past medical history, but previous renal symptoms in pregnancy point to pregnancy kidney, those occurring in the absence of pregnancy to chronic glomerular nephritis.

586 Simple Adenoma of the Breast

A. E. BOTHÉ (*Amer Journ Med Sci*, November, 1925, p 731) reports a case of simple lactating adenoma of the breast, and discusses this rare condition. In his patient, a negress aged 24, a small lump in the right breast appeared nine years previously. It remained stationary in size until the onset of pregnancy one year before admission to the hospital, when the mass gradually enlarged, until at the time of delivery it was the size of a chicken's egg and was slightly tender. At the onset of lactation it grew rapidly, and three months after delivery reached the size of a large orange. The tumour possessed a well marked capsule and was easily separated from the tissue. It was reddish yellow, soft, and lobulated. A thick, cream coloured fluid, with the appearance of condensed milk, oozed from the surface. Bothé mentions other cases in the literature, and states that the average age for the development of this condition is between the fifteenth and thirtieth years. Such adenomata give rise to very few symptoms, except during menstruation, pregnancy, and lactation, when they increase rapidly in size, and may become painful owing to retained secretion. Differential diagnosis, though impossible by clinical procedures, is of but little importance, since treatment of the different kinds of adenomata is always excision.

587 Temporary Sterilization

P. HENDLY (*Zentralbl f Gynak*, October 24th, 1925, p 2404) suggests that in cases where it is desired to induce temporary sterilization a doubling of the vagina may be induced by a special method of colporrhaphy. The interior and smaller vagina opens just below the urethral orifice and serves for egress of the uterine and cervical secretions and menstrual blood, the wider posterior one for coitus. When the need for avoidance of conception is past, the septum dividing the two passages can be removed. Hendly has twice tried this procedure: in the first case with the object of replacing an absent urethra, and in the second in a patient with myocardial insufficiency. In one case the sutures failed to unite, but it is stated that Zomakhon who devised a similar operation independently, has had a successful result.

Pathology

588 Basal Metabolism in Experimental Cancer

A. REMOND, M. SPENDRILL, and L. ASSALDI (*C R Soc de Biologie*, October 30th, 1925, p 979) have made observations on the changes in the rate of basal metabolism in rabbits suffering from experimental carcinoma. The estimations of the metabolic rate were made in a large chamber kept at constant pressure. Before and after the experiment the area of the animal was calculated by Meeh's formula, and the quantity of heat given out being estimated as a function of the respiratory quotient it sufficed to translate it into terms of area and time to arrive at the figure of the basal metabolism. Eight animals were examined. The results showed that in the pre-neoplastic stage there was a rise in the metabolic rate followed in the stage of full development by a marked fall. In one case in which the tumour retrogressed a rise followed a very pronounced decline, and

reached a figure considerably above that of the normal animal. Since no variation took place in the weights of the rabbits, the authors conclude that the fall in the metabolic rate during the cancerous stage could not have been due to malnutrition. They consider it rather to have been dependent on underactivity of the thyroid. Several investigators have shown that endemic goitre predisposes to carcinoma, and Korenehevsky has found that thyroidectomy increases the rate of proliferation of neoplasms in the dog. The authors conclude from their experiments that the nature of the soil "is of importance in the development of cancer."

589 A Delicate Colour Test for the Presence of Vitamin A

O. ROSENHEIM and J. C. DRUMMOND (*Biochem Journ*, 1925, vol. 19, No 5, p 753) have found that arsenic chloride gives with cod liver oil a brilliant ultramarine blue colour. The test is performed by adding 1 c.c. of pure arsenic chloride to one drop of the oil, and shaking the test tube immediately. The oil dissolves to form a clear blue solution in a few seconds it assumes a purple tint which gradually fades. The reaction is characterized by a well defined absorption band extending from $\lambda 550$ to 590 . The sensitiveness of the reaction may be gauged by the fact that it is given by 0.05 mg. of oil in the crude state, and by a 1 in 2,000,000 dilution of the unsaponifiable cholesterol free fraction. The reasons for believing that the colour reaction is distinctive of vitamin A are that it is given by the same fraction of the oil as is known to contain the vitamin, that it persists in undiminished intensity after distillation with superheated steam in a nitrogen atmosphere, that it is destroyed by oxidation when a current of air is passed through the oil at 100°C , and that in a series of tests on over thirty oils and fats a complete agreement was found between the colour intensity and the growth promoting activity as tested by animal experiment. This colour reaction makes it possible also to distinguish between the growth promoting vitamin A and the antirachitic vitamin D. From the analogy between the colour reactions of arsenic chloride with cholesterol, and from the possible relation between sterols and lipochromes and their general association with vitamin A in plant tissues, it is suggested that the arsenic chloride reaction is concerned with a substance derived from these types of synthetic plant products under the influence of sunlight. By means of this colour reaction it will now be possible to estimate the amount of vitamin A in various substances by a simple colorimetric method instead of by the tedious mode of animal experiment. A description of such a method is given.

590 The Widal Reaction in the First Week of Enteric Fever

T. OSTER (*Deut med Woch*, October 2nd, 1925, p 1653) states that in typhoid fever the Widal reaction is positive in 66.07 per cent according to Schmitz and in 69.2 per cent according to Kalthoff in the first week of disease. Uhlenhuth gives approximately the same figures as regards the abdominal form of paratyphoid B fever during the first week, while in gastro enteritis paratyphosa no specific agglutinins are formed during the first days of the disease. In about 33 per cent of the early cases the Widal reaction does not confirm the clinical diagnosis, partly because no agglutinins at all are formed and partly because agglutinins are formed for other organisms. Oster records the results of investigation of the Widal reaction at the Hygiene Institute of Heidelberg University since 1910. In 240 out of 444 cases of typhoid fever, or in 54.2 per cent, and in 18 out of 50 cases of paratyphoid B fever, or in 36 per cent, the Widal reaction confirmed the clinical diagnosis in the first week of the disease, whereas no clinical conclusion could be drawn from the condition of the reaction in 28 cases of gastro enteritis paratyphosa at this early stage. These results are in approximate agreement with those of previous observers.

591 The Active Principle of Chaulmoogra Oil

L. F. HIRST (*Ceylon Journ of Science*, Section D, November 2nd, 1925, p 107) refers to the contradictory views as to the value of chaulmoogra oil in the treatment of leprosy, investigators in India and the Philippine Islands reporting favourably, whereas others in South Africa and Ceylon have been disappointed. Hirst thinks that the failures may be due to the therapeutically inactive oils used having lost their active principle, which is possibly a photosynthetic product of "high energy chemistry" due to solar irradiation. Baly (see *Journ Med*, November 21st 1925, p 961) suggested that vitamins were not specific chemical substances, but compounds in a state of high energy content and Hirst considers that the antileprotic powers of active hydnoceps oils are due to their retention of such a vitamin factor. He mentions that irradiated olive oil requires antirachitic powers (see also *Epitome* 1924 vol 11 para 505), and hopes that his hypothesis may be submitted to experimental trial.

 GORDON

TRAVELLING ARRANGEMENTS

To members intending to be present at the Bath Annual
 Meeting the railway companies have agreed to issue return
 tickets at the cost of a single fare and a third. The con-
 cession applies to all railway companies in Great Britain
 (but not in Ireland), and the tickets will be available from
 July 15th to July 27th. They will be issued only upon
 production of a special voucher signed by the Financial
 Secretary of the British Medical Association, Tristram
 Squire, W.C.1, to whom application should be made

For the convenience of members residing within a radius of
 fifty miles of Bath the railway companies have undertaken to
 issue from Bath on presentation at the booking office of the
 Official Member's Card

1 Return tickets available for the day of issue or following
 day or from Sunday to Monday at a single fare and a third—
 minimum 1s per passenger fractions of 3d reckoned as 3d

2 Season tickets for not less than six days allowing for more
 than one journey per day (Sunday being a *die non*) at a charge
 not less than the accumulated fares per day (see Clause 1)
 minimum 1s per day fractions of 3d reckoned as 3d on each
 day free

The Official Member's Card will be obtainable in the
 Reception Room at the Banqueting Hall, Guildhall

Members should use the railway ticket they obtain in
 exchange for the voucher for the first journey to and the
 last journey from Bath. For all intermediate journeys the
 reduced tickets can be obtained by exhibiting the Member's
 Card to the booking clerk at Bath

HOTEL ACCOMMODATION

A considerable amount of hotel accommodation is avail-
 able in Bath. The terms are indicated in the table printed
 below. It should be noted that the bookings at the Grand
 Pump Room Hotel and the Empire Hotel for the period of
 the Annual Meeting are now complete and no further rooms
 in either of these hotels can be obtained. Members
 desiring accommodation should write immediately to Dr.
 R. G. Gordon, British Medical Association Committee Rooms,
 Assembly Rooms Bath

Harris's Hotel	8/6
Weston Hotel	10/6
Lamphey Stoke Hydro (several miles out of Bath)	

There are also several boarding houses and private rooms the
 terms for which may be had on application

THE PATHOLOGICAL MUSEUM

The committee responsible for the organization of the Pathological Museum is anxious to secure the co-operation of the officers of the various scientific Sections at the forthcoming Annual Meeting in Bath of the British Medical Association. The committee will be glad to take charge of, and place in the museum for exhibition, any specimens, casts, photographs, diagrams, or microscopic slides during the time they are not required by those who are reading papers or taking part in the discussions. Every care will be taken of specimens, and the contents of the museum will be insured.

THE ANNUAL EXHIBITION

In connexion with the Annual Meeting at Bath, the exhibition of surgical instruments, appliances, x-ray apparatus, drugs, books, foods, etc., will be held in the Market Hall from Tuesday, July 21st, to Friday, July 24th, inclusive.

ANNUAL DINNER

The Annual Dinner of the Association will be held at the Assembly Rooms, Bath, on Thursday, July 23rd, at 7 p.m. Full evening dress will be worn, with decorations. The accommodation is limited to 400, including ladies. The price of the dinner ticket is 12s 6d, exclusive of wine, and 41s with wine. Those intending to be present are requested to address their applications to Mr. A. de V. Blithin, 1st, 6, Broad Street, Bath.

GOLF COMPETITIONS AT THE ANNUAL MEETING

THREE CUPS FOR COMPETITION

The British Medical Association holds each year a golf competition wherever the Association happens to be holding its Annual Meeting. In the past members have only had the privilege of playing for two cups—namely, the Ulster Cup, presented to the Association by the Ulster Branch, and first played for during the Annual Meeting at Belfast in 1809, and the Childs Cup, presented by Mr. C. P. Childs at the Annual Meeting at Portsmouth in 1923.

There is now, however, a third cup, called the Treasurer's Cup. Mr. N. Bishop Truman, the Treasurer of the Association, generously presented this to the Council for competition at the December (1924) meeting of the Council.

It will be remembered that the Secretaries' Conference at Bradford approved a proposal for a golf competition to be played during the year throughout the Divisions and Branches of the British Medical Association in England, Ireland, Scotland, and Wales. Below will be found the rules drawn up by the committee appointed at the Conference which govern the competition this year. The cup will, of course, only be held for one year. It must be understood that the rules are for this year only and will be reconsidered in the light of the experience of this year's competition. The competition is in three stages: (1) a knock-out competition in the Divisions (the winners' names were given in the SUPPLEMENT of May 16th), (2) a knock-out competition in the Branches (due to be completed by June 1st) and (3) the final stage, to be played off on Friday, July 24th during the Annual Meeting of the Association at Bath.

RULES AND REGULATIONS FOR PLAY

The Ulster and Childs Cups

Both cups will be played for during the same round. The Ulster Cup is open to all members of the Association, the maximum handicap allowed being 18, the Childs Cup is open to all members of the Association who have a handicap of 10 or over, 18 being the maximum again allowed. Play in both cases is against bogey. If the Ulster Cup is won by any competitor with a handicap of 10 or over the Childs Cup will be presented to the player (with a handicap of 10 or over) with the next lowest score.

Conditions of play are as follows:

1. One round of 18 holes to be played on Thursday, July 23rd, by kind invitation of the Bath Golf Club at their course.
2. Competitors are not permitted to put in previous play on the course on the day of the competition.
3. Intending competitors are required to furnish with their entry a certificate signed by their club secretary stating (a) their handicap, (b) the bogey score of their own course and (c) the length of their own course.

4. Entries to be made at the Reception Room before 6 p.m. on Wednesday, July 22nd.

5. Competitors may choose their own partners, although partners will be arranged for by the committee on notice being given at the time of entry.

6. Play to commence at 9.30 a.m., no cards to be issued after 3.30 p.m.

Treasurer's Cup

To be played in three stages. Entrance fee 2s 6d. Open to all members of the British Medical Association.

First Stage—Entries to be handed in to the Secretary of the local Division by November 15th. Arrangements for the eliminating rounds to be in the hands of a special Golf Subcommittee or, failing this, the Executive of the Division. Competition to be a knock-out competition under handicap rules, members' club handicap to be accepted. Once a handicap has been settled by the Division Executive or Golf Subcommittee no alteration can subsequently be made. Draw to be arranged by the Golf Subcommittee first round to take place by January 1st. Matches to be played upon ground mutually agreed upon by the players. Failing agreement the matter to be referred to the Golf Subcommittee for decision. Subsequent eliminating rounds to be arranged so that first stage will be completed by March 15th.

Second Stage—Division winners in the area of the Branch to engage in knock-out competition. This stage to be completed by June 1st. Committee in charge—the Branch Council or special Golf Subcommittee appointed, arrangements as in first stage. For the purposes of this competition the Metropolitan Counties Branch Inner and Outer Groups will count as separate Branches.

Note—In some Divisions or Branches it may be convenient to play one or more of the rounds on one day—making a "field day" for golfing members of the Division or Branch.

Third Stage—The successful forty-four competitors will play off under medal play conditions (handicap) on the Friday (July 24th) during the Annual Meeting of the Association at Bath. Winner to be the one who returns the lowest score under handicap. Arrangements for this stage to be made by the Central Committee appointed by the Secretaries' Conference.

All disputes to be settled by the Committee responsible for completion of each stage. Dates must be strictly adhered to. No extension of time can be given.

LADIES' SPORTS

Those responsible for the arrangements for the comfort and convenience of members and the ladies accompanying them are anxious to have information which will enable them to satisfy everybody. Ladies accompanying members and lady members of the Association are to be made honorary members of the local golf and tennis clubs, and it will greatly assist in the arranging of matches and competitions if intending players will send their names in advance to Mrs. Doveton, 16, Queen Square, Bath, who is Chairman of the Ladies' Sports Subcommittee.

ACADEMIC DRESS

Academic dress will be worn in connexion with several functions during the meeting. Messrs. Edie and Ravenscroft, the official robe makers for the Association, have a large selection for hire. The prices for the week are shown below. Communications should be addressed to Messrs. Edie and Ravenscroft, 83 and 84, Chancery Lane, London, W.C.2.

M.D.	15s 6d	own hood and cap
M.B.	10s 6d	own hood and cap
F.R.C.S.	12s 6d	own and cap
M.R.C.S.	10s 6d	own and cap

Plus 1s carriage for each set

GARAGE ACCOMMODATION

Members requiring garage accommodation for the whole or part of the period of the meeting are requested to make early application to Mr. C. Terry, F.R.C.S., 15, The Circus, Bath.

NOTICES OF MOTION BY DIVISIONS FOR THE ANNUAL REPRESENTATIVE MEETING, BATH, 1925

Hospital Policy of Association
 By WEST BROMWICH That (with reference to the second recommendation contained in para 168 of the Annual Report of Council) the suggested new paragraph for insertion in the Association's Hospital Policy be amended to read as follows

Contributions to hospitals by employers of labour or massed or periodic contributions by employees or contributions by Approved Societies should be considered as contributions for service rendered or to be rendered only when such contributions are calculated on the number of cases treated

Coroners Law and Death Certification
 By WEST SUFFOLK That (with reference to the Recommendation contained in para 101 of the Annual Report of Council) para 8 (2) "Certificates of Stillbirths" of Appendix III be amended by the insertion, in the fifth line, after the word "that," of the words "I was informed that," it being stated in a footnote to the certificate that these words should be erased except in cases where the practitioner was not in attendance at the stillbirth

By NORTH EAST ESSEX (1) That (with reference to the Recommendation contained in para 101 of the Annual Report of Council) para 26 of Appendix III be deleted, and (2) that the following provisions be inserted in that Appendix

(a) That the usual medical attendant of the deceased should be called to give evidence at a request and (b) that in case of an inquest being held the coroner shall give the medical practitioner called at least twenty-four hours' notice

Locumtenents Bureau in Teaching Centres
 By NORTH EAST ESSEX That the Recommendations contained in para 46 of the Annual Report of Council be referred back for further consideration

Payment for Health Certificates for Elementary School Children

By NORTH EAST ESSEX That the Recommendation contained in para 119 of the Annual Report of Council be rejected and that Min 156 of the Annual Representative Meeting, 1920 (quoted therein), be amended by the substitution of "should" for "shall" in the last line

Salaries for Combined Public Health Posts
 By NORTH EAST ESSEX That inasmuch as the Recommendation contained in para 166 of the Annual Report of Council does not cover the case of combined appointments in Essex, this recommendation be referred back for further consideration

British Medical Association.

CURRENT NOTES

Workmen's Compensation Act and Assistants in General Practice

THE Medical Secretary occasionally receives inquiries as to whether those practitioners who employ assistants ought to insure themselves against claims under the Workmen's Compensation Act. The question is one depending entirely upon salary. The 1906 Act did not include persons employed otherwise than by manual labour whose remuneration exceeded £250 per annum, and as the salary of assistants was often considerably above this figure the question did not arise. In 1923 the income limit was raised to £350, and doctors who are employing assistants whose total remuneration does not exceed this sum would be well advised to protect themselves by insurance against possible claims under the Act.

Supplementary Report of Council Correction
 In the Supplementary Report of Council, which appeared in the SUPPLEMENT of June 27th, an error was made in a date under the heading "Naval and Military." The date of the meeting at the War Office between the Secretary of State for War and a deputation from the British Medical Association should have been June 30th, not July 30th.

Association Notices.

NOTICE OF ANNUAL GENERAL MEETING

NOTICE IS HEREBY GIVEN that the Annual General Meeting of the Association will be held in the Concert Hall, Grand Pump Room, Bath, on Tuesday July 21st, 1925, at 2 p.m. Business: (1) Minutes of last Meeting (2) Appointment of Auditors (3) Report of Election of President for 1925-26

ALFRED COX,
 Medical Secretary
 L. FERIS SCOTT,
 Financial Secretary and
 Business Manager

NOTICE OF EXTRAORDINARY GENERAL MEETINGS

NOTICE IS HEREBY GIVEN by Order of the Council that an Extraordinary General Meeting of the British Medical Association will be held in the Concert Hall, Grand Pump Room Bath, in the County of Somerset on Friday, the 17th day of July 1925, at 4.45 o'clock in the afternoon when the following Resolution will be proposed as an Extraordinary Resolution, namely

That the Articles of Association of the British Medical Association be altered in manner following—namely
 (a) By inserting immediately after Article 36 the following new Article—namely

Affiliation
 (1) The Association may admit to affiliation with it any Medical Association or similar body established outside the United Kingdom on such terms and with such privileges as may in each case be approved by resolution of the Representative Body passed after consideration of a report by the Council

(2) The Association may terminate any such affiliation (after due notice on either side) by resolution of the Representative Body, passed after consideration of a like report

(3) Any resolution of the Representative Body under this article shall be final and shall not require to be approved under Article 34

(6) By inserting in Article 34 immediately after the word Body in line 7 the words

'except as otherwise expressed in the Regulations'

Should the above Resolution be passed by the requisite majority it will be submitted for confirmation as a Special Resolution to a further Extraordinary General Meeting, and such meeting will be held at the British Medical Association House, Tavistock Square, London, W.C.1, on Tuesday the 4th day of August 1925 at 2.30 o'clock in the afternoon for the purpose of considering and, if thought fit, confirming such Resolution as a Special Resolution accordingly

Dated this 22nd day of June, 1925

By Order of the Council

ALFRED COX,
Medical Secretary

L. FERRIS SCOTT
Financial Secretary and
Business Manager

British Medical Association House,
Tavistock Square, London, W.C.1

NORFOLK BRANCH—The annual meeting of the Norfolk Branch will be held at the Norfolk and Norwich Hospital on Wednesday July 8th, at 3.15 p.m. Agenda: Annual report of Branch Council and financial statement; induction of new President, Mr Cecil Jeffery Muriel; election of President Elect and two Vice Presidents; address by His Honour Judge Herbert Smith, LL.D., County Court Judge for Norfolk on the law and procedure under the Workmen's Compensation Act. At 4.30 p.m. tea in the hospital grounds by invitation of Mr and Miss Muriel.

NORTH OF ENGLAND BRANCH GATESHEAD DIVISION—A special meeting of the members of the Gateshead Division will be held at 9 Walker Terrace, Gateshead, on Monday, July 6th, at 9 p.m. In view of the importance of the business of this meeting, it is hoped that members will make a special effort to be present. Agenda: To consider (a) suggested agreement with miners' lodges to undertake responsibility of collecting contributions of an employed miner; (b) memorandum with reference to co-operation between the State medical officer and the general practitioner; (c) Supplementary Report of Council (British Medical Journal Supplement June 27th 1925), and to instruct Representative thereon; (d) various motions for Annual Representative Meeting published in the Supplement since the Annual Meeting, and to instruct Representative thereon, to receive resignation of honorary secretary and treasurer and elect their successors.

NORTH WALES BRANCH—The annual meeting of the North Wales Branch will be held at Carnarvon on Friday, July 10th. The President will deliver an address.

OXFORD AND READING BRANCH—The annual meeting of the Oxford and Reading Branch will be held at the Radcliffe Infirmary, Oxford, on Friday, July 10th, at 3 p.m. Agenda: Election of officers; paper by Mr J. E. H. Roberts, O.B.E., F.R.C.S., Modern chest surgery. In the morning the Collier golf cup will be played for at Linford Heath against bogey. Competitors take three quarters of their best handicap. Transport from Oxford Station can be arranged on application to the honorary secretary, Dr William Stobie.

SUFFOLK BRANCH WEST SUFFOLK DIVISION—A combined clinical and social meeting of the West Suffolk Division will take place on Thursday August 6th, when Dr Wood has very kindly offered to entertain the Division once more at Woolpit. Tea in his garden will follow a clinical meeting at the Institute.

Meetings of Branches and Divisions.

METROPOLITAN COUNTIES BRANCH

Annual Meeting

The seventy-third annual general meeting of the Metropolitan Counties Branch was held at the British Medical Association House, Tavistock Square, on June 23rd, when the Past President (Dr SANDERS) occupied the chair in the absence of the President (Dr Charles Buttar).

The following officers were declared elected for the ensuing session 1925-26:

President—Mr Comyns Berkeley. President Elect—Dr F. W. Good.
Dr C. J. B. Buchanan and Dr Percy B. Spurgeon.
Harold S. Beadles, Honorary Secretaries.
and Dr C. F. T. Scott.

The annual report and financial statement for the year 1924-25 were adopted together with the report of the four Representatives of the Branch on the Central Council. A vote of thanks to the Representatives was passed with acclamation.

Mr E. B. TURNER, in moving a hearty vote of thanks to Dr Buttar for his services as President of the Branch, drew attention to the enormous amount of work which he had done for the Association in the past, both as a member of the Central Council and in connexion with the Central Medical Welfare Committee. The motion was supported by Mr HERBERT TANNER and Mr BISHOP HARMAN and carried unanimously. On the motion of Dr GOODSON, seconded by Dr PATERSON, a hearty vote of thanks was recorded to Dr Ernest A. Worley, the retiring honorary secretary of the Branch for his services during the past four years. Dr GOODSON drew attention to Dr Worley's work in resuscitating certain Divisions of the Branch and his untiring efforts as Honorary Secretary of the City Division.

The CHAIRMAN, on behalf of the retiring President, inducted Mr Comyns Berkeley into the Presidential Chair and Mr Comyns Berkeley then delivered his presidential address entitled 'Save the women and children'. A vote of thanks to the President for his able and interesting address proposed by Mr McADAM ECCLES, and seconded by Dr BRACEGIRDLE, was carried with cordiality.

that if the Association honoured Edinburgh in 1927 the meeting would be as great a success as the previous ones. Another reason why it should be held there in 1927 was that that year would be the centenary of Lister's birth. Lord Lister read a paper at the meeting in 1875 on 'The effect of the antiseptic treatment upon the general salubrity of surgical hospitals'.¹ It was even then in his mind that something could be done to make things better. For some years Lister studied and worked in Edinburgh. In 1860 he went to Glasgow as professor of surgery where he remained for nine years, coming back to Edinburgh in 1869. In 1865 he for the first time began to think of carbolic as antiseptic, and it was in that year that Pasteur entered into his life. From 1865 onwards he developed the theory which was gradually to evolve into the aseptic methods of today. The work was begun in Glasgow and came to fruition in Edinburgh. This was surely a strong reason why at the centenary of his birth the Association meeting should be held in their academic town. Sir David Wallace then moved the following resolution:

That this meeting of the medical profession resident within the area of the Edinburgh Branch approves the proposal that the British Medical Association should hold its Annual Meeting in Edinburgh in 1927.

Professor LORRAIN SMITH, in seconding the motion, said that the Faculty of Medicine of the University took the view that the resources of all the medical organizations in Edinburgh must be pooled to make this meeting as brilliant a success as those of 1875 and 1898. So far as the Faculty of Medicine was concerned, whatever resources the University had would be placed at the disposal of the meeting. 'Though the Association has many other interests besides looking after the scientific and clinical side, it certainly is our most important post-graduate school.' Professor Lorrain Smith added the interesting point that it was after the 1875 meeting that Edinburgh led the way in founding a school of public health.

Professor G. LOVELL GULLAND (President of the Royal College of Physicians of Edinburgh) said that the idea had the support of the Council and the Fellows of the College, who all heartily concurred in the proposal that the Annual Meeting of the British Medical Association should be held in Edinburgh in 1927, and promised to do their best to make it a success. The College had always, he said, been very much in sympathy with the British Medical Association, and recognized to the full its capacity for good for the medical profession.

Mr. MILES (Secretary of the Royal College of Surgeons of Edinburgh) said he was present to offer the apology of his President (Sir Harold Stiles) for his absence. The Royal College of Surgeons was in accord with everything that had already been said. It supported the proposal very cordially, and, as on previous occasions, would do everything in its power to make the meeting a success.

The motion met with the whole-hearted approval of the meeting and was carried with acclamation.

Professor ROBERTSON explained that there were certain other preliminary steps to be taken, two of which required to be undertaken that day—nomination of the President Elect and appointment of a General Committee. It was probably known to all that the choice of President Elect had fallen upon Sir Robert Philip. The President, continued Professor Robertson, must possess many qualifications: he must be prepared to face a very large amount of committee work among other things, and no one could do this work better than Sir Robert Philip. The President must also be one of the recognized leaders of the medical profession, and no one in Edinburgh was better known or more highly respected than Sir Robert Philip. His election to the Presidentship of the Royal College of Physicians for five years in succession marked him out as a man in a thousand for such a post. Moreover, Sir Robert had already done a very great deal of work for the British Medical Association. He acted as Secretary for the 1st Annual Meeting in Edinburgh (1893), thereby contributing greatly to its success. His fine organizing powers, his exceptional tact, and his driving force would be exceedingly useful to the meeting in 1927. The meeting having expressed its unanimous approval of the appointment, Professor Robertson called upon Dr. Mann of Sellart, an old and respected member of the medical profession, who proposed the following motion:

That the members of the medical profession present at this meeting shall constitute along with the members of the Council of the Edinburgh Branch of the British Medical Association a General Committee with power to add to its numbers for the purpose of giving effect to the above resolution.

It would be a very large committee, and would probably have to be subdivided. He trusted the 1927 meeting would mark an epoch in the records of the British Medical Association. Dr. Mann seconded the motion, which was adopted.

National Insurance

MEDICAL BENEFIT AND THE PENSIONS BILL

WE publish below the correspondence that has recently passed between the Medical Secretary of the British Medical Association and Sir Arthur Robinson, K.C.B., Secretary of the Ministry of Health, on the subject of the new Pensions Bill in relation to medical benefit under the national health insurance scheme.

It seems almost certain that the practical incorporation of the present definition of insured persons in an additional Act of Parliament must, in fact, make any alteration more difficult, but it is satisfactory to have the assurance that the Minister of Health does not bind himself to this definition, and that the Government will consider its modification if so recommended by the Royal Commission. It is well, also, to have secured an authoritative statement that Section 12 (3) of the National Health Insurance Act is regarded as applying to all voluntary contributors under the new Pensions Bill, for this is by no means clear from Clauses 13 (1) and (3), 14 (5), and 15 (5) (a) of that bill. If there is any possible doubt about this under the wording of these clauses it should be safeguarded. Even so, the fact remains that certain classes of persons, many of them of a fairly well-to-do type, may be readmitted to insurance, and if readmitted will be required to insure for medical benefit also. How many such persons will avail themselves of this privilege is, of course, uncertain. It depends on how far they appreciate the principles of insurance, for there can be no doubt that what they will obtain is worth, actuarially, considerably more than they will have to pay. It still seems simpler to admit these persons to insurance for pensions purposes only.

British Medical Association House

Tavistock Square, W.C.1

June 22nd, 1925

Sir,

In amplification of the representations made to the Minister of Health at our interview with him on June 18th I am directed to send the following note:

It will be remembered that the Insurance Acts Committee, at its interview with the Minister on June 18th, referred to one point in which the new Pensions Bill appears to affect somewhat seriously the conditions of the national health insurance medical benefit. The Committee thinks it may be well to set out specifically the points which it thinks should receive consideration with a view to amendment of the Bill.

It is probably generally accepted that there are a number of persons compulsorily included in the national health insurance scheme who are economically capable of providing medical advice and treatment for themselves without the aid of such schemes, and many others who are excluded from the scheme who have great difficulty in providing, or find it economically impossible to provide, for themselves without some such aid. The difficulty is to draw for administrative and practical purposes a satisfactory line of inclusion and exclusion. This is one of the important problems which a Royal Commission has been set up to consider, and the Council of the British Medical Association has given evidence before that Commission both as to the impropriety in some respects of the present definition of insured persons, and as to the possible methods of adjustment. It seems unfortunate that in these circumstances the new Pensions Bill should, by stereotyping this definition, make it much more difficult to secure any alteration thereof even if such alteration is accepted as desirable.

In any case, whether or no the Bill is easy to amend in this respect, it should be easy to amend it so as to prevent further complications in regard to insured persons. The Bill permits any person, other than a married woman, who has at any time hitherto been an insured person consecutively for a period of two years, to come within the benefits of the pension scheme, and compels such of those persons who elect to do this to become insured persons for medical benefit purposes also. The Insurance Acts Committee and the Council of the Association express no opinion as to the desirability of such persons being admitted to the advantages of pensions insurance, but they have hitherto not been admitted to the scheme of medical benefit, and almost without exception belong to the class which is able to provide medical advice and treatment for themselves, and who would wish to do so. It is therefore submitted that the provision requiring these persons to be insured also for health purposes is undesirable, and this submission is made with the greatest confidence in that it is clear that even as

Experience in the outpatient department of a large general hospital had revealed the undoubted fact that a considerable number of patients included in the insurance scheme required specialist treatment. In these days of well defined specialism such patients secured at the hospital the best advice obtainable and in large towns a workable scheme of close co-operation with voluntary hospitals to cover these cases should be well within the bounds of possibility, in scattered districts the deficiency could be met by establishing specialist clinics at convenient centres. The absence of any organized provision for general institutional treatment was a serious impediment to the carrying out of an insurance scheme to its logical conclusion. Here again full use should be made of the advantages which the voluntary

... it rained in very real doses. If we
... to be a good story of his training, are we
... to make a more general practitioner at all?

The purpose of the present project was to make a study of the method of the optical system which appears to be the most effective in producing the desired effect. The project was carried out in the form of a series of experiments. The first experiment was to determine the effect of the optical system on the human eye. The second experiment was to determine the effect of the optical system on the human ear. The third experiment was to determine the effect of the optical system on the human nose. The fourth experiment was to determine the effect of the optical system on the human mouth. The fifth experiment was to determine the effect of the optical system on the human skin. The sixth experiment was to determine the effect of the optical system on the human hair. The seventh experiment was to determine the effect of the optical system on the human nails. The eighth experiment was to determine the effect of the optical system on the human teeth. The ninth experiment was to determine the effect of the optical system on the human bones. The tenth experiment was to determine the effect of the optical system on the human muscles. The eleventh experiment was to determine the effect of the optical system on the human nerves. The twelfth experiment was to determine the effect of the optical system on the human blood. The thirteenth experiment was to determine the effect of the optical system on the human lymph. The fourteenth experiment was to determine the effect of the optical system on the human sweat. The fifteenth experiment was to determine the effect of the optical system on the human tears. The sixteenth experiment was to determine the effect of the optical system on the human saliva. The seventeenth experiment was to determine the effect of the optical system on the human urine. The eighteenth experiment was to determine the effect of the optical system on the human feces. The nineteenth experiment was to determine the effect of the optical system on the human excretion. The twentieth experiment was to determine the effect of the optical system on the human reproduction.

BRITISH DENTAL ASSOCIATION

Evidence was tendered on behalf of the British Dental Association by Mr John H Brodcock (president), Mr E Y Richardson, and Mr Bryan Wood. It was stated that up to the passing of the Dentists Act, 1921, the association represented roughly three fifths of the practising members of the profession, it had not so far admitted to its membership the 1921 dentists."

The association was in favour of a substantial extension of dental treatment under the insurance scheme and considered that the Public Dental Service Association might form a suitable framework for the establishment of a dental service as a normal benefit. This association was formed as a combination of the panels of dentists who undertook to treat insured persons for whom dental treatment was provided as an additional benefit by approved societies, and it now numbered nearly 7,000 members of the dental profession. The dental treatment at present given as an additional benefit was unsatisfactory in its limited application its varying scope and its administrative arrangements, whereby some of the poorest of the insured population were often deprived of a benefit to which they were justly entitled owing to the fact that some of the societies paid as little as 25 per cent of the total cost.

The complete service which the British Dental Association proposed would include (1) dental treatment at maternity and child welfare clinics (2) treatment during school age, and (3) treatment for adults (and for dependants if dependants were brought in for medical benefit) under an insurance scheme. It was very important that dental benefit for insured persons should be made available upon entrance into insurance in order that the valuable work already done by the school dental clinics should not be lost. Dental benefit should be a permanent benefit, coextensive with medical benefit, with free choice of dentist administration by the body which administered medical benefit and adequate dental representation on the Insurance Committees and other bodies controlling administration. Dental panel committees and dental service subcommittees should be established, and regional dental officers should be appointed to act for groups of Insurance Committees.

With regard to the investigation of complaints Mr Richardson claimed that purely professional matters should be examined by a professional committee reporting to the dental service subcommittee, which would have to decide what was to be done. In reply to Mr Jones who asked if they thought it reasonable that the dental profession should ask for something that the medical profession had not got, Mr Wood said he did not think it was. He thought it was suggesting something that did exist in the case of medical benefit.

The scope and nature of the suggested treatment would be the extraction of teeth under local or general anaesthetics, the scaling of teeth and the treatment of inflammatory conditions of the mouth, the filling of cavities in serious teeth, and the provision and repair of partial and complete artificial dentures. Adult dental treatment for some considerable time must consist largely of the extraction of septic teeth and roots and their replacement in due course by artificial substitutes. In view, however, of the large demands which would be made under any system of permanent benefit until the effects of an extended system of school dental treatment were felt it was recognized that the cost of a complete scheme under present conditions might be prohibitive and should conditions of expense make such a scheme impossible of adoption in its entirety it might be modified so that dental treatment included (1) operative treatment only (2) operative treatment and such dentures as might be certified by the competent authority as necessary for health or vocational reasons and (3) operative treatment with part payment for dentures. Miss Tuckwell a member of the Commission thought it an impossible proposition that dentures should be left out, and she wished the witnesses had been courageous enough to recommend the entire scheme irrespective of expense. The witnesses replied that so much had been heard about economy in various departments that they had hesitated to put forward a costly scheme but on grounds of national well-being they certainly advocated the scheme in its entirety. In any case the necessitous person ought to be supplied with dentures when he required them from the point of view of health.

The witnesses were convinced that a sufficient number of dentists would be available to work the scheme. Some discussion arose on the question of the status of the 1921 dentists and Miss Tuckwell wanted to know if these people who were on the *Dentists Register* were all of them good enough from the point of view of the witnesses to treat anybody. Mr Richardson replied that that was an extremely difficult question to answer, and of course, the witnesses did not like to cast any slur.

The panel system was preferred to the clinic system although a panel system did not exclude clinics in certain localities and if the clinics were properly run with free choice of dentist and professional control preferably with part time officers paid on a fee per session basis there would be no objection to them. But in general the panel system was preferable. A capitation fee did not appear to be practicable simply on account of the scarcity of data for establishing such a fee at present. A careful analysis of a full treatment and two thirds of that amount on the present basis would be required for the provision of dentures. This latter cost would drop and the operative cost rise as the insured population became educated to the value of operative treatment and treatment in the remote future when all arrears were worked off would be possible.

The witnesses were against a State whole time salaried dental service which they said would be objected to by the dental profession on the ground that it interfered or would be likely to interfere, with the responsibility of the dentist to his patient.

THE ROYAL COMMISSION

Session in Scotland

The thirty third meeting of the Royal Commission on National Health Insurance was held in Edinburgh on June 23rd, Professor Alexander Gray in the chair.

Evidence on the question of the supply of medicines and drugs in Scotland under the insurance scheme was given by Mr Rutherford Hill on behalf of the General Council of Panel Chemists of Scotland. The National Farmers Union of Scotland, represented by Mr J C Henderson, submitted evidence as to the position of agricultural societies in the scheme and the need for reducing the rate of contribution for agricultural workers in view of their higher standard of health. Dr Asher of Thurso gave evidence on various aspects of the medical service under the Act in rural areas.

The thirty fourth meeting was held at the Home Office Whitehall, on June 25th, Lord Lawrence of Kingsgate in the chair. Evidence was submitted on behalf of the Queen Victoria's Jubilee Institute for Nurses by Miss Peterkin, Mr Bruce Richmond, and Major H F Cadell, the College of Nursing by Miss Watt, Miss Viney, and Miss Bremner, the Incorporated Midwives Institute by Miss Doubleday and Miss Gilhgan, and the Scottish Midwives Association by Miss Barker. Thereafter Mr J L Cohen of the Department of Economics, Cambridge University gave evidence on the structure of the insurance scheme and the need for fundamental alterations in certain directions.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE

Surgeon Lieutenant Commander J F Hayes to the *Argus*. Messrs W G F Murray and J G Maguire have entered as Surgeon Lieutenants and appointed to R N Hospital Haslar for course.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenant T W Drummond to R N Hospital Haslar for fourteen days training. Probationary Surgeon Lieutenants R H Tincker to the *Truro* and A T G Thomas to the *Champion* for twenty eight days training.

ROYAL ARMY MEDICAL CORPS

Captain J A Cowan retire receiving a gratuity.

ROYAL AIR FORCE MEDICAL SERVICE

Flight Lieutenants J A Perdrau to No 39 Squadron Spitigate. J S Wilson to R A F Depot on transfer to Home Establishment. Flying Officers P D Barling, to R A F Depot H W D Mackenzie to Central Flying School Upavoo. B Pollard to No 5 Flying Training School Seaforth. R F G Dickson to No 24 Squadron Kenley.

INDIAN MEDICAL SERVICE

Lieut Colonel W R Batten DSO is granted leave on average pay for six months with effect from May 7th.

Lieut Colonel J R J Tyrrell is posted as Administrative Medical Officer in Central India and Residency Surgeon Indore with effect from May 7th.

The services of Major H L Batra MC are placed permanently at the disposal of the Government of Assam.

The services of Major E E Doyle DSO are placed permanently at the disposal of the Government of Bombay for employment in the Jail Department.

Lieutenant G H Fitzgerald to be Captain. The following officers have retired: Lieut Colonel E C C Macosell. F D S Fayrer and A Leventoo CIE.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Major D M C Church (IMS ret) to be Major. Captain R F Linton re-igns his commission and retains the rank of Captain.

Captain G S Lewis (late R A M C SR) to be Captain with precedence as from December 5th 1919.

Colonel G W Robinson

Colonel (Brevet Colonel) D J Graham OBE for tenure of command and retain his rank. Supernumerary for service with the OTC—Captain P B Green (late R A M C SR) to be Captain with precedence as from April 18th 1919 for service with the medical unit Durham University OTC. Jam Whillis to be Lieutenant for service with the medical unit Durham University OTC.

COLONIAL MEDICAL SERVICES

Dr C I Kibble appointed Lady M O Malayan Medical Service. Dr G D A Waldron appointed M O Nigeria. Dr J Enn appointed M O Kenya. Dr J Laudi promoted M O H Sanitary Department. Dr E M Frazer and O G Wilde appointed M O Gold Coast.

CURRENT NOTES

ROYAL OPENING OF THE NEW HOUSE

THE arrangements for the opening on Monday next of the New House by the King, who will be accompanied by the Queen, are now complete. Their Majesties will be attended by the Right Hon. Neville Chamberlain, M.P., Minister of Health. The tickets of admission to the ceremony have now been sent out, and it is important to note that no person can be admitted to the premises without a ticket. Certain instructions have been issued with the tickets of admission, but it may be well to repeat here that at the afternoon ceremony morning dress, or morning dress with academic costume, will be worn without decorations. For the evening reception, evening dress is to be worn, with miniature decorations.

Members and guests who come in cars should note that motor cars will enter the private roadway from the north-east corner of Tavistock Square and proceed through the Memorial Gates, depositing guests according to the colour of their tickets. Cars then pass through the covered driveway into Burton Street, where they will be parked under the direction of the police. Similar arrangements will obtain on the evenings of both the 13th and 14th July. Under no condition can cars return through the Memorial Gates on the afternoon of the 13th before 4.30—that is to say, after the departure of Their Majesties.

Factory Medical Service

The British Medical Association has for some time been endeavouring to obtain an opportunity of discussing matters connected with the proposed Factories Bill with the Home Secretary, and on June 3rd the points which the Association desired to raise—namely, those which appeared in para. 127 of the Annual Report of Council (BRITISH MEDICAL JOURNAL SUPPLEMENT, April 11th)—were placed before him in a letter.

On July 2nd the Home Secretary received a joint deputation of the British Medical Association and the Society of Medical Officers of Health consisting of the following:

Representing the British Medical Association: Dr. R. Wallace Henry (Chairman of Parliamentary Subcommittee B.M.A.), Dr. H. B. Brackenbury (Chairman of Representative Body), Dr. R. A. Bolam, LL.D. (Chairman of Council), Dr. T. Ridley Bailey, Mr. E. B. Turner, F.R.C.S.

Representing the Society of Medical Officers of Health: Dr. R. A. Ivister (President), Dr. T. W. Naylor Barlow, O.B.E., Dr. C. W. Hull.

together with Dr. Cox, Medical Secretary, and Dr. Lord Assistant Medical Secretary, of the Association, and Mr. G. S. Elston, Executive Secretary of the Society.

The deputation was introduced by Dr. Wallace Henry, and the various points were dealt with chiefly by him and by Dr. H. B. Brackenbury and Dr. R. A. Ivister. The Home Secretary promised to give the points his careful consideration.

Association Prizes for Essays by Medical Students

The Council of the British Medical Association proposes to award in March, 1926, prizes of £10 each for the best essays by final-year medical students on the disabilities that may be directly due to simple fracture (excluding separation of an epiphysis)—(a) of the femur, (b) of the tibia, (c) of the fibula, (d) of the tibia and fibula (simultaneously injured), and the means to be adopted in the treatment of such cases in order to prevent or minimize these disabilities—namely, one prize in each of the following groups of medical schools:

Group 1—University of Aberdeen, University of St. Andrew (University College Dundee)

Group 2—Queen's University of Dublin (Trinity College), Ireland (University College Cork, Uni. Galway), Royal College of Surgeons in Ireland (Schools of Surgery).

Group 3—University of Birmingham, University of Bristol, University of Wales.

Group 4—University of Durham, University of Leeds, University of Sheffield.

Group 5—University of Edinburgh, School of Medicine of the Royal Colleges.

Group 6—University of Glasgow, Anderson College of Medicine, Queen Margaret College, School of Medicine for Women, St. Mungo's College.

Group 7—University of Liverpool, Victoria University of Manchester.

Group 8—London: Charing Cross Hospital Medical School, King's College Hospital Medical School.

Group 9—London: Guy's Hospital Medical School, London Hospital Medical College.

Group 10—London: London (Royal Free Hospital) School of Medicine for Women, University College Hospital Medical School.

Group 11—London: Middlesex Hospital Medical School, St. Mary's Hospital Medical School.

Group 12—London: St. Bartholomew's Hospital Medical College, St. George's Hospital Medical School.

Group 13—London: St. Thomas's Hospital Medical School, Westminster Hospital Medical School.

Group 14—Medical Schools in the British Empire outside the United Kingdom.

The prizes will be awarded to the authors of the essays deemed by the examiners to be the best sent in from the respective groups, but if no essay received from a group is considered deserving of a prize, no prize will be awarded in respect of that group. The essay which must not exceed 5,000 words should be clinical in nature, and must include concise notes of three cases personally observed by the student. Essays should be plainly written or typed on foolscap paper (one side only), and must reach the Medical Secretary, British Medical Association House, Tavistock Square, London, W.C.1, not later than January 16th, 1926.

Each essay must be signed by a pseudonym and be accompanied by a sealed envelope marked on the outside with the pseudonym and containing inside a signed and dated statement that the essay has been the bona fide work of the competitor, and that he or she has not yet passed the final professional examination, together with full name, address, and medical school. The essays received will be adjudicated on by examiners appointed by the Council from among

members of the Association not resident in the area of the particular group. The decision of the Council will be final. Notices in regard to the essays have been sent to the deans of the medical schools with a request for exhibition on the notice boards, as well as to those hospitals concerned with the education of medical students, and to the honorary secretaries of the Divisions and Branches of the Association in whose areas the respective schools are situated. A new feature of the competition on this occasion is the tentative formation of a group for the medical schools in the British Empire outside the United Kingdom.

TREASURER'S CUP GOLF COMPETITION

SECOND STAGE

The following are the winners of the second (or Branch) stage of the Treasurer's Cup golf competition

Bath and Bristol—Dr W V Wood M.C.
Birmingham Central—Dr H E Collier M.C.
Border Counties Branch—Dr F W Clark, M.C. (w.o.)
Cambs and Hunts—Dr W H Sturge
Dorset and West Hants—Dr C H Ackland (w.o.)
East York and North Lincoln—Dr A S Plant, M.C. (w.o.)
Edinburgh—Dr H R Dodson (w.o.)
Essex—Dr N F Norman
Glasgow and West of Scotland—Major E C Whitehead, R.A.M.C. (ret.)
Gloucestershire—Dr A Alcock
Kent—Dr G R Stilwell, O.B.E. (w.o.)
Lancashire and Cheshire—Mr Garnett Wright, F.R.C.S.
Metropolitan Counties
Inner Group—Dr G C Anderson,
Outer Group—Dr W McElroy
Midland—Dr J Mowat
Norfolk—Dr F P Bush (w.o.)
North Lancashire and South Westmorland—Dr L A Wilson (w.o.)
North of England—Dr J B T Keswick
North Wales—Dr C Robertson (w.o.)
Oxford and Reading—Dr W Stobie O.B.E. (w.o.)
Shropshire and Mid Wales—Dr G Laurence
South Wales and Monmouthshire—Dr J P J Jenkins
Staffordshire—Dr G E Dias M.C.
Suffolk—Dr H G Kulner (w.o.)
Surrey—Dr J A Lewis
Sussex—Dr F J Cutler (w.o.)
Ulster—Professor A Tullerton C.B. M.G.
Worcester and Hereford—Mr N Duggan, F.R.C.S. (w.o.)
(w.o.=walk over)

The final stage of the competition will be played on the Ludlow Golf Club Course at Brith on the afternoon of Friday, July 24th, commencing at 2 p.m.

Association Notices

PROPOSED CHANGE OF AREAS OF SOUTHERN AND SURREY BRANCHES

NOTICE is hereby given to all concerned of the following proposal made by the Surrey Branch

That the Urban District of Aldershot and the Civil Parish of Bramshott in the Rural District of Petersfield be transferred from the Winchester Division of the Southern Branch to the Guildford Division of the Surrey Branch

Written notice of the proposal has been given to the Southern Branch and the Winchester and Guildford Divisions, and the answer will be determined in due course by the Council. Any member affected by the proposed change and objecting there to is requested to send a statement of the fact, and of the reason therefor, to the Medical Secretary, British Medical Association House Tavistock Square, London, W.C.1, to reach him no later than August 11th, 1925.

TABLE OF DATES

July 17 Fri.	Annual Representative Meeting opens at Bath. Nominations for election of 12 members of Council by grouped representation must be received (at A.M. Bath) by this date.
July 18 Sat.	Annual Representative Meeting Bath.
July 19 Sun.	Council and Annual Representative Meeting Bath.
July 20 Tue.	Annual Representative Meeting and Annual General Meeting Bath. Pre-arranged Address.
July 21 Wed.	Conference of Secretaries. Conference of Honorary Secretaries. Bath.
July 22 Thu.	Meeting of Secretaries at Bath.
July 23 Fri.	Meeting of Secretaries at Bath.

ALFRED COX, Medical Secretary

BRANCH AND DIVISION MEETINGS TO BE HELD

BORDER COUNTIES BRANCH—The fifty-fourth annual general meeting of the Border Counties Branch will be held in the Cumberland Infirmary, Carlisle to-day (Friday, July 10th), at 3.45 p.m. Agenda: Branch Council report and financial statement; election of officers for 1925-26. Mr Norman Maclaren, T.D., F.P.C.S. Eng. will deliver his presidential address entitled 'The Cumberland Infirmary—past, present and future'. The Branch Council will meet at 3.15 p.m. Tea. The annual meeting of the English Division will follow.

CAPE OF GOOD HOPE (WESTERN) BRANCH—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday, August 28th, at 8 p.m. when there will be a symposium on the diagnosis of intracranial tumours arranged by Mr D. J. Wood. Among the speakers will be Dr J. D. M. Claassen, Mr F. T. Petersen, and Dr A. W. S. Sichel.

EAST YORK AND NORTH LINCOLN BRANCH—The sixty-ninth annual meeting of the East York and North Lincoln Branch will be held at the Grimsby and District Hospital, to-day (Friday, July 10th) at 3 p.m., when the President Elect, Dr W. Wallace, will be installed as President for the coming year. Business: Annual report and financial statement; election of officers. The President will deliver the inaugural address.

KENT BRANCH ISLE OF THANET DIVISION—The next meeting of the Isle of Thanet Division will be held on July 14th, at 3.45 p.m., at the Kent County Mental Hospital, Chatham Down. When Dr Hugh Raven will take the chair. A communication on the malarial treatment of general paralysis will be made by Mr M. A. Collins, the medical superintendent, and Dr G. T. Baker. A tour of the hospital with a demonstration of type of dementia praecox and other interesting cases, will follow.

NORTH WALES BRANCH—The annual meeting of the North Wales Branch will be held at Carnarvon, to-day (Friday, July 10th). The President will deliver an address.

OXFORD AND READING BRANCH—The annual meeting of the Oxford and Reading Branch will be held at the Radcliffe Infirmary, Oxford to-day (Friday, July 10th) at 3 p.m. Agenda: Election of officers; paper by Mr J. E. H. Roberts, O.B.E., F.R.C.S. Modern chest surgery. In the morning the Collier golf cup will be played for at Fildford Heath against hockey. Competitors take three quarters of their lowest handicap. Transport from Oxford Station can be arranged on application to the honorary secretary, Dr William Stobie.

SOUTH MIDLAND BRANCH BEDFORDSHIRE DIVISION—The annual meeting of the Bedfordshire Division will be held at the Swan Hotel, Bedford, on Wednesday, July 15th, at 3 p.m., when Dr G. F. Birks will preside. Business: Annual report, election of officers; nomination of president of South Midland Branch for 1926. Dr Farquhar Buzzard will give an address on some problems in prognosis. The chairman kindly invites members to lunch at the Swan Hotel, Bedford, at 1.15 p.m. Reply postcards should be sent to the honorary secretary not later than July 13th. An executive committee meeting will be held at 2.30 p.m.

SUFFOLK BRANCH WEST SUFFOLK DIVISION—A combined clinical and social meeting of the West Suffolk Division will take place on Thursday, August 6th, when Dr Wood has very kindly offered to entertain the Division once more at Woolpit. Tea in his garden will follow a clinical meeting at the Institute.

Meetings of Branches and Divisions.

KENT BRANCH

The twelfth annual meeting of the Kent Branch was held on June 11th at the Royal Naval Hospital, Chatham, by kind invitation of Surgeon Rear Admiral C. Marsh Beadnell, C.B., R.N., and Surgeon Captain R. J. MacKewen, O.B.E., R.N. The chair was taken by Colonel C. Pryor, C.M.G., M.D., President, who, when the result of the election of new officers had been declared, vacated it in favour of Dr A. W. G. Woodforde (Chatham). The usual votes of thanks having been accorded to retiring officers, and formal business completed, Dr Woodforde gave a valuable address on hypertrophy of the prostate gland, for which a very hearty vote of thanks was accorded to him.

The President then conveyed to Surgeon Rear Admiral Beadnell and Surgeon Captain MacKewen the thanks of the Branch for their hospitality for the annual meeting. This was carried with great acclamation and both officers responded. During the afternoon members were shown the x-ray biochemistry, massage and electric treatment and other departments, and also the system of electric cookery. They were also entertained to tea. Dr Woodforde entertained about sixty members and their wives to luncheon in most agreeable open air surroundings, and twenty-three members dined together at the Sun Hotel under his presidency. The Tennison Smith golf challenge cup was won this year by and presented to Dr Linton, M.O.H. Tunbridge Wells. The exertions and the hospitality of the 'service' members at Chatham largely contributed to making this a most successful meeting.

LANCASHIRE AND CHESHIRE BRANCH

Annual Meeting

THE eighty ninth annual meeting of the Lancashire and Cheshire Branch was held in the Music Room, Werneth Park, Oldham (kindly placed at its disposal by Dame Lees and Miss M. Lees), on June 18th. After an excellent luncheon, generously provided by the Oldham Division, Dr W. HIRST BATEMAN occupied the chair. The annual report and balance sheet were adopted. The annual report showed a steady increase of membership and of the activities of the Branch, especially with regard to the holding of successful scientific meetings in various centres throughout the Branch.

The Mayor of Oldham, Alderman FREN BROADBENT, J.P., gave a hearty civic welcome to the Branch. He said that if only the factory chimneys could be removed Oldham might become a health resort. He spoke of the great esteem in which the new president, Dr Thomas Fawcitt, was held by the whole people of Oldham. The honour of the Freedom of the Borough had been conferred on two citizens only, Dame Lees and Dr Fawcitt, both of whom had done great and valuable work in Oldham.

Dr Fawcitt, who is the doyen of the medical profession probably in the whole of Lancashire, gave a presidential address entitled "Conditions affecting health," basing his remarks on the progress of sanitation in Oldham, where he had spent the whole of his life. He began his apprenticeship in 1862, at which time the town had grown so rapidly that the sanitary conditions had not kept pace with the increase in the population. Infectious diseases were extremely prevalent and of a bad type, and the mortality was very high. In 1872 there were 505 deaths from scarlet fever out of a population of 84,000. Dr Fawcitt was a member of a committee of the medical profession which in that year approached the corporation and urged upon them the need for greater efforts to improve the sanitary conditions and thus diminish infectious disease. Prompt action was taken, and in 1873 the first M.O.H. was appointed. Continuous progress had taken place and the corporation of the town had always welcomed suggestions from the medical society. The death rate had fallen from 31 per mille in 1872 to 13.7 last year. Dr Fawcitt described the work that had been done in clearing away all cellar dwellings but he regretted that there was still overcrowding. He spoke on the low vitality among women and children and on the menace of the smoke nuisance. Conditions of work in the mills had greatly improved in consequence of the introduction of dust extractors and of shorter hours of labour, and deaths from phthisis was thus continually falling. The medical profession in Oldham had all along been imbued with public spirit and he knew that the British Medical Association had done a very great work in the progress of prevention of disease. His long experience had shown him that while it promoted preventive medicine and medical research it radiated the honour and interest of the profession and fostered a feeling of friendship amongst all its members.

On the motion of Dr W. HIRST BATEMAN, seconded by Professor MURRAY, a hearty vote of thanks was accorded to the President for his address.

Professor G. R. MURRAY (Manchester) and Dr J. C. MATTHEWS (Liverpool) were appointed Vice Presidents for the year. Dr A. C. STURROCK was re-elected Honorary Secretary, and Dr J. D. EWART and Dr S. COLLEY SALTER were re-elected Honorary Auditors. Votes of thanks were passed to Dame Lees and Miss M. Lees to the retiring officers of the Branch and to the Oldham Division for their kind hospitality. After the meeting the members separated some to golf on the course of the Saddleworth Golf Club and other parties to the works of Messrs Platt Bros. Ltd. and to the cotton mill of the Wye Mill Ltd. Shaw. An enjoyable tea party brought a very useful and successful annual meeting to a close.

National Insurance

THE ROYAL COMMISSION

THE thirty fifth meeting of the Royal Commission on National Health Insurance was held in Edinburgh on June 30th, 1925, Professor Alexander Gray in the chair.

Evidence as to the provision of dental treatment for insured persons was given by the East of Scotland Dentists' Panel, represented by Mr Ernest Miller and Mr William Arbuckle. Mr William Thomson, secretary of the Scottish Co-operative Friendly Society, gave evidence as to the desirability of extending the scope of medical benefit and providing dental and other treatment benefits for insured persons, and also as to various matters in connexion with the administration of benefits by approved societies. Mr John Reid, representing the Chartered accountants of Scotland, gave evidence as to the audit of accounts of approved societies, and urged that this work should be entrusted to chartered accountants in general practice rather than to a special Government audit department. Mr Matthew Reynard, clerk to the Association of Parish Councils of Scotland and clerk to the Glasgow Parish Council, gave evidence as to the relations between health insurance benefits and Poor Law relief. Mr T. J. Adley, secretary of the Scottish Professional Assistants Society, and Mr R. Williamson, secretary of the Independent United Order of

Scottish Mechanics, gave evidence on behalf of the Edinburgh, Leith, and District Friendly Societies Council.

The thirty sixth meeting was held at the Home Office Whitehall, on July 2nd, 1925, Lord Lawrence of Kingsgate in the chair. Evidence as to the work of the British Social Hygiene Council was given by Mr E. B. Turner, Dr Otto May, Mr P. A. Clements, and Mr Leonard Bowden. The Cambridgeshire Tuberculosis After-care Association, represented by Dr Varrier Jones and Mr I. Bunnell, submitted evidence on the need for special benefit arrangements under the insurance scheme for persons suffering from tuberculosis. Similar evidence was given on behalf of the London County Council by Mr G. H. Walmisley. The National Council of Agriculture, represented by Mr James Donaldson and Mr Denton Woodhead, gave evidence as to the undesirability of pooling the insurance funds of societies. Thereafter the Society of Apothecaries, represented by Dr A. D. Brenchley and Dr Reginald Wall, and the Association of Certificated Dispensers, represented by Mr Graham Bott and Mr A. Wager, gave evidence as to the qualifications of the holders of the society's certificate for insurance dispensing.

Volume I of the Minutes of Evidence covering the period from October 16th, 1924 to January 8th 1925 (the first to twelfth days inclusive) is now on sale in its final form and may be obtained from H.M. Stationery Office, Adastral House, Kingsway, London W.C.2, 28 Abingdon Street, London S.W.1, York Street, Manchester 1, St. Andrew's Crescent, Cardiff 120 George Street, Edinburgh, or through any bookseller. Price 10s. 6d. net and postage.

Part II of the Appendix to the Minutes of Evidence containing the statements submitted by certain approved societies, insurance committees, dental societies, representative bodies etc. on which the oral examination was based is now on sale in final form and may be obtained as above. Price 10s. 6d. and postage.

Naval and Military Appointments

ROYAL NAVAL MEDICAL SERVICE

SURGEON COMMANDER W. W. REID CMG to be Surgeon Captain. Surgeon Commander D. G. Addison Scott to the President 101 R.N. Recruiting Headquarters. To be Surgeon Lieutenant Samuel Morrow.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Commander T. Turner to the Victory for R.N. Barrack Portsmouth, for fourteen days training. Surgeon Lieutenant Commanders to be Surgeon Commanders D. D. F. Macintyre, T. B. Dixon, L. S. Ashcroft. Surgeon Lieutenant Commander H. J. C. Martin to the Dolphin for fourteen days training. Surgeon R. N. Hospital to be Surgeon Captain for twenty one days training. Probation H. Willoughby to the Victory for R.N. Hospital.

British Medical Association: Annual Meeting, Bath, 1925.

ANNUAL REPRESENTATIVE MEETING.

Friday, July 17th

The Annual Representative Meeting opened in the Concert Hall, Grand Pump Room, Bath, on Friday, July 17th, at 10 a.m. There was a large and early attendance of representatives.

Dr H. B. BRACKENBURY (Chairman of the Representative Body) presided, supported on the platform by Dr R. A. Bolam (Chairman of Council), Dr C. O. Hawthorne (Deputy-Chairman of the Representative Body), Mr N. Bishop Harman (Treasurer), the Medical Secretary, the Deputy Medical Secretary, the Financial Secretary and Business Manager, and the Solicitor.

The CHAIRMAN was greeted with hearty applause on moving the first resolution, that the return of election of representatives be received.

Standing Orders

Certain amendments to the standing orders were agreed to relating to the publication of the minutes, and to the simplification of the procedure on election returns. New standing orders were adopted for the election of members of standing committees. These provide that representatives alone shall be eligible for nomination to the Finance, Journals, and Public Relations Committees and that no representative shall be eligible for nomination for election by the Association as a member of more than two committees, and no person not a representative as a member of more than one committee.

Illness of President-Elect

The CHAIRMAN said he regretted to have to announce that the President-Elect (Dr F. G. Thomson) was seriously ill and would be unable to take part in the proceedings. He was sure that at the outset of the meeting the members would wish to send to Dr Thomson a message of sympathy and condolence, and accordingly proposed that that be done.

This was agreed to.

Election of President for 1926-27

The CHAIRMAN OF COUNCIL moved that the Annual and Supplementary Reports of Council (published in the SUPPLEMENT of April 11th and 18th and June 27th respectively) be received and this being agreed to, he moved, as a recommendation of Council—

That Mr Robert George Hogarth, C.B.E., F.R.C.S. Eng. be elected President of the Association for 1926-27.

This was agreed to with applause.

Mr HOGARTH said that as he would have the pleasure of addressing the meeting on the following Tuesday he only desired on the present occasion to thank the representatives very warmly for the great honour they had done him, and to assure them that he would endeavour to carry out his duties to the best of his ability. On behalf of Nottingham he offered a hearty welcome to the meeting there next year.

Annual Meeting 1927

It was also agreed that the Annual Meeting 1927, should be held at Edinburgh and so form part of the Inter-Centenary celebration.

Election of Vice-Presidents

The CHAIRMAN, in moving that Mr C P Childe, B A, F R C S, M R C P F (President of the Association, 1923-1924), be elected a Vice-President of the Association, said that the election of Past-Presidents as Vice-Presidents was one of the ways in which the Association could show its gratitude for the services they had rendered. He was sure that in the case of Mr Childe the proposal would be warmly received.

The motion was agreed to with applause.

The CHAIRMAN also moved that Alexander Primrose, C B, F R C S, M D, and Frederick Newton Gisborne Starr, C B E, M D, both of Toronto, be elected Vice-Presidents of the Association.

The CHAIRMAN OF COUNCIL, in supporting the motion, said that the Association had consummated its affiliation with the Canadian Medical Association during the present year, and there was now in this country a very important delegation of medical men from across the Atlantic, two of the outstanding members of which were Dr Primrose, the Dean of the Medical Faculty of Toronto and Chairman of the Council of the Canadian Medical Association, and Dr Starr, who was honorary secretary of the 1926 Annual Meeting and was well known in this country as a Canadian representative. The Council felt the Association would wish to take advantage of the opportunity so presented to appoint two Vice-Presidents from Canada.

The motion was agreed to with applause.

Election of Honorary Member

The CHAIRMAN moved, as a recommendation of the Council, that Mr Frederic G Hallett, O B E, be elected an honorary member of the Association. He said that reproduced in the SUPPLEMENT to the BRITISH MEDICAL JOURNAL for the current week was some of the magnificent artistic work which Mr Hallett had put into the *Roll of Honour*, deposited in the Library at the Association's new House, and inspected by Their Majesties on Monday last. It must be seen to be appreciated. This was not the first time Mr Hallett had done work for the Association. The only way in which the Association could honour a layman was by electing him as an honorary member.

This was agreed to with applause.

Other Preliminary Business

The CHAIRMAN OF COUNCIL, in moving approval of the remainder of the Supplementary Report of Council under "Preliminary," said that during the past year the hand of death had been heavy on the Association, particularly in the case of those who had been intimately associated with the central work of the Council. Dr Haslip had passed away, but had left the fruit of his wise judgement in the Association's financial affairs. The Council had also lost members who were carrying the burden of the work last year. Dr Bolam went on to refer to the new fund which had been established by the generosity of one of the members of the Council, Colonel Rait, and his wife, for giving assistance when urgently needed without formality. This would not interfere with the activities of the existing benevolent funds. The Council hoped that Colonel Rait's example would result in the formation of a fund which would redound to the credit of the Association. With characteristic modesty he refused the suggestion that it should bear his name, asking the Council to agree to call it after the name of the Association's founder, Sir Charles Hastings.

The CHAIRMAN, before putting the motion, referred to the paragraph in the Report stating that the Council had awarded the Gold Medal of the Association to Dr Bolam (Prolonged applause). He did not enlarge upon it, because there would be other opportunities.

Affiliation between the Association and the Canadian Medical Association

Dr Morton Mackenzie (Chairman of the Organization Committee) moved approval of the affiliation of the Association with the Canadian Medical Association on the conditions set out in the Annual Report of Council and more fully in the report of the delegates to the Canadian Medical Association presented to the Bradford Representative

Meeting. Dr Mackenzie said that this was the final and formal stage of negotiations which had arrived at a very happy termination. It was hoped the affiliation would prove of lasting benefit to the profession, both in the Mother Country and her Dominions.

The motion was carried with applause.

Dr Morton Mackenzie then moved the approval and adoption as an article of association of a draft new article relating to affiliation of medical bodies outside the United Kingdom, which article was to be submitted to Extraordinary General Meetings of the Association for adoption. The article was as follows:

(1) The Association may admit to affiliation with it any medical association or similar body established outside the United Kingdom on such terms and with such privileges as may in each case be approved by resolution of the Representative Body passed after consideration of a report by the Council.

(2) The Association may terminate any such affiliation (after due notice on either side) by resolution of the Representative Body passed after consideration of a like report.

(3) Any resolution of the Representative Body under this Article shall be final and shall not require to be approved under Article 34.

A verbal amendment was also necessary, and was approved, in Article 34.

The New House of the Association

The CHAIRMAN OF COUNCIL moved that the Report of Council under "New House of the Association" be approved. He went on to say that, as the Chairman had remarked, the Gold Medallist had no chance of saying even "Thank you" at the formal function when the Medal was presented. He (Dr Bolam) took the opportunity of thanking members of the Representative Body for doing what was quite out of the usual run of proceedings. He valued the appreciation shown in conferring the Medal more than almost anything that could come from any section of the profession. That the Association should have followed the advice of Bacon, "Honour your friends while they live with you," was a thought that he should always treasure. As to the New House itself, owing to the great amount of energy expended by Mr Ferris Scott, it had been possible to get things ready in time for the function last Monday. The occasion was one which would be memorable in the history of the Association, and many of those present at it considered that it was the finest function in which the Association had been privileged to participate. The New House would be of untold value to the Association. It would provide a rallying point for the members in the kingdom and the empire. Such a rallying point had been greatly needed in the past. He wished to utter one word of caution. It might be that those who had been active in the arrangements hitherto would not see the final completion of the programme that they had in their minds, and he wanted those who had the opportunity of continuing the work not to become fearful at any time as to the extent to which the Association could launch out in regard to its settled headquarters and its activities in them. Matters should not be spoilt by fear at the last moment. The Association had behind it an energy and a financial strength which should not be underrated. He hoped that, while exercising all due care for economy, those responsible would look with a generous eye upon provision for the future even though it might need some self-denial on the part of members at the time.

A Resolution of Thanks

Mr McADAM ECCLES moved the following:

The Representative Body desires to place on record its deep appreciation of the services rendered by all in connexion with the selection, preparation and opening of the British Medical Association House in Tavistock Square, London W C 1. While it is difficult fully to gauge and invidious to differentiate the individual labour which each has so efficiently given to the work, the Representative Body specially wishes to thank:

- 1 The Chairman of Council Dr R A Bolam, O B E for his acumen in selection of the premises, his assiduity in watching over their preparation and his aptness in presenting the Address to His Majesty the King at the opening.
- 2 The Treasurer Mr N Bishop Harman for his care of finance and most helpful suggestions.
- 3 The Financial Secretary Mr L Ferris Scott for the way in which he has met the extra and heavy burdens thrown upon him during the whole period.

- 4 The complete body of office workers for their splendid co-operation
- 5 The Architect Sir Edwin Lutyens R.A., for his art and skill
- 6 The Contractor Mr F. J. Walton, for the promptness with which the work of adaptation was carried out
- 7 The Foreman Mr G. E. Staples and the workmen through their representative Mr W. Reynolds for their good and timely work

The motion was seconded by Mr E. W. G. MASTERMAN, Dr H. G. DAIN (Birmingham) thought that there were two members of the staff who should be mentioned in the resolution. He referred to Dr Cox, who had done a tremendous amount of extra work in advising and helping the Editor, Sir Dawson Williams, who had carried on and had brought out the JOURNAL with such promptness, in spite of all the difficulties to be encountered, and had had all the extra trouble entailed in giving the members in account of what had been happening. (Applause)

Mr McADAM ECCLES said that he would be only too pleased that these names should be mentioned in the resolution.

The CHAIRMAN said that none of the members would forget the extraordinarily good work by their predecessors in securing the old building nor the extraordinarily good work that was done in it while the Association occupied it.

Sir JENNY VERRALL said he was glad to have the opportunity to speak as to the good work which had been done in getting into the new building, all the more because his memory went back to the time before the entry into of the very few members left who remembered the original house in the Strand. The splendour of the present building must bring before the world at large all the good the Association wished to do, and the thanks of the Association were due to all those who had had the duty and the pleasure to do their share of the work involved.

CIVIC WELCOME TO BATH

The proceedings were interrupted at this point for a civic welcome. The Mayor of Bath (Alderman Cedric Clivers, J.P.), who was accompanied by Mr W. G. Mumford (Honorary Local Secretary and Acting President-Elect) and Dr R. G. Gordon (Honorary Assistant Secretary).

The Mayor said that it was both his duty and his great pleasure to offer a very sincere and hearty welcome to the city on this occasion. As in the olden time on the visit of other notable people, the Abbey bells had been rung that morning to acclaim their coming. The British Medical Association was among the most distinguished as it was the largest, company which had ever at one time so honoured Bath. The city was very glad to have this opportunity to recognize the immenso service, and, indeed the value of the work of the medical profession. More especially did all who were engaged in public affairs regard with the utmost gratitude, both expectant and retrospective, all that the medical profession was doing, not only to cure human ills, but in preventing disease, helping towards a healthier, happier, and prolonged human life. What Bath offered to her medical guests would be bounded only by the limits of space at her command. Continuing, the Mayor said it was his chief and sole concern that morning to do what he could to make the members of the Association feel heartily welcome and to assure them that first and foremost the city's desire was to make their stay memorable for its success and pleasure. (Applause)

The CHAIRMAN, in thanking the Mayor on behalf of the Association, said that the Representative Body, and indeed the whole Association, had looked forward for some years with pleasurable anticipation to their visit to Bath. The members appreciated very highly the unlimited offer of service. He was sure that not only the civic authorities, but all the inhabitants of the city, were extending to them such treatment as would make every member of the Association remember all his life the charming historic, and beautiful city of Bath, which was renowned for the two things—health and education—for which the Association primarily stood. (Applause)

The Mayor then withdrew.

THE NEW HOUSE (resumed)

Dr J. A. MACDONALD who was received with hearty cheers, said it was difficult for him to express what he desired. He could not help feeling very deeply that he was drawing near the end of his long connexion with the Association ("No, no!") It was twenty-five years since he started work for the Association. When the old building had been pulled down in the Strand he had stated his opinion that the property was worth from 15 to 20 per cent more than before. That estimate had been received with jeers, but one of the greatest rating authorities at the time had said that his estimate was, if anything, too low, and that the figure should have been 25 to 30 per cent. A step had been taken towards making the Association what it ought to be—the greatest association for the good of the people and for the advancement of medical science in the world. (Applause)

The CHAIRMAN suggested adding to the resolution the words "The Editor, Sir Dawson Williams, and Medical Secretary, Dr Alfred Cox, for the admirable way in which the work of the Association and the conduct and publication of the JOURNAL have been carried on during the difficult time of transition."

The resolution, so amended, was agreed to.

Mr McADAM ECCLES further proposed that the resolution be sent to those mentioned in it and that it be engrossed, framed and hung in a suitable place within the British Medical Association House.

Mr MASTERMAN seconded the motion, which was carried unanimously.

The CHAIRMAN OF COUNCIL said many of those who deserved mention had been passed over in silence, but on his own behalf and on behalf both of those who had and who had not been mentioned, he wished to thank the meeting for putting on record its appreciation of the services they had rendered. In a body like the British Medical Association it was only a question of time and place and circumstance if one person rather than another had been in a position to render those services. The devotion displayed by the staff, including the lay officials, during the times of stress through which they had passed should be a cause of pride to all the members of the Association. (Cheers)

The Supplementary Report of Council under this heading was agreed to.

FINANCE

The TREASURER (Mr Bishop Harman), in submitting the balance sheet, said it revealed a very satisfactory position. His predecessor had budgeted for a surplus of £5,000, but the surplus realized was over £8,000, and that in spite of the fact that the expenditure—£113,000—was a "record" for the Association. In each of the three preceding years both income and expenditure, due to increasing membership, had increased by about £5,000. The Reserve Fund stood at £29,000 on December 31st last, but there had since that date been a slight fall in the value of the securities held. That fund had been instituted to provide for an extension of the Association's premises, and the Finance Committee had power to realize it, when advisable, to pay off the costs of the new building. The Loan Account from which the expenditure on the building had in part been met, stood at a very low figure because current subscriptions had been largely used to finance the expenditure, and instead of being put on deposit had been employed to reduce the overdraft at the bank. Subscriptions in arrears were rightly shown as assets, since the greater part of their value had been realized. The Council had increased in size and Council meetings had increased in number and there had therefore been an increased expenditure on railways fares. The Secretaries' Conference had been less expensive not because of a smaller attendance but since so many secretaries were also representatives. Salaries had increased according to the scale proposed by the Council and approved by the Representative Meeting. Extra copies of the JOURNAL to the number of 120,000 had been supplied during the year but the advertising revenue had increased and the expensiveness of production had been kept down through the installation of linotype machinery. There had budgeted for an increased expenditure of £2,791 on the new premises.

because the upkeep would be more expensive than in the old. The estimated total revenue for next year was £125,000, and the total expenditure £121,000. He was assured of the financial stability of the Association, despite the heavy liabilities it had undertaken.

In reply to a question by Dr L. A. PARRY (Brighton) the TREASURER proceeded to give details of the expenditure incurred by the Association upon the new premises.

Dr JENNIFER VERNALL asked whether, when the extension took place, there would not be an opportunity of getting a financial return by letting part of the building. The TREASURER replied that he hoped that a large part of the present building would be a source of revenue. The Great Hall must be one of the most desirable meeting-places in London.

Dr J. H. THOMPSON (Nottingham) asked what was the length of lease and was there an option of purchasing the freehold.

The TREASURER said that the lease was for 200 years, and could not be broken. There was no option on the freehold.

The CHAIRMAN or COUNCIL agreed with what the Treasurer had said. It might be found practicable to use the present building so as to bring in a yearly return, without accommodating members or interfering with their privileges. He put the value of the present building and the lease at about a quarter of a million, and he believed that in six or seven years, if the Association took a broad view, it would have buildings worth half a million ("Hear, hear"). Money laid out there sensibly and with restraint would prove a good investment, and if those who were arranging the details during the coming years had liberty in varying the plan of building the new wings, the return would be very satisfactory. It might be that the return would come through one wing being made, say, a hostel for empire post-graduate work. It might be that some of the return should be sacrificed because it would be a legitimate expenditure on behalf of the Association to further that purpose ("Hear, hear"). There were a number of possible developments, and he hoped the matter would trustfully be left fluid with those who had to carry out the details, due oversight being taken in the way of reasonable expenditure and care.

Dr H. S. BEADLES thought that the Representative Meeting should have a certain amount of control over finance. He was in dread of the Council moving into the extension of the new building room by room, and of the upkeep expenditure that would arise from such a procedure. The letting of a portion was the correct principle upon which to proceed.

Dr C. E. DOUGLAS criticized the acoustic properties of the Great Hall.

Dr JOHNSON SMYTH (Bournemouth), speaking on the Financial Statement, considered that before the Association launched out on any serious further expenditure the membership should be allowed to become more stabilized. As to the Superannuation Fund, as far as he knew no provision had been made for the superannuation of the Editor or of the Medical Secretary. He hoped the Finance Committee would study this matter sympathetically. He congratulated the Treasurer on his very lucid statement.

Dr D. C. KIRKNOFF (North Middlesex) asked how the figure of £170,848 6s 3d as the total of the Surplus Account and the Reserve Account was arrived at.

The TREASURER, in reply, said that this figure represented the addition of all the assets of the Association after all the liabilities had been paid or provided for. It included the Reserve Fund of nearly £30,000. It might be taken that the figure represented what the Association was worth at the present moment. The Chairman of Council had projected further expenditure. If it was to be productive expenditure the Finance Committee would report on it favourably to the Council. Dr Beadles had emphasized the necessity of control by the Representative Body over finance. He entirely agreed with him. Dr Douglas had criticized the acoustic properties of the Great Hall. He (the Treasurer) had made some tests, and the results of those tests were satisfactory. As to the criticisms made by Dr Johnson Smyth, he hoped that the membership of the Association would never be stabilized. Stabilization

rather suggested fossilization. He would like to see the membership go up, as it was doing at present, year after year. If it did not go up he would like to see it go down and give a jolt to the executive so that something would be done. He believed that it would increase. With regard to the matter of pensions, this was receiving the consideration of the Council. Certain memorandums had been submitted, and it was proposed to lay a report before the Council shortly.

The CHAIRMAN invited Dr Kirkhope to put his question again if he thought his point had not been fully answered.

Dr KIRKNOFF said he found in the Report under "Finance"—

"The Reserve Account stands at the same figure as last year. It is invested in first class securities of a market value at 31st December, 1924, of £29,683 10s. The Surplus Account including the surplus for the year 1924, stands at £143,601 8s 9d, making with the Reserve Account a total of £170,848 6s 3d."

That was an addition, the Reserve Account was added to it.

The TREASURER said that in the Reserve Account the figure given was the figure of cost, which was less than the value by £3,000, which accounted for the difference. The profit had not been realized, and therefore it could not be put down.

The Annual Report under "Finance" was then unanimously approved.

THE "BRITISH MEDICAL JOURNAL"

Dr J. A. MACDONALD (Chairman of the Journal Committee), in moving approval of the section of the Report under "Journal," said the Association was to be congratulated on the continued progress of the JOURNAL, which he believed was the most effective medical publication in the world. The main point in the Supplementary Report of Council under "Journal" was the proposal that the Association should undertake the publication of a subsidiary journal dealing with the subject of children's diseases. It had been thought that the important work done by pediatricians in this country was not at present adequately represented. The matter had been discussed by the Journal Committee and submitted to the Finance Committee, who considered that it would be proper to risk a possible cost of £600 a year, and the Council recommended that the publication of such a special journal should proceed. It had been asked whether the proposal would interfere with the BRITISH MEDICAL JOURNAL in any way. His own view was that it would not do so in the least. Articles which were suitable for the JOURNAL would be published therein, and those more particularly suitable for specialists would be put in the proposed special journal.

Dr H. ROSE asked whether the new journal was for specialists and not for the general practitioner at all.

Dr MACDONALD replied that it was not to be thought that the matter dealt with in the proposed journal would not be of interest to the general practitioner. The new journal of pediatrics would be independent of the BRITISH MEDICAL JOURNAL so far as subscriptions were concerned, and it was hoped that it would pay for itself.

The Annual Report under "Journal" was then unanimously adopted.

Reports of Committee Proceedings

Dr L. A. PARRY (Brighton) moved to instruct the Council to arrange, when considered advisable, for the publication in the SUPPLEMENT of the fullest reports of the meetings of the standing and other committees, as at present members had little or no opportunity of judging for themselves the very great amount of detailed work done on their behalf by these committees.

Dr JOHNSON SMYTH (Bournemouth) opposed the motion on the ground that an expansion of the size of the JOURNAL would result in a serious increase in the cost of postage.

The CHAIRMAN or COUNCIL, while expressing sympathy with the desire of the Brighton Division to know more about the work of the committees, agreed with Dr Johnson Smyth that the question of postage was a serious matter. He thought that until conditions became less stringent the committees would have to be content with

relative obscurity. He was reminded by the Medical Secretary that the results of the work of the committees were covered in the reports to Council, and the Council's work was reported to the Representative Meeting, so it was necessary to consider carefully whether a good deal of repetition would not be caused by publication of the work of the committees.

Dr MACDONALD, speaking as Chairman of the Journal Committee, said the suggestion from Brighton was not a practical proposition. If the JOURNAL were enlarged it would come outside the postal rate, which meant a heavy additional expenditure.

Mr E B TURNER said that, as Chairman of the Medico-Political Committee, he wished to point out that in many cases the reports of that committee required very careful editing before publication. What could be published was sent out under "Current Notes," but it would be undesirable to give full particulars of difficult and delicate negotiations before they were finally completed. The members should be made cognizant of the work of the Medico-Political Committee, and have the opportunity of approving it or otherwise, but as much was already being done in that direction as was possible.

Dr PARRY, in reply, said he had never suggested that full reports should be published, and the words in the resolution, "when considered advisable," disposed of the point raised by Mr Turner. He had not, moreover, suggested that the JOURNAL should be increased in size, or that additional expenditure should be incurred. What he proposed could be accomplished by cutting out some of the matter now printed, he suggested the JOURNAL should be slightly decreased in size and the SUPPLEMENT correspondingly increased. The publication of proceedings and reports of Council did not meet the case, as they did not contain particulars of the detailed work done by the committees. All the resolution asked was that the members should be better informed of the good work which was being done on their behalf.

The CHAIRMAN said the resolution had been represented by Dr PARRY as perfectly harmless, and if Dr PARRY's view of it were accepted it might be said that all he wanted was being done already, so that the resolution was superfluous, but if it meant what those who opposed it took it to mean the meeting would have to consider whether it was possible or advisable to carry it out.

Dr E R FOTHERGILL asked whether the Chairman of Council would agree to take the proposal into consideration.

At this point a motion was carried to pass to the next business.

SCIENCE

Dr C O HAWTHORNE (Chairman of the Science Committee) moved approval of the report of Council under that head. The report, he said, did not contain any formal recommendation to the Representative Meeting, it merely recorded the scientific and educational activities of the Association during the year, activities which, it would be agreed, formed by no means the least important part of the work of the Association. The first part of the report recorded work undertaken in response to direct instructions from the Representative Meeting. In 1923 the Ophthalmological Section passed a resolution urging the Council to call the Government's attention to the importance of certain research undertakings to the work of the combatant services. The Council thought it impossible to take valuable practical action, but were again instructed to take the matter up by the 1924 Representative Meeting, and thereupon wrote to the various Government departments in the sense desired by the Ophthalmological Section. With the exception of the Admiralty, the departments addressed had replied to the effect that they were giving consideration to the matter. Reference was also made in the report to the Sir Charles Hastings Prize. It was the wish of the last Representative Meeting that the awards in connexion with that foundation should not necessarily be restricted to a single candidate. The Council had accordingly decided that more than one prize might be awarded should the merit of the essays sent in warrant such a course. Essays had to be submitted before December 31st of the present year, and it was hoped that the prize—the first to be awarded for clinical work conducted in general practice—would excite

considerable attention and lead to a number of essays being submitted. The promotion of scientific research by the Association had gone forward. The expenditure of money there referred to had been fully justified by results, the work submitted was of high quality. In particular, he wished to refer to that performed by the Ernest Hart Memorial Scholar, Dr A J Copeland, as a result of whose investigations the profession would shortly be put in possession of a local anesthetic which had all the virtues and none of the perils of cocaine hydrochloride. That would redound to the credit, not only of the worker himself, but of the Association through whose support the work had been in part accomplished. (Applause.) All the work of the research workers was supervised or inspected by experts in the various departments, who sent confidential reports to the Science Committee. The inspection or visitation was very responsible and important work, and the Association was heavily indebted to those gentlemen who undertook it. With those remarks he associated the names of the judges, on whose considered verdict the Middlemore Prize had been awarded. Coming to the Library, he said personal attendances there had greatly increased, and within the last few years the number of books sent out on loan had more than doubled. With the new facilities offered by the Association's new home, the Library activities would considerably increase.

Mr H S SOUTHWICK bore testimony to the admirable work done by the Science Committee and also by the prize-winners. When a scholarship was given to Dr Copeland it was scarcely hoped that such a brilliant result would follow. At present there was practically only one surface anesthetic—cocaine—and this was an exceedingly dangerous substance to use. It was practically certain that by next year, as a result of Dr Copeland's work, there would be available an anesthetic of almost the power of cocaine, and of a little toxicity as novocain. Such a brilliant discovery redounded to the credit of the Association. Besides this, Dr CUNN, as a result of the work he did for the Association, had received the great honour of a Hunterian professorship at the Royal College of Surgeons.

Mr E B TURNER corroborated what Dr Hawthorne had said, but thought the Association ought to be ashamed of itself that it allocated only about £1,000 to these matters. Something had been said about the ratio of the medico-political to the scientific work of the Association, in regard to money the difference was tremendously on the other side. He believed even the Treasurer would look with sympathy upon giving an extra twopenny or threepenny a member in extra grants for research and scholarships. Last year the Science Committee was at its wits' ends how to strike a just balance between the extraordinary excellence of the candidates for scholarships and grants, and the very limited amount of money available. It ought to be very carefully considered whether the Association could not double the amount it gave for the promotion of research in medical matters on scientific lines.

Dr J L LIVINGSTON (Winchester) asked whether the Library could not extend the present time for which books could be kept. A fortnight was not long enough, especially for men living in the country. Occasionally an extension could be got, but application had always to be made before the end of the fortnight. Dr C E DOUGLAS supported the last speaker. Certain books in the Library could not be read in a fortnight. Dr HAWTHORNE said that the question raised had been considered more than once by the Science Committee. The present regulation was that a book must be returned within fourteen days, but a reader who desired to keep it longer could send an intimation to the Librarian, and unless there was a demand for the book it would be granted. The desire was to make the Library useful to members of the Association as a whole, and the present arrangement conducted to regular and systematic working. Dr FOTHERGILL asked whether the arrangement for keeping a book longer than fourteen days appeared in the rules and if not asked that it be inserted. Dr LIVINGSTON suggested that the time limit should be four weeks instead of two. Dr HAWTHORNE read the rule in question and said that if there was any ambiguity in the wording of it he would see that it was put right.

This portion of the report was approved.

24 JULY 25, 1925]

Annual Representative Meeting

[SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL]

felt that, having regard to the retrospective nature of that binding resolution, it would not be wise or politic to put the powers of the Association into motion. But that transitional stage was probably ending, and those crises of retrospective action would not occur in the future. Therefore every man who, after the binding resolution, accepted a post not under the terms of the scale would be dealt with simply as a recalcitrant member under Rule 6 and the following and consequent rules. Rule 6 was the ordinary rule which governed the complaints as to ethical misconduct against any member. If this motion was therefore unnecessary, then certainly it was undesirable. If Rule 5 were altered for the sake of this unnecessary object, all the ethical rules of the Divisions would be thrown into the melting-pot again, and it took nearly a year—probably more than a year—to get all the Divisions all over the country to readopt all these ethical rules. They were only “drawing their own teeth” by this suggested alteration of the rules. Further, Rule 5 might still be wanted for the sort of cases for which it was originally devised. When these rules were devised the Association was taking no action with regard to public appointments. All that it was really concerned with at that time was appointments held at clubs and institutions where the terms and conditions had perhaps for years been unsatisfactory. The lawyers had advised that it was only fair that the person complained of who held that appointment should have in common justice the alternative of being entitled to exonerate himself from blame by bringing the terms and conditions of his appointment into harmony with the new view.

Dr FOTHERGILL asked if Rule 6 did not require that the individual member must start the complaint, not the Division.

Dr LANGDON-DOWN said that the secretary of the Division could act in his official capacity.

The Solicitor to the Association (Mr W E HEMPSON) said that, if he might speak quite frankly, the one nightmare of his life for the last twenty-five years had been the ethical rules. (Laughter.) He had them brought before him week by week. He would say now what he intended to say at the end. He begged the representatives not, in a meeting like the present, to set about altering the ethical rules, because they did not know where a small alteration would lead. He maintained that these rules had been settled with the utmost care. They represented not only the sweat of his brow, but also that of two counsel who had been engaged upon them. He thought there had been a misconception. It was quite evident that the mover of the resolution had not been through the mill to the extent that he (the speaker) had been in connexion with the rules.

The Solicitor continued

It has been decided, as one of the fundamental principles of your present constitution, that there should be local autonomy, as far as Branches and Divisions are concerned. As has been said, you are not yet agreed on a definite scale for these salaries, but you are arriving much nearer that point at this meeting than you have hitherto done. I do hope to see that when once the scale for the salaries is arrived at, it will be adopted by each individual Division throughout the length and breadth of the Association. If that be the case, then you will have a new plan on which to work. The autonomy of your Branches and Divisions has been so fundamental that it has been left to the Branches and Divisions practically to decide for themselves as to whether they shall pass binding resolutions. You all know what a binding resolution is. When that binding resolution is brought into being anyone who then applies for an appointment which is not on the scale dealt with by the binding machinery is committing an ethical offence for which you have machinery provided to deal with, and the mere fact of his applying for it brings his conduct into question, and you can proceed accordingly under your ethical rules. It seems to me now that you must have some such rule as Rule 5, because there must always be a period at which your binding resolution is brought into being, even though you have one given fixed scale running throughout the length and breadth of your Association. It may be, and I think probably will be, that in certain Divisions when that time arrives there will be appointments then filled, and it is as to those appointments then filled at the time when your binding resolution becomes operative that the necessity arises for Rule 5. What does Rule 5 provide in that respect? It provides that those members who then hold those appointments must do one of two things—take the necessary steps to

terminate their appointments, or take the necessary steps to bring their engagements up to the terms which the scale provides. I do not quite know why the mover of this resolution to day, and those who are supporting him, want to cut out one thing and leave the other. They are prepared to cut out the part which enables him to get his appointment put upon terms which will not bring him into conflict with the ethical rules, but they leave him with the part that says he must terminate his engagement. When the practitioner accepted the appointment he was not placing himself in the wrong, because there had been no binding resolution in his Division which dealt with the matter. We only bring this under our rules to meet contingencies which do arise, and which may, I think, arise in the future, and give the man involved two ways of getting out of it. I really think, as your legal adviser, that you had better leave it as it is. (Applause.)

Dr FENNISON SMITH. As far as my knowledge goes, the binding resolution was passed before the appointment was made.

The CHAIRMAN. Then you act on the other rule, and not on this one.

Dr FENNISON SMITH. We are acting on the advice of the central office.

The CHAIRMAN. Very likely. I am not saying that the central office is always perfect.

The Chairman added that he was anxious that the meeting should clearly understand what it was voting on. By keeping the rule as it was there was an alternative the practitioner could either resign or get the authority to bring the appointment up to the scale. That contingency had to be provided for in some way. The Solicitor had advised that if the contingency arose which was spoken to by the supporters of the motion, it could be dealt with by proper action by the Division under a different rule.

Dr RENTON, in reply, said that after conferring with the seconder he agreed that if what the Chairman had said was right the rules could be left alone, but he was not quite convinced that what the Chairman said was correct, and would like the matter put to the Representative Body to get their opinion. (Cries of “Vote”.)

The Dartford motion was lost.

The Practice of Psycho-analysis by Medical Practitioners

Dr A LYNDOX (Surrey Branch) moved to instruct the Council to consider certain practices alleged to be prevalent among some medical men practising psycho-analysis, and to report. He contented himself with moving the resolution, leaving his seconder (Dr Parry) to explain it further.

The CHAIRMAN said the motion had presented some difficulty to him. He was quite sure it was in order, and therefore it could be moved, and no doubt there would be some discussion on it. But it was in vague terms. He would like the mover to tell the meeting when he wished anything not reported by the press, if there were such things.

Dr PARRY said if any good were to result from the discussion it must be held in public. The CHAIRMAN said it was for the meeting to decide whether the proceedings should be reported or not. Dr FOTHERGILL asked if Dr Parry could outline what he was going to say, so that the meeting would know what attitude to adopt on the question of publicity. The CHAIRMAN suggested the press might be allowed to report the proceedings on the understanding that they submitted to him what they proposed to publish. Members of the lay press present indicated that such a condition would be unacceptable.

The CHAIRMAN said the position was a difficult one, some of the things which might be said might only be of value if recorded publicly, others it might be undesirable to mention. Dr PARRY said he did not intend to intend to publish, and he was sure the press could be relied on to exercise discretion. The CHAIRMAN said if a point was reached where it became obvious that publicity was undesirable he would have to offer the press the alternatives either of reporting nothing or of submitting to him what they proposed to publish. Dr BARNETT ANDERSON (South Africa) said if the proceedings were to be reported speakers might be obliged to refrain from saying certain things they might wish the meeting to hear.

Dr PARRY said the resolution had received very careful consideration from the Sussex Branch Council, which had taken the advice of some of the leading members of the Association before putting it on the agenda. It was not intended in any way as an attack on psycho-analysis as such, but only on some abuses of which certain practitioners were guilty, and which it was suggested should be investigated by the Council with a view to its taking such action as it thought fit.

Dr J A MASON, interposing, called attention to what Dr Parry had just said, which meant that the British Medical Association was to investigate the manner in which a practitioner conducted his practice. The CHAIRMAN said it was perfectly in order to put such a proposal before the meeting. The meeting had chosen to deal with it.

Dr PARRY, continuing, outlined cases which, in his opinion, showed the necessity for the resolution, which, moreover, only asked the Council to investigate the matter. A judge of the high court recently commented on one such case, and referred to the filthy practices which were taking place, and articles to the same effect had appeared in the newspapers. When judges and journalists took the matter up it was time, he thought, for the profession itself to put its house in order. Dr Parry gave certain specific instances, and contended that he had made out a prima facie case for investigation.

Dr LANGDON-DOWN said if the meeting decided a prima facie case had been made out he was sure the Council would consider it and give such advice as it could. What was under discussion was whether it was worth while to do that. The thing complained of was an offence on the part of certain practitioners in the form of their practice. There were two ways in which a medical practitioner might be held to offend in that respect. It might be said that he held a wrong judgement about medical matters—that he held medical views and doctrines with which his colleagues disagreed. That could only be made an offence by the Association if the whole question were considered and a rule laid down as to what was correct practice and what was incorrect. The other offence which might be alleged was that a doctor did not hold wrong views but deliberately acted against his own judgement. That, except in the rarest cases, was a proposition it would be extremely difficult to produce evidence about, much less prove. Either, therefore, some standard of orthodoxy must be set up for the medical profession, which would be a disastrous thing for the Council or the Representative Body to attempt to do, or, on the other hand, it would be necessary to show that a man did not believe in the doctrine he was teaching and practising, which was almost impossible to prove. A similar position arose in dealing with the question of homoeopathy, so far as mistaken judgement was concerned, and the Association then said it did not profess to decide whether the doctrines of homoeopathy were true or false, it merely laid it down that a man should not, by reason of his alleged belief in homoeopathy, take undue advantage of his fellow practitioners. If those methods were impossible surely the right methods of promulgating truth in medical matters were the Association's scientific meetings, local and general, and the medical press. Most questions of medical conduct related to misconduct alleged by one practitioner towards another. As a general rule, where an individual medical practitioner committed an offence against a member of the public, the remedy lay with that person, and it was no part of the Association's duty to act for the individual member of the public where he had a legal remedy of his own against a member of the profession. On the general question they were more entitled to intervene. He doubted whether it was worth while sending the motion up to the Council.

The CHAIRMAN pointed out that though speaking with all the prestige of chairmanship of the Ethical Committee, Dr Langdon-Down had intervened as an individual member. He had not concluded the discussion by his remarks. He added that it would be a mistake to try to investigate details there and then. If the resolution were passed the Council might possibly bring up a report somewhat in the terms Dr Langdon-Down had mentioned—and it might not. Could Dr Parry define exactly what was meant by "to consider certain practices alleged"? Did he mean cases alleged by him that afternoon or was it a

wandering commission over the whole area of psycho-analysis? It was a vague term which he thought would put the Council in a difficulty if the resolution were passed.

Dr BANCROFT ANDERSON said it was not clear to him that what had been described by Dr Parry, as far as he understood the English language, was either medicine or surgery. It seemed to him to be outside both.

Dr C L DOUGLAS (Life) hoped the resolution would be adopted. The speaker had brought forward some exceedingly important and very serious suggestions or allegations, which were too difficult to be dealt with by the Representative Body. Some of them had not begun to understand the case put before them, because they had not had one-tenth of the evidence for or against to enable them to come to a proper judgement. All that they were asked was to refer the matter to the Council, and in the circumstances that was the soundest thing they could do. The Council could ask for evidence if it desired to have it, and could give what was needed—a considered report for further guidance (Applause).

Dr C O HAWTHORNE said that the suggestion had been made by Dr Langdon-Down that the matter was one which came within the authority of the Science Committee. He repudiated that suggestion. Science was associated with liberty of thought, and not with an endeavour to impose restrictions. His principal objection to the reference of the matter to the Council was that there were already existing tribunals by which indictments of the sort put forward by Dr Parry could be investigated. In one of the cases a medical practitioner did not appear to be concerned. If there was an offence committed by an individual who was not a medical practitioner it was a case for the police and not for the Association. If there was evidence against medical practitioners competent to support the charges which were suggested by Dr Parry the investigation could surely be conducted by the General Medical Council. He appealed to the meeting to say that, on the whole, the best thing to be done was to leave such charges to be dealt with by the proper authorities.

The CHAIRMAN of the Council agreed with the ideas put forward by the Chairman of the Scottish Committee, Dr Douglas, but he could not help feeling that the form in which the resolution was at present drafted rather went further than some would wish. It would bind the Council to investigate certain matters the details of which were at the moment, for very good reasons, left vague. Many cases were matters for the legal authorities and others were matters for the General Medical Council. There might be some residuum that could be dealt with internally by the British Medical Association, or which might be dealt with by the Association arranging to put forward representations in other quarters. The object aimed at would surely be met by Dr Parry's resolution being referred to the Council. If that were done, the Council would not be bound. The meeting would be expressing the opinion that the matter was one that might be referred to the Council so that it might investigate it and see in what way action could be taken. On cognate subjects the Association took action in many directions which were not reported in the annual proceedings from year to year. If it could be so arranged that Dr Parry's resolution was referred to the Council or to an appropriate committee, Dr Parry and other people might give evidence that would enable the Council or the committee to decide whether the Association could usefully and safely take action. It seemed to him that it would be hazardous to go beyond that.

Dr PARRY in reply said that he was very grateful to Dr Bolum for his suggestion. He asked the meeting not to allow itself to be led astray by the chairman of important committees. Both Dr Langdon-Down and Dr Hawthorne had he thought drawn red herrings across the track. He had never attempted to suggest to the Council that it should set up a standard of orthodoxy, nor had he attempted to curtail liberty of thought in any way. All that he wanted the Representative Meeting to do was to ask the Council if it considered it advisable to give further consideration to the subject. If the Council said "We do not think that we can do anything" that

would be the end of the matter so far as the Council was concerned. The Association would be committed to very little if the resolution were adopted, but it would be keeping a hand on a matter in regard to which, if it did not move, it would be led by outside bodies. It was necessary for the Association itself to do something or it would have it done for it.

The CHAIRMAN said that the line between passing the resolution as it stood and referring it to the Council was a little thin, but it was important. He understood the mover and the seconder to consent to the resolution being referred to the Council. He would therefore put the resolution in the following form: "That the motion standing in the name of Sussex be referred to the Council for consideration."

This motion was carried.

THE NON-PANEL COMMITTEE

Dr J STUBBS (Chairman of the Non-Panel Committee) moved approval of the section of the Report of Council under that head. He said that his committee had applied itself very assiduously to the consideration of evidence which might be given before the Royal Commission. It had not been able to convince the larger committee to which the preparation of evidence was entrusted of the rightness of its case, it was overborne by *force majeure*. At the same time, he saw some distinct signs of grace in the Memorandum of Evidence as presented, and he hoped that when some future memorandum was put forward the views of his committee would be more fully represented.

This section of the report was approved.

NATIONAL HEALTH INSURANCE

Dr H G DAIN (Chairman of the Insurance Acts Committee) moved the approval of the portion of the Report and Supplementary Report under "National Health Insurance." The Insurance Acts Committee had taken its share in the preparation of a report which was presented to the Royal Commission. That was the work of a separate committee and was the subject of a separate report. One or two rather important matters had been dealt with during the year. The new regulation providing for ophthalmic benefit through approved societies had been put into force during the present week. The Association had set up a list of ophthalmic surgeons who were prepared to accept the fees under that scale, and there were now nearly 600 names on the list. With regard to the burning question of the disciplinary action of the Ministry, there had been some difficult cases. Last year, as members were aware, the Association had taken serious exception to a case in which two practitioners were fined £1,000. The Insurance Acts Committee had succeeded, by its representations to the Ministry, in obtaining a remission of the remainder of the fine imposed upon those gentlemen in Lancashire, and a sum of about £400 which had been paid was considered by the Ministry to be a sufficient penalty for the offence, and no further deduction would be made from their emoluments. The Committee had had a personal interview with the Minister, and at that interview it laid before him four definite principles which it considered should cover all cases on which the Ministry had to issue judgement. Those principles were set out in paragraph 42 of the evidence before the Royal Commission, and the Ministry had agreed that the principles set out were, on the whole, quite fair. The Insurance Acts Committee had, by its action, very usefully drawn attention to what it considered to be infractions of those principles, and that might cause more care to be exercised in future to see that regard was had to them before judgements were issued. Dr Dain went on to say that the balance sheet showed a net increase of some £13,000 in the funds of the National Insurance Defence Trust, bringing those funds up to about £56,000 at the end of last year. The figure to-day, he believed, was about £73,000. The Committee had considered the uses to which that money should be put, and had decided that the interest from it should be used to a greater extent in defraying the expenses of the Insurance Acts Committee and certain activities of the Conference. The time was not far distant when that Committee would have to consider at

what amount the fund should be considered sufficient for organization purposes, but meanwhile it was hoped that the Panel Committees—and particularly those which were late in starting to subscribe—would continue their contributions, so that the time when no further subscriptions were required might be brought nearer. He did not know what sum should be fixed, but in any case it would be some time before that position was reached. Some committees had provided a great deal and some very little, he hoped the latter would try to make up their leeway.

Practitioners' Right of Appeal to the Courts

Dr H J M MILBANK-SMITH (Chichester and Worthing, and Horsham) moved to instruct the Council, when consulting Divisions with regard to any suggested amendments of or additions to the policy of the Association in reference to the Insurance Acts, to include for consideration the following proposal:

That in addition to the right now enjoyed of appeal to the courts on the ground of improper procedure appeal to the High Court shall be legitimate against any penalty other than removal from the panel, imposed upon a practitioner by the Ministry.

Some might consider, he said, that the resolution was unnecessary, since the Association had just given its evidence to the Royal Commission, and that evidence was the result of a meeting in London with representatives of the Panel Committees. The reason the resolution was put forward was that certain things had happened since which had caused a great deal of distress amongst insurance practitioners generally. The fact that the finding of the Ministry was often not in accordance with that of the committee which had carefully considered the case was a grievance which was deeply felt, and in his opinion the evidence offered by the Association might have been quite different had the motion by Chesham, which was only lost by a small majority, at the last Annual Representative Meeting been accepted. Had the two London cases which had been mentioned been published in the press prior to the meeting at which it was considered, he felt certain the motion put forward by Chesham would have been passed by the necessary majority. He would have liked the resolution to be stronger. The words "other than removal from the panel" had been inserted because the Association's recommendation to the Royal Commission was that before a practitioner was removed from the panel the matter should be referred to a tribunal of the medical profession. That, if it could be achieved, would be satisfactory. The result of a recent appeal completely reversed the whole practice. Exactly the same thing would apply in the case of any reference to the High Court where an appeal was upheld. On the other hand, the Ministry would be extremely careful before he gave decisions which might not be upheld by the appeal. Through recent representations to the Ministry the position was very much more satisfactory than it was before, but there was no certainty of continuity. Ministers changed ("Heu, heu"). The passing of the resolution would make it known to the medical profession that the matter would be under the consideration of the Council and would be referred back to it when the report of the Commission was published.

Dr L J PIERCE (Chester and Crewe) said that while his committee was keen upon this matter he received no specific instructions to support the motion. The recent interview with the Minister (SUPPLEMENT, June 27th, p. 280) made such a considerable change in the situation that they might possibly be influenced to drop the matter, but he trusted the question would be kept alive. An appeal to the High Court made the position clear, and he could not follow the argument that that appeal was unconstitutional. He understood that the judges of the High Court themselves did not regard the matter as closed. National health insurance had convicted private practitioners, not into Statism, but into people who had a new relation to their patients. If that relation were so altered as to make the patients interfered with, so to speak, by a third party, it would alter the whole principles of justice between the two contracting parties—who were not the Insurance Committee or the State but the doctor and patient—and eventually

the common law of the land would be brought to adjust the differences between them. What was needed was the right of appeal to the High Court in the last event. Machinery of a special character ought to be erected, and the recommendations of the Council tended to create it, but in view of the recent legal cases that machinery would not deal with all possible eventualities. Right of appeal to the High Court was essential as a safety valve. He instanced a recent case in which the Minister was about to give his judgement, but the patient appealed to the common law, and he withheld his judgement pending the result. That was a one-sided state of affairs, because it gave to the patient a right which the doctor had not. At present the profession was deprived of a right of citizenship which they ought to enjoy. (Applause.)

Dr FOTHERGILL asked Dr DAIN whether, if the matter were sent down for consideration, the pros and cons, so far as they could be obtained, would be fully set forth. The CHAIRMAN said that, as the question was one of order, it should be addressed to him. If the motion were carried, he would have to rule that it bound the Council to send down to the Divisions the exact form of words used and no others for their consideration. They would not be asked to give their opinion upon the whole subject. Dr FOTHERGILL submitted that the Council might put in other considerations also. The CHAIRMAN reported that if the resolution were carried its exact proposition and no other would have to be submitted to the Divisions.

Dr DAIN asked the representative of Chichester and Worthing and Harsham to withdraw the resolution, because the whole profession—not only the Representative Meeting, but the Conference of Local Medical and Panel Committees—had agreed on certain things which were given in evidence before the Royal Commission—that where it was a question of the removal of a doctor from the panel, before judgement was made effective the case should be submitted to a purely medical tribunal, and where the fine was considered to be excessive he should have the right of appeal to the courts. The profession had formed and expressed its opinion, and the passing of such a resolution as was before the meeting would not serve any useful purpose.

The CHAIRMAN said that it was important that the Representative Body should not get into such a position that it was asking something different from that which the Conference of Local Medical and Panel Committees had done—namely, that there should be an appeal to the courts only in those cases in which the resolution said there should be an appeal. As there was no danger of the matter being lost sight of, he asked the mover and seconder of the resolution whether they were content with the assurance of the Chairman of the Committee and were willing to withdraw the resolution.

The mover and seconder of the resolution declined to withdraw it.

Dr J. CANTLEY (Salford) moved an amendment, that the words after "penalty" ("other than removal from the panel imposed upon a practitioner by the Minister") be deleted.

The CHAIRMAN said the amendment was in order, but what had been read out was not the full resolution before the meeting moved by Dr Milbank-Smith. That resolution prescribed the exact form in which the Council was compelled to submit the resolution to the Divisions.

Dr DAIN hoped that the Representative Meeting would not accept the amendment. As the result of the Conference, a policy had been arrived at which the Association was proceeding to put forward—the policy that there should be a right of appeal to the courts in cases of an excessive pecuniary fine and that cases of removal from the panel should be dealt with by a medical tribunal. To reopen that policy and to refer it back again and to find out whether the Divisions wished to have it altered was not desirable having regard to the fact that it had just been agreed to. The policy was a perfectly sound one, and its adoption would very much improve the position of insurance practitioners.

In answer to a question by Dr J. A. MACDONALD Dr DAIN said that the power of removal could not be used until after the opinion of a medical body had been obtained. The

CHAIRMAN said that the desire of the Association was to go further. It asked that the Minister should not have power to remove from the panel except with the acquiescence or the medical tribunal.

Dr Cantley's amendment was put and lost.

Dr MILBANK-SMITH, replying on the discussion, pointed out that the fine in each of the two cases which had become public property quite recently was a very small one, and that an appeal on the amount would have been ridiculous. The insurance practitioners wanted to know that he had the safeguard that, if a similar case occurred again, he would have the power of appeal.

Dr Milbank-Smith's motion was lost by a very large majority.

Dr MOTHERSOLE (Bolton) moved

That the Representative Meeting strongly protests against the action of the Minister of Health in penalizing Dr X for an alleged offence of which the Committee of Inquiry has declared that Dr X was not guilty and that the charge ought not to have been brought.

He said that his Division wished him to bring the motion forward because of its importance to the members of the profession, not only as medical men, but as citizens of the freest country in the world. The case was that of a doctor who did not take a swab from a throat. The *Times* was moved to a leader on the subject called "Perils of the Panel." The *BRITISH MEDICAL JOURNAL* also had a note entitled "Acquitted—but fined." Everybody had heard of a famous brand of justice called "Jedburgh justice," under which a man was hanged first and tried afterwards. The Minister of Health had provided a new kind of justice. It was new, though the furious or infamous Star Chamber might have had some connexion with it. When the deputation from the Insurance Acts Committee was interviewing the Minister of Health, it spoke of the strong feeling existing in the profession, and the Minister of Health said that he wanted to see the basis of the statement made. It was only right that the Representative Meeting should show to some extent what was the feeling in the profession on the point.

Dr DAIN did not think that the mover of the resolution could be congratulated on the accuracy with which he had presented the case. It was not accurate to say that the doctor was found not guilty of not having taken a swab. What he was found not guilty of was gross negligence. In the recent interview with the Minister the particular case was used as an example of the principle that the Association could not consent to any authority setting up standards of treatment, that the professional standard was laid down by the General Medical Council, and that the Association would not consent to the judgement of the practitioner being made subject to consideration by officials of the Ministry who had not even heard the evidence, but had only read the report of the case. The principle that was then enunciated was accepted by the Minister of Health. The resolution really came too late. A strong protest had been made against the action of the Ministry. The resolution asked that such a protest should be made. The Minister, in the presence of his officers and with their advice, had accepted the principle which had been laid down. Before any further steps were taken by the Association it ought to see what effect resulted from the interview which had taken place. He hoped the Representative Meeting would not ask the Council to make any further protest with regard to this particular case.

The CHAIRMAN said that the protest which had been made based upon this particular case emphasized the principle which it was desired to establish. That principle had been accepted by the Minister.

Dr JOHNSON SMITH desired to move that the meeting proceed to the next business, the matter having been thoroughly ventilated.

Dr WALLACE HENRY thought that if a resolution to proceed to the next business were moved it might be misunderstood. He moved and Dr J. F. WARRER seconded, that the meeting approve the action of the Insurance Acts Committee in protesting in this particular case.

Dr MOTHERSOLE agreed with this course and was willing to withdraw his motion in its favour. He had, he said, been dealing merely with the injustice of penalizing a man

after he had been tried and found not guilty. His resolution was intended to support and strengthen the hands of the Insurance Acts Committee.

The meeting signified its assent to the withdrawal of Dr. Mothersole's resolution.

The CHAIRMAN said that some who were present at the interview with the Minister of Health were of opinion that what the Minister felt most was that he personally was being accused of doing something more objectionable than previous Ministers had done, and that was something which it was certainly not desired to convey.

Dr. DAIN remarked that the evidence given before the Royal Commission was not finally the business of the Insurance Acts Committee at all, but was the responsibility of the Council.

The CHAIRMAN said that Dr. Wallace Henry had elaborated his resolution so that it read as follows:

That this meeting approves the action of the Insurance Acts Committee in protesting in the case of Dr. X and welcomes the declaration of the Minister of Health that he accepts the principle put forward by the deputation.

The motion in this form was carried.

The Evidence before the Royal Commission

On the general motion to approve the Report, Mr. E. B. TURNER wished to draw the attention of the meeting to a precedent which had been set up in the presentation of the evidence to the Royal Commission, which seemed to him and many others extremely dangerous, and likely to destroy the democratic constitution of the Association. The Representative Meeting was the supreme body of the Association, and alone had the power to give expression to the opinion of the Association, to put the imprimatur or the Association upon acts done, and to determine the policy. The Council was the executive body of the Association, working under the Representative Body. The Council could express an opinion of its own, but it was the opinion of the Council, not of the Association. The Council might initiate new policy on the reports from the standing committees or from *ad hoc* committees set up by itself, which policy must come before the Divisions and before the Representative Meeting before it became the policy of the Association. It was right for the Council to take action, and take action promptly, within its powers and within the policy of the Association, but the evidence which had been laid before the Royal Commission had not been submitted to the Representative Body as such. It was submitted to a body consisting of the members of the Representative Body disembodied, and diluted with a very strong infusion of the Panel Conference—a body possessing no statutory authority whatever in the Association. He was very jealous of the rights and privileges and offices of the Representative Meeting.

The CHAIRMAN OF COUNCIL said he would be glad to have a confirmation of the impression he had at the time the meetings in question were taking place—namely, that the Representative Body entered with cheerfulness and alacrity into the method by which an endeavour was made to obtain the views of the whole profession ("Hear, hear"). There might be some who thought that the technicalities of a constitution should override the necessities of an occasion such as that which had arisen, but he was not one of them. The Association had many times disregarded the strictly legal rights of one or other of its bodies in order to be sure that there should be no vestige of suspicion that it was endeavouring to put forward, as the view of the profession as a whole, something in which people outside might conceivably have had no voice and the procedure adopted on the occasion now under discussion was eminently calculated to elicit the opinion of all sections of the profession. He believed the Commission and the Government departments who were interviewed were satisfied that the Council had obtained the views of the profession as a whole. The members of the Representative Body took part as individuals in the Conference and expressed their views and the occasion was obviously one when the Association threw aside all narrow restrictive conditions and tried to find out the opinion of the medical men of the nation ("Hear, hear"). If the Council had acted unwisely the meeting

should say so, but it was his firm conviction that it had acted properly, and that the Representative Body would unhesitatingly approve.

The CHAIRMAN said he could, he thought, be trusted not to give away any of the privileges or powers of the Representative Body. The evidence before the Royal Commission was presented, not as the evidence of the Representative Body, but as the evidence of the Council arrived at after adopting a certain procedure and calling a special conference. The consultation of the Divisions and of the whole profession, the calling of the special conference, and the fact that the Representative Body did not sit alone, but with others, were all set out in the preamble to that evidence, and the Royal Commission asked certain questions about it. It was made clear to the Commission that the evidence was presented to them on behalf of the whole profession, so far as any body could speak on its behalf, by the Council of the Association, after it had taken immense trouble to go through the particular procedure designed to ascertain that opinion. The Council now presented a report of what it had done, and it was for the Representative Body to censure or to endorse its action. To endorse it did not mean to endorse every item of the evidence submitted, but to approve the way in which that evidence was procured, the way in which the Council formed its opinion on it, and the fact that it presented that evidence to the Royal Commission, not in the name of the Representative Body, but of the whole profession. By approving the motion submitted by Dr. Dain that would be done.

Mr. TURNER wished to ask the Solicitor whether everything he himself had said with regard to the powers of the Representative Body was not correct. The CHAIRMAN said that as far as he could recollect, Mr. Turner had said nothing which was against the proper interpretation of the constitution of the Representative Body. Mr. TURNER said he had stated that the Representative Body was the only body which could give the imprimatur of the Association to any evidence or in any way go to work contrary to the previously declared policy of the Association. The CHAIRMAN said he had already mentioned that it was made clear to the Royal Commission that it was the Council of the Association which, after adopting a certain procedure, tendered the evidence given.

Dr. J. W. BOVE asked whether it was not a fact that a Special Representative Meeting, consisting of the representatives themselves, was held as a preliminary to the joint conference and authorized the action taken by that conference. The CHAIRMAN said that meeting merely authorized the sitting of members of the Representative Body in a conference with representatives of other people. Dr. BOVE said that that made the position legal.

The report of the Council under "National Health Insurance" was approved.

Dr. MOTHERSOLE submitted the second part of his resolution, the first part of which he had already withdrawn. It read:

That the Minister of Health be invited to state what are the functions of a committee of inquiry, and how far its findings are binding on himself.

He did not wish to embarrass the Insurance Acts Committee, and would be willing, if the Chairman of that Committee could assure him that the information could be obtained by other means, to withdraw it.

The CHAIRMAN said the functions of a committee of inquiry were laid down in the regulations.

The amendment was by leave withdrawn, and approval was given to the sections of the Report under "National Insurance."

Co-operative Societies and Insurance Prescriptions

Dr. C. J. KIRK (Darlington) moved:

That the action of the co-operative societies in allowing the prescriptions presented by patients under the Insurance Acts when the patients are also members of the co-operative societies, to rank for dividend is entirely opposed to the spirit of the Acts. It is calculated to encourage malingerers to throw unnecessary work upon the practitioners and mistaking the medical benefit and to bring the work of the Insurance Acts into disrepute.

He asked that the Council might be instructed to press the Minister of Health to remove this abuse. Some months

ago the Darlington members discovered that the local branch of the co-operative society was giving dividend warrants for every prescription handed in by insurance patients. A protest was made to the Insurance Committee, which in turn protested to the local branch of the co-operative society, and received the reply that pending a legal decision on the question the giving of such dividend warrants would be suspended. No warrants had been given since, so that it might be the society had seen the error of its ways. It was felt that was calculated to throw unnecessary work on practitioners administering the Insurance Act, especially if, as was contemplated, that Act was extended to cover dependants.

Dr DAVY asked whether Dr KIRK would consent to an alteration to refer the resolution to the Council, which would pass it to the Insurance Acts Committee for investigation and, if necessary, lay the facts before the Minister.

Dr KIRK accepted the suggestion to refer the resolution to the Council, and in this sense it was agreed to.

The meeting adjourned at 6.15 p.m.

Saturday, July 18th

The meeting resumed at 10 a.m., under the chairmanship of Dr BRACKENBURY.

ORGANIZATION

The Membership of the Association

Dr MORTON MACKENZIE (Chairman of the Organization Committee) said the membership of the Association the previous day stood at 29,680 (Applause). There was an increase in 1924 of 2,300, and a further increase of 1,250 in the last six months. The membership was now 3,000 more than ever before. When, as Chairman of the Propaganda Subcommittee, he inaugurated the chart of membership hanging above the platform, he never expected to see the figures go right off the chart as they had done. The increase was most gratifying, but he must not be expected to be able to continue to report such enormous increases. The entries into the profession, in the natural course of events, would not be so numerous in the next few years as they had been in the last five. By the efforts of the Propaganda Subcommittee nearly every non-member who might reasonably be hoped to join the Association had become a member. The increase was due to various causes. It was due not only to the very good work, and the increasing amount of work, done at headquarters, but also to the tremendous field for recruiting which had been discovered among the newly qualified. That was a field which ten years ago had not been explored as it ought to have been. It was owing to his predecessor, Mr Russell Combe, that it had been explored. It had proved a very prolific source. He wanted specially to mention the names of four areas and the names of certain gentlemen connected with them who had done very good work for the Association in this regard. The names were Newcastle, Dr Farquhar Murray, Glasgow, Dr Allan and Dr McCutcheon, Liverpool Dr Matthews, and Sheffield Dr Barr.

Bureau for Locumtenents and Assistants

Dr MORTON MACKENZIE then moved as a recommendation of Council:

That a bureau for the provision of locumtenents and assistants with power for further expansion be formed under the auspices of the Association to operate in such centres as may be deemed desirable and that the organization be set up under the control of the Association by means of (a) a separate limited liability company or (b) a society registered under the Friendly Societies Act whichever may be found the more suitable.

He said that this concerned a new activity of the Association. It was a rather radical suggestion perhaps that the Association should start this fresh work, but the proposal had not been put forward without very good reason. Last year the Council did not feel quite able to embark on it, but this year the Council and the Organization Committee had unanimously decided to ask the Association to take the matter up. The great reason why the work should be undertaken was that it was necessary to do

something for the newly qualified man. The Association, in connexion with its arrangements with the Society of Medical Officers of Health, was asking its younger members to refrain from applying for posts which meant a great deal to them, and it was providing little in return. There was a real need for such bureaux in provincial centres. Newcastle and Edinburgh had set up bureaux of their own. Manchester had set up a bureau on somewhat different lines under the auspices of the Local Medical Committee. Newcastle and Edinburgh were acting under the auspices of the Association, and their legal position was a little uncertain. It was hoped that it would be regularized by the adoption of the proposals he was about to make. Another factor in the situation was the work of Dr Farquhar Murray in Newcastle, which could not be spoken of too highly. Dr Farquhar Murray was an enthusiast, he had devoted an enormous amount of time and trouble to the matter. He ran the bureau almost without charge to its clients purely as propaganda work for the Association, and it had produced a tremendous effect in the Newcastle area. Another reason for the proposal was that there was a growing feeling that, with the removal to the New House, the time had arrived when the Association should undertake everything for medical men. What were the disadvantages connected with the proposal? The Association could not legally undertake the work itself, but, thanks to the suggestions of the Financial Committee, it would be possible practically to perfect an organization which, while under the control of the Association, would be a separate entity. If the resolution were adopted it would be possible within a very few weeks to register a limited liability company which would be able to do the work for the Association. A difficulty in the way was that of finding the voluntary workers, but there was in view in every area a man who, it was hoped, would take up the work. The adoption of the resolution he was now moving would merely authorize the registration of a limited liability company. It was hoped that the agencies in Newcastle, Edinburgh, and Manchester could come in when the company was registered, and it was hoped to establish bureaux in Birmingham, Bristol, Leeds, Liverpool, Sheffield, Belfast, Dublin, Aberdeen, Dundee, and Glasgow, and, later on, Cardiff. There were certain details which he was going to ask the Representative Meeting to leave to the Council to decide.

Dr MACKENZIE said, in reply to questions, that after careful exploration of the question the Organization Committee was unanimously convinced that a limited liability company offered better means than a society registered under the Friendly Societies Act.

Dr J. STEVENS suggested that the word "bureau" be used instead of "a bureau," and that the words "to operate" be left out.

The CHAIRMAN said he would ask Dr Stevens to move an amendment after the amendment on the paper had been dealt with. In the absence of the representative of North-East Essex, the Chairman moved on behalf of that Division that the recommendation be referred back for further consideration, and, after calling for a show of hands, announced that the amendment was "lost unanimously."

Dr STEVENS then formally moved as an amendment his suggestion to substitute "bureau" for "a bureau" and to delete the words "to operate." Dr P. MACDONALD formally seconded. The amendment was lost.

Dr J. A. MACDONALD proposed instead of the words "to operate" the phrase "with branches" ("that a bureau be formed in such centres"). Dr STEVENS said this suggestion met his point and seconded Dr MACKENZIE's suggestion and the amendment was agreed to.

Dr F. C. MANNING said the proposal was to set up an organization under the control of the Association, but he did not see how the organization was going to control it unless the Association kept all the shares in it to itself. Even so he had a great dread of bureaucracy, and feared lest the working of the company should never come before the Representative Meeting at all. He wanted some safeguard to ensure that the Representative Meeting should be able to exert some control and that the company should communicate with the meeting and let it know what was being done.

Dr MACKENZIE said the proposed company would be under the Association's control, so far as it could be provided for under its Articles. Most of the shares would be held by the Association, and most of the directors would be members of the Association, but there might be some outside directors. As regards the control by the Representative Body, the annual meeting of the company would be held during the session of the Representative Meeting so that members of that body could be present at the annual meeting of the company.

Dr JOHNSON SMITH asked whether the proposed company would be a private or a public limited company. There was, he said, a great deal of difference between the two.

The FINANCIAL SECRETARY said the intention was that it should be a private limited liability company with shares of two classes, the "A" shares having the voting power and being held by officers and officials of the Association.

Dr E. R. FOTHERGILL said the members of the Representative Body, not being shareholders of the limited liability company, would have no power to be present at or take part in the meetings of the company, so it was difficult to see in what way the Representative Body could control the company.

The FINANCIAL SECRETARY said the voting power would be held by officers and officials of the Association, and the Representative Body could get rid of them if it disapproved of their action.

Dr JOHNSON SMITH said if it was to be possible to reappoint the directors then shares would have to be held on transfer. He agreed with Dr Fothergill that the Association could have very little control over the directorate.

Dr J. A. MACDONALD asked whether, should an office be transferred to someone else at the next election, his votes would be transferred also, or whether they would be retained by the person who already held them.

The FINANCIAL SECRETARY said the votes would be transferred with the shares. There was nothing to prevent a man holding shares and signing a blank transfer which could be used by the directors when required. One of the advantages of a private limited company was that the shares were at the disposal of the directors.

Dr BARCROFT ANDERSON thought all objections would be met if it could be arranged that there were as many bearer shares as there were members of the Representative Body, so that all those attending the Representative Body meetings would be shareholders.

Dr H. C. BRISTOW asked whether the directors could be got rid of as directors without depriving them of their positions as officers of the Association.

The FINANCIAL SECRETARY said the answer was in the negative. The suggestion that every member of the Representative Body should be a shareholder was impracticable, because the number of shareholders in a private limited liability company was restricted by law to fifty.

The CHAIRMAN said that the first point on which the Committee would like to have the opinion of the Representative Body was whether it wished a bureau of the kind suggested to be established under the auspices and, as far as possible, under the control of the Association. (Cries of "Yes.") The discussion recently had been confined to the details of how that should be done, there had been no discussion on the principle, which seemed to be accepted. He would like the debate to be directed in the first place to the question of principle—whether the bureau should be set up or not.

Dr T. R. DAVIES (South-West Wales) thought there was every prospect of the company acquiring a monopoly in the agency business. There was a subsequent motion dealing with the remuneration of assistants in general practice, and the two questions were connected. If the Association laid down a minimum for the payment of assistants in general practice, and at the same time acquired a monopoly in the agency business, it could enforce that minimum, but it was doubtful whether, in view of the various circumstances which might prevail, it was desirable to enforce even so moderate a minimum as that suggested.

Mr E. B. TERNER said the Association should be absolutely certain before proceeding further, that it was on a sound legal basis, because it was attempting to do in a

roundabout way what it was not allowed to do. He wondered whether the precautions taken for that purpose would not be swept away by a judge if the question came before a court of law.

Dr C. J. KIRK (Darlington) said that doctors preferred men of experience as locumtenents. The fact that the bureau it was proposed to establish would be in competition with other bureaux providing locumtenents might lead to its having to provide, as the others did, men with a certain amount of experience, thus interfering with one of its primary objects, the helping of the newly qualified man. If the bureau reported only to the limited liability company, and not to the Representative Meeting, he did not see how the Representative Meeting could safeguard the interests of the newly qualified man.

Colonel J. W. F. RAIT regarded Mr Turner's suggestion, that the matter should be referred to the Solicitor, as most important. With his legal skill he would be able to find some method by which the Association would be able to undertake the duty proposed, and by which the profits, if any, would all fall to the benefit of the Association.

Dr MORTON MACKENZIE said the Association had a first-class business man in charge of its business affairs, and he was taking every possible step to safeguard its interests, an Organization Committee, which had been checking very carefully what he did, and a Solicitor, to whom the articles and memorandum of the company would be sent directly the proposal was passed. As far as was humanly possible, what everybody desired was going to be done.

The CHAIRMAN said the Solicitor's view was that the meeting must first approve or disapprove the principle. When the exact form of words of the memorandum was submitted to him it would be very closely scrutinized from a legal point of view.

Dr F. RADCLIFFE asked to whom the articles of association would be submitted before adoption—to the Representative Body, the Council, or whom?

Dr MACKENZIE said that must be left to the meeting, but he might express the Committee's preferences. It was very important that the company should be registered as quickly as possible. If the meeting was not confident the Committee could cope with the matter they were prepared to submit it to the Council, but that would mean a delay of three months. If it was to be submitted to the Representative Body that would hang it up for a year, which would be the greatest possible mistake.

Dr FOTHERGILL: If to neither the Council nor the Representative Body, to whom will it go?

The CHAIRMAN said that if the meeting approved the principle, without saying anything else it wished done, everything was in order for the principle to be carried into effect as rapidly as possible, with proper legal and business safeguards.

Sir JENNIFER VERRELL said that at this time of day it was a little late for the Association to trouble itself about details. Years ago they were told by many people that by means of a limited liability company the Association could do many things that it could not do by itself. He suggested the meeting should content itself with accepting the principle, and leave the whole matter in the hands which had always proved reliable. (Applause.)

Dr D. C. KIRKHOPE doubted whether the meeting could accept the principle until it was satisfied that the Association was legally able to control a limited liability company.

The TREASURER (Mr Bishop Harman) said the Association owed it to the younger brethren to adopt the principle. The only question was as to ways and means. The law was most accommodating, and allowed all well disposed persons to carry out their business to the widest possible extent, with the least hindbound principles. The Solicitor would confirm that. (Laughter.) There was no difficulty in carrying the matter through in a perfectly legal and straightforward way. The Association could control a limited liability company in the same way as it controlled the several trusts already established under its regis. He urged the meeting to pass the principle and leave details to the proper officials. At first he was strongly biased in

favour of a friendly society, but had been convinced of the superior advantages of a private company.

The CHAIRMAN said the proposition committed the meeting to the principle of establishing a bureau in various places in the country, and left the officers of the Association to carry the matter through on sound legal and business principles, without reporting details to the Representative Body. Was that agreed? ("Agreed.")

The motion was carried with one dissident.

Dr MACKENZIE further moved that the questions of confining the activities of the bureau to provincial centres, of the bureau subsequently taking over the work of transfer of practices, and of limiting the activities of the bureau to newly qualified practitioners up to the end of the fourth year after registration, be reserved for further consideration by the Council. He asked the meeting to delegate the decision on these details to the Council, because they would have to be settled before the Representative Body met next year. The time was not ripe for a full discussion of the details, and the matter should not be delayed, because bureaux were being formed, and every fresh one formed independently increased the difficulty of co-ordination. Referring to the question of confining the activities of the bureau to provincial centres, he said that the question whether to open in London or not was a very difficult one. The advantages rather appeared to outweigh the disadvantages. Whether the Association should open on its own account or whether it should do the work through any existing agency was also a matter of discussion and of delicate negotiation. The desire was to give the Branch bureaux as much local option as possible. As to the limitation of the activities of the Association to men in the first four years, a little consideration showed that such a limitation would be practically impossible. He did not think that the Organization Committee would recommend the Council to go further into that matter.

The motion was carried.

Dr MACKENZIE finally moved that in any such scheme instituted as above, preferential treatment be given to members of the British Medical Association.

Dr R. D. MOTHERSOLE (Bolton) asked whether preferential treatment referred to financial treatment only or whether it covered wider matters. Dr MACKENZIE said that it was suggested that the matter should be left to the decision of each bureau.

The motion was carried with three dissidents.

Individual Medical Defence

Dr MORTON MACKENZIE moved

That the Council be authorized to prepare a draft scheme (as to a separate medical defence organization as outlined in the Annual Report of Council) on the basis of an annual subscription of £1 in order to a certain number of members who desire the initiation of such a scheme and would be prepared to join in its membership.

Dr F. C. MURLEY raised the question whether this motion was in order, in view of the fact that it had been the subject of a decisive vote at the last Annual Representative Meeting. The CHAIRMAN said that it was perfectly in order.

Dr MACKENZIE, proceeding, said that there was a full discussion on the subject last year at Bradford, and the year before at Portsmouth. On both those occasions the matter was raised by the Warrington Division. In 1923 it asked the Council to get the articles and by-laws altered, and in 1924 it brought forward a motion on somewhat similar lines. On each occasion the Council felt obliged to resist the Warrington proposal. In 1923 the proposal made by the Warrington Division was lost by a small majority, and in 1924 a proposal by Manchester was lost by 53 votes to 76. It was obvious that there was a very large number of who earnestly desired that the Association should undertake medical defence. The Organization Committee persuaded the Council to allow it to explore the whole subject, and it had been explored as it had never been before. Mr Ferris Scott had been most carefully into the financial question. The history of the whole movement had been gone into most fully by Mr Lawrence (the Intelligence Officer), whom he would like to congratulate on what appeared in the JOURNAL about 18 or 20 the previous day

(July 18th, p. 135) (Applause). Dr Cox and he had gone into every detail of the varieties of medical defence. They had carried on a triangular correspondence with Mr Ferris Scott. Eventually a special meeting of the Organization Committee was held which went into the whole subject in a very thorough manner. The argument about the Association undertaking medical defence had been going on for fifty years. Dr Brown said in 1894 that he had been wrestling with the Council on the subject for the preceding twenty years. He (Dr Mackenzie) hoped that in twenty years' time his good friends Dr Manson and Dr D'Ewart would be able to say, "It is twenty years ago since we and the Council came to an agreement about medical defence." In 1886 the Essex District of the East Anglian Branch suggested that a small sum should be contributed by every member to a defence fund. In the same year the Medical Defence Union was started in Birmingham and enrolled about sixty members. The suggestion made by the East Anglian Branch fell to the ground on the opinion of the Association's Solicitor and of the two counsel who were consulted that the matter was *ultra vires* as regards the Association. Eight years then passed by, and in 1894, on the recommendation of Dr Sussan, the Council appointed a committee to consider the matter. That committee tried to shift the individual defence on to the General Medical Council, and when its report came up at the 1895 meeting Dr Arthur Welsford opposed it, and brought up a resolution passed by an independent meeting in London. Dr Welsford also stated that he had already got 19 of the 40 Branches then existing to support the resolution—namely, that the Association should undertake medical defence. After discussion Dr Welsford's resolution was passed, and the Council again appointed a special committee, whose report was considered at a special meeting in Birmingham, and after much discussion it was decided by the necessary two-thirds majority to alter the memorandum. The second meeting necessary to alter the memorandum was called at Chislehurst, and a committee was again appointed to prepare a definite scheme for medical defence. This committee reported in favour of an optional scheme, and the Council decided to send it to the Branches, 19 Branches reported in favour and 30 against, and the Council decided not to proceed further, mainly on the ground that only 10 per cent of the members had voted. This raised a storm, and 100 members sent in a requisition for a special meeting, which was called, and after a somewhat stormy discussion Dr Welsford's original resolution was carried by one vote, and it was decided to take a referendum of the whole Association by post. Of the 8,000 who answered, 6,000 were in favour and 2,000 against. The Council decided by 25 to 22 that as only one-third of the members had voted in favour it would take no action. At the next annual meeting, in 1898, this was vigorously opposed, but an amendment to compel the Council to act was lost by 89 votes for and 108 against, and the Council's action was approved. People by that time were getting tired, and in 1899, at Portsmouth, a resolution was passed that the resolution should lie on the table. In 1903 interest was once more aroused in connexion with the constitutional changes. Sir Victor Housley again came on the scene, with others, and a new committee was appointed to consider the matter. The committee reported in favour of a scheme of co-operation with the existing societies, and the voting in the Divisions was again close—45 for and 39 against. Counsel advised that the best means was not to alter the articles of association, but to apply for a charter. That was turned down, and in 1913 and 1914 it was decided by a special meeting of the Representative Body to form a special unlimited fund for medical defence, but the war intervened and nothing had since been done. In reply to those who said it was illegal to bring forward the resolution at all, it was enough to say that the resolution of 1914 had never been repealed. Since then efforts had been made to co-operate with the existing societies, but without success.

There were several varieties of possible medical defence. First, there was full medical defence, such as that afforded by the existing societies for all members. That could be done in two ways—either in conjunction with the existing

societies or in opposition to them. Another possibility was optional full medical defence—optional for such members as desired it, and for them only. Then there was partial medical defence, including that form which one medical society provided at present, by which every legal help was given as far as the doors of the court only. Another suggestion which had been brought up by Dr. Forthgill in 1923 was that the Association might pay such expenses as were not paid by the existing societies. A third suggested form of partial defence was the provision of a legal bureau at the offices of the Association. With a view to shortening the discussion he wished to lay down certain propositions which he thought were incontrovertible: first, that if there were no existing defence societies the work of defence was a work which the Association ought to undertake; secondly, that the Association could not undertake the work under its existing Articles and Memorandum but, as in connexion with locumtenent bureaux, it could be done by a separate organization; thirdly, any form of co-operation with the existing societies was out of the question (this last was a solution for which he had always worked); fourthly, that it was impossible to impose provision for full medical defence on all members, and finally, that none of the forms of medical defence he had outlined was preferable. What was left? There remained the question of full optional medical defence. The advantages of that scheme were that it would satisfy the existing agitation, it would not disquiet members who were satisfied with the existing societies, they would not pay an increased subscription and would not be interfered with, and the Association would be saved a good deal of difficulty in the collection of the extra subscriptions because they could be collected at the same time as the ordinary subscriptions. He could see very few disadvantages. The main disadvantage, in his view, was that the existing societies would not like it, but frankly he had no sympathy with them—they had had the chance of co-operating, and had turned it down. He did not think they could do much harm. Another disadvantage, of which he was not very frightened, was that both the London defence societies had accumulated reserve funds, while the Association's society, on starting, would have no reserve fund, but it would have the backing of the Association, and he thought the backing of the great Association was worth as much as the reserve funds of the societies (Cheers). There were people who thought the Association could not do the work as well as the societies, but the brains in the office of the Association were quite as good as the brains in the offices of the societies.

The crux of the question was finance. He did not think it possible to charge a larger subscription than the societies charged. Mr. Ferris-Scott estimated that £6,500 would be sufficient, but personally he thought £7,000 would be safer, as the new society might have to face a possible future reduction of subscriptions by the existing societies. In order to make certain that there would be sufficient support forthcoming before the society was launched, it would be necessary to circulate a scheme and enclose a stamped postcard to find out whether or some maintained and others doubted, there were 6,500 or 7,000 members who desired to take optional medical defence at an extra subscription. (Applause.)

Before the merits of the question were discussed,

Dr. A. LYNDON (Guildford) moved that the Representative Body express the opinion

That the action of the Council in formulating proposals for the individual medical defence of members being undertaken in connexion with the Association is unconstitutional in view of the decisions of the Representative Body at the Annual Representative Meetings, 1923 and 1924, and a serious encroachment on the rights and privileges of the Representative Body to the general control and direction of the policy and affairs of the Association as defined in Article 31.

He said that this amendment did not raise the question whether it was wise or not wise for the Association to undertake individual medical defence. But it did impugn the action of the Council in bringing forward on its own authority this report this year. In 1923 the Council definitely advised the Representative Body that no action should be taken as regards individual medical defence and

that the work should be left to the existing societies. The Representative Body accepted that advice and rejected the resolution by Warrington and St. Helens "that this meeting is of opinion that the individual defence of members in professional matters should be one of the functions of the Association, and instructs the Council to prepare statistics on the work and cost of ensuring medical defence." In 1924 the Representative Body rejected by 58 to 76 the instruction to the Council by Manchester to formulate a scheme for individual defence. In face of its own considered judgement in 1923 and of the opinion expressed in 1923 and 1924 by the Representative Body, the Council had taken action as regards individual medical defence and had formulated proposals which it suggested should be sent round to the Divisions—all of which things the Representative Body in 1923 and 1924 refused to allow it to do. In Article 31 it was laid down that the general control of the affairs of the Association should be vested in the Representative body. The Representative Body definitely had told the Council that it did not wish this work to be done, and in face of that the Council had brought forward this report. He pressed it upon the meeting that the Council had exceeded its authority, and was encroaching upon the privileges and rights of that meeting.

Mr. E. B. TURNER said that he intended to speak and vote against the Guildford motion. The Council had behaved correctly and constitutionally. The Representative Body was the directing and controlling authority in the Association, but there was no law whatsoever by which a decision made one year stood permanently beyond such time as the Representative Body desired to rescind it. In this matter the Council was absolutely right, and he was certain that anyone who studied the constitution of the Association with an intimate knowledge of its work would vote against this resolution, though not as expressing any opinion on the merits of the discussion afterwards.

Dr. J. S. MARSON (Warrington) said that Dr. Lyndon had brought a serious indictment against the Council, but that had been completely answered by Mr. Turner, and he need not say anything about it.

The CHAIRMAN: But that is the only thing we are at the moment discussing. (Laughter.)

Dr. MARSON went on to say that the indictment was also against the decision of the Representative Body a good many years ago—in 1906 Dr. Mackenzie had said something about the charter. In 1903 the constitution of the Association was altered, and in 1906 the Representative Body found that it could do very little owing to the legal constitution of the Association. It attempted to get its freedom by the method of applying for a charter, and with this charter it hoped it would be able to get individual medical defence amongst many other objects. If this motion were passed it would be a censure on the position of this very body in 1906—because the charter for which it applied was deferred, not by anyone in the Association, but by outside bodies who opposed the application of the Association for the charter. He maintained that this motion by Guildford was of the same character as the opposition that was offered to the application for the charter in 1906.

Dr. J. T. D'EWART (Manchester) said that they were reinstated in the Representative Body to very definite discussion on the things brought before them, and they did not consider that they were bound down by resolutions which were passed some indefinite period ago. They were now told by Guildford that they must be bound down, but why? For several years this resolution had come forward. It met the usual response which fell to the lot of other resolutions. The first year a resolution was listened to, the second year it received a certain measure of support, the third year a good deal of support, and the fourth year it passed. This Guildford proposal was simply a means of bunking discussion in this fourth year. This subject had been dealt with by the Representative Body with increasing thoroughness. They had discussed it from A to Z. The minority in favour of it had gradually increased. Last year, because the Representative Meeting did not instruct the Council to do something, therefore, said Guildford, the meeting told the Council that that thing must not be done. (Laughter.) Which particular decision in which particular

year was to hold good? The years 1923 and 1924 suited Guildford. But what about 1914, when the Council was given specific instructions that it must do certain things which until this year it had not done? He did not blame the Council for not having done what it was instructed to do in 1914. The war excused not only the Council of the Association, but the Government of the county and many other people, for doing things that otherwise they would have done. The Representative Body was quite competent to deal with the matter—let it do it effectively (Applause).

Dr JOHNSON SMITH recalled the days when the Association tried to obtain a charter, chiefly because it wanted to do the very thing resisted by Guildford. At that time a great majority of the members of the Association evinced a desire for what was now proposed, but the charter was not obtained, and the matter hung fire from year to year. Personally he was content with the present arrangement, but a great many men were not. The Council had been perfectly in order in trying to ascertain what support its scheme would obtain. His Division wished the matter to be dealt with in the simplest possible manner.

The CHAIRMAN OF COUNCIL said it was only fair that the constitutional conscience of Guildford should be perfectly satisfied before the Representative Body voted on the resolution. While control of the general policy and affairs of the Association rested with the Representative Body, there must be an executive to watch events between its sessions, so as to direct the attention of the Body to changing circumstances and conditions. He considered the Council would be guilty of a dereliction of duty if it did not from time to time bring forward matters such as the one under discussion.

The amendment by Guildford was lost. Four voted in its favour.

The meeting then came back to the main proposition, which, the CHAIRMAN said, simply was that the Council be authorized to detail a draft scheme and to circulate it, in order to ascertain how many members would be likely to adhere to such a scheme. There were two amendments, one by Liverpool and the other by Cardiff, and it was for the meeting to decide which should be taken first. (Cries of "Cardiff.")

The meeting gave permission for the amendment of Liverpool to be withdrawn.

Dr E COLSTON WILLIAMS (Cardiff) then moved

That as the matter of individual medical defence is being competently dealt with by existing bodies and as it does not appear that the Association could conduct medical defence in any cheaper or better manner and as the provision of individual medical defence is not within the present powers of the Association the Representative Body is of the opinion that the matter should be dropped and that the expense of the proposed referendum of the profession be not incurred but that the Association should bring to the notice of all practitioners especially those recently qualified, the urgent necessity of joining one of the medical defence bodies.

He admitted that if his Division had been as well informed as it would have been had it known all the facts given that morning by Dr Morton Mackenzie, the amendment would have been framed differently. He thought that what was proposed was in principle eminently desirable, but as, according to the report of the Council, a separate organization might be a success if it could get 6,500 members out of a possible 7,000 non-included insured persons, there was so narrow a margin of success for recruitment that the proposition seemed a little doubtful. Having expressed his opinion on that point, his Division would probably be willing to reconsider the matter on its merits.

The CHAIRMAN: Do you withdraw the Cardiff motion?

Dr WILLIAMS: I cannot do that, Sir.

Dr P MACDONALD (York) said that at last year's meeting he spoke in favour of the Association taking up individual medical defence, but he had since become doubtful about the proposal, because there was a disadvantage which the Chairman of the Organization Committee had not touched. Sometimes it would mean defending conduct which was indefensible. That item would be small in the total amount of medical defence, but it would blink so largely in the public eye that it might be a great disadvantage to the Association.

On the other hand the Association might have to decline to concern itself with the defence of certain of its members, and that again would react to its disadvantage. He was supporting the recommendation of the Council, because he agreed it ought to be ascertained what number of members of the Association wished individual medical defence to be undertaken under its auspices.

Mr McADAM ECCLES (Maireboure) raised points which concerned those who taught in the large medical schools and had frequently to direct the young qualified practitioners. When students who passed through his hands at the hospital qualified, he always advised them as to what they should immediately do. It was extraordinary that a number of qualified practitioners forgot that the first thing they should do was to register. The second piece of advice which he always gave was to join a medical defence society, the third was to join the British Medical Association. He put that third because the other two points were so important that he thought that they ought to come first. One question that he was constantly asked was "But cannot I, by joining the British Medical Association, get the advantages of a medical defence society?" Unfortunately the answer he had had to give to that question was "No." He thought the Association could and should take up medical defence. As one of the older members of the profession, he had done his share in supporting a medical defence society, and that society had done its share in helping him. He had belonged to one of the medical defence societies for thirty-five years, and he was exceedingly thankful for all the help that it had given him. If the British Medical Association had had a medical defence side he would have been covered for those thirty-five years, because he had been a member of the Association for that period. He was certain that if the Association took the matter up quite a large number of the young members would say, "It is now worth while to write one cheque only instead of two, and to transfer from the medical defence society to the British Medical Association." It might be thought that a little ingratulation to the existing medical defence societies would be involved, but time was moving on. It was time that the British Medical Association took all the matters concerning the medical profession under its own control.

Dr MACKENZIE said that Dr Fothergill had asked for certain information, and he was now able to give some figures, but they were only estimates, and he could not vouch for their accuracy. The estimated number of members of the British Medical Association in practice in the United Kingdom, if all forms of practice were included, was about 27,000. It was not possible to say how many of those were in medical defence societies. The membership of those societies was somewhere about 20,000. That figure included a large number of dentists. It was from the difference between the two figures that the 7,000 who were estimated to be uninsured would come. Those 7,000 must not be confused with the 7,000 or 6,500 who, it was estimated, would be necessary for the proposed society. Probably many members of the existing medical defence societies would transfer to the new body.

Mr E B TURNER said that he had been instructed to oppose the proposal. He quite agreed that it would be a beautiful and ideal thing for the Association to take over the defence of its members if that were possible, but there were a great many practical difficulties in the way. In the first place it might be found difficult to obtain the 6,500 members. Supposing that they were obtained, there would be £6,500 to commence with but there would be a certain amount of overhead expenditure for salaries, staff, and housing, and the result would be that the £6,500 would be very considerably cut down. Later on upon the agenda there appeared a motion asking the Council to inquire into the causes of so many cases being brought against medical men at the present time. All that sprang from the gigantic damages given in the Hallett case. That case was financed all the way through by one of the medical defence societies from its reserves. Had such a case arisen in the first year or two of that society's existence it would have gone bankrupt or, at any rate, it would not have

been able to finance the case in the way in which it financed the Harnett case. Ever since there had been an insurance society he had been insured in it, and he considered that it would show a very great lack of gratitude if he discontinued his subscription after it had protected him for so many years. He should feel very disinclined to withdraw his subscription from a society with a substantial reserve and put it into one which was commencing with practically no reserves at all, and he thought that a very large number of the members of the Association would share his opinion. If the proposed defence society was formed, then in any case in which it was implicated which came before the General Medical Council, every one of the members of the Association who was on the General Medical Council would have to retire while it was heard.

Dr J. C. MATTHEWS (Liverpool) said that the meeting would have gathered from the withdrawal of the Liverpool amendment that those in charge of it intended definitely to support the amendment from Cardiff. The Liverpool amendment was intended to be in direct opposition to the proposal of the Council. He only withdrew it because of the decision of the Chairman that the wording of it might be taken as a blessing of the Council's scheme. It was very improbable that anything like a sufficient number of members to support the scheme would be obtained. It was estimated that at present there were only 7,000 undefended medical men in the country, and practically the whole of that number would be needed for the scheme. The number of transfers from the existing societies might be small. The members of those societies were content with the moral and financial backing which the societies could give them. In the moral backing of the Association they had every confidence, but the financial backing would, at first, be rather slender. Another difficulty was the prominence that would be given to the name of the Association in certain actions. It was obviously undesirable, whatever might be the case with regard to civil actions, that the British Medical Association should appear in defence of a man brought before the General Medical Council. The medical defence societies had great experience in their work, while there were points in regard to medical defence concerning which the staff of the Association naturally had little experience. His Division therefore opposed the proposal of the Council to pursue the matter further.

Dr DAVID LAWSON said the proposal entailed a fundamental departure from the previous policy of the Association. It meant that a body founded originally to promote the honour and interests of the profession would take up ordinary commercial business. He was not impressed by the assurance that the staff of the Association could run an insurance business successfully. Many insurance offices which started with strong financial resources and were run by men of outstanding ability and a staff whose time was wholly devoted to the work had gone bankrupt. If the organization it was proposed to set up went bankrupt, was it proposed to use the funds of the Association to make up its losses? The reserves held by the Association were not accumulated for that purpose. Many members might wish to have their contribution to an insurance scheme included in the sum they paid to the Association, but that might be effected if the Association would find out how many were prepared to pay the extra amount required and then approach a commercial company and ascertain how much they would take off their rates for these men. If the Association could provide 10,000 or 20,000 clients, it should be able to secure a satisfactory reduction in the terms. That would get over the danger of the Association imperilling its reserves and allow it to remain a professional body and not become a business concern.

Dr JAMES NEAL said he spoke in the capacity of representative of the Hendon Division—(laughter)—and nothing he said must be taken as representing his own views, and still less those of the particular medical defence organization of which he was an official. He was instructed by Hendon to oppose the recommendation of the Council and support the amendment proposed by Cardiff. His Division considered that the requirements of the medical profession in the matter of individual medical defence were fully met by the existing arrangements. An attempt to set up a new

society would be a doubtful experiment from a practical point of view, it offered no advantages, and it might weaken the prestige and influence which, to the great advantage of their members, were possessed by the existing societies. The question had been discussed by the Representative Meeting before, but usually in a somewhat different form—either that the Association itself should undertake the work, or that it should co-operate with existing societies. The issue to-day, however, was whether the Council should be instructed to draft a scheme for a new body, outside the Association but in some way linked with it, a body with no experience of the work and no reserve fund, which would be in competition with organizations already supplying the needs of some 20,000 members of the medical profession. There was no suggestion of co-operation there. He challenged the statement of the Chairman of the Organization Committee that the existing societies had been asked to co-operate and had refused. They had never been asked to co-operate. In 1920 they were asked to grant lower rates of subscription to members of the Association, and in 1922 they were asked to exempt members of the Association from payment of an entrance fee—not a word about co-operation. It was said they returned an abrupt reply to the latter request, but he wished to read a letter written by the Council of the Medical Defence Union to the Council of the Association which controverted that statement.

Dr NOR SCOTT asked if Dr Neal was entitled to give evidence, not as representing the Hendon Division, but on behalf of another organization. The CHAIRMAN said a representative could properly place before the Representative Meeting any information at his disposal which was relevant.

Dr NEAL said the information had been published. The letter read:

'The Council of the Medical Defence Union has debated anxiously and earnestly the suggestion contained in your letter of the 2nd November, 1922. The Council recognizes with gratitude the intention of the British Medical Association to induce medical men who are not yet members of the medical defence societies to become members. It holds that when such intention is translated into action the British Medical Association will be conferring a great benefit upon the profession. The Council of the Medical Defence Union much regrets, however, that it is unable to accede to the suggestion put forward by the British Medical Association, and the reason for this decision is quite simple. The Council conceives, rightly or wrongly that it has a duty to perform to the whole body of the profession and it is unable to satisfy itself that it would be acting in this spirit if it granted a pecuniary advantage to members of the British Medical Association. The Council trusts that this decision will not in any way hinder the very friendly co-operation of the British Medical Association, which it desires to foster, to maintain and to increase.'

That could not be described as abrupt. His Division felt that the present position should be left undisturbed, and that the British Medical Association should continue its work of the collective defence of the profession, leaving to the existing defence societies the work of individual medical defence.

Dr C. SANDERS (Stafford) said all that was proposed was the collection of information. Why the Association, as a scientific body out to do all it could to improve its position, should go out of its way to avoid spending a little money on obtaining definite information on which action could be taken he could not understand. The Association must consider the interests of the medical profession of the future, and of the young men who were coming into it. If as a result of inquiry some scheme were adopted by the Association, although he had no complaint against the medical defence society to which he belonged, he would, as a matter of principle, join the society instituted by the Association.

Dr J. F. WALKER (South Essex) strongly supported the amendment, on the ground that if a defence society were started it would be looked upon as an integral part of the Association, and the Association would lose prestige with the public. If the proposition of the Chairman of the Organization Committee was accepted it would be another case of the wooden horse of Troy, which, under the guise of a gift, proved to be of the most deadly peril.

Dr C. E. DOUGLAS (Fife) thought that the recommendation of the Organization Committee ought to be carried out, and that the amendment of Cardiff should be rejected.

It was a sound proposition that the Council should undertake on behalf of the Association the experiment to find out whether the scheme would be sufficiently supported. He fully sympathized with those who, like himself, were seniors in the profession, who had depended for thirty or forty years upon the existing societies, and who felt a loyalty to those societies, but there were other men coming along, and it was the younger men who would have to do the thing if it was to be done at all.

Dr J LOCKHART LIVINGSTON (Winchester) said he was instructed by his Division to vote against the Council's recommendation, but afterwards he asked for discretion to vote according to his views after he had heard the arguments put forth, and he proposed to exercise that discretion. Most of the speakers seemed to think that they were being asked to commit themselves to a medical defence scheme straight away, whereas all that was being asked for was a preliminary inquiry. There was a considerable body of opinion in the meeting in favour of medical defence being afforded by the Association ("Hear, hear"). There need be no hostility between medical defence undertaken by the Association and the existing medical defence societies, there was room for both ("Hear, hear").

Dr CHRISTINE MURRELL said the proposed new society would either be very closely connected with the Association or it would not. If it was, the practical difficulties would be considerable and might be disastrous to the Association. If it was not, would they not be simply setting up a third medical defence society? ("Hear, hear"). They would all be in favour of doing that if they were dissatisfied with the present societies, but, judging by the discussion, they were not, the general opinion seemed to be that they were doing their work very well. If that were so, was there any point in public policy in setting up a third society—that was to say, if not closely associated in name and prestige with the Association? It would be a considerable advantage to a member who belonged to a protection society that, if he got into professional trouble, he could go to the protection society quietly and get redress without the matter becoming known in his professional and scientific association. Therefore there was an advantage to the individual in having the two things divorced. (Applause.)

Dr A LYMON (Guildford) said he had been instructed by his Division to support the amendment by Cardiff. He repudiated the suggestion that he was in any sense representing the Medical Defence Union. He was as loyal a member of the Association as anybody in the room. Believing that it would be a very unfortunate step for the Association to undertake the work proposed, he was bound to support the Cardiff amendment. It was obvious that legally the proposed new society must be distinct from the Association, and therefore would simply add one more to the societies now existing, which meant another set of offices and paid officers, and the money would have to come out of the pockets of the profession. In the first few years the new society's reserves would be very small. It was only within the last ten or twelve years, during which they had been able to accumulate large reserves, that the Medical Defence Union and the London and Counties Medical Protection Society had been able to carry on their work with conspicuous success. If the proposed society were started it must in the nature of things be in opposition to the existing societies, which would mean one society of medical men fighting against another. No society undertook to defend a member in any year in which his subscription was not paid. Moreover, if a member of one of the existing societies resigned and joined the new one, and he was afterwards accused of an offence taking place two or three years previously, he would be left without legal defence against that action. The Representative Meeting had already decided upon one big new venture—namely, the setting up of local bureaux. If another big scheme was embarked upon there would be the risk of piling a great deal of work upon a limited number of men, and there would be a danger that the work would be concentrated in the hands of men who lived in the South of England, to the exclusion of men who lived farther afield. Also it would tend to get into the hands of the very senior men. He felt very strongly that it would be to the disadvantage and

detriment of the Association if it undertook the work, and he should be compelled to vote for the amendment from Cardiff.

Dr H G DARY (Birmingham Central) said that his Division was strongly of opinion that the proposal of the Council should be opposed, and he was instructed to support the amendment proposed by Cardiff. He wished to mention one point that was relevant to the subject—namely, the position of the Association in the eyes of the public and in the eyes of the profession. The Association had striven to increase its influence and it had been very successful in doing so, largely because it had always been able to maintain the position that anything it did must first of all be in the interests of the public. Directly it attempted to deal as an Association with individual defence it would run very considerable risk of losing its influence and prestige. It was possible to work amicably with the societies which dealt with medical defence. They were carrying on their own work. They had learned it, and they had funds behind them. The Association could work with them in the way the Cardiff amendment suggested. He considered that it would be better not to enter into competition with them but to help them.

Dr W J LEIGHTON (Preston) said that he was instructed by his Division to vote in favour of the resolution as put forward by the Council. It was rather doubtful of the wisdom of the resolution, but it thought that at any rate there would be no harm in finding out how many men were likely to join such an organization as that suggested. The opponents of the resolution objected that it would involve interference with vested interests, but if the Association had never interfered with any vested interests it would not have been able to rebuild 429, Strand, or to expand to Tavistock Square, and it would have been in the position in which it was forty or fifty years ago. A great deal had been said about the prestige of the British Medical Association. The British public did not know the difference between the British Medical Association, the Medical Defence Union, and the General Medical Council. (Laughter.) It thought that they were all one and the same thing. The Association might lose prestige if it lost a case in the courts, but what would that be compared with the prestige that it would gain from the enormous number of cases that it would win? It had been said that the society would have no reserve funds, but he thought that there was no doubt that Dr Morton Mackenzie and Mr Ferris-Scott could devise a means of paying a premium to an insurance company to protect the society for the first few years during which the scheme was in operation.

Dr J S MARSON (St Helens and Warrington) said it had been stated that it was unlikely the new scheme would be any better than the facilities provided by existing societies, but that was a matter of opinion. There were some cases, it was said, which could not be taken up, being indefensible, but injustice might result to those whose cases were not taken up, and under the Association's scheme before a case was turned down it would be possible to get the support of the Division in whose area it occurred and get its advice as to whether it should be taken up or not. That safeguard did not exist at present, but that was the principle on which the French societies acted in defending their members. The duty of a defence society was to protect the individual, but individuals were not so fully protected at present as they might imagine. He knew of one case where a locum tenens made a blunder for which his principal was sued, and the principal's defence society declined to take the case up because the locum tenens was not a member of it. There were many such instances where the Association's scheme would afford additional protection.

Dr S NOX SCOTT (Plymouth) supported the Council's recommendation. If the information sought was not obtained, the representatives would be voting in ignorance of the feeling of the members generally. As secretary of a large constituency, he was often asked what the Association did to defend its members, and had to answer that it did nothing. The principle was now accepted that the Association should look after the financial interests of its members. The future of the profession as an organized

body depended on getting the younger members into the Association, and nothing was more likely to attract them than the assurance that the Association would defend them if necessary.

Dr J T D'EWART (Manchester) said it was not often he found himself defending the Council, which was frequently accused of not being democratic enough, but to-day the Council was suggesting that the Divisions should be consulted, while the Representative Body was being advised by some speakers to say that that must not be done. It was impossible to imagine why the Divisions should not be consulted. No definite scheme had been brought forward, once such a scheme was elaborated the details could be discussed and the wishes of the members ascertained. In spite of continual pressure by the Association many thousands of its members did not belong to defence societies, and such individuals were a potential source of weakness to the profession as a whole. Many of them, however, would join a defence society conducted by the Association. Those who would not join the Association usually asked what it would do for them personally. They took no interest in the welfare of the profession as a whole. If they could be told that it would defend them in individual cases that would be a powerful argument in persuading them to join. With regard to the newly qualified, only last week he addressed some of those who were about to qualify, and told them they must first of all register, then join a medical defence society (and that in spite of what had been said as to lack of co-operation between the Association and the defence societies), and thirdly, join the Association. It was not right that he should have to put the Association third ("Hear, hear").

Dr C O HAWTHORNE (Maitlebone), in supporting the amendment, said that if the referendum were taken and some 7,000 members could be obtained in favour of the scheme, then the Association would be morally bound to go forward with a scheme of defence. The second point emerged from a speech by Dr Manson in which he revealed one of the dangers which was likely to follow if an organization, British Medical Association in substance but not British Medical Association in name, took up the individual defence of members. Dr Manson said that the decision as to whether an individual member should be defended or should not be defended would be in the hands of the local Division of the Association, for the Division would know the good qualities he possessed. It might happen that the local Division would be in favour of the defence while the central organization was against it, and that was a source of danger. He agreed with the point Dr Landon had made, that the work of the chief officers of the Association was already very heavy.

The TRAFALGAR (Mr Bishop Human) said the Association could not say it would leave the individual to one society and the profession as a whole to another. He had only to refer to the Harnett case to show that if it were not for individual defence the profession would be in a perilous state. To fight for the individual was to fight for the profession at large. If the Harnett case had not been won there would have been many lunatics wandering about at large to do, to their own danger as well as to that of the public. On the night of the publication of the result of the trial before Mr Justice Lush the editor of one of the London papers had chided him (Mr Bishop Human) about the failure of the profession, and he had rejoined: "In a month's time you will be regretting that intensely, for no doctor will be certifying any lunatic in future." With regard to students, he met many post-graduates who said they must join something, and what was it to be? He was bound to reply, with great reluctance, that they should first join one of the defence societies, and afterwards the British Medical Association. If one looked at the reports of the societies one saw that they were trenching upon the job of the Association in giving advice on general matters. When the matter had come before the Organization Committee on the last occasion he had read with great interest the memorandum which had been prepared by Miss Lawrence, the Intelligence Officer, and he had been shocked to see that there had been such an intense desire on the part of a large number of members for individual

medical defence and that the Council had completely smothered it. Now Dr D'Ewart and Dr Manson were following, and he was impressed by the duration and intensity of the agitation, and he wanted to know, as an officer of the Association, what was the width and the depth and the volume of the opinion behind it.

Dr E R FOTHERGILL (Brighton) said his Division had gone carefully into the question, and did not want a referendum on the scheme which was now practically in the office. The foundation of a good defence society was the solicitor's department. It would be necessary to train a firm of solicitors, and that could not be done in a day. He suggested that the only way to get co-operation was to raise the subscription to the Association and tell the members to join any one of the three reputable societies, and for the Association to pay their subscriptions.

Dr MACFARLANE said that some speakers had assumed that the proposed defence society would necessarily undertake the defence of any member, whatever he had done. That was a mistake. The society would reserve the right to decline to defend anybody for sufficient reasons. If the referendum proposal had been passed much of the discussion at the meeting would have taken place better next year when the figures were known. The Council wanted to fill up the one gap in the information obtained. It was known what was the feeling in the Representative Meetings at Portsmouth and Bradford, 43 per cent of the representatives, approximately, were in favour of the proposal, and 57 per cent were against it, but it was not known what was the feeling among members generally. That could not be ascertained without taking a postal vote. If a large proportion wanted it, that would influence some of the waverers, if only a small number wanted it, those who had been so persistent in bringing forward the motion year after year might come to the conclusion that it was not worth while going on with it, at all events not for some years. The question was, not whether the Association should undertake medical defence or not, but whether the Council was to have permission to take a referendum—which it might have taken without permission had it wished. He did not agree with Dr Hawthorne that if the resolution was passed the Association would be morally bound to go on with its medical defence scheme, whatever the result of the referendum. The motion was for taking a referendum to find out what weight there was behind the agitation which had been going on in the Representative Meeting for several years and in the Association for fifty years in favour of the Association undertaking medical defence.

Dr COLSTON WILLIAMS, replying on the Cardiff amendment, said that he was a new-comer to the Representative Meeting, and when he spoke that morning he was insufficiently furnished with the facts. He admitted that he had gained additional information from the Chairman of the Organization Committee. But, living as impartially as possible to weigh the question on its merits, he could not see that anybody had answered what to him was the essential and crucial point of the whole position. To make a society which was essentially identified with the Association undertake the defence of its members would be to make it responsible for certain very difficult and complicated decisions. For instance, if the Association were contesting a matter of national negotiation, and owing to the position it took up it was the target for critical comment in the press, and at the same moment it undertook the defence of a weak case on behalf of a member of the Association, would not his case be prejudiced by its defence by the Association, although under another name? Any counsel who knew his job would bring before the jury the fact that the defendant was being defended by the British Medical Association as such. He admitted that that possibility worked two ways, backed by the Association, the defendant might be much better off than he would be without it. But it must be remembered that the Association might be forced into the defence of cases which it did not wish to take up. Members of the Association now had the advantage of receiving advice and help, if they were in serious difficulty, from members of the Association's office staff. With the assistance of a legal defence association

their position was stronger than it would be if they were in the hands only of the Association. The possibilities of co-operation had not been fully explored, because junior members could be influenced to join existing defence societies if it was the judgement of the Association that these societies were doing their job soundly and well.

The CHAIRMAN, in summing up the discussion, said that the proposition before the meeting was that the Council should be allowed to formulate a scheme and then ask members of the Association how many of them would wish to join a scheme of that kind. The amendment of Cardiff was in effect a reasoned negative to the proposition, with an alternative suggestion, and for that reason, as a matter of order, the one could not be separated from the other. If representatives thought that the dangers were so great that the results so certain that the proposal ought to be turned down at once, they would vote for the amendment of Cardiff. Neither proposition ruled out the possibility of exploring methods of co-operation ("Hear, hear"). What was proposed was not a referendum in the ordinary sense of expressing an opinion on the main issue, it was an inquiry as to how many members would like to join such a scheme.

Dr LYNDON demanded that the vote be taken by roll call, and, a sufficient number of members supporting him, the vote was so taken. There voted

In favour of the Cardiff amendment	97
Against	72

The Cardiff amendment was then put as a substantive motion, and, on a show of hands, the CHAIRMAN declared it to be definitely carried by a large majority. No count of numbers was called for.

Dr BANCROFT ANDERSON asked whether the carrying of the motion meant that the meeting was satisfied that individual medical defence was being competently dealt with at present.

The CHAIRMAN: The amendment by Cardiff was carried, and representatives must put their own interpretation upon it.

Constituencies for Election of Members of Council

Dr MORRIS MACKENZIE moved the adoption of the Council's proposal for an altered grouping of constituencies for the election of the Council for 1926-27.

With regard to the election of the twenty-four members of Council, it was proposed that the North Wales and Shropshire and Mid Wales Branches be made a separate group for the election of one member, that the South Wales and Monmouthshire Branch be similarly a separate group, and that the independent grouping of the Munster Branch be discontinued, this Branch to be added to the group formed by the Connaught and South Eastern of Ireland Branches. With regard to the election of the twelve members of Council it was proposed that the two Welsh groups, together with the Birmingham and Staffordshire Branches, should constitute Group IV, that the Connaught, South Eastern of Ireland, Leinster, and Munster Branches should constitute Group XI, and the Ulster Branch Group XII.

This was agreed to.

THE TWENTY-FIRST ANNIVERSARY OF THE REPRESENTATIVE BODY

Presentation of Badge of Office

The further discussion on organization was interrupted for a report by the Committee on the commemoration of the twenty-first anniversary of the Representative Body.

Dr C O HAWTHORNE stated that, as the result of the suggestion made at the Bradford meeting that each member be asked to contribute the sum of 10s to the fund to commemorate the twenty-first anniversary of the Representa-

tive Body, a total of £78 10s had been received. A Badge of Office for the Chairman of the Representative Body had been obtained at a cost of £70, and the balance was proposed to be paid into the Association's Medical Charities Fund if and when established. Dr W Douglas, who has been the representative of the Maidstone Division continuously from the inception of the Annual Representative Meeting in 1903 to the present, was asked to invest the Chairman with the Badge, and Dr Hawthorne, on behalf of his committee, transferred the Badge—a very beautiful medal—to the custody of the Representative Body.

Dr W Douglas, who was received with applause, said it gave him great pleasure to make the presentation. He congratulated the Chairman on receiving it at a time when the Association had reached so high a degree of success.

When he himself joined the Association some forty-six years ago its membership numbered 7,810 and it had an income of £15,978. To-day it had nearly 30,000 members, its income was £122,000 per annum, and its assets were estimated at £200,000. Many distinguished men had occupied the position of Chairman of the Representative Meeting, and it would be true to say they had so conducted themselves in the office as to set an example to their successors (Applause). Those who were connected in the earlier years with the Representative Meeting would, he thought, agree that there were two names which stood out prominently. The first was that of Sir Victor Horsley (Applause). Those who sat under him when he occupied the chair would know that a very great debt of gratitude was due to him. Then Dr James Alexander Macdonald, his successor, was a man who had rendered most exceptional services to the Association, especially during the war (loud applause). He then invested Dr Brackenbury with the Badge, amid acclamation.

Dr MILLER MOORE (Lewes and First Ginstard) said that he had been a member of the Association since 1869-70. He did not know whether he could claim to be the oldest member or whether Dr Crowe, who was presented to the King at the previous Monday's ceremony, was the oldest. He believed that he was right in saying that the membership at the time of the Plymouth meeting in 1870 was 4,000. He had been a constant

admirer of the Association and he had tried in every possible way to persuade members of the profession to join it.

The CHAIRMAN said that on behalf of the Representative Body he had great pleasure in accepting the Badge. When one came of age he was supposed to have greater judgement and discretion than he had in former years. He did not know whether that applied to a collective body as much as it did to the growing human individual. At all events the Representative Body must let the Badge be a sign that that at least was expected of it. He was sure that he might say on behalf of the members that they had been delighted to hear the venerable members who had presented the Badge to him. The Badge was a very beautiful piece of work and he hoped that whoever sat with it in front of him would feel that the awe of the Badge would prevent undue use of the hammer.

ELECTION OF CHAIRMAN AND DEPUTY CHAIRMAN

Before a brief adjournment the MEDICAL SECRETARY announced amid applause that Dr Brackenbury had been re-elected unopposed as Chairman of the Representative Body. Dr BRACKENBURY, in thanking the members, said he would do his best to maintain not only the honour and interests of the profession but those of the Representative Body.

At a later stage the MEDICAL SECRETARY announced that Dr C O Hawthorne had been re-elected Deputy Chairman (Applause).

The Badge of Office of the Chairman of the Representative Body (Designed and executed by Allan G Wyon)

OTHER ORGANIZATION ACTIVITIES

The discussion on "Organization" was resumed.

Dr MORTON MACKENZIE continued his summary of the work of the Organization Committee during the year. A great deal of help was given to individual members, and he had been surprised to hear from Dr Macpherson, one of the assistant secretaries, how wide a field was covered. Members came in and asked questions such as how to open a banking account, how to get married—(laughter)—how they could get rooms in London, where they should start in practice, and many asked about post graduate work. Post-graduate work in London was not organized in a way commensurate with the opportunities which that city afforded. The Association was unique among professional organizations in having established branches in the Dominions and Colonies, and, as Sir Jenner Verrill and Dr Cox had confirmed after their visit to Canada last year, Canadians looked to the Association to organize post graduate work in London so that they could take advantage of it when they came over. He had been glad to learn from the guarded words of the Chairman of Council that he also recognized that there was a great opportunity. The problem of post graduate work was one which had been often tackled but never yet solved. Among the other activities of the Committee were two publications. With the *Handbook*, no doubt, all members were familiar. Efforts were constantly made to keep it up to date, but not to enlarge it. The other, the *Handbook for Recently Qualified Medical Practitioners*, had proved a great success. A new edition was under preparation, the first being exhausted. Quite accidentally, when first printed it was put on sale as well as issued, and the sales had more than paid for the whole preparation and printing of the handbook. He hoped the new edition would prove a source of income to the Association. With regard to Dominions organization, it would be remembered that a great deal of time had been spent on the arrangements for the South Australian Branches to incorporate themselves. Queensland, of which Dr Robertson was the representative at the meeting, was the first body to take advantage of the opportunity of incorporation, and it had duly incorporated itself and become able to hold property in Australia. In South Africa no decision had been come to at all about the offer the Association had made about sharing the expense of a Medical Secretary there, but from the information he had the Association need not be dissatisfied with the trend of opinion in South Africa towards the British Medical Association. The Organization Committee was anxious that fresh men should put up and try to get elected to the standing committees, as the work was very heavy. The Propaganda Committee had recommended a standard badge for the Chairmen and Secretaries of Branches and Divisions, which could not be paid for out of Association funds. The Council recommended it as a good move. It felt that it would invest the office of Chairman with a little more formality than it had at present, and that the handing over of the badge would tend to enhance the dignity of the office. The central office would be glad to assist any Branch in getting the badges. The Financial Secretary had the drawings of the badge, and it was not a very expensive article. In gold it would cost about £4 with its case. This concluded his review of the work of the Organization Committee during the previous year. (Applause.)

Dr C. G. H. MORSE (Bournemouth) drew attention to post graduate work in Bournemouth during the three years previous to last year. Application to the Association for financial assistance brought the reply that the work must be done through the Division. But the Division organization was not sufficient, the work had to be done through the local hospital, and the Association's offer had to be turned down and private subscriptions obtained. He hoped the Council would try to make the scheme of post-graduate work more elastic, and not look upon London as the only place for post-graduate work.

Dr JOHN STEVENS (Edinburgh) said Edinburgh had had a very successful post graduate course for many years, and it would shortly be resumed. By the munificence of the Chairman of the Edinburgh and Leith Division the officers would shortly be provided with badges, and he suggested

there should be miniature badges for permanent retention by office-bearers after quitting office, as an interesting memento of their service.

Dr MORTON MACKENZIE said this could be done.

The report under "Organization" was then approved.

THE POLICY OF THE ASSOCIATION AND OF DIVISIONS

Dr E. R. FOTHERGILL (Brighton) moved to instruct the Council to prepare and issue a memorandum to explain the relative constitutional value of policies as adopted by the Association and by a Division respectively, and to advise what action should be taken centrally and locally in order to co-ordinate such policies. He said the problem was exceedingly important. The question were constantly coming up, What is the value of a policy adopted by this body? What relation has it to a Division? Is it effective, or what has to be done to make it effective? What is a Division policy? A memorandum put before the Association in 1915 supplied answers to some of those questions, but he wanted the Association to go a step further, because instances had occurred lately where failure to turn the ideal Association policy into a local Division policy had caused great trouble to the profession in the areas concerned. Those who founded the new constitution determined that every Division should be a little local medical society absolutely independent and able to have its own policy. The only central control was through ethical procedure and organization rules. It was also determined that the Representative Body should form from time to time a policy of the Association, the ideal policy on any problem. That policy did not run in any Division until it had made it its own. From time to time policies had been formed centrally, such as a tariff of salaries for whole time medical officers, and in the near future there would have to be a tariff of salaries for medical officers attached to municipal hospitals, consultants, and specialists, and probably salaries at voluntary hospitals. If a Division had not adopted the central policy and a man took a post contrary to it, the Association had no control over him. If the local Division suddenly woke up, called a meeting, and adopted the central policy, and asked the man to resign, and he did not, and he was turned out of the Association, legal difficulties might arise. Every Division had its own personality, and consequently its own policy. When a policy was adopted by the Representative Body, the Council had to meet within a certain period to consider whether it really represented the views of the members of the Association or not. If they thought it did not, they must resort to the referendum. He wanted something done on the same lines. There were two great dangers—one, the insidious, almost secret, attack on the liberties of the profession by organized State administration, and the other, that, however well the head office acted, there was a tendency to administrative control, and areas unconsciously accepted central control.

Dr NOR SCOTT (Plymouth) feared Dr Fothergill's proposal, if carried to its logical conclusion, would lead to chaos. If in Plymouth the scale laid down for public appointments by the central authority had not been adhered to, and the backing of the central authority obtained, men would have accepted those appointments at salaries 25 to 30 per cent below what they ought to receive. The Association should be cautious before allowing the Divisions to become autonomous in every way.

The Chairman of Council said the Divisions could not expect to be in a position which would allow them to send representatives to take part in moulding a general policy which would be the decision of the Association and then exercise a discrimination as to what sections of that policy they should apply. If their representatives agreed on a policy, the Divisions were in honour bound to carry it out as far as possible. Circumstances might arise when the policy of the Association could not be put into effect in certain districts, but it was dangerous to encourage Divisions to select and discriminate. On the other hand, progress would be slow if every representative had in mind that the decisions taken by the Representative Meeting might bind his Division and act disadvantageously in his own locality. A working method had been evolved, how-

ever, with which it would be better not to interfere. He would be sorry if the Council had to undertake the task Dr Fothergill wished to impose on it—namely, the explanation of the relative value of the policies adopted by the Association and by the Divisions respectively. Divisions adopted minor variations of policy within, and sometimes in advance of, the policy of the Association, and need appreciate no interference in that regard, but the Council would not welcome the task of defining the position in hard and fast language. He thought it was desirable to leave well alone.

Dr J. A. Macdonald said if the Representative Body laid down a policy which the Divisions took no steps to adopt as their own the question arose as to how far it was binding on them. If, for example, the Association laid down that the minimum salary for a certain appointment should be £500 a year, and a Division did not adopt that policy, could the power of the Division be applied to a recalcitrant member who accepted a lower salary? Dr Fothergill raised the question of whether the Association should not warn Divisions that unless they took the proper steps they would be left in a difficulty when dealing with recalcitrant members.

The Chairman said that, while there were those who thought that difficult problems should not be brought up when things were working satisfactorily, it was true that at any time an acute difficulty might arise if there was no firm general understanding of how far the decisions of the Representative Body, when taken with sufficient notice and by a sufficient majority, were operative. If it were true that decisions so arrived at were not binding on anybody who did not choose to adopt them, the effectiveness of the Association as a medico-political body disappeared. It might be said that the discussions of the Representative Body would still retain a certain moral and persuasive power and would thus influence the members, but it scarcely seemed worth while to maintain all the machinery of the Representative Body for that purpose. Everyone desired to maintain, so far as was proper and possible, the autonomy of the Divisions, but a policy properly enunciated by the Representative Body under the conditions he had mentioned must be made effective throughout the Association if the Association was to have any power at all. His own view as to the autonomy of Divisions differed from that of Dr Fothergill. It might be said that that was an argument in favour of the resolution, as showing the necessity for an official pronouncement on the subject, but an official pronouncement in black and white became more or less stereotyped and was more definite than might be desirable. His own view was that when, after proper notice and by a due majority, a resolution of the Representative Body became, according to the by-laws and articles, a decision of the Association it was binding on all the Divisions, the Divisions merely possessing the right to say how far, if at all, they would take ethical procedure with regard thereto. It would be impossible for the Association to lay down a scale of minimum salaries for certain appointments if a Division could set up an alternative scale which would be operative in its locality, and if advertisements in accordance with that local scale could be inserted in the Journal. It would be a breach of the arrangement which had been arrived at with the Society of Medical Officers of Health. The Association had united with that society on the matter of a joint scale of salaries. If it said to the society "Come and co-operate with us, become closely associated with us, organize with us, give up your medico-political activities into our hands, we will conduct them all for you, but every Division can have its own scale of salaries," that it would not be implementing the bargain which had been entered into. The Association had, he thought, arrived at the extreme autonomy which could properly be left to the Divisions. If the Representative Body, after due notice and free discussion, passed resolutions with large majorities, there must be some safeguard that they should be operative throughout the Association and should receive the backing of the Association but at the same time there should be given to the Divisions such autonomy as was compatible with general associated action. What he had said might or might not be the true interpretation. It certainly was not the inter-

pretation adopted by Dr Fothergill. The Representative Meeting might think it desirable that there should be a further investigation into the matter, or it might think it desirable to wait until something happened which had not hitherto happened which made it difficult to go on, but as Chairman of the Representative Body he wanted to emphasize the point that if the members of that body met and consulted together and formulated a general policy, that policy should be adopted throughout the Association.

Dr FOTHERGILL thought that it was most unfortunate that the Chairman had taken such a strong line on the matter, he dissented from the Chairman's view. It would be useful if the meeting could hear the Solicitor's opinion.

Dr WALLACE HENRY (Leicester and Rutland) considered that it would be extremely undesirable for the meeting to give a definite instruction to the Council to prepare a memorandum without there being a greater opportunity of considering the difficulties which might arise in the way than there had hitherto been. He moved as an amendment that the question of the desirability of preparing a memorandum on the points mentioned be referred to the Council for its consideration.

Dr FOTHERGILL stated that he was perfectly prepared to accept the amendment.

The Chairman said that the Solicitor wanted to know exactly what was the question that was put to him. He (the Chairman) would put it in the following form: "To what extent does the autonomy of the Divisions extend in reference to the resolutions of the Representative Body carried by the requisite majority after due notice?"

Dr FOTHERGILL said that he would like to put the question in the form in which it came before the Representative Body in 1915. The Report of the Council on that occasion said: "It will thus be seen that the degree of freedom of self-government thus conferred on the local units of the Association allows them to take their own line in respect of the ideal which is laid down by the Representative Body."

The Solicitor said:

This is a complex question dealt with under a variety of articles and by-laws in your constitution. It involves two aspects—the legal aspect and the ethical aspect. In its main, general aspect I endorse, and am prepared to accept, the explanations which you, Mr. Chairman, gave to this meeting. I would refer the members, in order to make the matter clear to them, to where the powers are erected. They arise in the first place, under Article 31, which provides that the general control and direction of the policy and affairs of the Association shall be vested in the Representative Body. Then you pass on to Article 33 where it is provided that resolutions carried in a certain manner therein prescribed shall be decisions of the Association. There are subsequent provisions contained in these articles and by-laws, which form your constitution, in regard to the autonomy of Divisions and Branches. Those were designedly left upon an elastic basis. I can say that personally because I carried out your new constitution in its legal bearings. I should firmly confirm what your Chairman stated in the remarks which he has just addressed to you. I think it would be extremely improper and wrong for a Division or a Branch to set up, and put into force anything which was in conflict with a decision of this Representative Body arrived at as prescribed by your constitution. That would clearly be wrong. Coming to the question of the ethical procedure, your Divisions and your Branches should, in my opinion, adopt as decisions of their own after each Representative Meeting those decisions which are and can be operative in their areas. I think they ought to do that. But there may be certain things arising out of those decisions which they feel cannot be made applicable to the local areas which they control, and they therefore do not adopt them as decisions of the Branch or Division. The reason for these matters being decided in this way is to enable the ethical procedure to flow and if a man acts contrary to those things which have been made decisions of the Branches or Divisions by binding resolution is then he can be proceeded against under the machinery which is provided for that purpose. We must not lose sight of the fact that we have one general controlling provision contained in the by-laws by which powers are given to the powers that be, in the event of a disorganized or inactive Branch not doing its duty toward the Association. My view, broadly put in reference to this matter is expressed in the memorandum which you had before you in 1915 in which it is laid down that these decisions of the Association are decisions which every member of the

Association should observe, and to which he should not in any sense act contrary. You, as the Representative Body in general control of the affairs of the Association, have put your imprimatur upon them. You have had representatives from your Branches and Divisions throughout the whole country come up and vote upon them. It is not, in my opinion, within the power of any Division or Branch (nor should it be allowed) to set up a policy which is contrary to the policy enunciated by themselves and passed with the machinery which is provided.

Sir JENNER VEIRALL said that the Association seemed to him to be between Scylla and Charybdis. On one side was the risk that the debates in the Representative Body should become futile, which would follow if it became the custom for Divisions to set at naught that Body's conclusions, and on the other was the risk, if that were insisted on too strongly, of taking away what was valuable and what was provided for in the by-laws and articles—the opportunity for the Divisions to set themselves a little outside the full intent of what had been decided by the Representative Body. Dr Fothergill was an old friend of his, who had the defects of his qualities, and if he might say so with great respect, he thought Dr Fothergill was a little disposed to push things to their logical conclusion. (Laughter.) There were some things that could not be pressed to a logical conclusion, and he suggested that between Scylla and Charybdis the Association should do what the ancient mariners did—sail down the middle!

The CHAIRMAN said that as he understood the situation, a decision of the Association—that is, a resolution of the Representative Body moved at after due notice and by a requisite majority—was binding upon the whole Association, but that before ethical procedure could be taken thereupon against any individual in any Division, that Division must have passed a binding resolution stating that anyone who acted contrary to that decision of the Association was acting against the honour and the interests of the profession, or whatever the proper phraseology might be. He would like to ask the Solicitor if that was a correct statement of the position.

The SOLICITOR said that that practice had been adopted under his advice. In general terms the Chairman had most clearly enunciated what the policy should be, and it was one which he should advise them to continue. He wished to emphasize a remark made by Sir Jenner Veirall. The machinery was obviously made elastic, and to try to tighten it up too much would in a big Association like this be extremely unwise. There must be some give and take, and the machinery had been found adaptable for the purpose.

Dr FOTHERGILL said if it was referred to the Council, the Council might refer it to an appropriate committee, and then decide to do nothing in the matter, or that it would elaborate the document of 1915, or suggest a new document.

The motion "That the question of the desirability of the Council preparing a memorandum be referred to the Council" was put and lost.

PARLIAMENTARY ELECTIONS

Dr E. K. LE FLEMING moved the approval of the Report of Council under "Parliamentary Elections." At the last general election the Association had a sum of about £300 at its disposal, and the report showed what support in various ways had been given to certain candidates. He would only mention one name in connection with the election, which would gratify the members—that of Sir Richard Luce—"hear, hear"—a very able member of Council and chairman of one of the committees, who was successful in an unexpectedly difficult contest at Derby. The Association was anxious to allot the money at its disposal more or less equally between the three chief political parties, but it would be seen from the Report why the Association had not been able to give financial support to a Labour candidate. It was because, although the Association had no political bias, it could not support those who did not subscribe to the broad lines of the policy of the Association. The Labour party supported a State medical service and State-aided hospitals, and the Association could not subscribe to that. The profession was now in a more favourable position with

regard to the representation of its views in Parliament. What the profession desired was always for the good of the public, but sometimes things were said from medical mouths in the Houses of Parliament which were not strictly in accordance with the views held by the profession generally. He hoped for a few years in which to accumulate a reserve, which at present stood at the low figure of £666. There must come a time when another Government would put a different complexion on medical views in Parliament, and if the Association's views were to be put before Parliament the fund must be increased. A shilling a head per year from members of the Association would enable much more to be done. It was not much to ask, but it was a great deal to get. The Association wanted in Parliament a sufficient number of medical men, whatever their political views, able to give on purely medical matters the opinion of the Association. The total number of subscribers since the fund was instituted was only 828 in seven years. That was a disgrace to the profession. The fund was instituted at a Representative Meeting, and he repeated what he said last year—"Get on with it, or do away with it." (Applause.)

Dr P. MACDONALD asked if the Parliamentary Elections Committee had considered the question of asking the Defence Trust Fund to make a grant to the Parliamentary Fund.

Dr JOHNSON SMITH said that a resolution he brought before the Representative Body some years ago was the beginning of the Parliamentary Elections Committee. Long before that the question of a parliamentary fund was a hardly annual. Medical interests were continually in conflict with Government departments. He entreated members to add to their subscriptions to the Association an extra guinea for the Parliamentary Fund, and also to encourage their friends to support it. Ministers had a habit of taking advice from permanent officials, and if there were not in Parliament men to protect medical interests, cases went by default.

The CHAIRMAN, answering Dr Macdonald's question, said the matter had engaged the attention of the Committee, but the question must be decided at the Panel Conference. It was not put before it last autumn because the Conference was then busily engaged on other matters. He hoped it would come before the Conference in October.

The motion approving the Report under "Parliamentary Elections" was carried.

The question was then raised as to how the balance remaining after the purchase of the Chairman's Badge—£8 10s—should be used. The decision on this matter was held over until the report on "Medical Benevolence" was taken at a later stage, and the meeting rose at 6.15 p.m.

ANNUAL GENERAL MEETING

THE ninety-third Annual General Meeting of the Association was formally opened in the Grand Pump Room, Bath, on Tuesday, July 21st, at 2 p.m. The business, which included a report from the Representative Body that Mr Robert George Hingarth, C.B.E., F.R.C.S., senior surgeon to the General Hospital, Nottingham, had been elected President of the Association for the year 1926-27, will be reported in a subsequent issue. The meeting adjourned until 7.45 p.m. at the Palace Theatre, Bath, when Mr W. G. MURFORD, O.B.E., F.R.C.S., Acting President, took the chair. Among those on the platform were Mrs Mumford, the Marchioness of Bath, Lord High Sheriff of the County of Somerset, Alderman Cedric Chivers, Mayor, and Madame Sarah Grand, Mayoress of Bath, and the Ven. the Archdeacon of Bath. Mr Mumford was supported by the Past-President (Mr Basil Hall), the President-Elect (Mr R. G. Hogarth), the Chairman of Council (Dr R. A. Bolam), the Chairman of Representative Meetings (Dr H. B. Brackenbury), the Treasurer (Mr Bishop Haiman), Sir Robert Jones, many members of Council, and the chief officials of the Association.

INTRODUCTION OF NEW VICE-PRESIDENTS

Dr R. G. GORDON, Honorary Local General Secretary, introduced to the Acting President, amid cheers, two of the new Vice Presidents of the Association—Dr Alexander

Primrose and Dr F N G Starr, both of Toronto Mr C P Childe of Portsmouth, who had also been elected a Vice-President, was unable to be present

DISTINGUISHED FOREIGN GUESTS AND OVERSEA DELEGATES

Dr Gordon then introduced the following distinguished guests from abroad Professor James Heyman (Stockholm), Professor Bugge (Amsterdam), Dr W G Haggard (President of the American Medical Association), Dr de Schweinitz and Dr Howard Fox (delegates from the American Medical Association), Dr L J Austin, Dr A T Bazin, and Dr H S Bunkitt (from the Canadian Medical Association), Dr W N Robertson (Australia), Dr A J Oronstein (South Africa), Dr W Nunn (Bombay), Dr C J Gomes (British Guiana), Dr H Bell Walker (Cape of Good Hope), Dr A M de Silva (Ceylon), Mr F C Madden (Egypt), Dr E F Hatton (Ghana), Professor H G Earle (Hong-Kong), Dr J Foleman (New South Wales), Major T J Hallinan (Mesopotamia), Dr H E Lee and Dr L Mileston (New South Wales), Dr W A Anderson, Dr C E Maguire, and Dr A J Hall (New Zealand), Lieut-Colonel Birdfield (South India and Madras), Dr Stoddart Barr (Tasmania), Dr H I Holmes (Victoria), Dr C Morlet and Dr Tregonning (Western Australia).

Dr A J HALL said he was requested by the President-Elect and the Executive of the second triennial Australasian Medical Congress, to be held in Dunedin in February, 1927, to convey to the members and Council of the British Medical Association a most cordial invitation to attend the Congress.

The ACTING PRESIDENT said he would be very pleased to forward the kind invitation to the Council and asked Dr Hall to convey the best wishes of the Association to the New Zealand Branch.

PRESENTATION OF MIDDLEMORE PRIZE

The Middlemore Prize, consisting of an illuminated certificate and a cheque for £50, was presented to Basil Graves, M C, M A, M R C S, L R C P, London, for the contribution he has made to the knowledge of ophthalmologists of microscopy of the living eye, especially in relation to the use of the slit-lamp.

PRESENTATION OF THE ASSOCIATION'S GOLD MEDAL TO THE CHAIRMAN OF COUNCIL

The next business was the presentation of the Association's Gold Medal of Merit and an illuminated address, awarded to Robert Alfred Bolam, LL D, M D, F R C P, for his distinguished services to the Association and the medical profession, and in special commemoration of his work in connexion with the acquisition of the new House of the Association, 1624 25.

The following was the text of the testimonial

To ROBERT ALFRED BOLAM, O B E, Hon LL D Glas, F R C P, M D

Chairman of Council of the British Medical Association since 1910
Direct Representative of the Medical Profession of England and Wales on the General Medical Council since 1920
Member of the Consultative Council to the Ministry of Health on Medical and Allied Services,
Member of the Voluntary Hospitals Commission

In calling you to take your place amongst those whom the Association has chosen for its highest honour the Council feels that it has the cordial assent of every member. The Association awards its Gold Medal to those who have conspicuously raised the character of the medical profession, whether by scientific work, by extraordinary professional service, or by special services rendered to the Association. On all these grounds your title to the Gold Medal of the Association is beyond dispute.

In connexion with your own University of Durham you have filled important and responsible posts, including the Professorship of Medical Jurisprudence, the Lectureship in Dermatology, and membership of the Senate. Your contributions to the branch of medicine in which you are specially interested have been recognized in various ways, including your selection to be a Vice-President of the Section of Dermatology of this Association and to be Corresponding Member of the Société Française de Dermatologie.

Your services to your profession have been great and varied

In your own home district there are few positions of responsibility in which you have not been placed by those who know you best. We are glad to feel that in bestowing this honour on you the Association will give pleasure to your colleagues in the North of England, who, by their choice of you as a leader and adviser, prepared you for the high offices you have since been called upon to fill.

When we come to the central work of the Association we note that you became a member of the Representative Body in 1913 and from the first made your presence felt. You came into the Council in 1915 and took an interest in many of its Committees, including specially the Hospitals Committee, of which you were Chairman during the year 1919-20, and the Central Medical War Committee, of which you were a hard working member during the whole of its existence. In the Representative Body, in the Council, and in Committee your words have been few but have always carried great weight.

In 1920, at a time when the state of your health might well have excused you from undertaking further responsibilities, you accepted the office of Chairman of Council. The duties of that office, always onerous, have been specially exacting during the past few years, and it has been a source of wonder and admiration to your colleagues to note the way in which living at a distance of over 250 miles from London and engaged in active practice, you have been able not only to direct the business of the Council, but to take an effective part in the work of the Committees, of all of which you are *ex officio* a member. In 1923 you were unanimously re-elected Chairman of the Council for a further period, and have signified this by taking the outstanding part in the acquirement and adoption of the new House of the Association. Your name must always be intimately associated with a step which marks an epoch in the history of our Association.

As a sagacious counsellor and a wise and courageous leader, possessed of a most persuasive personality and the gift of inspiring affection as well as respect, we ask you to accept the British Medical Association's Gold Medal for Distinguished Merit. We ask you to accept with it the gratitude of the Association for the splendid services you have rendered to your profession and to the Association.

J BASIL HALL,
President

F G THOMSON,
President Elect

H B BRACKENBURY,
Chairman of Representative Body

N BISHOP HARMAN,
Treasurer

Mr BASIL HALL, in introducing Dr Bolam, said: It is now my pleasing duty to introduce to you Dr Robert Alfred Bolam, in order that he may receive the Gold Medal of the Association—(applause)—and I do not know anything that gives me more pleasure than to feel that at the termination of my year of office I have the privilege of presenting this Medal to Dr Bolam, of whom we think so much. (Applause.) You have in your hands a copy of the engrossed testimonial which has been presented to him with the Medal, and it sets out many of his qualities and valuable services, for which we are all deeply grateful, but it omits what I may perhaps call the outstanding quality he possesses, and that is just that he is "Bolam" (Cheers.) When I had the privilege in the Council of turning him out of the chamber for a few moments in order to move that the Medal be presented to him I said I did not know whether Dr Bolam had a family motto, but if not the motto he ought to adopt is "Service and not self" ("Hear, hear.") While we appreciate all his valuable services, we appreciate still more his sterling character. He has endeared himself to every member of the Council, and I have great pleasure and great pride in presenting him to you, Mr President, to receive the Gold Medal at your hands. (Applause.)

The ACTING PRESIDENT Dr Bolam, it is with very great pride and pleasure that I invest you with the Gold Medal of the Association and present you with this illuminated address, which I feel sure you will treasure.

Dr BOLAM, who was received with loud applause, said: Mr President, it is the custom that the recipient of the Gold Medal shall not express his thanks, but on this occasion I would just say that this is a very proud moment in the career of my service for the Association, and that I feel the atmosphere of kindness and affection behind it which will remain to me always a source of pride.

PRESIDENT'S ADDRESS

The CHAIRMAN OF COUNCIL said I have now to make an announcement with regard to the Presidential Address which is of a very unusual character. Most of you know that through sudden illness Dr F G Thomson has been unable to fulfil the duties of his office, and in regard to presiding at meetings we have been able to call upon Mr Mumford, whose services as Honorary Local General Secretary have been superhuman—(applause)—and who now adds to his burdens at the special request of Dr Thomson and his local colleagues. But in the case of his Presidential Address Dr Thomson expressed a wish that his son, Mr Malcolm Thomson, should deliver the Address. The Address is of such a nature that it can be read satisfactorily by one who, like Mr Malcolm Thomson, is not a medical man. I have much pleasure in calling upon Mr Malcolm Thomson to read his father's address.

The Presidential Address, which is printed at page 153 of this week's JOURNAL, was then read by Mr MALCOLM THOMSON, and was illustrated by lantern slides.

At the close a vote of thanks to the President was moved by the Chairman of Representative Meetings.

Dr BRACKENBURY said It is my happy privilege to propose to you that we send to our President, Dr Thomson, a message of thanks for the Presidential Address which has just been delivered, and I think I may on your behalf add to that a sentence of thanks to his son for the way in which it has been delivered. ("Hear, hear") On these occasions it is customary not to discuss in any way the matter of the Address. On some occasions that is a more important custom than it would have been to night, because the address could scarcely be described as in any way controversial. But the innovation which was remarked at the beginning of the Address in presenting us with pictures as well as with words may possibly be referred to as a happy innovation. At all events, there have been times in previous years when some of the audience would have welcomed such a procedure. We have been suffering during this meeting from the unhappy withdrawal of the personality of our President, Dr Thomson, but those words of his have brought us into closer touch with him, and we hope to have the privilege of seeing him among us later on, and that he will make a speedy recovery and be able to take his full part in the work of the Association. It must have been clearly necessary for Bath physicians to cultivate some organization which would attempt to regulate such things as indirect advertising and the relationship between consultants and general practitioners. (Laughter) We are all of us delighted to listen to this address, and you will wish to support a resolution of thanks. (Applause)

The Venerable the ARCHDEACON of BATH, in seconding, said that Dr Thomson had paid a compliment to Bath in making the history of the city the subject of his address rather than taking a medical topic. That was not surprising: the city's history was very interesting. In seconding the vote of thanks he wished to express the general admiration at the ability and grace with which the duties of the lecturer had been discharged.

The vote was carried with acclamation.

Sir JAMES VERRILL, in moving a vote of thanks to Mr Mumford for presiding, said that however much they regretted that their President was unable to be with them, they were glad that Mr Mumford had been able so worthily to fill his place. In spite of a spell of ill health, he had started out to fulfil the duties of secretary, and then without hesitation he took up the new post which was thrust upon him—a post carrying with it very onerous duties for in the wheel that spun on these occasions the hub was always the President. He must make one personal allusion. He wished to say what pleasure it gave him, after living for many years in Bath and making so many friends there, that he was able to congratulate the citizens in the absence of the President in finding a substitute for him who could be so thoroughly counted on to contribute to the success which many months of preparation thoroughly deserved. (Applause)

Mr BRIDGES, in seconding the proposal, said there was a proverb in the vernacular which might be

known to some of them—"Handsome is that handsome does." Their Acting President that evening was undeniably handsome, as all could see, and that he had done uncommonly handsomely he could assure them from his own personal observation. To be the successful General Secretary of an Annual Meeting was no small job, but they expected British Medical Association workers to work like that, yet to be suddenly precipitated into the limelight was a trial to anyone, and Mr Mumford had succeeded handsomely in his efforts.

This vote also was carried with acclamation.

The Acting President, in reply, said he wished once more to express his regret that Dr Thomson had been so unfortunately prevented from fulfilling his duties as President, and that he was not present to return his personal thanks for the way in which they had received his address. It was with the greatest reluctance that he had consented to take over Dr Thomson's duty, and he was very grateful to them for the forbearance with which they had condoned his obvious shortcomings. He would not like to go away without paying a tribute to the memory of the one who first had the idea of inviting the Association to Bath—their late lamented colleague Mr Forbes Fraser, who should have been present occupying that chair. (Applause) No one could have been more fitted for the office than he. The Forbes Fraser Hospital, which he hoped all would take an opportunity of visiting, was entirely the creation of his brain, and was a piece of work which was second to none that had been set about and brought to fruition in this country. (Applause) In conclusion, he thanked the mover and seconder of the proposition, and said he felt proud of having acted as deputy if only for a few days. (Applause)

The company afterwards attended the President's Reception at the Assembly Rooms, where dancing took place.

EXTRAORDINARY GENERAL MEETING

At 4.45 p.m., on July 17th, an Extraordinary General Meeting was held, the CHAIRMAN OF COUNCIL (Dr R A Bolam) taking the chair.

The MEDICAL SECRETARY read the notice convening the meeting, which appeared in the SUPPLEMENT of June 27th (p. 223).

The CHAIRMAN moved the resolution for altering the Articles of Association which was set out in the notice, so as to admit of the affiliation of the Canadian Medical Association.

The motion was then put from the chair, and was declared to be carried by the requisite majority.

The proceedings of the Extraordinary General Meeting were then concluded.

ANNUAL DINNER OF THE REPRESENTATIVES

At the conclusion of the first day's Representative Meeting the members of the Representative Body dined together at the Grand Pump Room Hotel, under the chairmanship of Dr BRACKENBURY. Music was provided by the Bristol Glee Singers (a male voice quartet), and one of the representatives, Dr J S Muir of Selkirk, gave two recitations in excellent style.

The one toast to which there was any speech making was that of "The Chairman."

Dr C E DOUGLAS said that Dr Brackenbury was scarcely familiar to them yet as Chairman of the Representative Body, he was better known simply as Brackenbury, a power in the Association. When the speaker was asked to propose the toast, he was told that it was his opportunity for revenge upon Dr Brackenbury, who lately, in a visit to Scotland, proposed his health. But there was no question of revenge here and Dr Brackenbury were very good friends, and it was just as well to be friends with Brackenbury. For the man they honoured was a fighter, and fighters they loved in Scotland. In debate the profession had not his equal. Some almost forgotten words of Huxley came into his mind, referring to the bad old days when, if one had any theological opinion differing from Holy Church, it meant probably being burned at the stake. In those days, said Huxley, when a mistake in logic involved combustion not only in the next world but in this the framing of syllogisms acquired a peculiar interest. So it was when one measured swords

with Brackenbury. In Scotland they were all fighting men, and that day and on the morrow Dr Brackenbury was in the hands of the Douglas (a reference to the fact that not only was a Douglas in charge of the toast, but another of the clan, Dr W Douglas of Maudstone, was on the next day to invest the Chairman of Representative Meetings with his new badge of office to commemorate the twenty first year of the Representative Body). There was an old saying—it would be remembered better in England than in Scotland—that the mothers of English children used to send their babies to sleep with the lullaby, "Hush, my baby, do not fret thee, the black Douglas will not get thee." The old time story had it that a certain man, a fighter in his day—like Brackenbury—was a figure so much dreaded that, said one Archibald Douglas, "we must bell the cat." And on the morrow history would repeat itself, and a comrade and compatriot, another Douglas, would "bell the cat" in the Representative Meeting (Laughter). But whereas in the old time story the impulsion was fear, here it was love and respect for great qualities. There was no man in the profession who did not owe a debt to him. Let lawyers in the courts of justice measure their length intellectually with this champion, they all knew what would be the result. Those who in the profession were less skilled in advocacy might at least copy Brackenbury in his devotion to the best ideals of the profession, which in the last resort were the best ideals for the community at large.

The toast was given with musical honours.

Dr BRACKENBURY, in reply, said that hitherto he had always rejoiced in his purely English ancestry—he came from the prosaic Eastern Counties which had produced the stolid yeomen of England, though on his mother's side he had a connexion with Somerset. But whenever he heard Dr Douglas—and also on some other occasions—he was tempted to wish that he had been a Scotsman, because in Scotland the clan tradition was strong, and afforded in its legends such ample material for after dinner speeches. Dr Douglas had rather distressed him by his personal emphasis. As Chairman of the Representative Body he felt that he had a certain claim to respect, if not to dignity, but when it came to honouring an individual named Brackenbury he was frankly puzzled. In their kindness they had attributed qualities to him which he was wholly unconscious of possessing, and which he believed to be fictitious, although the continual repetition of the statement made it difficult for him to maintain his disbelief (Laughter). To one thing he did plead guilty—to a constant and zealous desire to promote the best interests of the profession, which were also the best interests, from all sorts of aspects, of the public.

The proceedings closed with "Auld lang syne," thus maintaining the Scottish atmosphere to the end.

EXCURSION TO STONEHENGE

On the afternoon of Sunday, July 19th, a very large party of members of the Representative Body, with their wives, sisters, and daughters, went on an excursion from Bath to Stonehenge. A fleet of charabancs awaited them at 2 o'clock on the Grand Parade beside the Abbey. Rain had threatened in the morning, but the afternoon was delightfully fine. The outward journey was by way of Steeple Ashton, Bratton, and Shrewton, one of the few villages on Salisbury Plain. At Stonehenge the party were met by Dr and Mrs J P Williams-Freeman, who had come from Andover. Dr Williams-Freeman conducted the party round these prehistoric monuments, and out of his wealth of archaeological knowledge gave a deeply interesting account of the stones, their arrangement, measurements, and probable significance, and of the outcome of recent researches. For most of the details and measurements Dr Williams-Freeman said he was indebted to Mr Stone's recently published book.

The Stones of Stonehenge

Standing well away from the stones in the axis of the monument, the lecturer first described the main features of Stonehenge which call for investigation.

1 A circular bank and ditch which surrounds the monument, the bank being outside the ditch like that of a defensive earthwork, and not inside, as in other megalithic monuments such as Avebury.

2 The stones themselves, consisting of (a) an outer circle of large sarsen stones, native to Salisbury Plain (b) An inner circle of small "blue" stones, which are foreign to the district (c) A horseshoe of five large trilithons of sarsen stone (d) A horseshoe of single blue stone.

3 The so-called altar stone, lying flat in the focus of the horseshoe.

4 The 'stations' just inside the earthen bank—namely (a) Two stones, still standing, on opposite sides of the great structure (b) Two shallow pits near them, also opposite to one another, and the same distance from the centre.

5 The so-called 'slaughter' stone, just inside the line of the bank a large sarsen now prostrate, but which evidently stood a few feet south of the line of the axis.

6 The 'helo' stone, still standing, though at a somewhat dangerous slope, six feet south of the axis. This is the furthest stone from the centre, about 120 ft beyond the 'slaughter' stone.

Dr Williams-Freeman explained that the monument although unique in design, must be considered in connexion with other stone and earth circles which were found, of all sizes and degrees of complexity, throughout England, and could be traced from India, through Arabia, Northern Africa, and Western Europe to the British Isles. Dealing with the axis of Stonehenge, he pointed out the two shallow banks and ditches which bound the avenue and run in a straight line for a quarter of a mile in a north-easterly direction. The centre line of this avenue corresponds with the axis of Stonehenge. The azimuth of the axis is $49^{\circ} 34' 18''$. The azimuth of midsummer sunrise in 1901 was $50^{\circ} 26' 30''$. According to the most recent astronomical tables of the changes of the obliquity of the ecliptic the azimuth of midsummer sunrise corresponded with the axis of Stonehenge about B.C. 1840. The possible error allowed by Sir Norman Lockyer owing to want of precision of data and the small size of the angles dealt with was ± 200 years. Despite all criticism of these findings, it was impossible to ignore them as furnishing a certain degree of astronomical evidence of the age of the structure.

Dealing with the archaeological evidence of the age of Stonehenge, the lecturer pointed out that all the excavations of Professor Gowland in 1901, and all those of Colonel Hawley during the last four years, had not furnished a single item of evidence that the use of metal was known at the time of its construction. It is incredible that if the builders had possessed metal tools, weapons, or ornaments, not a single specimen had been lost, hidden, or left on the site of the structure. All the numerous tools used in dressing the stones, the deerhorn picks found in great numbers in the ditch, belong to the Stone Age, and the single stave of copper carbonate found on a fragment at the base of one of the stones by Professor Gowland was not now thought by competent archaeologists to be evidence of contact with metal at the time Stonehenge was constructed. But the most convincing evidence of all was the fact that a piece of blue stone of considerable size had been found forming part of the structure of a typical Neolithic long barrow in the near neighbourhood. The archaeological evidence all pointed to a date very nearly corresponding with that of Sir Norman Lockyer.

Conducting the party to a point inside the outer circle, the lecturer pointed out the extraordinary accuracy of plan relieved by the builders. The outer circle of large sarsens is placed tangential to a circle of exactly 97 ft in diameter. The inner circle of blue stones is tangential to a circle of 76 ft 6 in. diameter with the exception of the two on each side of the axis, which are set back so that their outer sides correspond with the circle. The four stations just inside the bank are absolutely symmetrical in plan. A line drawn between the two outlying stones and the two shallow pits in which stones formerly stood intersect in the centre of the monument at an angle of 45 degrees. Moreover, a line drawn at right angles to the axis exactly bisects this angle. In passing, it was pointed out that these outlying stones do not correspond with either sunset or sunrise of winter or summer solstice. The accuracy of spacing between the thirty stones of the outer circle is precise. The stones vary in width, but the distance from centre to centre is 10.55 ft, and the average space between them is exactly half their average width. There is one exception to this—the stones on each side of the axis are slightly wider apart, the symmetry being made up by the slightly narrower space on each side of them. The inner circle, which consisted of forty stones, is 6 ft from centre to centre.

With regard to the stones themselves, the large stones of the outer circle, which stand 13 ft 6 in. above the ground, are dressed on all sides, but the most careful dressing is on the inner face. They taper about 9 in. in each diameter from the bottom to the top, giving them an obelisk shape, and there is a very slight curve or entasis in addition. The weight of each is about 26 tons.

With regard to the lintels or cap stones, their length averages 10 ft 6 in., and their weight $6\frac{1}{2}$ tons. Each has two mortice holes which receive a tenon on the top of the upright. The cap stones have toggle joints with one another—that is, a slight bend at one end which is received into a notch in the end of its neighbour. Where the cap stones vary slightly in depth the top surfaces are left level by dressing away the lower surfaces at the setting. The outer face is not straight, but is dressed to correspond roughly with the curve of the circle. The blue stones of the inner circle are broad flat stones, and much tougher in working.

The uprights of the five great trilithons of sarsen forming the outer horseshoe are of the same dimensions as regards width and depth, but rise in height from 16 ft 6 in. in the two end ones to 17 ft 9 in. in the side pair, and 22 ft in the great central one. The blue stones of the inner horseshoe are better stones than those of the circle. Their height is from 6 to 8 ft, their average diameter 2 ft. They are very carefully dressed to an obelisk shape, and one of them has a uniform groove down the length of one side. They were apparently nineteen in number. All these details point to a very high degree of skill, both in planning and building the structure.

The method of erection of the uprights has been definitely proved by the excavations. A pit was dug to receive the foot of the stone, the chalk was sloped outwards so that the stone could be slid into it, raised to a vertical position, and kept there by ramming chalk and stone fragments round its base. Many of the large stone mauls and hand punches with which the stones were dressed were found in the ramming. The lintels were doubtless rolled up to the top along an earthen ramp which was afterwards removed.

Dealing with the origin of the stones, the sarsens were pointed out by Dr. Williams Freeman to be solidified masses of Bigsnot sands which once overlay the chalk of Salisbury Plain and have been left lying on its surface when the Tertiary beds were washed away. All the varieties of the foreign stone (blue stones)—cyanite, diabase, and rhyolite—have been proved within the last two or three years to have come from the Prescelly Mountains in Pembrokeshire, from a region which abounds in ancient stone circles. Even the altar stone, which is a micaceous sandstone, can be matched from the same county. They were probably brought from Carmarthen Bay to the mouth of the Bristol Avon by water.

The discoveries of Colonel Hawley during the present excavations were next summarized. They consist of a circle of sixty pits in the chalk close inside the bank corresponding to depressions noted by Aubrey in the seventeenth century, and therefore now named the Aubrey holes. The bruising of the chalk at their bases proves them to have contained stones, and it is an interesting fact that simple cremated interments were found in the filling of many of them, evidently placed there since the removal of the stones. Two circles of pits which have contained stones have also been found not far out side the present outer circle, and as the pits correspond radially with the present stones of this circle, it is thought that they must have formed part of the plan of the present structure. The stones may have been removed during the years when Stonehenge was a stone quarry for the neighbourhood. The Aubrey stones show no such correspondence.

The ditch has been excavated for half the circle. A causeway of undisturbed soil, nearly but not quite corresponding with the axis, has been found. Numerous post holes, irregularly disposed, were found about this causeway, suggesting gates or defences at the entrance. Another elongated group of post-holes was found outside the outer circle of the opposite side, which may even have been the post holes of a wooden building.

By the kindness of Colonel Hawley, the lecturer was permitted to exhibit at the hut the most recent plan of all the discoveries and specimens of the mauls and deerhorn picks and other finds.

This instructive open-air lecture was followed by tea, which was served in adjoining military hutments. The return journey started at 6 o'clock, via Warminster, Westbury, Trowbridge, and Bradford-on-Avon (looking in the evening sunshine like an Italian town above the steep river valley). The arrival at Bath at 8.30 ended one of the most enjoyable and interesting Sunday trips within the memory of representatives.

Association Notices

QUESTION OF ADJUSTMENT OF AREAS OF SOUTHERN AND SURREY BRANCHES

THE notice of the proposals to the above made by the Surrey Branch, which appeared in the SUPPLEMENT to the BRITISH MEDICAL JOURNAL of July 11th 1925 (p. 14), being in certain particulars incorrect, that notice is hereby withdrawn.

ELECTION OF DIRECT REPRESENTATIVES ON THE SCOTTISH COMMITTEE

THE following have been elected members of the Scottish Committee of the British Medical Association for the ensuing session.

GROUP I—Aberdeen, Orkney, Shetland, Banff, Moray and Nairn, Caithness and Sutherland, Inverness, Islands, Ross and Cromarty. Dr J. MUNRO MORI (Inverness) and Dr J. E. SHANK (Skene).

GROUP II—Dundee, Fife, Perth, Stirling. Dr D. ELLIOT DICKSON (Lochgelly) and Dr G. W. MILLER D.S.O. (Dundee).

GROUP III—Edinburgh, Lothians, South Eastern Counties, Dumfriess and Galloway. Dr JOHN D. COMER (Edinburgh), Dr NORMAN P. LAIPFA (Innerleithen), Dr C. MOWBRAY PEARSON (Edinburgh).

GROUP IV—Glasgow Central, Eastern, North Western and Southern. Dr R. YUILL ANDERSON, Dr D. MCKAIL, and Dr JOHN PATRICK.

GROUP V—Argyllshire, Ayrshire, Dumbartonshire, Lanarkshire, Renfrew and Bute. Dr W. DOUGLAS FRAY (Kilmarnock), Dr J. LAURIL (Greenock), and Dr JAMES B. MILLER (Bishopbriggs).

The Members of Council representing Scottish constituencies are also members of the Scottish Committee, and two additional members may be co-opted.

BRANCH AND DIVISION MEETINGS TO BE HELD

CAPE OF GOOD HOPE (WESTERN) BRANCH.—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday, August 28th, at 8 p.m., when there will be a symposium on the diagnosis of intracranial tumours, arranged by Mr D. J. Wood. Among the speakers will be Dr J. D. M. Claassens, Mr F. T. Petersen, and Dr A. W. S. Siebel.

ESSEX BRANCH.—The annual meeting of the Essex Branch will be held at the Palace Hotel, Southend, on Thursday, July 30th, at 2.30 p.m.

SUFFOLK BRANCH, WEST SUFFOLK DIVISION.—A combined clinical and social meeting of the West Suffolk Division will take place on Thursday, August 6th, when Dr Wood has very kindly offered to entertain the Division once more at Woolpit. Tea in his garden will follow a clinical meeting at the Institute.

WORCESTERSHIRE AND HEREFORDSHIRE BRANCH, WORCESTER DIVISION.—A dinner will be held at the Crown Hotel, Worcester 3th, at 8 p.m., to be followed by the annual

The price of the dinner will be 8s (wines, intending to be present are requested to notify the Honorary Secretary.

Meetings of Branches and Divisions

YORKSHIRE BRANCH, SHEFFIELD DIVISION

Reception to Graduates

A VERY pleasant social meeting was held on July 3rd, when the successful students at the recent final examinations in medicine were entertained at luncheon. In the unavoidable absence of the Chairman of the Division, Dr Turner, the Vice-Chairman, Dr C. W. SMITH, presided, and Professor Sholto Douglas, Dean of the Medical Faculty, and eleven graduates were present as guests, in addition to twenty-four members of the Division.

After the loyal toast had been honoured Professor A. J. HALL proposed 'Our New Colleagues'. He remarked that as Sheffield graduates they had been exceptionally fortunate in one respect during their course in medicine: they had had several lectures by an eminent and experienced general practitioner, giving them some idea of the kind of thing they might expect in general practice; their thanks were due to Dr Gordon for the valuable help these lectures had given them. In entering the profession of medicine, Professor Hall urged the guests to bear in mind that at the same time they were entering what might be called the "fellowship of medicine" and a very much greater thing than merely the practice of their profession. Whatever branch they took up that fellowship implied loyalty to all their colleagues as well as loyalty to themselves. 'Medical life is essentially a very isolated life. Unlike the business man the doctor is in a position of superiority to his clients, inasmuch as the medical profession speaks a language that their patients do not and cannot understand. They are in a sense, in the position of absolute despots and autocrats. Suppose I told a patient that he was suffering from inflammatory atrophy of his hippocampus, you smile at the words but he would not; they are a foreign language to him. You are working among people from whom you are isolated by the possession of this special knowledge and the use of this special language. This tends to make us dogmatic and schoolmasterly, but we are saved from becoming either cranks or intolerable bores by the fact that we have to deal with human people.' He warned them very strongly in practice never to listen to what they were told, the doctor said, 'it was never what the doctor *did* say. With many the doctor was a kind of figure-head into whose mouth everybody put what they wanted

to say themselves or what they wanted the doctor to say. Finally Professor Hall wished them every success in their professional career. The greatest success they could have would be the doing of their work honestly and well.

Dr R. K. DOWSON, in responding to the toast, spoke of the suddenness of the change causing some bewilderment. He compared the case of the new graduates to that of new boys entering a big public school but they were proud of the traditions which they were expected to uphold, and hoped that each one of them would do his utmost to prove worthy of that great tradition.

Dr J. WILKIE proposed 'The University Staff.' He referred to the fact that although the Sheffield University only reached its twentieth birthday this year, they could justly be proud of having had in that short period no fewer than six men who had attained the honourable title of F.R.S. The most recent of these was Professor McLellan, whose reputation was world wide.

Professor DOUGLAS, Dean of the Medical Faculty, speaking on behalf of the university staff congratulated the new graduates on having attained to the summit of their desires, which should only prove to be the starting point of new aspirations. With the ending of the academic career the strenuousness of medical life commenced. He trusted their careers would be useful not only in a professional way, but often also by taking advantage of the opportunities of service to the public which their life work would offer. Few men could be so well qualified as the medical man to voice many of the people's needs.

Dr GORDON, proposing the health of the chairman, said it had been the chairman's duty, as the spokesman of the Division to welcome the new graduates into the profession. He wished them to understand that they were not regarded as enemies but were welcomed in the spirit of healthy rivalry. He advised them all to become members of the British Medical Association and urged the importance of an undivided front as there were many questions likely to arise, not only in connexion with national health insurance, but also with regard to public health where their interests would be concerned. Every one should join the British Medical Association and also a defence society.

Dr SMITH, in responding, referred to the fact that he had himself been a student of Sheffield University where he had sat at the feet of Professor Hall nearly thirty years ago.

Speaking of the British Medical Association he said it was such a necessary thing that practitioners of medicine should have a corporate life. "The Association is the only body which gives us any chance of fighting with the hope of success against the problems arising in increasing numbers." Some might say that the Association had not, perhaps done everything that it might have done but it had done, and was doing, a very great deal. It was the only body which could help each one individually. The Association was a reasonable body, not bureaucratic but absolutely democratic where everybody had the chance of giving a vote for or against any proposal that was brought forward.

BORDER COUNTIES BRANCH

A CENTRAL meeting of the Border Counties Branch was held at the Infirmary, Workington, on June 5th, when Dr G. B. MITCHELL (Vice President) was in the chair.

A British Medical Association lecture, entitled "Gastro intestinal disturbances in infants and young children" was given by Dr HUGH T. ASHBY of Manchester. The subjects chiefly dealt with were intussusception, diarrhoea, pyloric stenosis and infantile scurvy. Hearty votes of thanks were accorded Dr Ashby, and to Dr J. H. Dudgeon for his hospitality.

BORDER COUNTIES BRANCH DUMFRIES AND GALLOWAY DIVISION

The summer meeting of the Dumfries and Galloway Division was held in Dalry Galloway on June 25th, under ideal weather conditions. A good company of ladies and gentlemen assembled at 'The Lochmar' where an excellent lunch was provided after which the party adjourned to the bowling green and amid the towering hills of the Kells Rhinns played a game which, if not exactly good bowling, was good fun and thoroughly enjoyed by those engaged in it. An adjournment was then made to the Kenmore Arms, New Galloway, where a considerable addition was made to the party and tea was provided after which a visit was paid to the beautiful golf links. Votes of thanks, proposed by the Chairman, Dr P. M. KERR to Mrs Cowan, wife of Provost Dr Cowan and by Dr JOSEPH HUNTER to the Secretary, brought to an end a perfect day.

DORSET AND WEST HANTS BRANCH BOURNEMOUTH DIVISION

A MEETING of the Bournemouth Division was held on July 1st in St Peter's Small Hall. The CHAIRMAN drew attention to the flag which had been made for the Great Hall of the Association which was on view. The Report of the Council was then considered and the Representative instructed. Dr G. MORSE said he wished to present to the Division badges of office for the Chairman and Honorary Secretary. Dr HARRIS on behalf of the Division thanked Dr Morse for his kind offer and said the Division would be pleased to accept the gift.

EDINBURGH BRANCH SOUTH EASTERN COUNTIES DIVISION

A MEETING of the South Eastern Counties Division was held at Newtown St Boswells on July 1st when Dr MEXZIES, Chairman of the Division presided.

The meeting considered the Report of Council, the Supplementary Report and circulars from the Medical Secretary. In general the meeting approved of the views and recommendations of the Council, and instructed its Representative (Dr Muir) to support them at his discretion. In particular, the meeting asked Dr Muir to use his influence in any way feasible to advance the proposed publication by the British Medical Association of a book describing new and non-official remedies.

Dr ERNEST MUIR, research worker at the School of Tropical Medicine in Calcutta, read a paper on the changed aspect of the leprosy problem. He showed that leprosy as found in India could as a rule be diagnosed from clinical nerve signs long before it was possible to obtain a positive bacteriological examination and when treatment was begun at this early stage and carried on efficiently for a sufficiently long period in favourable circumstances it was possible, in the great majority of cases to free the patient from all active signs of the disease and provided the patient was able to maintain thereafter a fair degree of health there was a good chance of these signs remaining absent. This being so, the reasonable method of dealing with the leprosy problem was to lay stress on the training of medical men to make an early clinical diagnosis and to attract patients in the early stage to undergo efficient treatment, with the hope of remedy instead of as formerly leaving them till the disease was far advanced or frightening them away with the fear of lifelong compulsory segregation. Dr Muir described the nature of leprosy and some of the latest methods of treatment.

The CHAIRMAN invited members to ask questions and the correcting to the identification of the bacillus, the clinical signs of the disease, the effects of segregation in leper colonies, and the prevalence of the disease in Norway were answered by Dr E. MUIR in a most informative manner. Dr DIXON proposed a vote of thanks to Dr Muir for his exceedingly interesting paper, highly appreciated by those fortunate enough to hear it.

KENYA BRANCH

A MEETING of the Kenya Branch was held on March 11th at the Native Civil Hospital, Nairobi, when the PRESIDENT took the chair.

Before proceeding with the business of the meeting the President referred to the death of the late Governor, Sir Robert Coryndon and moved a resolution expressing the Kenya Branch's profound sense of personal bereavement and conveying to Lady Coryndon and her children its sympathy in their tragic loss. The members signified their assent by standing in silence for a few moments. The SECRETARY reported that during 1924 the membership of the Branch had increased from 36 to 52. Ten Branch meetings had been held during the year in Nairobi, the average attendance at meetings being eleven. The Branch was in a sound financial position, the balance in hand at the end of the year being over £40.

The PRESIDENT introduced Dr J. H. SEQUEIRA (London) to the Branch and asked him to open the discussion on syphilis. Dr SEQUEIRA gave a most interesting address on syphilis with particular regard to its various types. A general discussion followed on both syphilis and yaws, in which the majority of the members took part. Cases of skin disease were also shown by Dr BURKITT and Dr ALLEN. At the end of the discussion a hearty vote of thanks was accorded to Dr Sequeira.

The SECRETARY intimated that he had received a letter from the Colonial Secretary enclosing a copy of the proposed Professional Licences Ordinance and inviting the comments of the Branch on the proposed bill. It was resolved that the draft bill should be fully considered by the Branch Council and that after consideration a special meeting of the Branch should be called to discuss the whole subject.

A special meeting of the Branch was held on March 25th at the Native Civil Hospital Nairobi when the PRESIDENT reported that the draft Professional Licences Ordinance submitted by the Government for the comments of the Branch had been fully considered by the Branch Council which was of opinion that the proposed ordinance should be opposed. The President gave a brief outline of the reasons for adopting this attitude and also mentioned that the Law Society had decided to oppose the ordinance. After considerable discussion it was decided unanimously that the Branch was most strongly opposed to the principles involved in the proposed ordinance, and the Secretary was instructed to inform the Colonial Secretary accordingly and to state the reasons for the adoption of this attitude. It was also resolved that the whole of the correspondence in connexion with the matter including a copy of the proposed ordinance should be forwarded to the headquarters of the British Medical Association invoking their aid in opposing the measure and that the Colonial Secretary should also be informed of this resolution.

A further meeting of the Branch was held on April 8th at the Native Civil Hospital Nairobi when the PRESIDENT took the chair.

Arising out of the minutes the SECRETARY reported that a letter had been received from the Colonial Secretary intimating that His Excellency the Acting Governor in Council had decided that the Professional Licensing Bill would not be proceeded with at present.

Dr PATERSON read a paper on medicine and commerce in which he briefly outlined the history and organization of the United Fruit Company a number of whose estates he had seen during his recent visit to South America. A discussion followed, and Dr PATERSON was accorded a hearty vote of thanks for his interesting and suggestive paper.

National Insurance.

THE ROYAL COMMISSION

The thirty seventh meeting of the Royal Commission on National Health Insurance was held at the Home Office on July 7th, Lord Lawrence of Kingsgate, and later Sir Arthur Worley, in the chair.

A statement by the Government actually dealing with the results of the second valuation of approved societies so far as completed was considered by the Commission. Evidence was submitted by the Stepney Borough Council, represented by Councillor J. H. Burnby, as to the payment of contributions in respect of men usually employed on relief works, by the Sons of Temperance Friendly Society, represented by Mr. T. W. Huntley, as to various matters of approved society administration, by the Association of Pool Law Unions, represented by Mr. R. A. Lerch, as to the relations of Pool Law relief to health insurance benefits. Thereafter Mr. W. J. Brathwaite gave evidence on the question of the case value method of remuneration of panel practitioners.

Proof copies of the oral evidence and the relative statements submitted at the meeting of June 18th may be obtained from H.M. Stationery Office, Adelphi House, Kingsway, London, W.C.2 on remittance of cost (3s.) and postage.

The thirty eighth meeting of the Royal Commission was held at the Home Office on July 9th, Lord Lawrence of Kingsgate in the chair.

Evidence was submitted on behalf of the National Association of Trade Union Approved Societies by Mr. F. Kershaw (President), Mr. E. Corbey (Secretary), and Mr. G. W. Canter (ex-President) of the Association, and Mr. G. P. Blizard, covering the whole range of the health insurance scheme, in particular the need for expanding and unifying the arrangements of the various health services.

The Joint Tuberculosis Council, represented by Sir Henry Guvian and Dr. G. Lissant Cox, gave evidence on the need for amendment in the treatment and cash benefits of insured persons suffering from tuberculosis. Mr. Walter Farris was examined on his scheme for fundamental alterations in the financial structure of the scheme.

The thirty ninth meeting of the Royal Commission was held at the Home Office, Whitehall, on July 14th, Professor Alexander Gray in the chair.

Evidence dealing with the constitution of the Central Fund, the methods of audit of approved society accounts, the accumulation of cash benefits in respect of persons in institutions, and the provision of dental benefit was submitted by Mr. Wm. McLean on behalf of the Grand United Order of Oddfellows Friendly Society. The United Patriots National Benefit Society, represented by Mr. J. M. Roberts, gave evidence recommending the provision of curative treatment at the British Spas as a benefit for members of approved societies suffering from rheumatic diseases, this evidence being supported by Dr. Fortescue Fox, Past President of the International Society of Medical Hydrology, and Mr. John Hutton, Secretary of the British Spas Federation. Thereafter Miss M. A. Hilbery gave evidence as to delays and irregularities in payment of cash benefits.

Proof copies of the oral evidence and the relative statements submitted at the meeting of June 23rd may be obtained from H.M. Stationery Office, Adelphi House, Kingsway, London, W.C.2 on remittance of cost (2s. 3d.) and postage.

The fortieth meeting of the Royal Commission on National Health Insurance was held at the Home Office on July 16th, Lord Lawrence of Kingsgate in the chair.

Evidence was given by Mr. H. Lesser, on behalf of the London Insurance Committee, as to the powers and duties of the Committee and methods of improving the medical benefit service. Mrs. Hubback, representing the National Union of Societies for Equal Citizenship, put forward proposals for improving the position of women under the Act. The Standing Joint Committee of Industrial Women's Organizations, represented by Dr. Marion Phillips, submitted recommendations for extending medical benefit to dependants and widening its scope, for increasing the cash benefits, and for pooling the surpluses of approved societies. Mr. W. A. Middleton acting chief auditor of the National Insurance Audit Department, described the detailed arrangements for audit of the accounts of approved societies and insurance committees.

LONDON INSURANCE COMMITTEE

Complaints against Practitioners

At the meeting of the London Insurance Committee on June 25th reports were brought forward on six cases of complaint against practitioners which had been investigated by the Medical Service Subcommittee. In four cases the complaint was found not to be substantiated. In one of the remaining cases the subcommittee found that the practitioner had irregularly accepted fees for the

treatment which he provided for an insured person, but it had accepted his undertaking that he would comply with the requirements in the future. In the other case it was found that the practitioner had failed to attend and treat an insured person notwithstanding the fact that he had suspected two days previously that the patient was suffering from appendicitis (which proved to be the case necessitating immediate operation at a hospital) and it was recommended that he be censured and that the attention of the Ministry of Health be drawn to the case so that it might receive consideration in connexion with the distribution of money available for defraying the cost of medical benefit.

In a case in which the Committee had previously found that a practitioner had committed a breach of the medical certification rules in issuing a certificate without having made a further examination of the insured person and had also made improper use of the intermediate convalescent certificate it was now reported that the Minister of Health had reviewed the case and had decided that as this was the first breach of the terms of service on the part of the practitioner which had been brought to his notice, he would not on this occasion withhold any part of the money payable to the Committee for defraying the cost of medical benefit. The Minister had added however that in the event of any further breach he would take a more serious view of the matter.

LOCAL MEDICAL AND PANEL COMMITTEES

LONDON

Payment for Services of a Second Practitioner.—At the June meeting of the London Panel Committee Dr. H. J. Cardale, presiding, reference was made to two cases which had lately been before the Medical Service Subcommittee in which the insured persons obtained the services of a second practitioner and the subcommittee had found that the expenditure resulting upon this action was reasonably and necessarily incurred. The practitioner concerned in one of these cases discontinued treatment on finding that another doctor had been called in without his knowledge and the subcommittee was of opinion that he had thereby committed a breach of the terms of service. In the other case the finding of the subcommittee was to the effect that the practitioner had failed to provide adequate treatment. The Panel Committee expressed by resolution its opinion that in view of the free choice of doctor, which at present enables an insured person to change his doctor at any time the expenditure incurred by an insured person in cases such as these in obtaining the services of a second practitioner could not be held to be *ex ab initio* or *neccessary*. It was resolved to draw the attention of the Insurance Acts Committee to this point.

Claims for Emergency Treatment.—On a motion to pass for payment certain accounts for emergency treatment the Chairman stated that the Ministry of Health had pointed out that under certain circumstances if the Panel Committee thought there was reasonable cause instead of the fee being deducted from the remuneration of the practitioner concerned, it might be deducted from the general fund.

Range of Service.—A communication was read from the London Insurance Committee asking whether nasal cauterization performed by a practitioner should be considered as falling within the scope of medical benefit. Particulars of the case were submitted, and the Committee sitting as the Local Medical Committee agreed that the operation of nasal cauterization in the circumstances set out did not fall within the scope of medical benefit under the Act.

Public Medical Service for London.—The members who had been sitting as the Panel and Local Medical Committee held a further meeting as the central committee of management of the Public Medical Service for London. It had been previously agreed that the members of the Local Medical Committee should act as an *ad hoc* body to inaugurate a public medical service for the county of London but that after the scheme had been launched the service should be under the control of a separate and democratically elected body with officers and an executive committee. On the motion of Dr. Partridge it was agreed that some six members who under the chairmanship of Dr. Cardale had previously formed a section to study the possibilities of such a scheme should be appointed as the executive committee with power to co-opt up to a total membership of fifteen.

COUNTY OF WARWICK

The report of the Warwickshire Panel and Local Medical Committee for the year 1924-25 has now been issued in printed form.

The Committee met six times during the period and there were various meetings of sections and of subcommittees. Referring to the evidence given before the Royal Commission on National Health Insurance on behalf of the British Medical Association on April 30th and May 7th 1925 the Committee points out that the draft Memorandum of Evidence was prepared by a joint committee which included the personnel of the Insurance Acts Committee of the Association in its membership. This draft statement was submitted to meetings of all practitioners convened in each locality by the Panel Committee acting jointly with the local Division of the British Medical Association. Separate meetings for Warwickshire practitioners were held in Coventry, Nuneaton, Rugby, Leamington, Stratford upon Avon and Birmingham. At these meetings the general principles contained in the draft statement were reviewed and the opinion of the meeting thereon was conveyed to the Medical Secretary of the British Medical Association. The statement of evidence in a revised form was subsequently reviewed by the Panel Committee which instructed its representative member of the Panel Conference (Dr. W. Cook) to attend a special joint meeting with the Representative Body of the British Medical Association convened in London on March 12th,

British Medical Association: Annual Meeting, Bath, 1925.

ANNUAL REPRESENTATIVE MEETING

Monday, July 20th

The Representative Meeting resumed at 10.45 a.m., with Dr BRACKENBURY in the chair. The minutes of Saturday's meeting were confirmed. The CHAIRMAN apologized for a late beginning in view of the great importance of the business before the Council meeting, which had taken place at an earlier hour.

ELECTION OF EIGHT MEMBERS OF COUNCIL

The MEDICAL SECRETARY announced the result of the election of the eight members of Council under By-law 53 (d) and Standing Order 46 as follows (the names are in alphabetical order):

Dr H C Bristowe, Dr H G Dam, Mr MeAdam Eccles, Dr T W H Garstang, Dr Wallace Henry, Dr R Langdon Down, Dr J A Macdonald, and Dr G W Miller.

MEDICO-POLITICAL BUSINESS

Mr I B TURNER (Chairman of the Medico-Political Committee), in moving that the report of the Medico-Political Committee be received, said that many subjects were touched upon, a great deal of work had been done and some important matters would come before the meeting.

Coroners' Law and Death Certification

Mr TURNER went on to move that the Representative Meeting adopt the memorandum on coroners' law and death certification (Appendix III to Annual Report of Council) as the policy of the Association in substitution for the existing policy. He said that a subcommittee of

the Medico-Political Committee sat for a good many sessions working at the question of the memorandum, being most ably assisted by a very distinguished coroner, Sir Walter Schroder. It went into the matter with the knowledge that there was a bill before Parliament presented by Dr Freeman, and drawn up and proposed by another society.

Dr C O HAWTHORNE proposed two verbal alterations: (1) That the words that "a Judge of the High Court shall review the case" (SUPPLEMENT April 11th, p. 166, col. 1) be altered to "who would have the power to reopen the inquiry." In a coroner's court a case was not tried, but an inquiry into the cause of death was held. (2) The second alteration referred to a point in para. 33 of the Appendix. It would be observed that in paras. 31 and 32 the pathologist was spoken of as an expert in homicide; in para. 33 he was spoken of as an expert witness. That would seem to imply that the pathologist was the only expert witness in the case, but his submission was that the family practitioner was also an expert and not a common witness. He therefore suggested that in para. 33 the phrase should be continued so as to remove the implication that the general practitioner was not an expert.

Mr TURNER accepted the first point of Dr Hawthorne and agreed with what he had said on his second point, but suggested the addition of some such words as "an additional expert witness" so as to make the point clear.

The CHAIRMAN said he understood the first suggestion was accepted (Agreed). With regard to the second, Dr Hawthorne would be at liberty to move an amendment when the one on the paper had been dealt with.

Mr BISHOP HARMAN (Marylebone) moved

(1) That in the opinion of the Representative Body it is highly desirable that the information conveyed to the Registrar General on death certificates should be accurate and that accuracy will not be attained unless secrecy is preserved
(2) that the Representative Body is of opinion that death certificates should consist of two parts—one part shall be a certificate of death from natural causes which should be given to the person who registers the death the second part should be for the Registrar General's information only, and shall contain the opinion of the medical attendant as to the cause of death

In view of para 2, para 8 was unsatisfactory His Branch wished the whole of that line taken out, the result being a reversion to the original policy of the Association, which was consistent and scientific and practical

Mr E W G MASTERMAN (Camberwell) opposed both the amendment and the motion to the extent that he was against the hiding of the cause of death either by putting in "natural causes" or by putting in a camouflage of the facts and then sending in information of a scientific character to the Registrar-General. The facts which it was undesirable to put in the certificate were very infrequent and had but little bearing on accuracy of information. When the information failed in accuracy it was usually due to the lack of a post-mortem examination. As the head of a large institution his experience of death certificates was very large, and he could not see how the public was going to be benefited by keeping back information. People wanted to know why their friends died, and the result of suppressing information would be to create a spirit of suspicion that medical men were wanting to keep back facts which they were perfectly ready to give. In the ordinary certificate now given the information was not scientific. Where there was no necropsy the information which could be given on clinical grounds would not in most cases be scientific, he did not think the supplementary certificate would be of great scientific value. He intended later to move a resolution to the effect that it was desirable that, when a necropsy had taken place, or where there were facts which should be kept confidential information should be given direct to the Registrar-General. That information would be strictly scientific and of great value.

The CHAIRMAN understood that the amendment proposed by Marylebone was directed entirely to the form of the certificate suggested in the report. Mr BISHOP HARMAN thought the purpose of the amendment was clear, it was to omit the line which said, "State disease." The CHAIRMAN said it would still be open to the meeting to discuss whether there should be any reservation at all. Dr FOTHERGILL said it would be desirable to have a direct vote on the question of whether or not the disease should be stated in the certificate given to the relations.

The CHAIRMAN said there were two questions to be considered. The big question was whether things should be left as they were, and the disease disclosed to the relatives, or whether any information should be kept back for the Registrar General only. The smaller question was that if such a reservation was desired the form of certificate proposed did not enable it to be made. The Marylebone amendment merely invoked the deletion of that section of the certificate which said, "State disease."

Mr TURNER said "State disease" was put in as a compromise, so that something could be put down of a general nature such as "heart disease" or "brain disease," to satisfy the friends and relations of the dead person. In the certificate to the Registrar, on the other hand as much information as possible would be given where there was no post mortem examination, and accurate details where a post mortem examination was held.

Dr J L LIVINGSTON asked whether everything the amendment aimed at securing could not be done under present law. Dr CANTLER asked how policies for life insurance would be affected. Dr C FRIER asked where the cause of death would be shown on the certificate if the words "State disease" were omitted.

Dr NOR SCOTT (Plymouth) said news travelled quickly in small country districts and if the cause of a child's death were given as "congenital syphilis" all the neighbours would soon learn that the father had "the pox" but

if it were given as "congenital debility" no one would be any the wiser. Doctors should be able to state the cause in general terms on the certificate given to the relatives, and disclose the real cause of death in a confidential document to the Registrar-General.

The CHAIRMAN said that the carrying of the amendment would not preclude the moving of any resolution which would leave things as they were. It would still be possible so to amend the Report of the Council that the form of the certificate would remain as at present. If there were to be a reservation the amendment of the Marylebone Division suggested that that should be left in its simplicity and not complicated by the additional paragraph which said "State disease." That was what they would be voting for if they voted for the amendment.

The Marylebone amendment was lost by a large majority.

Mr E W G MASTERMAN (Camberwell) moved a further amendment.

That in addition to a certificate of death (as referred to in para 1 of Appendix III) the medical practitioner who certifies the death shall if he has further facts to report send to the Registrar General a further report giving any scientific data which he considers necessary or desirable.

The CHAIRMAN asked which certificate was referred to—the form proposed or the form now in use.

Mr MASTERMAN replied that he referred to the present certificate. He differed from the proposal of the Council on two points. He thought the first certificate should be as full as possible, one reason being that poor people would be much embarrassed by having no statement of the causes of death, for the insurance societies would insist on having such a statement, but the most fundamental reason was that the medical profession should not have the burden put upon it of doubly reporting on every case and sending in scientifically valueless documents. They could state their honest belief briefly without pathological details which could not be known without further examination. Mr TURNER had said friends of the deceased person would be quite satisfied to get "congenital debility" or "cirrhosis of the liver" on a certificate, but among the educated classes those were causes which it might be desirable to camouflage. He objected to giving full information to the local registrars, because there was no security that it would be thoroughly confidential.

Dr E R FOTHERGILL in para 2 of the Appendix and the points Mr MASTERMAN makes not met by putting in "Registrar General," and putting "may" instead of "shall" in the first line.

Mr MASTERMAN said he preferred the recasting of the recommendation, but he was willing to accept Dr FOTHERGILL's suggestion.

Dr P MACDONALD (York) seconded the amendment formally.

Sir JENNER VERRALL thought the difficulty arose primarily from a want of consonance between the first and second paragraphs of the Appendix. The first paragraph, headed "Medical Certificate, Death and Stillbirth," spoke of a certificate being on a statutory form for death and stillbirth. At that point it was not said whether the certificate was or was not to include anything beyond the fact of death and give the cause of death. In the second paragraph, besides the certificate of the fact of death, the cause of death had to be given. The Committee did not suggest that the certificate should contain nothing but the fact of death, it left in the form a space for stating whether it was from natural causes or not, and the disease. If the Committee desired the second certificate to be optional, and only used in cases where the practitioner had scientific facts to communicate, the form suggested by the Chairman was very good and covered all the facts. The Committee had to decide whether it wished that the certificates should convey two things—the first, the fact of death, and the second, whether it was from natural causes. Did they wish that the second certificate should be optional, and only to be used when the practitioner had further facts to communicate beyond the simple statement of natural causes, and further, when he had such facts did they wish them to be sent to the Registrar or Registrar General? If so, what was proposed by the Chairman would settle the whole matter, and there was no need for further debate.

Dr J W BONE said the amendment would wreck the whole scheme. The second certificate should be compulsory and issued in every case.

In reply to Dr FOTHERGILL, who asked whether the word "shall" did not appear in the amendment, the CHAIRMAN assented. It was open to the practitioners to say that he had no further facts to report, and therefore there was no certificate.

Dr J STEVENS (Edinburgh) Does this apply to Scotland? (Laughter.)

Mr TURNER It does not. Scots law on this question is different from English and much better.

Dr STEVENS said that reply delighted him, but there was always the danger of an ill-considered thing being passed for England, and afterwards being automatically brought into force in Scotland. The second certificate was secret and confidential, if insurance companies knew that a secret certificate had been sent to the Registrar-General, would they not refuse to pay until they knew the nature of it? That would dispel the secrecy.

The amendment was lost.

Dr FOTHERGILL proposed that in para 2 of the Appendix instead of "Registrar" should be substituted "Registrar-General." This was agreed to.

Mr MASTERMAN asked whether para 2 meant that it was a purely voluntary matter whether a man sent in his report or not.

The CHAIRMAN replied that if he did not consider there were any other facts necessary or desirable for the Registrar-General to know he need not send anything further, but if he considered there were such facts he must send them.

Dr BONE Is that a correct interpretation of policy?

Mr TURNER said the intention of the Committee was that in each case two certificates should be sent. If there was nothing in addition to the fact of death to report to the Registrar-General he would simply send a report, "I have nothing further to report", then he would get his fee.

Dr J L LIVINGSTON emphatically protested against two certificates being given in every case of death ("Hear, hear.") Living in a rural district, he was frequently compelled to give as the cause of death "old age." He objected to having to send to the Registrar-General, whether he supplied the envelope or not, a letter giving scientific information as to the cause of death. He suggested that "may" should be substituted for "shall."

After some discussion as to whether the amendment was in order, as being opposed to previous policy of the Association, the CHAIRMAN ruled that it should be put to the meeting, and called on the Medical Secretary to give a short account of the history of the matter.

The MEDICAL SECRETARY said that his memory, although not very definite as to dates, led him to say that certainly since 1908 the question of coroners' law had been under discussion, and one of the things which had been laid down was that there should be a certificate of the fact of death with perhaps some information as to the cause, with the compulsion on the doctor to give for the information of the Registrar-General full information in another confidential document. Since the war, and if it was to be so as a unit because, before the war, that had been the policy, a resolution to rescind a previous resolution was essential, that would mean that, as regards every motion affecting policy, it would be necessary to hunt up precedents and propose, if necessary, the rescission of resolutions perhaps twenty years old. That would be very inconvenient and obstructive.

Dr LIVINGSTON-DOWN submitted that the notice in the JOURNAL of the meeting rendered a rediscussion of the whole matter in order. The CHAIRMAN said he was not going to rule the amendment out of order.

To Dr BLAIRS, who asked whether a two thirds majority would be required, the CHAIRMAN said "No."

Mr TURNER said he hoped the amendment would be rejected, because it would render the whole thing ungovernable. If there was any question of "may"—well, practitioners "might" not do it. It must be remembered that if

the bill which the Government was bringing before Parliament became law with regard to coroners' law and death certification, anyone giving a death certificate in future would be paid.

This amendment also was lost.

Mr MASTERMAN said that on reading para 3 of the Appendix his Division understood that a medical practitioner sending a case into hospital was under a moral obligation to see that the patient had a certificate. He thought words should be inserted to deal with that point.

Mr TURNER said that was a difficult point. If a man was sent to hospital and died within a day or so, perhaps unconscious, the hospital might give a certificate without really knowing the history of the case, and in that case it would be a good thing for the practitioner also to give a certificate. It was rather difficult to redraft the paragraph.

Dr FOTHERGILL suggested that the onus was on the house-surgeon. Mr MASTERMAN said that in the present paragraph the onus was on the general practitioner.

Dr A MANKFILL (Bradford) said he had recently had a case where a man was dying slowly from malignant disease of the stomach. He took his leave, and ten days later the relatives called at his surgery asking for a certificate that the patient had died from the disease he had diagnosed. It transpired that in the interval the patient had been treated by a non-medical man, a herbalist. If the paragraph had been in operation he would have been obliged to give a certificate but he did not know what the herbalist had given the patient in the interval.

The CHAIRMAN, in reply to various members, said that Mr MASTERMAN's amendment was to para 3 of the Appendix, to add the words—

unless such practitioner has reason to believe that such a certificate has been already given by another medical practitioner.

Dr N RAWSON (Tyneside) saw no need to alter the wording in the Appendix. A hospital was outside the area in which a practitioner practised, he did not usually practise inside a hospital. Dr D'EWARD said some doctors took cases from a very wide area, some definition of what was meant by "the area in which a doctor practises" was therefore desirable. The CHAIRMAN said it had been suggested that the area was that enclosed by the four walls of the hospital, but he did not think the words could be interpreted in that way.

Mr MASTERMAN's amendment was lost.

Dr C F T SCOTT (Willesde) moved that in the case of a body viewed within one mile of the address of the practitioner or medical officer the fee payable by the local sanitary authority should be 7s 6d, with an additional fee of 2s 6d in respect of every mile beyond that distance, instead of the fees of 5s and 2s respectively set out in the Appendix. It was important, he said, that when doctors were asked to accept increased burdens they should be properly paid for doing so.

The CHAIRMAN said it was necessary to consider the scheme as a whole. It was suggested in the amendment that the fees should be paid by the local sanitary authority, but the certificates were to be sent to the Registrar-General so that the local sanitary authority would know nothing about them.

Mr TURNER said the first certificate would go to the local sanitary authority, and the certificate showing the exact causes to the Registrar-General. The first certificate would go to the local registrar of births and deaths and thence to the local medical officer of health and payment could be made on it.

Dr FOTHERGILL asked whether the 5s was to cover both the certificate and the report. Mr TURNER said that was so.

Dr SCOTT suggested the omission of the words "the local sanitary authority." It did no matter where the money came from.

Dr BONE said the proposal under discussion had been carefully considered by many committees for years, and had been the policy of the Association for a long time, yet now at a single sitting alterations were being proposed which might result in its destruction. The scale of fees

proposed in the report had been carefully thought out by medical men and by lay authorities on the subject, and represented the maximum it would be possible to obtain. There was a good chance of obtaining legislation on the lines of the scheme proposed, but not along those suggested by the amendment.

Mr TURNER said it would do no good to the Association to ask for higher fees than could possibly be obtained. The fees proposed were altogether new, would be a fresh charge on the exchequer, and a fresh source of income to the doctor.

The amendment was lost.

The CHAIRMAN, on behalf of West Suffolk (whose representative was absent), moved to amend the proposed certificate of stillbirth by the insertion of the words, "I was informed that" ("and that I was informed that the said child was stillborn"), the words to be erased except in cases where the practitioner was not in attendance at the stillbirth.

The motion was lost, as was also a motion by North-East Essex, similarly moved by the CHAIRMAN in the absence of the representative, to insert the following provisions in the Appendix:

(a) That the usual medical attendant of the deceased should be called to give evidence at an inquest, and

(b) That in the case of an inquest being held the coroner shall give the medical practitioner called at least twenty-four hours' notice.

Dr GORDON BELL (Sunderland) moved to substitute 2 guineas for £1 1s 6d as the fee payable to a medical practitioner by a coroner for every day of attendance to give evidence under his summons.

This motion also was lost.

Mr MASTERMAN, on the general question, said he wished to protest against the fee of 3 guineas which was proposed for every *post-mortem* examination done for a coroner. He regarded such a fee as excessive. In London, at any rate, necropsies conducted at a mortuary did not constitute any great tax on a practitioner, the mortuary attendant did most of the mechanical work. A fee of 4 guineas for attending an inquest where a necropsy was made was too high, and could not be obtained, and he disliked anything which could not be obtained being made the policy of the Association. The effect of the proposal in London would be, probably, to put all necropsies into the hands of pathologists, a practice which was already spreading, if general practitioners wished to continue performing necropsies thus keeping up their knowledge of pathology, they should vote against the fees proposed. He would therefore move the following amendment:

That the fee for making *post-mortem* examinations put in the report at 3 guineas should be 1½ guineas.

The amendment was lost.

Dr R. D. MORTIMER (Bolton) suggested that in para 9 of the Appendix the word "statutory" be added before the word "offence."

This amendment was agreed to.

Dr HAWTHORNE, referring to para 33 of the Appendix, said that the object of the alteration was to secure that a distinction should not be made between a pathologist called in as an expert witness and a family practitioner who was called in. He proposed that the paragraph should read: "When the coroner desires to call for expert witnesses he shall be empowered to do it and to pay such witnesses appropriate fees."

Mr TURNER accepted the proposal, and the amendment was agreed to. The whole of the memorandum as amended was then approved.

Supplementary Death Certificates

Mr TURNER next moved a recommendation of Council that additional death certificates should not be given except at the request of the patient's representatives or after their consent had been obtained. Dr Fothergill had suggested that "copies of" should be inserted in place of "additional." He thought this was the better wording, and he moved it.

Dr MANKFELL said that the certificates asked for were not copies. The duration of the disease was stated in the

certificates given to the registrars, but the insurance companies wanted to know if the death had supervened since insurance or reinsurance. The insurance companies sought for additional information.

Dr J. F. WALKER suggested that the word "duplicate" would be preferable.

Dr BOYF suggested "supplementary" as the more correct word, if the paragraph had to be altered, but he preferred to leave it as it stood.

Mr McADAM FIELDS asked if it really referred to certificates or reports. Everybody could get a copy of the certificate on application to the registrar, but the insurance companies wanted a further report, and he had always objected to such a report being given except with the authority of the relatives of the deceased person.

Dr LANGDON-DOWN, on a point of order, asked if the paragraph had anything to do with the official certification of death. He suggested the deletion of the paragraph. Dr J. F. BILSON replied that the matter was brought up by his Division (Southport) last year, and was intended to refer to copies or supplementary copies of certificates required by insurance companies in cases of people insured for small sums. It was not intended in the case of policies for large sums. It was an attempt to defeat the insurance companies, who sought to render their policies void by some slip or misstatement on the part of relatives of a deceased person.

Dr G. H. LOWE (Cleveland) asked if the passing of the resolution did not mean direct encouragement of the practice of insurance companies of insuring lives without previous medical examination.

Dr J. A. MACDONALD said that these certificates were asked for in order, if possible, to nullify a policy. He always refused to give copies of certificates, whether offered a fee or not.

Mr McADAM FIELDS moved as an amendment:

That the Representative Body is of opinion that an additional report as to the cause of death or a copy of a death certificate should not be given except—

and then to follow on as in the motion.

The CHAIRMAN said it was necessary to keep the two certificates distinct by different nomenclature.

Dr F. L. ANSON (Leigh, Wigan) Why not say "information"?

Dr C. W. CUNNINGTON (Hampstead) seconded Mr Eccles's amendment on the following ground: A certificate of death once given was public property, anybody could get a copy, and he thought it would be inequitable to charge a fee. Secondly, as to copies for information, he was out to protect his patients' interests, and he considered any information he had was confidential. In his own mind he was convinced that doctors should not tell, at least without the consent of the relatives.

Dr BILSON opposed the amendment, remarking that everybody knew what was meant by additional death certificates, and he thought that was enough.

The amendment was lost, and the Committee's recommendation was adopted.

Composition of General Medical Council

Mr TURNER moved the recommendation of Council, made after full consideration of the position with regard to the present constitution and duties and powers of the General Medical Council, that "the Representative Body does not consider that the Association should take steps (as suggested at the last Annual Representative Meeting) with the view of obtaining a larger number of direct representatives." He said it was a general misunderstanding of the medical profession that the General Medical Council was established in the interests of the profession. But this was incorrect, it was established to protect the public. Things which appeared in the lay press from time to time showed that the powers of the Council were jealously regarded by considerable sections of the public, who were usually very ignorant of the real facts. If anything that were done in the way of increasing the representation of the general practitioner led to the casting of the whole constitution of the Council into the melting-pot, there

might be in contention that would result in some of its powers and references being curtailed. That would be most undesirable.

Dr C. I. T. SCOTT (Willesden) moved to rescind the resolution passed last year by the Representative Body that there should be a larger direct representation. He said that the Committee's proposal was in direct contradiction to what the Representative Body did in 1924. The general practitioner was represented by only 6 out of the 38 members of the General Medical Council, and that was not nearly sufficient. The General Nursing Council was composed of 2 Privy Counsellors, 2 representatives of the Board of Education, 5 representatives of the Ministry of Health, and 16 representatives of the nurses on the register. That was a good democratic council. The general practitioner should be better represented, not only for disciplinary measures, but for educational measures.

The amendment was lost, and the recommendation of the Council was carried.

Payment of Health Certificates for Elementary School Children

Mr TURNER moved to rescind the resolution of the Representative Meeting, 1920: "That where in elementary school authority requires a medical certificate of the inability of a child to attend school, the fee for such certificate shall be paid by the education authority," inasmuch as this did not accord with the opinion of the Solicitor of the Association as to the legal position. He said the Solicitor had come to the conclusion that the resolution was not within the law.

North-East Essex had an amendment to reject the recommendation and to substitute "should" for "shall" ("should be paid by the education authority") in the resolution of 1920, but the representative was not present to move it.

Dr WALLACE HENRY submitted that the first part of the amendment, being a direct negative, was out of order.

The CHAIRMAN said the first part was unnecessary, the second part was in order. If passed, it would not become what was technically called a decision of the Association, but a resolution of the meeting. He moved the amendment on behalf of North-East Essex.

Mr BISHOP HARMAN supported the amendment. It should be the policy of the Association to correct the inequalities of the law. Assuming the Solicitor was right, the Association should engage in propaganda to get the law altered.

Dr J. A. MACDONALD asked how the practitioner would stand in relation to the two new positions. An occasion might arise when a practitioner might come to grief over it.

The CHAIRMAN OF COUNCIL suggested that if the meeting was of the opinion that it would be better to have a resolution with the word "should" instead of "shall" it might be better to rescind the original policy motion and thereby put the practitioner out of jeopardy, and then by resolution of the meeting have the altered form put up and make it policy next year.

Dr WALLACE HENRY said that in Leicester the resolution of 1920 had been carried to its logical conclusion. The education authority had declined to pay the fee for examination, and as a result of that no medical practitioners in general practice gave any certificate on any conditions whatever to any school child. That had worked perfectly smoothly, there had been no prosecutions of parents for not sending a child to school on account of physical defect. Consequently his Division wanted to know what had occurred since the resolution had been passed to cause any change in the policy. No Division in the country had asked that the resolution should be rescinded. Why, then, had the Council taken upon itself to propose the rescinding of the resolution? It was because the Solicitor was of opinion that the resolution was illegal. But that opinion had been before the Association when the resolution of 1920 was passed. That opinion was before the Representative Meeting in 1905. Some authorities certainly paid for the certificate, including Hounsey, and if some other authorities had not the power to pay then

the Association, by adhering to its policy, would assist them in obtaining the power they ought to have. Furthermore, it was a great saving of time to the practitioners not to have to give the certificates. He therefore hoped that the meeting would decline to assent to the recommendation of the Council. (Applause.)

Dr L. A. PARRY (Brighton) said that he had the greatest respect for the opinion of the Solicitor, but he believed he was wrong in the present instance, for many authorities paid for the certificates, and if they had no authority the Government auditors would see that that was surcharged.

The CHAIRMAN said that as the Solicitor had been publicly challenged he would invite him later, if the meeting thought that necessary, to justify his opinion.

The CHAIRMAN suggested that the best way out of the difficulty might be to rescind the original resolution and then put as a substantive motion the original resolution with the word "shall" changed to "should," as proposed by the amendment of North-East Essex.

Mr TURNER said he thought that would be the best solution of the problem, and the CHAIRMAN OF COUNCIL also supported the adoption of this course.

Dr BOVEY then proposed that the resolution of the Annual Representative Meeting, 1920, be rescinded, without giving any reasons. This was carried.

On the motion of Mr BISHOP HARMAN the resolution of 1920 with the substitution of the word "should" for the word "shall," was then carried.

Fees for Medical Examination of Emigrants

Mr TURNER moved the adoption of the following in substitution for the fees adopted by the Representative Body in 1923:

That the fees chargeable by the medical referees appointed by the Dominions of the Empire to examine proposed emigrants should be as follows:

- 10s. 6d. for an applicant of 16 years of age or over
- 2s. 6d. for each applicant under 16 years provided their parents or guardian are sailing with them
- Not more than two applicants under 16 years of age in one family to be charged for
- Applicants under 16 years proceeding alone will be charged 10s. 6d.

The motion, he said, was merely a formal one designed to make clear the satisfactory arrangement arrived at with the Australian emigration authorities. There was formerly a limit of 26s. to the amount that could be charged for any one family, which was interpreted by some emigration agents as meaning that boys of 18 or 19 were to be classed as children. By the present arrangement 10s. 6d. was chargeable for every person over 16.

Dr MOTHERSOLF pointed out certain ambiguities in the motion. Certain cases, such as that of children under 16 proceeding without parents or guardians, did not seem to be provided for. He therefore proposed as an amendment certain verbal changes designed to make the position clear.

Mr TURNER did not think the amendment would have any material effect and was unwilling to change the wording without good cause since it had been accepted by the Australian Government with which the Association was working very amicably. Taken in conjunction with the preamble the wording was quite clear as it stood.

The amendment was lost and the recommendation of Council was carried.

Factory Medical Service

Mr TURNER next moved the adoption of the principles set out in the Annual Report of Council (includes a factory medical service (SUPPLEMENT, April 11th p. 155)). The question was he said of great importance in view of the forthcoming introduction of a bill to amend the Factory Act. The question had been very carefully considered and a joint deputation from the Association and the Society of Medical Officers of Health interviewed the Home Secretary with regard to it at the beginning of the present month. Unfortunately he had been unable to take part in that deputation but would welcome a statement from Dr Wallace Henry who was present and was familiar with all that had occurred.

Dr WALLACE HENRY said at the interview with the Home Secretary Dr Bradenbury outlined the policy of

Association with reference to the Factory Acts, at the same time stating that certain members of the Association, and particularly those engaged in factory work, did not entirely agree with that policy. Dr Lyster also spoke on behalf of medical officers of health. The Home Secretary, Sir William Johnson Hicks, received the deputation very cordially, but was unsympathetic towards its object. He made it clear that while there was nothing in the bill he proposed to introduce which would prevent the Association bringing forward its policy again at some future time, there was nothing at all likely to further the aims of the bill of his put before him, beyond a clause taken from the information contained in the reports of school medical officers with the work of the factory surgeon who inspected young people about to enter factories.

Dr W F DEARDEY (Manchester) had a proposal to make which he thought would facilitate business. He had conferred with the representative of the Glasgow Eastern Division, which had an amendment on the subject, and it had been agreed that the amendments by Glasgow Eastern and Manchester should be combined, the former being altered to read "That paragraphs (iv) and (v) of the principles set out in the report be referred back to the Council for further consideration." If that was acceptable he would withdraw the Manchester amendment.

The CHAIRMAN said the suggestion was a valuable one. As far as paragraphs (iv) and (v) were concerned the question of urgency did not arise. If the Chairman of the Committee saw fit to accept the reference back of these paragraphs the meeting could go on with the other parts of this policy.

Dr BEADLES said that factory surgeons would like an opinion on the question involved rather than have paragraphs (iv) and (v) referred back indefinitely.

The CHAIRMAN said these contentious paragraphs could be referred back, well and good, but if some representatives want us to reject them without further consideration they are in order.

Dr DEARDEY: I am willing.

Mr TURNER said he was willing to accept the reference back of the paragraphs, whereupon the meeting agreed to the reference back of these two paragraphs, and the remaining paragraphs of the Report were agreed to.

Unqualified Practitioners

Dr J S MASON (St Helens and Warrington) considered that the policy adopted by the Association in 1906 should be resuscitated in so far that the Medical Acts should be amended in the near future to make it impossible for any unregistered person to practise medicine or surgery. His motion, he said, did not deal with the question of direct representation on the General Medical Council or with that of one portal of entry into the profession but simply with the amendment of surgery by Acts to prevent the practice of medicine and surgery by unregistered persons. This question was admittedly difficult to deal with, but should not be buried simply for that reason. In the interests of public health and public safety the Association should embark once again on its 1906 policy. In 1906 the Association adopted a very active policy against unregistered practice, it might be regarded as a hungry cannibal ready to seize on and eager to devour any unregistered person, such as a stray osteopath, who crossed its path. Intely it had become a vegetarian, almost a fruitarian, living on the "refreshing fruit" of the mild and curious eye of a ruminant. (Laughter) At the time the Association first took the matter up there was fierce competition for small fees and a seat on the public took the view that the profession was merely jealous of its financial interests but to day the position had changed. A great many members of the profession now received more or less assured incomes, and they should show that they were not prepared to tolerate unregistered practice simply because it relieved them of part of their work. In the old days the opposition of the Association to unregistered practice was largely directed against the humble bonesetter or prescribing pharmacist, but to day

the evil was assuming a more subtle and sinister aspect, as was shown by certain cases which had come under his notice recently. In two instances sufferers from forms of tuberculosis had been treated by "spiritual healers." In one case a girl suffering from lupus vulgaris was treated for some months by the invocation of the "spirit" of an Indian who lived 400 years ago, and charged several guineas, and in the other, a woman who had plemisy with effusion was under treatment for seven months by a man who did not even see her, but sent her medicine on the strength of being given a locket which belonged to her. Many people were sent to prison for pretences less false than those made in those instances. Another form of unqualified practice was carried out through a weekly periodical, and two young men who asked him to help them to get the treatment in question told him that there was a medical committee running the treatment for consumption which that periodical professed to give. The time was ripe for the Association to deal with this question. Only registered dentists and midwives could now practise, and the same applied to the treatment of venereal disease, and the whole range of medicine should be kept for those properly trained for the job. The Association should adopt the active policy of 1906.

Dr HARMONIE expressed the opinion that the motion was unsuitable to be put forward in a meeting of medical practitioners. If the citizens of the country required direction to be provided by Government let them ask for it, but do not let medical practitioners set up a rule with the apparent object of getting patients driven into their consulting rooms. The quack had always flourished, but could it be imagined that the House of Commons was going to set up a rule which would interfere with the activities of "Lady Bountiful" in the village or those of the curate in his visitation of poor parishioners? It was an endeavour to restrict the liberty of a number of people regarded as their right and privilege. Every man and to make certain privileges which a number of people regarded as their right and privilege. Every man in this country thought he was competent to drive a gig or edit a newspaper or prescribe for a friend. (Laughter) If this were passed the meeting would be saying a man was to be prevented from conveying his opinion and advice to his neighbour, even if he did not do it for gain. On the other hand, patients were to be prohibited from going to an individual in whom they had faith. All who valued liberty must take the disadvantages as well as the advantages. If the meeting thought individuals should be left a choice—no doubt a foolish one—to take advice from any quarter they liked, they would have nothing to do with a proposal in which their financial and professional interests were concerned. He moved that the meeting proceed to the next business.

Dr C E DOUGLAS seconded, and the proposal to proceed to the next business was carried.

Income Tax and the Association Subscription
Mr F C FINNIS (Newcastle-on-Tyne) moved that members of the profession assessed for income tax under Schedule E should be entitled to a rebate in respect to the subscription to the British Medical Association and kindred societies in the same manner as those assessed under Schedule D. After a brief discussion the motion was lost.

Fees for Examination of Recruits
Dr W T HINE (South Suffolk) moved to instruct the Council to take action with a view to getting the daily maximum remuneration for the medical examination of recruits for the Regular Army and Royal Air Force increased from £1 17s 6d to £2 2s. This resolution also was lost.

Nursing Homes (Registration) Bill
Dr E R FOTHERGILL (Brighton) moved to instruct the Council actively to oppose the Nursing Homes (Registration) Bill, as also any other bill having reference to nursing homes, and based on the same principle. First, a definition of a nursing home was necessary. The definition provided was any premises used for the reception of persons who are suffering from sickness, injury, or infirmity, for the purpose of providing such persons with food where any

parent is used." So that if a medical man's method-in-law, suffering from chronic gout, was staying with him, his house became a nursing home. The bill was so badly drafted that the Minister of Health would have power to refuse to register a home if any person employed in it was unqualified to run it. The framers of the bill—the College of Nursing—agreed that that clause needed in evidence. Nursing homes were not for the industrial classes, but for the middle and upper classes. The inmates were able to pay fees and choose their doctors. They were under no compulsion, they could enter and leave whenever they wished. The ridiculous intrusion of a State department into the practice of the profession should be resisted. He secured Sir Henry Cantley to oppose the bill, doctors wrote to their members of Parliament, and it was withdrawn under promise that a committee should be formed to go into the whole question and decide what, if anything, should be brought up at a later date. Steps had been taken to ensure the Association being represented on the committee if it was not to be entirely composed of members of Parliament. Several other interests were trying to get representation on the proposed committee. He urged that on boards formed locally to deal with nursing homes the medical profession should be represented; that the British Medical Association should be represented on or appear before the committee of inquiry, that any home conducted by a medical man should be outside the scope of the bill, that, wherever the nursing home was, records and details should be confidential between the doctor and his patient, and that the profession should have a seat on any local body formed to control the homes. (Applause.)

Mr TURNER said that the matter was of considerable importance, because when the bill was withdrawn the Minister of Health intimated that a Select Committee of Parliament was going into the whole subject. If the committee was appointed the Association would be asked to give evidence, and the first question would be, Do you approve of the registration of nursing homes? Those appointed to give evidence from the Association should know the opinion of the Representative Meeting. The matter would probably come up before next year's meeting. Although the Council theoretically approved the registration of nursing homes, provided the provisions of the bill satisfied them, it was desirable to have an expression of opinion from the Representative Body whether the Association should support the registration and inspection of nursing homes under proper safeguards and conditions, and limiting those who ought not to be brought into the Act. It was the meeting dead against the proposal and lesions of having nothing whatever to do with it?

The CHAIRMAN said that the difficulty, as Dr Fothergill had pointed out, was exactly what was meant by "similar principles." The Council if the report was approved, did not stand against the registration of nursing homes in general; it had no objection, provided that the things to which Dr Fothergill had drawn attention were safeguarded, and indeed that the Association undertook to support certain nursing organizations in getting the registration of nursing homes. The Council approved the principle of registration, under proper conditions and with proper safeguards—did the meeting approve of that? ("Yes.") The Brighton amendment meant that the Association would not support any bill for the registration of nursing homes, unless it was safeguarded in regard to the three prominent objections pointed out from the medical point of view. If the motion were carried it would not mean that the meeting disapproved of the registration of nursing homes in general, but simply disapproved of certain things in the particular bill which had now been withdrawn.

Dr JOHNSON SMITH said he felt sure the Representative Body would not object to the registration of nursing homes. He took it that Dr Fothergill would not object to the local authority supervising a nursing home in a particular area.

The motion of Brighton was then put and declined carried.

In reply to a question by Mr BISHOP HARMAN the CHAIRMAN said that the interpretation of the motion had been made clear in the meeting. Sir JESSE VERRALL

said that interpretation would not appear in the resolution. He was not satisfied with the position. The CHAIRMAN said he would be prepared to take a supplementary motion.

Mr BISHOP HARMAN asked for a count of the votes on the Brighton motion, which he said, had been put hurriedly. On a count being taken the motion was declined carried by 65 votes to 14. Mr HARMAN then moved that the "similar principles" mentioned in the Brighton resolution, to which principles objection was taken, included the three points mentioned by Dr Fothergill—namely, (1) the non-recognition of the local medical profession by the supervising authority, (2) the disclosure of the case sheets and records of the patients treated to the supervising authority, and (3) that any premises under the control of registered medical practitioners are included within the definition of a nursing home by the supervising authority. The motion was carried.

Remuneration of Assistants in General Practice

Mr TURNER next moved as a recommendation of Council the principles formulated for the guidance of the profession in the matter of remuneration of assistants as set out in the Supplementary Report of Council (SUPPLEMENT, June 27th, p. 276). As would be seen from the Report the Medico-Political Committee had come to the conclusion that the employment of assistants was good both for the practitioner and the public in proper cases, it did not approve of that system where a medical man was sitting in the middle with a lot of assistants "dotted round" almost free from supervision but it thought it was right that he should employ an assistant over whom he could exercise proper supervision, and that he should not make the promise of a partnership the excuse for paying a lower salary.

The motion was carried.

Practitioners Engaged at Municipal Maternity Hospitals

Mr TURNER moved, as a further recommendation of Council to insert in the Report on the utilization of municipal hospitals for civil needs the paragraphs dealing with the remuneration of medical officers of municipal maternity clinics as set out in the SUPPLEMENT of June 27th (p. 277).

Dr J. F. WATKINS suggested with regard to the second paragraph of the recommendation—

That where a general practitioner is called upon to render assistance at a confinement in a municipal maternity hospital the fees payable to such practitioner should be in accordance with the scale of fees approved by the Ministry of Health for the payment by local supervising authorities to medical practitioners called in on the advice of midwives under Section 14 of the Midwives Act 1918—

that the fees for the municipal maternity hospitals should be higher than those paid when a practitioner was called in by the supervising authority under the Midwives Act. The fees under the Midwives Act were on the principle of average—some were very hardly earned, and some were fairly easily earned. In the case of a municipal maternity hospital if a man were called in there it would be an extremely difficult case, not comparable to many of the cases in which men were called in under the Midwives Act. Furthermore, in the case of the municipal maternity hospitals the cases would not, as in the cases under the Midwives Act, be necessitous cases, and therefore the fee should be higher.

Dr J. H. THOMPSON said it was not intended that the patients themselves should pay the fees in the hospitals in the class of case referred to.

Mr E. W. G. MASTERMAN said he only rose because he had charge of a municipal maternity home which was entirely for cases where the housing accommodation was not sufficient. The cases were generally necessitous cases, the patients paying what they could to the medical officer of health—generally 15s a week—and there was a grant from the County Council towards the expenses. He thought, therefore, that the circumstances in which a doctor was called in would be similar to those in cases under the Midwives Act because if there were an efficient resident

Medical Officers and Consulting Fees

Major P. HARRISON (Derby) withdrew his motion to rescind the resolution of the Annual Representative Meeting, 1924, that it was not advisable that whole-time medical officers engaged in public health work should accept fees for private consultations, but the CHAIRMAN said that he had a similar motion from Rochdale.

Dr J. HEVLYN (Rochdale) said that his Division had such great confidence in the skill and judgement of the Council that that was the first time he had brought forward a motion in opposition to it. But in Rochdale there were three medical officers of health, and under the existing arrangement two of the bodies could give powers to their officers to accept fees for private consultations, and the Ministry of Health might object. That was an invidious position for the Division, and it wanted from the Council a definite answer as to whether the medical officers of health could ask for fees or not. It did not mind whether the answer was "Yes" or "No," but it wanted to know the position.

Dr R. BORD (Manchester), supporting the amendment, said that last year his Division brought forward an amendment which was virtually the one before the meeting, though the Manchester resolution added the words, "except when freely offered through the practitioner attending the case."

This amendment was lost.

Food Preservatives

Dr RIDLEY BAILEY went on to mention that a departmental committee was appointed to deal with the subject of food preservatives, which committee had made a report. It had come to the knowledge of the Association that certain vested interests were putting pressure on the Government and Parliament not to adopt certain of the recommendations of that departmental committee. The Public Health Committee of the Association was called together to deal with the matter as one of urgency, and that Committee, having with it a number of experts, gave its opinion, stating that that opinion would come before the Council and the Representative Meeting in due course. The recommendations had been sent to the Government department concerned, they had been before the Council that morning, and they now came before the Representative Meeting as recommendations of Council for the support of the meeting.

The recommendations were as follows:

(1) That the Representative Body is satisfied from the experiments made, from the recorded cases and also from the fact that other countries have discontinued their use that it is essential in the interests of public health that boric acid and borons should not be used as food preservatives.

(2) That while recognizing that there are difficulties in heretofore in this country due to the lack of cold storage facilities and efficient means of transport which do not exist to the same extent in America and other foreign countries the Representative Body is of opinion that as a matter of principle it would have been better if the example of other countries in prohibiting entirely the use of preservatives and metallic and other toxic colouring matters in foods could have been followed in the draft regulations *re* food preservatives etc. issued by the Ministry of Health.

(3) That the members of the Representative Body draw particular attention to the evils which have arisen in their own experience from the importation of liquid eggs preserved with boric acid and the Representative Body considers that it is essential from the public health point of view that liquid eggs preserved with boric acid or other preservative should be prohibited at once.

(4) That subject to the foregoing recommendations the Representative Body places on record its approval of the draft regulations (issued by the Ministry of Health on February 17th, 1925) with regard to preservatives etc. in food.

These recommendations were immediately adopted unanimously and without discussion.

Strancous Duties of Medical Officers

Dr G. G. S. JOHNSTON (Wakefield) moved as in opinion of the Representative Body, "That it is inadvisable and improper that whole time medical officers engaged in public

health work should be required to undertake duties other than those for which they were appointed." He cited two cases in support of the motion. In one case a local authority required its bacteriologist, a whole-time officer, to perform *post-mortem* examinations, for which he received the princely sum of four shillings for expenses. In the other case a whole-time officer was expected by the local education authority to examine mental defectives. If whole-time officers were not permitted to accept fees for private consultations, surely it was only reasonable that they should enjoy the safeguard of his or a similar motion so that they were not exploited by parsimonious local authorities.

Dr RIDLEY BAILEY said there was a good deal to be said in favour of the speech which Dr Johnston had made, but the reference was rather wide.

The CHAIRMAN said he thought Wakefield would agree that the motion said rather more than the Division meant, and suggested that the matter should be referred to Council.

Dr JOHNSTON agreed, and this course was adopted.

Standard of Purity of Calf Vaccine Lymph

Dr JAMES NIAL (Hendon) moved.

That inasmuch as vaccination against small pox by means of calf vaccine lymph is the sole obligatory medical operation known to English statute law—abstention being permitted only after statutory exemption has been obtained—calf vaccine lymph be now recognized in the *British Pharmacopoeia* as a therapeutic substance that standards of purity, potency and source or seed used in its preparation be prescribed that the provisions of the Sale of Foods and Drugs Act be made to apply and that early parliamentary action be urged to enable the Ministry of Health to lay down and enforce regulations governing the conditions of the preparation and sale of calf vaccine lymph.

This was agreed to without discussion. The Report under "Public Health and Poor Law" was then approved.

MEDICAL BENEVOLENCE

Proposed Association Charities Committee

Dr C. O. HAWTHORNE (Chairman of the Medical Benevolent Fund Committee) moved as a recommendation of Council that it be instructed to set up a British Medical Association Charities Committee, to be constituted and conducted according to the provisions set out in the Statute of June 27th (p. 280). He said that the committee set up by a resolution at the Annual Representative Meeting at Bradford last year was given two instructions to survey generally the benevolent organization existing within the profession, and to inquire particularly whether it was advisable or inadvisable to set up a new and fresh benevolent enterprise under the auspices of the British Medical Association. The committee had come to the conclusion that the latter course was not desirable. It had surveyed the field, and recognized that the value of existing organizations was hindered solely by want of funds. It was considered that it would be a useful function of the Association to use its machinery to supply that defect. Apart from smaller and local enterprises, there were two large and important benevolent organizations in connection with the profession—the Royal Medical Foundation associated with Lpsom College, and the Royal Medical Benevolent Fund. Lpsom College was, of course, an educational organization, while the Royal Medical Benevolent Fund was a benevolent enterprise. The former did two things—it provided fifty pensions for aged medical practitioners in reduced circumstances and it supported fifty foundation scholars, each of them being the son of a deceased or disabled medical practitioner, and each being maintained, clothed, and provided with pocket money. The admirable and complete education provided enabled the boys to teach, by their own efforts, positions such as might reasonably be anticipated by the sons of professional men. The Royal Medical Benevolent Fund was also conducted by a committee of medical practitioners, with the help of some laymen. It disbursed last year about £8,500, of which £3,500 was paid in annuities from invested funds and £5,000 distributed

58 AUG 1, 1925]

Annual Representative Meeting

would bring about all that was wanted in the way all such things were achieved—by human reason and the lapse of time. The public looked on the Association's policy as a profiteering policy, and just as practitioners were forbidden to exploit their patients, so they should refrain from exploiting the public.

Dr FORTHERGILL said what Dr Gordon Bell really supported was the speech made by the representative of Glamorgan, the motion put forward by Glamorgan did not contain the points the mover of it had referred to in his speech.

Dr C J KIRK (Darlington) said Darlington had been loyal to the Association's scale, and their experience differed entirely from that referred to by the mover of the resolution (Dr Jones). Last year the Darlington Education Committee asked for applications for the post of school assistant medical officer at £500. There were fourteen applicants. They were communicated with, and eleven withdrew. His Division followed the proper procedure in sending a deputation to the appointing authority, and so on. The appointment was eventually given to a lady, but for periods of six months at a time only, and as she was refused an unconditional appointment she resigned. His Division took no further action, but the Darlington Committee advertised the vacancy at £600. The Association's scale had received the approval of the Ministry of Health, and had been recognized as a serviceable guide by the Association of Municipal Corporations.

Dr EUSTICE HILL (Public Health Service) hoped the Representative Meeting would not accept the amendment. He was medical officer of health for one of the largest industrial counties and he believed he had about twenty-five whole-time medical officers in the group to which he referred, and it had been the policy of his council, at any rate since the beginning or the middle of the war, to pay the commencing salary the Association recommended, and undoubtedly it had been to the great advantage of the health of the county. The remarks made by the representatives of North Glamorgan and Sunderland meant that while the policy he referred to had been highly successful, there were bodies which would be content to pay the lowest salary for which they could get in office. Because there were difficulties in certain areas there was no need to adopt such amendments. For a long time Sunderland had been in an invidious position, their medical officer of health having been paid little more than half the rate proposed in the scale now before the meeting, and Sunderland liked to base the other salaries in proportion. Many of these posts were blind-alley posts, and a large proportion of the men in the public health service could not hope to get the best posts, and many consequently went into private practice. It was obvious that if £500 were laid down as sufficient salary for a whole-time officer the general public would take that as a standard for insurance practitioners. It was a point the meeting would have to consider. (Applause.)

The CHAIRMAN OF COUNCIL said it was felt when the recommendation was drawn up that for a probationary year the person who had not had the full experience that was thought to be necessary to fill these important posts could be serving the local authority at £500, but after that the full scale must be paid. The Council did not want to encourage local authorities to appoint people with less qualifications and experience because of their particular local attachment, but it was hoped they would go to the open market to get the best person possible. He had not tried to ride off on the technical point that this was a matter not open to discussion, he welcomed the discussion, for it enabled him to say that these £600 a year posts were not for young people fresh from college. Every person who applied for this post at £600 a year had probably spent at least three years after qualification in getting experience in various ways, and probably in getting an additional public health qualification. It was not advisable to have young people fresh from college in these posts, and he hoped the Representative Body would not give the impression that it thought otherwise. It was important that the leading representative men among the municipal authorities welcomed the idea that these medical officers were people likely to com-

mand the confidence of the public and the support of the general practitioner. He wanted to say to the representative of Sunderland that the central office was extremely sorry that the circumstances of the cases referred to had compelled the Council to speak with two voices and, as he had put it, "let Sunderland down." But there were circumstances which could not well be spoken about in public, which had to be considered in particular cases. There were sometimes the personality of an applicant. There were circumstances in which a little delay in taking certain action in Divisions made it unwise to proceed along the general ethical lines. He wanted the meeting to have lost one or two outpost actions, and to have done certain things not and in which would give the impression that it was not prepared to fulfil its policy, yet on the whole front of the battle they had won. (Hear, hear.) The Council had been labouring under the disability that it was waiting for the formal approval of the Representative Body to this final scale before adopting the more rigid procedure which would follow if it were implemented by the meeting's approval that day. He hoped the meeting would reject the amendments and pass the Council's report. (Applause.) With regard to the Poor Law medical officers, he found that Dr D'AVANT was perfectly right. At the last meeting a proposition was carried for the inclusion of the word "Medical superintendents of hospitals, including Poor Law hospitals," but at the Ministry of Health one did not come first to free with the people who could talk about these things, so it was withdrawn from those particular negotiations. But the Council was pursuing it in regard to Poor Law hospitals in another way, though it was not included in the present scheme.

Dr J T D'AVANT I wanted to know when the Poor Law officers will be dealt with. The scale is being applied to advertisements in every case. The amendment was lost, and the scale of salaries was then put to the meeting and approved without a single dissentient.

Salaries for Combined Public Health Posts
Dr RIDLEY BAILEY (Chairman of the Public Health Committee) moved the recommendation of Council with regard to the principles applying to whole-time medical officers (SUPPLEMENT, April 11th, p 159). He explained that the recommendation applied to joint appointments for combined areas, and the object was to ensure that the combined remuneration should not be less than the minimum commencing salary of a whole-time medical officer of health, also that where an assistant medical officer under a county council became a district medical officer for a definite portion of his time, the salary should be proportioned between the two authorities.

In the absence of the representative, the CHAIRMAN formally moved an amendment by North-East Essex, that as the Council's recommendation did not cover the case of combined appointments in Essex it be referred back for further consideration, but this amendment was lost and the recommendation of the Council was adopted.

Dr RIDLEY BAILEY then moved that the remainder of the Annual Report of Council under "Public Health and Poor Law" be approved.

Dr STURTEVANT (Lumbago Wells) said that he had been requested by the Glasgow representative (who could not be present) who proposed the resolution which was carried at the last Representative Meeting to point out that the proposal that the local Poor Law work should in future be carried on by a panel of doctors, instead of by a single officer, was not referred to in the Annual Report. Dr RIDLEY BAILEY replied that the Committee dealt with the matter and sent a recommendation to the Council. The CHAIRMAN explained that the proposal was found to be impracticable in the places in which it was tried, and the Committee recommended to the Council that the resolution should be rescinded. The Council did not feel justified in proposing that course so that the method could be tried in other places if it was wished.

AUG 1 1925]

enough confidence in it to subscribe to it. In 1924 the Fund collected £8,468, and the expenses of doing so were £1,254, which worked out at 14.5 per cent for expenses. He thought the Association, with its new building and its great facilities, could do the work very much more economically than that Dr Hawthorne had mentioned the question of, by support. In his (Dr Walker's) view the Association, with its great and growing prestige, would be able to obtain a large amount of its support. He urged the meeting to set up a fund of its own. It would be a notable landmark in the progress of the Association, they would pay a debt of honour long overdue, and bring ease of mind as well as of body to their poor and distressed brethren who, through no fault of their own, had fallen by the wayside. (Loud applause.)

Mr H S SOUTER, in supporting the original motion, said the view expressed by the last speaker and by Dr Hawthorne that the Association must support members who had fallen into difficulties would be supported by everybody, but there were politic and impolitic ways of doing it. Dr Hawthorne's methods were statesmanlike, but if the amendment were carried the Association would be lauded in difficulties. He knew something of the Royal Medical Benevolent Fund, as he was on its management committee for several years. The Fund was managed under considerable difficulties, and, he thought, not always with great wisdom, but there could be no question as to the wholehearted manner in which the management did its level best to assist the profession, and the amount of work the secretary, Dr Newton Pitt, had put into the Fund was extraordinary, and deserving of their deepest gratitude. He (the speaker) was invited to discuss the matter with the committee of management, although he was at that time a member of that body, and he thought he thoroughly grasped the committee's point of view. It was this, that if the Fund had any official connexion with the British Medical Association the bulk of its subscriptions would be at once cut off. The committee did not dislike the Association or general practitioners, but it thought, on a calculation, it would lose on the transaction. That being so, it was up to the Association to prove the fallacy of the thesis. If the Association could show that it was able to put down the money there would be no difficulty in getting the control it wanted, but if the Association set up a fund of its own it would start with a disadvantage. It could not be called the "Medical Benevolent Fund." The present fund was started by the Association, and why should it be given up? He thought members of the Association had lost control of it largely through their own neglect. The medical profession was subscribing only 7 per cent, and in London it was below 7 per cent, and what right had they to grumble if the management was taken in hand by a group of men who, he thought, had done then best with the funds at their disposal? When the Association had done what it could to find the funds it could regain control. But to form a fund of its own meant duplication of funds, which would be disastrous. It would be a case of lobbying right and left to get benefits. The whole income of the Benevolent Fund was about £8,000. Surely it could be increased to £20,000 (Applause.) But the present arrangement was ridiculous. Let the Association have its own Charities Committee and obtain all the money it could, and then make terms with regard to this bulk sum. By this method they would not duplicate funds, there would be no antagonism, and all that was wanted could be obtained.

Dr E L ELETOR DARTING (Portadown) said it was a disgrace to the profession that only 7 per cent supported the Fund. In Ireland, with a very small number in the profession they raised between £3,000 and £4,000. He thought it would be altogether wrong to disqualify members of the profession because they had ceased to be members of the Association. In his own county the individual contributions had until recently averaged 5s, but by tactful and pleasant handling the usual contribution, even of the young members, had risen to 10s, and older members had willingly doubled that amount. (Applause.)

Dr W I DEANER (Manchester) said that although he had much sympathy with the amendment he must oppose

it. He had set the ball rolling at Portsmouth, and last year he induced the Representative Meeting to ask the Council to go a step further. That step had now been taken, and was in the right order. The first essential was to have a committee that would thrash out the various phases of the matter. It would be a mistake to rush matters. If the fund were started now it would be a considerable time before it became operative. He believed that in a very short time there would be sufficient funds and subscriptions. It was right to begin with a committee in London, but even at the commencement it should be duplicated. A big collecting agency must have a committee in every Branch of the Association. He suggested that every Division should be asked to appoint a charity representative, and those representatives form the Charity Committee of the Branch. That method was followed by the biggest charity organization in the world, and they could not do better than imitate it. (Cries of "Vote.")

Dr C L DOUGLAS said the Royal Medical Benevolent Fund was the creation of the Association, and they could see what had happened by letting it run on its own. Their predecessors twenty years ago made a fundamental mistake—let them not repeat it by creating a second fund and again handing it over. Every member of the Association should subscribe and exert interest in the proposition in the matter. Then the Association could approach the Fund, and say, "You are going to undergo a process of peaceful penetration, we are going to take you over, whether you like it or not. We are going to be the power behind the Royal Medical Benevolent Fund." He had nothing to do with that Fund, he was connected with Epsom College, which was well worthy of support. It was heart-breaking to read from year to year tales of distress and disaster that had fallen upon good fellows who had died before their time, leaving wives and families. Something must be done. It was a disgrace that a great benevolent profession should subscribe to outside charities that ought properly to be looked after by laymen and leave its own kith and kin alone.

Dr G C TROTTER understood that through the medium of the Association these charities had received a considerable sum. A good deal of money had been forthcoming through the Medical Insurance Agency, and he asked that information on that point might be given.

The CHAIRMAN OF COUNCIL said that with the sentiments expressed by Dr Walker everyone must have sympathy. But he (the speaker) had taken some little pains to find out exactly the work that the present organizations were doing, in particular the work of the Royal Medical Benevolent Fund. Those in charge of that organization were doing an exceptional work with the very small means that the profession had given them to handle. Frequently they supplemented the funds out of their own pockets without giving a word about it in public. The Association had the power to implement any appeal of the character proposed, and to guide the activities of the organization. It was only because general practitioners had not attended the meetings of subscribers that there were no general practitioners on the governing body. There was now a prominent representative of the profession—himself—on the executive of the Fund. He was impressed by the extraordinary devotion shown in that body and in particular by the work, never blazoned abroad, of the Ladies' Guild. Such beneficent activities should not go for nothing. They should be furnished with the means of war. He deprecated any assumption of management on the part of the Association, but he would like the Association to go in and help—not to usurp the place of the prominent men in London who were doing detailed work in connexion with these bodies. The Association through local secretaries, who would in most cases be men already doing some work for such bodies, could accomplish a great deal. It would be quite easy if every member instead of talking, would pay. He envisaged the Charities Committee using every Division and Branch to use its organization to gather money, which the Charities Committee could pass either to the Benevolent Fund, or Epsom College, or directly, in emergencies, through the Sir Charles Hastings Fund or otherwise. He begged that no narrow or provincial view

meet more immediate cases of difficulty and distress. It had a special organization attached to it known as the Ladies' Guild, the members of which rendered personal service to the beneficiaries, and by inquiries and investigations kept the governing authorities informed of the merits of individual cases. They were also able to supply certain necessities such as clothing, and to obtain opportunities for general educational and sometimes technical training for boys and girls. Both funds were hampered by want of money. The annuities paid averaged £25 a year, although a few reached £30, and even £40. Having in view the present value of money and cost of living, such sums could hardly be regarded as adequate or as worthy of a profession which had never been reputed lacking in generosity. At the last election of foundation scholars at Lpsom there were 23 applicants for 13 vacancies. If there had been 60 scholarships to distribute instead of 50, 10 more boys would have received the advantages he had outlined, instead of having to suffer a demoralizing and depressing disappointment. The greater part of the sums distributed was obtained by annual subscriptions and donations, so that to maintain the present income level, and, if possible, increase it, called for constant and sustained effort. It was only effected by the self-denying and largely unrecognized efforts of members of the profession who devoted their time and energy with unstinted zeal to promoting the success of the Royal Medical Benevolent Fund and the Royal Medical Foundation. Both organizations (Dr Hawthorne continued) were managed by committees whose work came under review by the subscribers at annual meetings, while on the other hand there was the British Medical Association, a great organization, comprehensive, penetrating, and able to define the exact position of those funds to the great majority of medical practitioners in this country. It would surely be worth while, therefore, to bring about co-operation between the two benevolent organizations and the British Medical Association. His committee suggested that such co-operation should be secured by the establishment of a special committee which would collect funds to be distributed to any benevolent organization which was in need of funds and was doing work of which the Association approved. He submitted that by accepting the motion he proposed to that effect the prestige of the Association would be enhanced, while by linking its name to enterprises which must command the sympathies of all, the Association would be carrying help and sympathy into quarters where they were particularly needed. On the one hand, there were elderly people who had been broken by fate and needed help. With such there must necessarily be an abiding note of sadness, and all that could be done was to mitigate future hardships. On the other hand, there were boys and girls who had suffered, no doubt, great misfortunes, but whose faces were turned to the future rather than the past. With them the note was not of sadness but of hope. It was for the representatives to see that that double appeal, to which all of them must individually respond, was responded to also by the Association as a body.

The discussion on this subject was postponed to the following day, and the meeting adjourned at 6.30 p.m.

DRUG ADDICTION

Mr. TURNER, in submitting the report under "Medico-Political" for approval referred to the report of the Committee on Drug Addiction which was appointed in June, under the chairmanship of Dr. Bone, to advise the Association's witnesses in giving evidence before the Home Office Committee on Drug Addiction. These witnesses were Dr. L. K. Le Fleming, Dr. C. P. Symonds, the Medical Secretary, and himself. He suggested that Dr. Bone should be allowed to put the position before the meeting.

Dr. J. W. BONE, as the representative of the Association on the Home Office Committee on Drug Addiction, placed before the Representative Body the provisional findings of that body, which, as its report is not yet available, cannot be published. The meeting fully discussed the matter and arrived at definite decisions for the guidance of Dr. Bone, and these will also be communicated to the Home Office Committee and reported later in the SUPPLEMENT. The discussion occupied a considerable part of Monday

Tuesday, July 21st

The Annual Representative Meeting assembled at 10.30 a.m., the hour being indicated in order that members might attend the opening of the exhibition of surgical instruments, appliances, drugs, etc., and spend some time among the exhibits.

The Chairman invited on to the platform three distinguished persons, who were technically not representatives, but whom the whole meeting was very glad to welcome—Dr. A. J. Ornstein, C.M.G. (Vice-President, South African Committee), and Dr. Alexander Primrose, C.B., and Dr. A. T. Bavin (respectively chairman of the executive and treasurer of the Canadian Medical Association).

The minutes of the previous day's meeting were confirmed. Dr. R. H. FRASER asked when he could raise the question of the procedure of election of the eight members of Council by the Representative Meeting. The Chairman promised that an opportunity should be given if possible before the meeting ended.

MEDICAL BENEVOLENCE (continued)

Dr. HAWTHORNE, who had made his speech on the subject just before adjournment the previous evening, moved that the Council be instructed to set up a British Medical Association Charities Committee, to consist of the officers of the Association *ex officio*, three members appointed by the Representative Body, and three appointed by the Council, together with the Editor, the Medical Secretary, and the Financial Secretary. The duty of this committee would be to direct the attention of members to the financial and educational positions which arose as a result of misfortune falling on members of the profession and to appeal for contributions to meet those positions. All the sums in response to such appeals should be paid to a trust fund, the trustees being members of the Council for the time being in office, and should be distributed to such medical benevolent organizations and in such amounts as the committee might deem desirable, provision being made for contributions earmarked by the donor for a particular purpose.

Dr. J. F. WILSON (South Essex) moved to amend para. 3 of Dr. Hawthorne's motion, which set out that the sums obtained in response to the appeal should be paid to a charities trust fund, and distributed to medical benevolent organizations. His amendment was:

All sums obtained in response to such appeals shall be paid to a charities trust fund the trustees being the members of Council for the time being in office. Such fund shall be administered by the Charities Trust Fund Committee for the benefit of those members and ex-members of the Association and their dependants who may in the opinion of the committee require assistance.

He appealed for the very careful and earnest consideration by the meeting of his proposal, for it affected, not only those who needed the help of the Association, but also the honour and prestige of the profession. It was a curious anomaly that the medical profession, which was rightly known as the most charitable of all professions, had so far terribly neglected the unfortunate among its own numbers. Large sums were subscribed by medical men to those excellent Masonic charities for the benefit of lay people, yet they could not find enough money for their own people. That was a reproach which could, should, and, he ventured to say, must be removed. (Applause.) So far he was in total agreement with Dr. Hawthorne, but when he came to the methods by which this might be effected he found himself in opposition. His own proposition was that there should be a British Medical Association Fund, with funds collected by the Association, managed by the Association for the benefit of members of the Association. If the resolution were adopted unamended it would mean that the Charities Trust Committee would be a channel whereby sums were collected for existing organizations, of which the most important was the Royal Medical Benevolent Fund, and if that committee merely acted as a channel for collecting funds it would be a failure and would lack the confidence of the profession. Until quite recently the general practitioner was unrepresented on the committee of management of the Royal Medical Benevolent Fund. There was not a single representative of Wales, Scotland, or Ireland, and that was a lamentable defect. Although the Fund had been in existence for forty years, only 7 per cent of the profession had

might be taken. The occasion was one for kind gestures, and cordial action. (Applause.)

Dr. WARRICK HENRY pointed out that at present individual subscribers had individual votes. If the money was sent directly to the central organization how would adequate voting representation be secured? The CHAIRMAN or COSEY said that there were ways and means of attaining that end. The CHAIRMAN reminded that a subscriber could cut-mark his subscription, and in that way retain his original voting power.

Dr. C. O. HAWTHORNE said that on the previous day he had the opportunity of pressing the claims of prominent medical organizations in the profession, and he had now to face a severe attack upon the economy, efficiency, and generosity of the Royal Medical Benevolent Fund, and, in addition, in equally severe attack by inference, upon the British Medical Association, for the mover of the amendment had told the meeting that, while the Royal Medical Benevolent Fund had failed to do this or that, it had yet managed to collect and distribute a sum of £8,500 a year, whereas the British Medical Association had not yet managed to contribute one penny to a debt which, he said, was long overdue. The time and place for criticizing the Royal Medical Benevolent Fund was at the annual meeting of subscribers. What would be the position if a benevolent fund entirely confined to members of the Association were set up? For one thing, its efforts in regard to educational opportunities for sons of deceased members would be restricted in comparison with the work of the Ipsom Foundation. It would be confined to the duty—a duty they all acknowledged—of trying to mitigate the distress of those who had met with misfortune. Dr. Walker had criticized the administration of the Fund, but the speaker's view was that it was administered on an economic basis and could be readily defended.

Dr. WALKER was sorry if any remarks of his were construed as personal criticism against the Benevolent Fund. But could the Association be blamed when it had made overtures to the Fund and had been severely rebuffed? With the power and prestige of the Association a successful fund could be set up, it might take a year or two, but it would become, he was quite sure, worthy of the profession and commensurate with the need.

The CHAIRMAN or COSEY in reply to Dr. Trotter said that grants of varying amounts had been made in the past by way of the Medical Insurance Agency, and a representative of the Agency, in the person of the Financial Secretary and Business Manager, had a seat on the committee of management of the Royal Medical Benevolent Fund.

Dr. DAVID LAWSON asked whether the benefits would be extended to the whole profession. The CHAIRMAN replied that under the amendment members and ex-members would be included.

Dr. Walker's amendment was lost by a considerable majority.

Dr. D'LEWIS asked whether the proposed committee was supposed to be a standing subcommittee of the Association or a committee of the trustees. The CHAIRMAN replied that it would be a committee, not a standing committee. By operation of the by-laws it could be made a standing committee at any time.

Dr. D'LEWIS said he assumed the expenses of the committee would in that case fall upon the Association fund and not upon the Benevolent Fund, and called attention to a standing order which said that the Representative Body should not provide funds for outside purposes until the Finance Committee had dealt with the matter. What had the Finance Committee dealt with it?

The CHAIRMAN or COSEY said that instruction to set up the committee had not yet been given by the Representative Body, and the question of finance had not therefore arisen.

The CHAIRMAN said it was possible to pass the resolution without involving the question of finance at all. If the question of the Association's finance was involved it would, of course, have to be done in the orthodox way.

Dr. FORMER asked whether the money could only be given to certain benevolent organizations and not to an individual. The CHAIRMAN replied that the

Sir Charles Hastings Fund was in an organization which, by the liberality and at the suggestion of its recent donors, could be used without the slightest formality and at any moment to deal with individual cases, and money collected by the Association could be given to that fund.

Dr. J. J. D'LEWIS asked whether in the paper the members received on January 1st the list of benevolent associations usually given would be diminished and the British Medical Association's charity put in. The CHAIRMAN replied that that was what should be done.

The recommendation of Council moved by Dr. Hawthorne was then put and carried.

Dr. Hawthorne announced that he had received in offer a contribution of £5 to the fund on condition that nineteen other men would contribute the same sum.

The CHAIRMAN said that the Representative Body would have to elect the three members on the Medical Charities Committee, the Council electing the other three.

Several nominations were made from the body of the meeting and Dr. W. J. Dearden, Dr. J. A. Macdonald, and Dr. J. L. Walker were elected.

Dr. Hawthorne announced that in addition to the offer of £5 on condition that nineteen others subscribed £5, there had been an offer from a member of the Representative Body of £100 as a contribution to the fund. (Applause.)

Later an appeal was circulated in the meeting, and as a result some £250 was promised, and a further £70 in annual subscriptions.

It was decided, on an amendment proposed by Dr. McCutcheon and seconded by Dr. W. Douglas that the balance remaining after the purchase of the Chairman's Badge—a sum of £8 10s—should be devoted to providing elms on the ribbon of the badge giving the names of the past and present chairmen and the dates of their tenure of the office.

OVERSEA BRANCHES

~ Sir JENNER VERRILL (Chairman of the Dominion Committee) moved approval of the Report under "Overseas Branches." He said he had had considerable experience of committees, but till he was Chairman of the Dominion Committee he had not realized what an important committee it was in the interests of the solidarity of the Association. The Committee had received assurances from the Mesopotamia Branch that the activities of the Association with regard to the difficulties of the profession in that country and with regard to questions of employment and unemployment had been of great value. The Australian Government had appointed Sir George Syme and other members of the Association on a Royal Commission recently set up to inquire into conditions relating to the preservation of health, which showed that when expert members of such bodies were required the Australian Government realized the value of the British Medical Association. (Applause.)

The CHAIRMAN reminded that the Government of New Zealand had appointed an important commission to inquire into questions of mental deficiency and in that case also the Government had looked to the British Medical Association to supply suitable personnel.

Dr. W. N. ROBERTSON (Queensland) briefly addressed the meeting, and was cordially received. He said he would like to refer to the tremendous power the British Medical Association had in Australia. Sir Jenner Verrill had just alluded to the Commission of which Sir George Syme was chairman. Two other members of the Commission were members of the Association and there were two women doctors and one layman. The interesting thing about the appointments was that the Government appointed Sir George Syme straight away, and having appointed another member of the Association, the Government then asked the Branches to nominate a third. The Government went to headquarters for the chairman and then went to the Branches to recommend another member. He was coming to the conclusion that the powers that be in Great Britain were beginning to discover also that the British Medical Association could not be neglected, and he hoped that that would encourage every member of the profession to join it. He would carry back to Australia an impression of the brilliant way in which the work of the Association was done. Of course, here, as in Australia, there were some men who

got up and tilled puzzle—(laughter)—but he was pleased with the sound arguments and the brilliant speeches even when he thought they were on the wrong side. (Applause.)

Major T. J. HARRISON (Mesopotamia) who was involved with applause, said that in Iraq a very difficult period of negotiation in regard to the service of British officials generally and health officers in particular had been passed through, and his Branch desired him to convey to the Association its strong appreciation of the assistance and backing of the Association. In that way the solution of terms for other British officials generally in Iraq had been greatly aided.

The approval of the report was agreed to.

NAVAL AND MILITARY

Sir RICHARD LUCE (Chairman of the Naval and Military Committee) gave a review of the position especially in regard to the negotiations with the War Office with regard to conditions of service in the R.A.M.C. The question was in some respects parallel with that of the senior surgeon commanders of the Navy, which had exercised the Association for four or five years. On that matter a partially satisfactory conclusion had been reached. By retirement before the expected age these senior surgeon commanders lost a very considerable sum. They were offered at first £250 on a slightly sliding scale, which did not make much difference. The Committee tried for £500, but when at length the Admiralty offered £300, and those affected were willing to accept that sum, the Committee recommended them to do so. The shortage in the R.A.M.C. had been exercising the Committee and the Council, and steps had been taken with a view to improving the position. The Secretary of State for War, at an interview a month ago, held out certain offers which if carried out would have done much to improve the conditions of service and to make the service more attractive. Those offers were being opposed by the Treasury, and it was not known whether the War Office, which was in entire sympathy with the increase, would be successful. The matter had been referred to a committee by the Cabinet. Coming to the most important question of all that of a grievance which had come to light in the matter of pensions, the speaker said that by the pre-war warrants it was promised to all officers joining the R.A.M.C. that on retirement after twenty years' service they would receive £365. By an alteration in the warrant which took place in 1919, when pay and pensions generally were being raised, the pension of R.A.M.C. majors was raised to £396, a considerably smaller increase than that of most other branches of the service. By an alteration of the method the £396 was now made up of two elements—service of twenty years and service in rank. Certain R.A.M.C. majors on retirement, if a portion of their service had been spent in West Africa or other unhealthy climates, were enabled to count then time there as double, so that, if four years had been spent in an unhealthy climate, they could retire after sixteen years' service. Hitherto the sixteen years counted as twenty in all circumstances. But some officers who recently retired, instead of receiving £396, had the amount considerably reduced, because they did not get the element of rank pay for more than four years, instead of for eight under the old warrant. Consequently these officers had retired with a sum considerably below the amount promised them when they joined the service. The War Office actually failed to carry out its agreement with them. The Committee had made strong representations to the War Office telling the Secretary of State in the interview mentioned that the Association could not help in recruiting for the R.A.M.C. unless the grievance was righted. On June 10th the Council passed the following resolution:

That it be recommended to the Representative Body that inasmuch as the provision for a 20 per cent reduction in the retired pay of majors after twenty years' service under the R.A.M.C. Warrant can have the effect of reducing the pension of many of these officers below the sum of £1 a day, which was provided by the warrant under which they joined the service the Representative Body is of opinion that a serious breach of faith has been committed by the War Office and that therefore the Association is unable to recommend recently qualified doctors to enter the R.A.M.C. and declines to publish the terms and conditions of service in the P.A.M.C. in the other publications.

Sir Richard Luce added that the recommendation which went forward from the War Office to the Government had been hung up by the Treasury for the time being, so that the position was now that the answer which it had been hoped to have before that meeting had not come to hand. In view of the fact that it had not been settled it was for the Representative Body to decide whether it should say to the War Office that it would not advise the Association to take any steps to help in the recruiting for the R.A.M.C. until the grievance was remedied. He proposed that the resolution already passed by the Council be forwarded to the War Office, explaining that the profession quite realized that the War Office was not hostile, but that it was up to the Government to get the matter settled through its committee.

Dr J. A. Macdonald seconded Sir Richard Luce's proposal. This manner of dealing, both in the case of the army and of the navy, was a perfect disgrace. ("Hear, hear.")

Dr J. CLARKE (Woolwich) supported, and said that only those in close contact with army doctors knew the sad disappointments that they had to meet with.

Dr F. W. GOODBODY said that at present every man who was a captain in 1919 had to accept this warrant. To get over the difficulty of the huge number of senior ranks there were no promotions to major from October, 1918, to January, 1923. Therefore at least forty or fifty men were not given the opportunity to decide which warrant they would elect to retire under—the 1919 warrant or the previous one, which latter was, of course, much more favourable. Also it was quite probable that if the cost of living came down lieutenant-colonels would find their pension fell to pre-war or below pre-war rates. In the case of majors who had retired on less than £365 a year it was quite conceivable that under the present warrant the pension would go down eventually to £277. He asked the meeting to take a decided stand on this question. The War Office had been plying with them for the last three years, hoping that it would get the recently qualified men into the R.A.M.C. And it had been "fobbing off" the profession with all sorts of excuses. The time had come when the Association must say what it said at the end of last century, "We will not advise any man to go into the R.A.M.C. and we will take all steps we can to boycott the service until this injustice has been remedied." It was the desire of the Association to get the best men possible into the service, and the only way to do that was to assist the service against its titular chiefs.

The CHAIRMAN OF COUNCIL suggested that all that was desired would be obtained, and the negotiations by the Council helped, by adding some such words to the resolution (and he hoped the mover would accept them) as the following: "Until the Council is assured that this and other matters under negotiation have been dealt with to its satisfaction."

Major General Sir WILLIAM MACPHERSON suggested the substitution of the word "Government" in the resolution for the words "War Office," and the CHAIRMAN agreed that that would be the better wording since, apparently, the breach of faith could not be laid at the War Office door.

The resolution in that form, with the added words proposed by the CHAIRMAN OF COUNCIL, was carried unanimously.

Sir RICHARD LUCE said that he was not at present in a position to make a statement as to the negotiations with the India Office on the report of the Lee Commission.

The Report under Naval and Military was approved and Sir JOHN ROY ADMIRAL Sir Peter Bassett-Smith K.C.B. C.M.G. R.N. (ret.) was elected to represent the Royal Naval Medical Service on the Council for the period 1925-28.

HOSPITAL POLICY OF THE ASSOCIATION

Mr H. S. SOUTER (Chairman of the Hospitals Committee) moved to rescind para. 10 of the Hospital Policy as adopted by the Representative Body in 1922 as being no longer applicable. (This paragraph which later became para. 9, provides that gratuitous contributions to hospitals by employers or employees should not be treated as the payment of premiums for insurance against the cost

maintenance and medical treatment, nor as entitling to hospital treatment, but as charitable contributions.) He proposed to substitute the following.

Contributions to hospitals by employers of labour or massed or periodical contributions by employers should be considered as contributions for services rendered or to be rendered.

For some years, he said, the Association had been elaborating a hospital policy, and, largely owing to the energy and statesmanship of the present Treasurer, that policy had reached its present stage of perfection. It was at present a coherent and substantial whole, founded on certain broad elementary principles. One of the principles on which it was founded depended on the alteration in the relationship between the hospital and the patient produced by the demand for payment by the hospital. It was felt that that altered the whole situation in the voluntary hospitals. As long as the patient was purely the recipient of charity, his relation to the profession was well established and perfectly understood, but when the hospital not merely accepted a contribution from him, but exacted a definite payment, the profession wanted to know where it stood, and what the payment was taken for. The great difficulty arose where the payment was made through some insurance scheme, through some contributory fund, for he stoutly maintained that a contributory fund was a very definite insurance scheme, and involved actual contractual relationships. He heartily approved of contributory schemes, for through them the hospitals would be put on a sound financial basis. He ought to remind the meeting that at the Annual Representative Meeting last year the motions were agreed to, but not by the requisite two-thirds majority, and he hoped that motion on the present occasion would be carried by a very large majority.

The CHAIRMAN, in view of the fact that no one rose to discuss the motion said he imagined there was no opposition to the resolution.

Dr F RADCLIFFE (Oldham) said there was strong opposition. A great many of the hospitals of the country were at present carrying out the policy of the Association, and to rescind it seemed to him to be sheer nonsense.

The CHAIRMAN intervened to say that the remarks of Dr Radcliffe would be quite appropriate on the next motion, which was to substitute the new paragraph.

Dr RADCLIFFE said he preferred to say what he had to say there and then. If he spoke on the next resolution a two-thirds majority might not be required.

The CHAIRMAN said that on both motions a two-thirds majority would be required.

Dr RADCLIFFE, continuing, said that some of those who spoke on this question were unfamiliar with the conditions in Lancashire and the North. For years Lancashire people had taken part in contributory schemes and had had no voice in the services provided. In the majority of the hospitals in the North of England there was no contractual obligation that those who contributed to contributory schemes should have treatment in return. The only hospital he knew where such an arrangement had been in existence was Leicester, where the scheme originated, and there it had broken down. When the representatives of the workpeople found that the hospital staff would take a percentage they said, "Don't touch our funds." He asked the meeting not to make it difficult for Lancashire to carry on as it wanted to carry on. (Applause.)

Mr BISHOP HARMAN said that in some parts of the country contributions were made by employers who did expect as a right that their employees would receive treatment at the hospitals. Therefore, the old para 10 was out of date and had better be rescinded. That was the proposition before the meeting, and he hoped it would be carried. The fear that if this were done it would wipe out old contributions was quite unjustified. If Dr Radcliffe would refer to the Hospital Policy, para 7, he would see that hospital contributions were still to be received and expended freely without restriction. He hoped the rescinding would be agreed to unanimously.

Dr P MACDONALD (York) expressed the hope that the meeting would not be influenced by the appeal of Mr Bishop Harman, but would back up the appeal of Dr Radcliffe. London conditions were not the conditions of the rest of England, nor he believed of the provinces.

generally. If the rescinding would help to sweep away the principle of voluntarism he would be in agreement, but he thought voluntarism should be allowed to disappear under proper conditions, and not have substituted for it a new control like that of the friendly societies. Although employers and employees expected, possibly, to receive for their contributions a *quid pro quo* it would be a very disastrous thing for the medical profession if it were recognized that the contributions of employers and employees were of this nature. He hoped the meeting would not rescind this policy of the Association. On this occasion he was a constitutionalist! (Laughter and applause.)

Dr R D MOTHERSON said that in Bolton these contributions were not held to be given for treatment as a *quid pro quo*, either by those who subscribed on the one hand or by the committee of the hospital or the voluntary staff on the other. His own opinion was that the most satisfactory solution of hospital financial problems would be found in a comprehensive compulsory insurance system, to provide, not only for hospital maintenance, but payment of hospital staffs, but till that system was adopted the question of taxing voluntary or semi-voluntary contributions would be abhorrent to many in the profession.

Mr I C PINEY (Newcastle) remarked that it seemed there were still some members of the Representative Body who had not yet mastered the essential definition of the voluntary system. That consisted in voluntary management and not in appointment of staff or the methods by which contributions were received. This policy had been framed to meet the need of certain of the larger institutions in industrial centres—to meet the position which was growing up with regard to massed contributions from workmen and employers, and it was to them that the hospitals in future, apart from State hospitals, would have to look for support. In his district 45 per cent of the contributions came from levies obtained from works. These levies did in reality imply payment for services rendered or to be rendered, because for that money practically all these workpeople were treated. At works it was becoming a custom for the employer to keep an ambulance and to carry all accident cases to the hospital to which the works contribution was made.

The CHAIRMAN said that the matter could properly be further discussed on the next motion as well as on the present one. He suggested that the vote for rescission should be taken at once, and he thought a two-thirds majority was required.

The motion to rescind the paragraph was carried by 71 votes to 33, the CHAIRMAN announcing that this was the requisite majority.

Mr SOUTER then moved the substitution of the new paragraph already set out.

Dr J M MYRELL (West Bromwich) moved an amendment whereby the suggested new paragraph would read:

Contributions to hospitals by employers of labour or massed or periodical contributions by employers or contributions by approved societies should be considered as contributions for services rendered or to be rendered only when such contributions are calculated on the number of cases treated.

He explained that in the Birmingham area it was found that the policy set out in the Council's recommendation could not be adopted. West Bromwich Hospital, for instance, was a voluntary institution supported almost entirely by voluntary contributions, including many from employers of labour. He had made personal inquiries as to the attitude of these contributors should they find that doctors took a percentage from voluntary subscriptions, and the reply was that they would at once cease to subscribe. Would hospital boards agree to adopt the scheme? Would public opinion support it? The Association would be ill advised to adopt a policy it could not enforce.

Dr W J LEIGHTON (Preston) did not agree with the mover of the amendment. He believed that working men and other subscribers would support the Association's view if the position were put to them plainly and frankly. Only the previous week the management and staff of the hospital he was associated with had met the workers, who were organizing a contributory scheme, and there was no hostility to a percentage being taken for services rendered.

Dr NOY SCOTT (Plymouth) said that the only objection to putting all their cards on the table before the contributors was that they would demand, not only some services, but all services. In the West of England there was a contributory scheme, and the benefits excluded removal of tonsils and refraction work, but the demand was made that these services should be included. He feared contributors would, under such a system, exploit the services of all the medical men of the town.

Mr SOUTER pointed out that the proposals did not affect genuine voluntary contributions, and it was nonsense to say a distinction could not be drawn between voluntary contributions and contributions given with the intention of getting a return. This was not a demand that staffs of hospitals should be paid, it was that the work of the men at the hospitals should be recognized as of definite monetary value.

Dr P. MACDONALD moved, and it was agreed, that the question be now put, whereupon the West Birmingham amendment was lost by a large majority.

Dr F. RADCLIFFE moved as a further amendment that after the word "should" in the suggested new paragraph the words should be added, "except where there be no implication of contract." He thought this would be a means of meeting two opposing views.

Dr J. C. MATTHEWS, in seconding, said he thought this would meet the difficulties of some of the old standing funds which were now becoming contributory funds.

Mr BISHOP HARRIS said that this olive-branch was studded with prickles. If the words "except where there be no implication of contract" were accepted, there would never be any implication of contract.

The CHAIRMAN OF COUNCIL pointed out that it was impossible to define these implications. If anyone would go into any hospital secretary's office and read the letters which were received from employers and employed he would be convinced that the contributions from these sources were regarded as contributions for the services of medical men. He believed employers and employees who suggested the withdrawal of their contributions if this policy were adopted would think better of it when the question came to a head.

Mr SOUTER said the amendment would cut the ground from under the feet of those who supported the policy proposed. It was all very well to say contributors would withdraw their voluntary contributions, but what about the medical men's services?

This amendment also was lost.

Dr PETER MACDONALD said that he was a loyal member of the Association and he liked to be able to support its policy. But he had a good deal to do with the management of a hospital of whose honorary staff he was a member, and he could not at the present moment carry out in that hospital the policy recommended. It would be useless to try. He suggested that the resolution should be passed, but not by a two-thirds majority. It would thus stand as the principle of the Association, though not as its policy (laughter and applause).

The CHAIRMAN said that Dr Macdonald's position was met by the resolutions passed already. Having passed all the rest as the policy of the Association, the whole of that policy was governed for the moment by a succeeding resolution, which declared that the Association could not expect the policy to be enforced, but that for the next year or two an educational propaganda must be carried on inside and outside the profession.

Mr SOUTER's motion on behalf of the Council—to substitute the following in place of old para 10

Contributions to hospitals by employers of labour or massed or periodical contributions by employers should be considered as contributions for services rendered or to be rendered—

was carried by a very large majority. The CHAIRMAN said that the show of hands was a matter of scores as against units.

Teaching Hospitals and the Hospital Policy

Mr A. P. FLEMING, M.C. (Birmingham Central), moved that

Taking into consideration the importance of medical education and the fact that the large teaching hospitals are specially organized and staffed for such work this meeting is of the

opinion that in the scheme of hospital policy of the British Medical Association these hospitals should be put in a class by themselves.

He said this motion was not framed in a spirit of hostility to the Association. In the preamble to the policy in a broad, general way there were set out three types of hospitals for the treatment of the sick—voluntary hospitals, municipal hospitals, and Poor Law hospitals. Birmingham held that in point of fact there were four distinct types of hospitals, which could be readily differentiated. The first group, that of voluntary hospitals, should be subdivided into a first class, a small class of large voluntary hospitals either associated with universities or recognized as schools for teaching students or for post-graduate study, and a second class of voluntary hospitals, more numerous, but not so large, and where teaching was not included among the duties of the medical staff. The Association, in regard to the establishment of clinical laboratories, had pleaded with the Ministry of Health for the recognition of a different type of institution where research was to be carried on. Birmingham claimed that the position of the voluntary hospitals was closely analogous to that. They claimed that as there was a distinction drawn between two types of laboratories, so there should be a distinction drawn between the two types of voluntary hospitals. Mr Thomson concluded by saying that his remarks could be summarized in the statement that there were certain essential differences between the two classes of voluntary hospitals, which entitled them to separate consideration.

After some discussion Mr Thomson agreed to the reference of his motion to Council for consideration.

The CHAIRMAN said that he wanted Birmingham to realize that its resolution did not imply that teaching hospitals were to be taken out of the hospital policy, but merely that they should be put in a class by themselves.

Dr J. A. MACDONALD protested against the vague terms of the resolution. In what form was the Council to consider the matter? The CHAIRMAN said that apparently Birmingham desired that the question should be considered in its entirety, not in the limited form set out in the specific terms of the resolution. Mr THOMSON indicated agreement, and the motion was passed as a reference for the consideration of the Council.

Payment of Medical Staffs in certain Accident Cases

Mr SOUTER moved, as a further recommendation of Council

That in all cases of accident where medical attendance is given at a voluntary hospital and such medical attendance is covered either directly or indirectly by insurance the hospital authorities should recover from the insurance company the full cost of maintenance and treatment of such patient. That where patients who would ordinarily be considered as private patients are admitted to hospital solely on account of accident or emergency they should be considered as private patients.

Dr F. RADCLIFFE moved that this recommendation be referred back to the Council for further consideration. Hospitals in such cases had no power to recover the cost. Further, if the policy were adopted insurance companies would increase the premium of every motor car policy.

Mr F. C. PIERCE said that the proposal of the Council was supported by the lay committee of his hospital, who had long been in favour of it.

Dr C. G. H. MONSE (Bournemouth) opposing the amendment, said that in the hospital to which he was attached with 150 beds in the last six months there had been sixty accident cases attended, with a total of 1,308 days in hospital, which meant a loss of nearly £300, and no payment could be obtained. There ought to be some means of recovery.

The amendment was lost, and the Council's recommendation was adopted.

Case Sheets of Hospital Patients

Mr SOUTER next moved a further recommendation of Council

That case sheets and records of patients treated in hospitals should remain in the custody of the hospital that they may be regarded as confidential documents and access to them allowed solely to the members of the visiting staff of the hospital.

Dr RAWSON (South Shields, Tyneside) moved to add at the end of the resolution, "or to persons authorized by them, such as members of the resident staff or students."

Mr SOUTTAR was willing to accept the addition, but the CHAIRMAN OF COUNCIL said it would open the door to access by the governing body through a member of the resident staff. There was no difficulty in any hospital about proper access by the resident staff and students.

Dr RAWSON withdrew his amendment, and the motion in its original form was passed.

SCOTLAND AND WALES

Dr C E DOUGLAS (Chairman of the Scottish Committee) moved approval of the Report of Council under "Scotland." He remarked that the membership in Scotland was increasing at a quicker rate than in the rest of the country. The membership in Scotland during the year had gone up by 13 per cent, whereas the total membership had gone up by only 8 per cent. He also referred to the acquisition of the new house of the Association in Edinburgh.

The Report under "Scotland" was approved, as was the Report under "Wales," moved, without a speech, by Dr W E THOMAS, Chairman of the Welsh Committee.

PROCEDURE AT ELECTIONS

Dr FARR suggested that the Council should seriously consider the question of postponing the voting for members of the Council by the Representative Body from the first or second day of this meeting till the last day. In view of certain happenings at the recent elections he would suggest this as a better arrangement. By this means, he thought, the newer members of the Representative Body would become more fully acquainted with the candidates, and he hoped that the irreparable, but, he hoped, temporary, loss which the Council had sustained in the present election might be avoided in future. (Applause.)

Dr BOWEN on behalf of the Council, accepted the proposition that the time of the election should be considered.

THE REPORT OF COUNCIL APPROVED

The CHAIRMAN OF COUNCIL moved the adoption of the Annual and Supplementary Reports of Council as a whole subject to amendments and resolutions carried during the meeting.

The motion was agreed to.

Dr HAWTHORNE said he was informed earlier in the meeting that an opportunity would be given to the Chairman of the Science Committee to reply to certain criticisms on the subject of post-graduate education. It was true that this was one of the functions of the Science Committee and that that Committee appointed a Post-Graduate Subcommittee, but negotiations had taken place and the matter was for the time being removed from the Science Committee and a new committee was set up to deal with the subject. There was no justification for any reflection on the Science Committee which suggested that it had been unworthy of its trust so far as the matter of post-graduate education was concerned.

VOTES OF THANKS

The CHAIRMAN moved that the hearty thanks of the Representative Body be conveyed to the following, who had contributed to the comfort, convenience, and pleasure of the members of the Representative Body and the ladies accompanying them:

The President (Dr I G Thomson), the Acting President (Mr W G Mumford), the Acting Local Honorary General Secretary (Dr R G Gordon), the Mayor of Bath Mr Hutton and the Staff of the Grand Pump Room, the Chairman (Mrs I G Thomson) the Honorary Secretary (Mrs D Ackland) and the members of the Ladies Executive Committee, the Chairman (Mrs A L Macenzie) and the Honorary Secretary (Miss Kathleen Harper) of the Ladies Social Club Subcommittee, the Chairman (Mrs A G Gordon) and the Honorary Secretary (Miss K Ealand) of the Ladies Excursions Subcommittee and Dr J P Williams Freeman for his services during the excursion to Stonehenge on Sunday.

(Applause.) There were also a number of others not mentioned by name whom they desired to thank.

The vote was carried by acclamation.

The CHAIRMAN asked that it should be left to the Chairman and Medical Secretary to distribute the minutes by post to the residences of members of the Representative Body.

This was agreed to.

Dr WALTER HENRY moved a hearty vote of thanks to the Chairman, and this was passed by the members rising and applauding. A vote of thanks was also carried to the clerical staff, on the motion of Dr J A Macdonald.

The business of the Annual Representative Meeting then concluded.

ANNUAL GENERAL MEETING

The ninety-third Annual General Meeting of the members of the British Medical Association was held in the Concert Hall, Grand Pump Room, Bath, on Tuesday afternoon, July 21st.

The President (Mr J Basil Hall, F.R.C.S.) took the chair.

THE PRESIDENT, 1925-26

The President said he had a very simple and pleasant duty to perform, and that was to induct his successor. In one sense he performed it with some regret, because he thoroughly enjoyed his year of office, and he was leaving it with a very much enhanced opinion of the British Medical Association. (Applause.) He very much regretted that his elected successor, Dr Thomson, was unable to be present owing to illness, and everyone would join with him in wishing him a very speedy and successful recovery.

The President then, amid applause, invested the Acting President-Elect Mr W G Mumford, O.B.E., F.R.C.S., with the presidential insignia, and Mr Mumford took the chair.

Mr MUMFORD said he wished to add his regrets to those of Mr Basil Hall at the unfortunate absence of Dr Thomson. He was sure he was expressing the earnest desire of everyone present in wishing him a speedy recovery ("Hen, hen"). For himself, he wished to thank the meeting for according him the honour of acting as Dr Thomson's deputy.

The notice convening the meeting was read, and the minutes of the last meeting, held at Bradford, were taken as read, and the latter were confirmed.

APPOINTMENT OF AUDITORS

Dr F W GOODHORN proposed, and Dr MILNER MOORE seconded, that Messrs Price, Witherhouse and Co be appointed auditors of the British Medical Association until the next Annual General Meeting, at a remuneration of two hundred guineas. This was agreed to unanimously.

PRESIDENT-ELECT

The MEDICAL SECRETARY reported that Mr Robert George Hogarth, C.B.F., F.R.C.S. Eng., senior surgeon, General Hospital, Nottingham, had been elected by the Representative Body as President of the Association for the year 1926-27.

Mr HOGARTH thanked the Representative Body for the very great honour it had done him in electing him to his high position. He felt very unworthy when he looked at the long list of distinguished members of the profession who had held it before him. At the same time, he would not disguise the fact that he felt a great sense of satisfaction when he realized that he owed his position entirely to the wish and recommendation of his professional brethren in the way in which he had worked for the last twenty-five years. He had had a number of letters from old friends, and they all seemed rather surprised to hear about the whole thing, and to think that the Nottingham Division must be very hard up for talent! (Laughter.) Only one had given him any advice—and he hoped to carry it out—that he should carry out his duties with dignity and becoming modesty. (Laughter.) With regard to the visit of the

Representative Body to Nottingham next year, the Buxton Corporation had invited the representatives to go to Buxton by special train, offering to put them up for the night, and have them the baths, and on the following day the Division hoped to take them by car through the Peak District, having them Haddon Hall and Chatsworth. If Bath was the Queen of the West, he might claim that Nottingham was Queen of the Midlands, and he hoped there would be a large attendance. The Nottingham Division would certainly do its best to make the visit instructive, interesting, and enjoyable. He asked the representatives for their support in his endeavour to carry out the important duties of his office in a manner worthy of the occasion. (Applause.)

NOTE OF THANKS TO PAST PRESIDENT

The CHAIRMAN OF COUNCIL (Dr Bolam) moved

That the hearty thanks of this Annual General Meeting of the Association be given to the retiring President, Mr Basil Hall for his services as President, 1924-25.

He said that one of the privileges of those who attended the Association's meetings year by year was to be brought into contact with and to get to know intimately eminent men in various parts of the country who held the office of President, and not the least of those years, in that respect, by any means, had been the last presidential year. Mr Basil Hall was held in great honour in his adopted city of Bradford, and they had learned to know and love him for himself. (Applause.) The past year had been an interesting and memorable one in the history of the Association, and in the great events that had been forward he had played a prominent part with great skill and tact and great success. He went on behalf of the Association to Canada and America, he was its official delegate to the Canadian Medical Association, and he had the unique distinction of being the first official delegate of the British Medical Association to attend the meetings of the American Medical Association. "We have," Dr Bolam concluded, "first-hand evidence that his work and his personality have been of the very greatest value in helping to cement the alliance between the English speaking members of the medical profession." (Applause.)

The resolution was passed by the members rising and applauding.

Mr BASIL HALL said it had been a very great pleasure indeed to him to be President of the British Medical Association. It was something of which he felt very proud and always would feel proud. He had been President during a year when there was perhaps rather more going on than was usual and he was very fortunate in going to Canada and America. For many years he had been anxious to visit both countries, and he hoped that his going as delegate would help to promote fraternal feeling between the American Medical Association, the Canadian Medical Association and the British Medical Association. The Canadians loved to feel that they were British and anything that tended towards that feeling delighted them. He was received everywhere with the greatest hospitality and kindness. He was very grateful for the kind way in which he had been supported and for all the kindness he had received on every hand.

The meeting was then adjourned until the evening.

ANNUAL DINNER

The Annual Dinner of the Association was held in the Assembly Rooms Bath, on July 23rd, with Mr W G MUMFORD, O.B.E., F.R.C.S., Acting President, in the chair. The company, numbering about 350, were distributed at thirty-six tables. Immediately supporting the Acting President were Mrs F G Thomson (wife of the President), Dr R A Bolam (Chairman of Council), and Dr H B Brackenbury (Chairman of Representative Meetings). Among the guests at the principal table were the Marquess of Bath, K.G., the Mayor of Bath (Alderman Cedric Chivers), the Mayoress of Bath (Madame Sarah Grand), the Venerable S A Boyd (Archdeacon of Bath), Lord Dawson of Penn, Mrs Forbes Fraser, Dr W D Haggard (President of the American Medical Association), Professor J Hermann (Stockholm), Sir Basil Meymian, Brigadier-General

H S Bilett (McGill University), Dr A J Orenstein (Johannesburg), Dr A Primrose (Chairman of Council, Canadian Medical Association), Dr W N Robertson (Australian Federal Committee), and Sir StClair Thomson (President of the Royal Society of Medicine). Members of Parliament present were Dr A V Davies, Professor T Simelton, and Dr T Watts.

A larger number of ladies were present than at any previous annual dinner of the Association. The number of overseas representatives also was large. The dinner end was an artistic production, bearing an engraving of Pulteney Bridge. After the King's health had been honoured, the toast of prosperity to the City of Bath was proposed by Lord Dawson of Penn.

"THE CITY OF BATH"

Lord Dawson said it would be surely difficult to find a city in this kingdom which embraces so many qualities. It has a wonderful setting. Nature has made it fine, and man has made it beautiful. Its history goes back for two thousand years. Twin where you will, you find riches of the past. Its springs have brought it reputation, and opportunity has been given to its citizens to endow their city with worthy architecture. The springs, in the course of history, have brought comfort for physical ills and solace for jaded nerves. Not always, it is true, have they been successful, and if the members of my profession ever to search the old records they may find that their ancient colleagues no more than themselves always attained the end they sought. I came across a letter written about 1600 by a patient here to the famous Robert Cecil, which states that here he had found no hope or help, though he had endured "as great heats, distemperatures, and excessive draughts as flesh can abide. Yet I am persevering to the end of my limited time to take away the scandal that other wise the physicians would lay upon me if I should sever from their direction and their command." Bath seems to have mirrored the social customs of England perhaps more than any other city. It has shown aptitude for combining the grave and the gay. But it is not a city which rests upon its past. It is a progressive city. If anybody is in doubt as to that he should go to the Forbes Fraser Hospital on its confines. Bath has been foreseeing and courageous enough to realize that no hospital in the future should ever be built within a city, and accordingly 21 acres of ground have been purchased just outside the city boundaries where a hospital to meet modern needs has been erected. In such a city as this—a city of traditions and yet of progressive outlook—what more can an association of scientific men require? And was there ever hospitality more precious? Was there ever hospitality conceived in a way likely to give greater pleasure? We have held here one of the most successful meetings in the history of the Association. (Applause.) The occasion has left in all our hearts a desire to come back again as soon as possible. To the citizens of Bath for the efforts they have made the Association is full of gratitude, and of the Mayor we can only say that he must be a product of this city or he could not have entertained us as he has done. He is a man of generous interests in it and literature, and he is a leader in all good work. He embodies the traditions of this city, and also its expectations, and for what he has done for us this week I express on behalf of the Association our admiration and our thanks. (Loud applause.)

The Mayor of Bath. This is a very embarrassing moment for me. All that Lord Dawson has said about Bath is perfectly true, his only extravagance is his kindly reference to myself. There is a story of an admirer of Whistler and Velasquez to whom Whistler said, "But why drag in Velasquez?" Someone this week has said that Bath is the two most beautiful cities in Great Britain and that and Edinburgh. But why drag in —? (Laughter.) I am proud of the fact that Bath, although old, is not ageing. Old age is sometimes a time of decay, but sometimes also it is an apothecosis. I am the 695th Mayor of this ancient city, but I assure you that our faces are of the future, and anything that your honourable profession can recommend we shall endeavour to fulfill in order that our city may render still better service for humanity. (Applause.)

"THE BRITISH MEDICAL ASSOCIATION"

THE MARQUSS OF BATH I have the honour to submit the toast of "The British Medical Association" and I am comforted by the reflection that however inadequate my recommendation it is sure of a unanimous and enthusiastic reception at your hands. As laymen we wish the best of health to the doctors. Your President—may I say how much I wish he could have been here this evening—reminded us in his address of the leading part which British physicians played in the formation of this Association ninety-three years ago. Bath has always been to the forefront when any useful purpose was to be served. I yield to no one in my affection for this city. You have seen Bath at its best—hot in above, hot water below (Llangtref). But I venture to offer you in equally cordial welcome on behalf of the county of Somerset. We are proud to welcome this Association with its Branches or affiliated organizations wherever the British flag flies, with its 30,000 members and with its new House recently so signally honoured by Their Majesties. In your sessions at this assembly you have continued to uphold your honourable traditions in the discussion of important discoveries and investigations, some of which only within these last few days have been made known to the public, and which give promise of such untold help for suffering humanity. I give you the toast of 'The British Medical Association,' with the earnest hope of the restoration to health of your President, and I couple with the toast the name of the Chairman of your Council (to whom I offer my congratulations upon the signal honour which his colleagues have conferred upon him in the presentation of the Cold Medal), and also the name of Dr. Robertson, one of your representatives from overseas. (Applause.)

DR R. A. BOLAM said: There are few members of the Association who have been privileged to see such a year of activity as this present year of grace, and not the least memorable of the events we shall always cherish in connection with this year will be our visit to Bath. To this city of charm and culture many of us have come as strangers and the cordial welcome and easy hospitality have left an impression on our minds that it will take long to efface. The wonderful function of last evening only emphasized the care which the Mayor has taken throughout in all things ministering to our comfort and pleasure. We also value extremely the fact that you, my lord, should have taken so keen an interest in the proceedings of this meeting, and should have thrown open your historic home at Longleat to our members as you did yesterday. You have said that we shall all be happy to drink the health of the Association. Yes, in pride in the Association, in zeal for its progress, we stand foursquare to it.

It comes. But in our Divisions and Branches we are very keen critics of each other, and our detailed work is carried on in that stimulating atmosphere. But we are all one in our pleasure at the progress of the Association in these latter days. I had hoped this evening to be able to announce that we had reached a total of 30,000 members, but a telegram received from the office this morning states that the number is 29,871. (Applause.) It has been said, quite truly, that there are a great many men outside the fold of the Association, but there are not many men outside its fold who take any interest in the organization of their profession. I had occasion to say before the Royal Commission on National Health Insurance that of all those medical men in this country who band themselves together with a view to organizing the profession so that it may exhibit unity of action only some 1,500 or 2,000 belong to any medico-political organization except our own. In our work we are often pressed to lay down a standard in one direction or another in the way of guidance to the public. We are asked to express an opinion as to the value of, say, psycho-analysis, or as to the danger of allowing unqualified practice. It is difficult to touch on these subjects in such a way that we in the profession shall not be accused of self-interest. It is ours to seek the interest of the profession and of its individual units only in so far as that interest is a communal interest also. Therefore you must bear with us if we hold our hand and say our voice with regard to many things upon which

doubtless the public are anxious to have a pronouncement. When, in the Representative Body, it was suggested that some stringent action should be demanded against unqualified medical practice, one of our members well said that it was a hard thing to interfere with the undoubted right of any member of a family to try his 'practise hand' on the healing of his relatives. The law of the land so runs that every man or woman may attempt healing, the only limitation is that he or she shall not attempt to recover a reward, and possibly this profession of ours is favoured in that the law so runs. I have been urged often that some steps should be taken by our Council to make the profession of medicine such an entrenchment that no one could possibly do anything in the way of healing, unless he had gone through a well considered curriculum. It may be that such a day will come to pass, the dental profession is well on the road in that respect. But these things come only by the education of the community, and when the community feels that for its safety and comfort the medical profession requires such an entrenchment then doubtless it will tell us so. ("Hear, hear.") You very kindly put men like myself in the position of receiving thanks in all our formal affairs, but I want to say that behind those who are placed in the forefront for the time being we have a devoted permanent staff of men and women, medical and lay, to whom the success of our organization is in very large measure due. (Applause.) Some of them have given up a considerable practice in their love for medical politics, and they have carried on the work for which I fear, we most frequently reap the credit. The work is more difficult than many outside realize. Perhaps that will be understood in the light of what I have just said. We are often accused of not going to the goal directly, but the crooked path—using the word "crooked" in no obnoxious sense at all—may be the real path of progress. It is not possible for us to go directly to the things we wish to achieve, we have to consider all the interests that are involved and many things which those who look on from a distance do not see. In conclusion Dr. Bolam took the opportunity of responding for the permanent staff of the Association and mentioned each of the chief officials in a few gracious words.

DR W. N. ROWATSON, C.B.I. (Vice-Chairman of the Australian Federal Committee), also responded to the toast. He gave some account of the organization of the British Medical Association in Australia, which, he said, was even more thorough than in the Old Country, and indicated a few of the manifold activities of the Australian Branches. The Association out in the antipodes, where one of the great nations of the earth was in the shaping, loved its parent, even as Australia herself loved the motherland. Dr. Robertson mentioned some of the many occasions on which the Australian Federal Government had turned to the British Medical Association for counsel in matters affecting the public health and individual welfare. He paid a warm tribute to his friend Dr. Robert Todd, Honorary Secretary of the Federal Committee, to whom the success of the Association in Australia was due more than to any other man.

"OUR GUESTS"

SIR STCLIN THOMSON, in proposing the health and happiness of the visitors, remarked that he was one of the oldest members of the Association, which he joined forty-two years ago and happened to be a Insman of the new President. When he saw Dr. Thomson that afternoon he asked him to send to all present, especially those from overseas, his very cordial good wishes. He hoped within a very few weeks to be shouldering the duties and responsibilities of his post, and he looked forward to meeting them all in Nottingham next year. Sir Stclin Thomson said there could be no doubt that this meeting had been signally successful, thanks very largely to the hospitality of their Bath friends, who had exhibited what the French called *une hospitalité croissée*. (Applause.) We have visitors with us (he said) like Brigadier General Birtlett, of Montreal—the first Canadian in the war and the last Canadian out of it—my learned friend Dr. Chevalier Jackson of Philadelphia, and Professor Burger of Amsterdam.

Then, for the first time, the American Medical Association which represents 90,000 members of the profession, has sent its President to our Annual Meeting. Dr Haggard comes from Tennessee—a State which has recently demonstrated that whatever you may think about evolution you must not say it. He is over here to raise his opeime index by immunizing himself against the dry when prohibition is revoked in his own country. (Laughter.) Dr Haggard is a great American surgeon—not like another American surgeon of whom it was said (it was an American also who said it, and therefore I quote it) that he “removed all that he could see, and a damned sight more that he could not see” (Laughter.) We hope that all our visitors from overseas will have a thoroughly enjoyable time, that good digestion will wait on appetite, and health on both, and that they will carry away with them all the glad eyes given them by the Bath beauties, will be none the worse for the Bath luns they have eaten, and that it will be long before they have occasion to step into a Bath chair. For them and for all our guests, “welcome ever smiles, and farewell goes out sighing.”

Dr A. J. CHRISTIAN of Johannesburg, in replying to the toast, said that South Africa was a country of very great distances, populated by large numbers of doctors who were reputed to be extremely prosperous in their practices. He was not pretending medicine himself! (Laughter.) South Africa, considering the size of the country and the character of the population, had a strong British Medical Association. In South Africa they were proud of this great organization, and fully appreciated the remark of the late Sir William Osler, when he addressed the American Medical Association, that the greatest benefit of medical organization was, not in listening to scientific papers, but in contact with one's fellow workers, which was what they had enjoyed. In the name of his South African colleagues he thanked them all for their hospitality.

Dr W. D. HAGGARD, President of the American Medical Association, brought greetings from his colleagues in the United States. Only an accident saved the United States from being one of the very great Dominions of the British Empire. Had it not been for that circumstance he might that evening have been responding to the toast without having to drink water! (Laughter.) In common with the other guests at that meeting he had come to learn. The little red rooster and the little brown hen were walking down the village street when they saw an ostrich egg in a shop window, and the rooster said, “My dear, I am not complaining, but I just want to call your attention to what other people are doing.” Well, he had been surprised at the magnificent way in which the other people were doing things in this country. One of the principal functions of the medical societies he had attended hitherto had been the presentation of scientific papers and discussions thereon, but in this wonderful Association they had managed in these days to do more than recapture the glories of Bath in its palmiest times. The gorgeousness of Rome had been outdone by the Annual Meeting of the British Medical Association at Bath. He had flown from Paris to London to attend that meeting, but he did not think he wanted to fly back! He went on to refer to the privilege which the American Medical Association had had of receiving the Past-President, Mr Basil Hall, and he offered a general invitation to the President and members to the next annual meeting of his Association, which would be held in the State of Texas.

PRESENTATION OF GOLF CUPS

At this point in the banquet Mrs Thomson, the wife of the President, presented the Ulster and Childe Cups to the respective winners. These were Dr G. Brand of Glasgow and Dr W. V. Wood of Yatton, Somerset, both of whom were “all square with bogey.”

“THE PRESIDENT”

Dr H. B. BRIDGEMAN proposed in very warm terms the health of the President. In drinking this toast, he said, the first thought would be for Dr Thomson, for whom he wished an early restoration of that health which his labours in connexion with the visit of the Association to Bath had helped to impair. The toast included also the Acting

President, Mr Mumford. It was an honour to my town to have a citizen like Mr Mumford, and he had shown his worth in the peculiarly difficult circumstances of the Annual Meeting. The Association had to thank him for immense responsibilities manfully undertaken, for hard work generally done, and for important functions in connexion with this visit to Bath effectively performed. Fewness of words on this occasion did not mean lack of gratitude.

The toast was drunk with musical honours.

The Acting President, after acknowledging the compliment on his own behalf, expressed the indebtedness of all concerned to many people who had contributed to the success of the meeting. In the first rank were the Marquess of Bath, the Mayor of Bath, and the Mayoress (Madame Sarah Grand). Then there was Dr R. G. Gordon, without whom there could not have been a meeting at all, and whose labours had been simply colossal. Mr John Hutton had also rendered inestimable service. Much work had been done by the various committees. The way in which the Transport Committee had marshalled the visitors to the Mayor's Reception the previous night was beyond all praise, and in this connexion he must mention the name of Mr C. Terry and that of Dr L. Scott White, also Mr Donald Acland, the chairman of the committee, who had laboured hard until he was laid aside by illness. Then the Dinner Committee and its honorary secretary, Mr A. de V. Blathwayt, must be mentioned. And what would the meeting have been without the ladies? Mrs Thomson had acted as chairman of the Ladies' Executive and General Committees, and had been ably seconded by Mrs Donald Acland as honorary secretary, by Mrs Mackenzie, and many other. Finally, he expressed his gratitude to the officers of the Association, and especially to Dr Bolam for his personal help in a difficult position. There were many others who had helped in various ways—including, on the financial side of the arrangements, Dr E. J. Cope and Dr H. C. Nixon—but he knew that the many unnamed helpers would regard this general word of thanks as a sufficient acknowledgment.

When the proceedings of the dinner were over the company were conveyed from the Assembly Rooms to the Grand Pump Room for the reception, dance, and concert given by the Bath Division.

CONFERENCE OF HONORARY SECRETARIES

The Conference of Honorary Secretaries of Divisions and Branches took place at the Guildhall, Bath, on July 22nd. Dr MUN SMITH (Eastbourne) was voted to the chair. Dr MORRIS MACKENZIE (Chairman of the Organization Committee) welcomed those attending, and spoke of the debt which the Association owed to the voluntary workers in the various areas.

Local Propaganda

Dr H. BROWN (Sheffield) opened a discussion on local propaganda. In his view one of the first essentials to successful propaganda was a strong and rather huge executive committee, and one thoroughly representative of all branches of medical work. With such an executive systematic canvassing of non-members could be judiciously shared out. Literature was of value but only if it was followed up by personal work. Invitations to non-members to attend meetings should be limited to those meetings at which it was desired to elicit the opinion of the whole profession. In Sheffield the number of medical students qualifying was comparatively small, but this had the advantage that it was easier to get into personal touch with them. Last year 13 out of 21 joined on qualification.

Dr C. J. B. BUCHAN (Lewisham) said that his Division in three years had increased its membership from 43 to 66. Each year the Division sent out a list of its officers and a letter written by the Chairman asking non-members to join. Literary propaganda was almost a *deus ex machina*. Divisional meetings did good, especially in London where it was always possible to get consultants to give addresses.

Dr WALLACE HENRY (Midland Branch) wondered how many Divisions had carried out the suggestion of the Organization Committee that special propaganda committees should be

up in each area. In widely scattered rural areas it was important to have on the executive representatives of every part of the area as far as possible. Dr J. I. WALTER (South Essex) took up a remark of one of the speakers that some newly qualified men thought they could not afford to join the Association. The fact was, they could not afford not to join. The subscription for the first four years after registration is £1 11s 6d a year, when worked out roughly at 'ten goldfishes a week'. The position of honorary secretary in a Division carried with it an enormous amount of prestige. Originally the honorary secretary was an innocuous sort of person who was chosen because people could get hold of no one else but as time went on the position became one to be sought after rather than avoided. For the solution of the propaganda problem much depended on the personality of the secretary. He suggested that a quarterly letter be written for general publication in the locality, embodying points of interest, especially local interest, much on the lines of the *Monthly Circular* from headquarters.

Dr H. M. STRATFORD (Metropolitan Counties Branch) suggested the value of social functions in Branches and Divisions, the proceeds of which, after paying expenses, could be handed over to the Benevolent Fund of the Association. In his own borough of Kensington he had found the municipal authorities most helpful in lending rooms and giving patronage. Dr O. C. CARTER (Bournemouth) asked for guidance in those cases in which there was in the town, side by side with the Divisional activity a flourishing medical society. Dr C. C. C. SCUDMORE (Croydon) said that in his own Division out of 30 members of the medical society only 6 were not members of the Association. Dr P. MACDONALD, speaking as a member of the Propaganda Subcommittee, said that at York there existed one of the oldest medical societies in the country; there was no question of hostility between that society and the Division and, indeed, the officers and membership were very largely identical. The existence of the society, however, had the necessary result of curtailing the scientific activities of the Division. Dr W. E. A. WOLLEY (City of London) said that in his Division there was a clinical society which was run in association with the Division and the meetings of the two bodies were announced on the same card.

Dr J. G. McCURCHEON (Glasgow and West of Scotland Branch) said that in Glasgow the Divisions had been exceptionally favoured by valuable demonstrations by members of the hospital staff, and at each of the last three meetings held at the hospital the attendance had been well over 300. With regard to the new Committee he hoped that efforts would be made to maintain sufficient support from within the profession without the necessity for any outside appeal. Dr A. LAYDON (Surrey Branch) said that in Divisions in which there was a good medical society the Divisional activities tended to become entirely medico-political. Areas differed widely in the interest which they showed in clinical discussions in the one hand and medico-political discussions on the other. Dr E. W. LEWIS (Southport) remarked that his Division had always devoted itself to medico-political work and the local medical society to clinical work. The two bodies enjoyed the use of the same rooms and many members were unaware as to which of the two bodies was actually meeting at a given time. Dr BRACKENBURY was doubtful as to the merits of the advice given by the speaker that a large and strong executive committee was the first essential of success. With such a committee there was a tendency for members to imagine that everything would be all right without any call for their own active interest. New members on joining should be made to feel that they were actively associated with the organization. Dr NOR SCOTT (Plymouth) thought it not worth while to run after people who made repeated refusals. Efforts should be concentrated on the newcomers into a district. He regretted that the Representative Body by its recent decision had deprived the Divisions of what would have been most useful material for propaganda—individual medical defence.

Panel Committee and Association Work

Mr RUSSELL COOMBE opened a discussion on the tendency of some panel committees to do what was really Association work. He said that during the ninety years of its history the Association had seen its competitors disappear and itself become the body to which the public looked for guidance.

but the position which had been relieved would be undermined if local sectional aggregations began as isolated units to do work which should be done for the whole profession by one united body. In many cases meetings of the local medical and panel committees and Divisional meetings were called simultaneously and were run by the same officers, and, of course so long as the officers of the committees were strong Association men it was all to the good, but it might be that men antagonistic to the Association would come into office in particular localities, and therefore he thought the local position needed constant watching. Dr P. MACDONALD did not share Mr Russell Coombe's view that there was a danger from interference by local medical and panel committees with the activities of the Divisions. It was for the Association to capture the local medical and panel committees and this could be done without much difficulty. He gave an account of events at York, formerly a Medico-Political Union stronghold where now there was the heartiest spirit of co-operation between the local medical and panel committees and the Division.

Dr A. I. JONES (North Cheshire) said that there was a similarly good understanding in his own area. Dr BRACKENBURY said that there were at present several important areas in England in which, because the local medical and panel committee was doing the work which ought to be done by an active Division it was difficult to give life to the local activities of the Association. He begged members to take an interest in the election of panel committees and to use their influence to ensure that the Association was predominant on those bodies. The MEDICAL SECRETARY said that when the local medical committees were first formed a good many people thought they might endanger the future activities of the Association. It was largely the foresight of Dr Fothergill of Brighton which saved the situation permanently. At Dr Fothergill's suggestion the first conference of local medical and panel committees was called in 1913, and from that had sprung an alliance between the panel committees and the Association with the increasing influence of the Association with the Ministry of Health and its recognition as the representative body of the profession on the subjects with which local medical and panel committees had to deal so that even hostile committees could not afford to do without the Association. He believed that time was on the side of the Association in this matter. Dr H. S. BRADLEY (Stratford) referred to the difficulties which arose owing to the fact that the Divisions were often not coterminous with boroughs or counties whereas local medical and panel committees were coterminous with these areas. This led in some cases to lack of co-ordination. Dr FARGHUR MURRAY (Newcastle-on-Tyne) thought that the chairman and secretary of the panel committee should be definitely appointed upon the local Association executive. Dr I. D. ROBERTS (Dudley) pointed out the importance of holding a meeting of the Division when the election of the local medical and panel committees was about to take place. Dr JOHN STEVENS (Edinburgh Branch) said that he was in agreement with Dr Brackenbury—and when Dr Brackenbury and he were in agreement it might be taken that there was no doubt as to the rightness of the particular matter—with regard to the serious danger lest local medical and panel committees should, if not supplant, certainly affect the position and work of the local Divisions and Branches. He gave illustrations of cases which ought to have come before the executive of the local Division and not before the panel committee. The danger arose because, fortunately or unfortunately, a large proportion of the profession had their interests associated with the work of the panel committees and this was apt to lessen if not to take away altogether their interest in other work which was appropriate to the Divisions and Branches. Dr E. A. STARRING (Kent Branch) supported the principle of co-optation of certain members of the panel committee on to the Branch Council or Division Executive.

The CHAIRMAN expressed the thanks of the Conference to Mr Russell Coombe for opening a useful discussion.

Election of Standing Committee

Dr L. A. PARRIS (Sussex Branch) moved to urge strongly upon the Council the desirability of altering the by-laws so that members of standing committees should be elected for three years and one third of the members of such committees should retire annually. He said that this was the procedure

very generally followed on municipal bodies. Under the present arrangement, whereby the whole of the members retired every year, the personnel of some of the committees was considerably changed, with peril to continuity of policy. He also referred incidentally to the way in which resolutions sent up by Divisions were turned down by the Council, and he wanted to see—although he proposed no resolution on the subject—the Council composed entirely of representatives, and to be in fact the executive of the Representative Body. Dr CHURTON (Carlisle) seconded.

Dr W. PATTERSON (Willesden) reminded the mover that it was not the Council which turned down resolutions from the Divisions; it was the Representative Meeting itself representing all the Divisions. Dr JOHN STEVENS said that the resolution would involve wide changes in the constitution, in his view there had always been a sufficient number of old members elected to ensure continuity. Dr PARRIS said that he was well aware that the resolutions were turned down by the Representative Body, but it was the Council which gave the lead. The chairman of a committee had only to pour cold water upon a Divisional motion to turn dozens of votes against it in the Representative Meeting.

Dr PARRIS's resolution was altered to become a request to the Council to consider the desirability of iranging their members of standing committees should be elected for three years, but it was lost by a large majority.

Other Business

The rules and regulations governing the Treasurer's Golf Cup competition were discussed, and it was agreed, on the suggestion of the Deputy Medical Secretary, to appoint a small committee to draw up the rules for the forthcoming year; the committee to consist of Dr McCutcheon (Glasgow), Dr C. J. Kirk (Darlington) and Dr Le Fleming (Bournemouth). Some desire was expressed that each Division and Branch should be allowed to find its own winner and in its own way.

No suggestions were forthcoming for the improvement of the *Annual Handbook*, and the Medical Secretary said that a great deal of the credit for that compilation was due to his colleague, Dr Macpherson. One Secretary asked for guidance on the question of medical charities, and Dr COX replied that the committee concerned would meet shortly, and that various questions must be held in reserve until it had reported.

Reports were received with regard to resolutions of the last Conference. The Organization Committee had been asked to consider how secretaries might be notified of arrears of subscriptions of members prior to the deletion of the names from the list, but the committee was of opinion that the balance of evidence was in favour of taking no action on the lines suggested. It was also asked that some rearrangement of dates might be made whereby the names of recently appointed officers of the Divisions could appear in the Annual List. To this the Organization Committee had replied that there were serious disadvantages in making any change, and that the desire for an up-to-date list of officers was met by the publication in October each year of the *Annual Handbook*.

A vote of thanks to the Chairman was accorded by acclamation.

DINNER OF HONORARY SECRETARIES

Following the Conference the Honorary Secretaries with their ladies dined together at the Red House under the presidency of Dr MUIR SMITH.

In proposing the health of the Chairman Dr A. LONDON mentioned that Dr Muir Smith had held office as a Divisional Secretary for a longer period than any other secretary now living. He was the embodiment of all that a B.M.A. man should be. Dr MUIR SMITH replied that it was true he had been secretary of the Eastbourne Division for twenty years, but it had been an office of unmitigated pleasure. It was a great privilege to come so closely into contact with one's fellow practitioners to learn their difficulties, and to have the opportunity of adjusting their little disputes. Although in the central councils of the Association the importance of secretaries might be small as compared with representatives or members of Council, he looked upon them as the salt of the local profession. He recalled the organization of the profession thirty years ago to resist the injustices inflicted upon it by the friendly societies. The present generation would never understand the tremendous debt of gratitude owed to the late Sir Victor Horsley particularly, and to those associated with him—Dr J. A. Macdonald, Dr Smith Whitaker, and Dr Cox—for the part they played

in those early struggles and for the emergence of a constitution of the British Medical Association on democratic lines. In those days nobody ever dreamed that the Association would become the power in the land that it was to-day. That it was now fully consolidated there could be no doubt whatever.

Dr C. G. C. SCUDWORTH, with appropriate compliments, proposed the health of the ladies, and mentioned particularly the help of the ladies of Bath in making for the success of the social functions of the Annual Meeting. Miss A. L. LAWRENCE, the Intelligence Officer, in a few happy sentences, responded to the toast.

Dr E. A. STANLEY proposed the health of the Medical Secretaries—the man who taught the honorary secretaries how to do their business, stimulated them if they were laggards, restrained their over-zeal, and rectified their errors. Dr COX paid, in response, a generous tribute to his colleagues, especially the clerical staff at headquarters, which, he said, was a well-picked body of men and women, second to none in zeal and devotion, taking a real interest in their work and giving their service in no niggardly measure. He also spoke in similar terms of his fellow secretaries Dr Anderson, Dr Lord and Dr Macpherson the Financial Secretary, Mr Ferris Scott—a more devoted servant the Association had never had—and the Intelligence Officer, Miss Lawrence of the origin of whose post he gave some account. Then there were Dr Drever and Dr Hennessy, respectively the Scottish and Irish Secretaries, to whose work the present position of the Association in those two countries was largely due. Dr ANDERSON and Dr LORD also spoke briefly to the toast and the proceedings were over in early hour to enable those present to attend the civic reception by the Mayor at the Grand Pump Room.

HONORARY DEGREE CONGREGATION AT BRISTOL

In connexion with the Annual Meeting of the British Medical Association at Bath a special congregation of the University of Bristol was held in the Great Hall of the University on the afternoon of Thursday, July 23rd, for the purpose of conferring the honorary degree of LL.D. upon Sir Humphry Rolleston, Bt. & C.B., President of the Royal College of Physicians of London and Regius Professor of Physics at Cambridge, and upon Sir Berkeley Moubray, Bt., K.C.M.G., Professor of Clinical Surgery in the University of Leeds. About 200 medical men and ladies travelled from Bath by motor coach as the guests of the Bristol Division of the Association and a luncheon party to meet the Vice-Chancellor and members of the Faculty of Medicine was held in the old Council Chamber of the University. In reply to a brief speech of welcome by the Vice-Chancellor (Mr T. Loveday), the Acting President of the British Medical Association (Mr W. G. Mumford) acknowledged the assistance cordially given by Bristol to Bath in the organization of the Annual Meeting, and spoke of the happy relations that had long existed between the medical profession in the two cities. In the name of the Association he acknowledged the honour about to be conferred upon two of its most distinguished members by the University of Bristol. Sir Humphry Rolleston, in a very happy speech, mentioned the proverbial hospitality of the inhabitants of the ancient city of Bristol, and touched briefly on some of the historical associations between Bristol and medicine. Sir Berkeley Moubray expressed his pride in being about to receive a degree honour causa in company with his friend, the eminent President of the Royal College of Physicians, and his satisfaction that medicine and surgery once asunder, would stand side by side to receive this honour. After praising the exquisite conception of design and superb craftsmanship of the new University buildings, Sir Berkeley observed that in the revival of learning in the great provincial cities medicine had once again proved herself the mother of the sciences.

Shortly before the congregation the guests assembled in the magnificent Great Hall of the University where the Chairman of the Bristol Division (Dr R. A. Ashmole) introduced Sir George Ostley, the architect who gave a brief account of the memorial tower and other parts of the building, which were then inspected by the visitors. The congregation ceremony, held at 4 o'clock, was presided over by the Vice-Chancellor, beside whom were Sir George Wills Bt. (Chairman of the Council), Professor L. I.

Francis (Pro-Vice-Chancellor) and members of the Council and Senate and academic staff of the University. These, and a large proportion of those present in the body of the hall, wore academic dress. The two honorary graduates were presented to the Vice-Chancellor by Professor J. Fawcett, F.R.S., Dean of the Faculty of Medicine. In his introductory remarks Professor Fawcett observed that the visit of a body like the British Medical Association, representative as it was of medical men throughout the Empire, must always be regarded as an important event in the life of any community. When such a visit was paid to a university town it was customary for the university to take official cognizance of it. Bath was not a university town, but since the inception of the University of Bristol the neighbouring city had taken the greatest interest in its prosperity, and had not hesitated to support it both morally and financially. Moreover, this was a medical visit, and the medical faculty could fairly claim to have had considerable influence in laying the foundation of the movement towards a university for Bristol and the West. On these grounds the University had deemed it fitting that the visit to Bath should be marked by the conferment of honorary degrees on two prominent members of the British Medical Association, who were taking an active part in its deliberations, who were representative of the two great branches of medicine, physic and surgery, and who possessed, moreover, the additional qualification of having some connexion with the University or city of Bristol.

Sir Humphry Rolleston

In presenting Sir Humphry D. Rolleston, Professor Fawcett said:

He who has been selected by the University as a representative of physic is one who to an unusual degree has gained and returned the trust and confidence of his fellow men whether in the strictly professional or academic sense. Sir Humphry Rolleston is a distinguished son of distinguished parent and through his mother is directly and hereditarily connected with that celebrated man of science, who commencing his career at Bristol discovered the physiological properties of nitrous oxide and invented the safety lamp which bears his name. Professionally he holds the office of Physician in Ordinary to the King, his for the third year in succession been elected President of the Royal College of Physicians of London while during the whole of the great war Sir Humphry Rolleston served as consulting physician (with the rank of temporary Surgeon Rear Admiral) to the Royal Navy. Academically he is a graduate of the University of Cambridge in which he has recently been appointed to the important office of Regius Professor of Divinity, honorary graduate of the Universities of Glasgow and Padua, a corresponding member of the Academies of Medicine of Paris and Rome and of the Association of American Physicians. His judgement is so highly appreciated that he has served as external examiner in medicine in most of the universities of the kingdom, and the University of Bristol is numbered among those which he has served during two different periods in the same capacity. Invited for his public services, high honours of a different character have been bestowed on him. In the year 1916 he was made Companion of the Bath. In 1918 he was created a Knight Commander of the Bath and quite recently he has been advanced to a baronetcy of Great Britain.

Sir Berkeley Moynihan

In presenting Sir Berkeley Moynihan, the Dean said:

The University has selected as representative of surgery one who thirty years ago was regarded by his medical confidants in the city of Leeds as of outstanding promise in the domain of surgery. It is common knowledge that that promise has been amply fulfilled and it is not too much to say that wherever modern surgery is taught and practised the name of Moynihan is known. Those who have worked with Sir Berkeley Moynihan know that his manipulative skill as an operating surgeon is as dexterous as his powers of diagnosis are brilliant and those whose fortune it is to be treated by him have felt from the very first that confidence which dispels to a great extent the natural dread attaching to surgical operations. His fellow practitioners have every reason to be grateful to him for his great kindness and sound ration for them in their illnesses and whenever advice on academic matters has been sought of him Sir Berkeley Moynihan has been no less responsive as this University gratefully acknowledges. A graduate of the University of London receiving the Master's degree in Surgery with gold medal in 1893 Sir Berkeley Moynihan is in addition an honorary graduate of the University of his adoption and of the University of Glasgow. He is an Honorary Fellow of the Royal College of Surgeons in Ireland and of the American Medical

Association. Professor of Clinical Surgery in the University of Leeds, Senior Surgeon to Leeds General Infirmary and a corresponding member of the Chirurgical Society of Paris. During the late war Sir Berkeley Moynihan served with distinction in the Army Medical Service as temporary Major-General. He has at various times held important lecturership, as for example the Ainslie and Gale Lectureship in the Royal College of Surgeons of England. He was Bradshaw Lecturer in the year 1920 and Hunterian Professor in 1919-20. In 1922 he was elected Vice-President of the Royal College of Surgeons of England. In recognition of his great services he was, in the year 1912, created a Knight Bachelor. In 1917 he was made Companion of the Bath, in 1918 was created Knight Commander of the Order of St. Michael and St. George and in 1923 he was created a baronet of Great Britain.

Each of the new honorary graduates, after his admission to the degree with due ceremony, was received with loud applause by the company. The Vice-Chancellor having declared the congregation closed the proceedings ended with the singing of the National Anthem. After the ceremony a garden party was held in the delightful grounds of Port Royal, now a part of the University.

IRISH GRADUATES' LUNCHEON

The annual luncheon of the Irish Medical Schools' and Graduates' Association was held on Wednesday, July 22nd, at the Pullman Hotel, Bath. Dr. J. A. McENAMARA presided over a very large company of members and guests. After the King's health had been honoured the toast of continued prosperity to the British Medical Association was submitted by Mr. RUSSELL COOMBS, who referred to the wonderful progress made by the Association in recent years, and in coupling with the toast the name of the Chairman of the Representative Body spoke of the debt of gratitude owed to him. Dr. BRICKENBURY, in responding, had to admit that he had never yet set foot on Irish soil, and could claim no Irish ancestry. He said that the Association to day was even more anxious than ever before to be of a due to Irish graduates and to attract them into its membership. The CHAIRMAN, in proposing the health of the guests, welcomed them with *cord mille faillies*, and in alluding to his friend Dr. W. N. Robertson (Vice-Chairman of the Australian Federal Committee) to respond, said he was only second to being a good Irishman—a good Scotsman. Dr. ROBERTSON expressed the thanks of all the guests to their hosts, and said that the message he would take with him on his 13,000 miles journey home would be that the British Medical Association was as good in Great Britain and Ireland as it was in Australia. Mr. W. D. HENDERSON, speaking as a perennial guest of the Association submitted the toast of "Prosperity to the Irish Medical Schools' and Graduates' Association". Dr. McENAMARA, in a brief reply said that the Association delighted above all things to entertain guests at its gatherings. Before the company parted the health of Dr. W. Douglas, the honorary secretary, was drunk on the proposal of Dr. MILLS.

THE ANNUAL EXHIBITION

The exhibition of surgical appliances, drugs, foods, and other materials and apparatus of professional interest was housed in the wholesale and retail markets of the Bath Corporation, situated between the Guildhall and the Technical School, in both of which buildings the sectional and other meetings took place. The area allotted for exhibition purposes was rather smaller than in recent years, but the utmost use was made of the space available and every one of the eighty-six stands had a good showing. Many of the exhibitors expressed themselves entirely satisfied with the results of the four days' display. The visitors were in general limited to those who could produce a membership card or badge, with the result that the Marquess of Bath and Lord Lieutenant of the County was challenged by the conscientious gatekeeper and only secured admission on the intervention of a police inspector. Lord Bath appeared amused at the incident, and spent a considerable time in the exhibition. Among the exhibitors were many old acquaintances, but there were also some

new-comers, and several things of interest were shown for the first time. The number of bootstalls was noteworthy, and it was also remarked that Buxton, Droitwich, and Harrogate all had stands advertising their waters at this queen spa of the West. In an early issue we shall begin the usual detailed survey of the more outstanding exhibits.

THE TEMPERANCE BREAKFAST

Sir Maurice Craig on Alcohol and Mental Disorder

THE fifth annual breakfast conference of the National Temperance League was held during the Annual Meeting at the Grand Pump Room, Bath, on July 23rd, when Dr Charles A Marsh acted as host.

Sir MAURICE CRAIG addressed the gathering on alcohol in relation to mental disorder. After quoting a statement by Sir Frederick Mott—that alcohol played a relatively unimportant part in the production of certified insanity—he reminded the gathering that certified insanity was a legal term, connoting a disorder which by statute had to be dealt with in a certain way. The lunacy laws were thoroughly unsuited for regulating the detention and care of a person whose mental disorder was due to the direct action of alcohol, for the vast majority of such cases regained mental equilibrium in the legal sense within a few days of the withdrawal of the alcohol, so that it was not to be expected that any large proportion of alcoholics would be found in mental hospitals. Nor was a mental hospital the ideal place for such persons. When clinics for the treatment of early phases of disorder were set up it was to such institutions that the alcoholic should go. It was the minor mental changes resulting from alcohol that were so damaging to a person's efficiency and happiness, and so hurtful to those who had to live with him. Children of alcoholic parents also were especially prone to develop such minor changes which might pass later in life to greater disturbances. The unhappy home surroundings of such children, the frequent emotional stress, the positive ill treatment, were likely to lead to mental instability in later years. Often the child of alcoholic parentage was above the average in intelligence, but this was generally due to hypersensitivity associated with unstable emotional reaction. Those who criticized the advocates of temperance (Sir Maurice Craig went on) declared that alcoholism was merely the expression of some other degenerative factor in the individual. To some extent this was true, but it did not justify a policy of inaction. To read some writers one would conclude that the testing of alcohol was a good test for deciding who were the fittest, but medical science had to do with the prevention of disease, and its aim was the efficiency of the greatest number. Research in mental medicine increasingly went to show that mental changes were frequently the result of poisons produced within the body or absorbed from without. That one individual was more sensitive to a poison than another did not exclude the importance of protection from such poison. Much had been heard of drug addiction, but whilst it was right and proper to see that any danger of this kind was guarded against, drug addiction, save in a limited number of cases, was negligible in this country, while addiction to alcohol was only too prevalent, and there was no such activity for dealing with it.

Sir Maurice Craig next spoke of alcohol as a hypnotic for sleeplessness. Dr Robert Hutchison, in *The Action of Alcohol on Man*, had said that the sedative action of the drug could be turned to good account by the doctor, the best example being the employment of alcohol as a hypnotic in cases of mild insomnia. But the observable symptom to which the taking of alcohol led in very many persons was more restless activity. Thirty years experience had taught him (Sir Maurice Craig) how dangerous was this practice of taking alcohol to encourage or produce sleep. He had seen many disastrous consequences. Even if alcohol at first produced the desired effect, the dosage had to be rapidly and continually increased. He had known a man who up to the time of his insomnia was almost an abstainer come to take as much as a bottle of whisky a night in the endeavour to obtain sleep, until he became alarmed at the consequences. This patient's sleep became thoroughly re-established when alcohol was withdrawn and 7½ grains of medinal alcohol for sleeplessness except in very rare instances as he found it unreliable in its action and in some cases as dangerous

as morphine, in the rapidity with which habit might be induced. The fact that the physiologist found by investigation and test that the action of alcohol on the nervous system was essentially depressing or sedative did not justify the ignoring of any opposite effect that might be commonly observable in clinical experience. Empirical experiences must not be set on one side. For example, chloralhydrate was far less effective as a hypnotic when dissolved in alcohol than when given in its solid form, whereas, according to laboratory investigations it ought to be more effective. That the healthy person could sleep better for or in spite of, his night potion did not mean that the person who was ill would do the same. In some persons sleep was better induced by depressants and in others by excitants but in any case the choice should fall upon the means least likely to establish a habit. Many patients had told him that they dated their intemperate habits from the time they took or were prescribed alcohol for sleeplessness. In conclusion, he urged that greater powers should be given for dealing with chronic alcoholics, whose number was large, and whose baneful influence was well recognized. Education would never touch such persons, and national prohibition would but increase their cunning. They must either be treated as normal persons and their conduct made an indictable offence or as sick persons requiring treatment, which others must be empowered to apply if they failed to seek it for themselves. Some means would have to be found for controlling the activities of these alcoholic persons, and the sooner the better.

Sir WILLIAM WILLCOX, in speaking to a vote of thanks, said that a fairer statement of the case than Sir Maurice Craig's he had never heard. It must always be remembered that the first effect of alcohol was not towards the production of cirrhosis of the liver or Bright's disease—it was the effect on the brain and therefore it was fitting that a neurologist should speak with authority. The only point on which he differed from Sir Maurice Craig was with regard to the giving of medinal for re-establishing sleep. Sir Maurice had said that disastrous consequences followed from the use of alcohol in this connection, and with that he agreed, but when he went on to recommend medinal the speaker was bound to say that the whole of these barbituric acid compounds were harmful and habit producing, and he hoped something more efficient would be found than medinal or any of its congeners. Lady BARNETT and Dr ALFRED COX also spoke to the vote of thanks.

MEDICAL MISSIONARY BREAKFAST

THE third annual Missionary Breakfast, held under the auspices of the Medical Prayer Union, was held on Friday, July 24th, during the Annual Meeting at Bath. The chair was taken by Mrs SCHARLIEB, supported by Mr W McADAM ECCLES, and an address was given by Dr H GORDON THOMPSON, of the Church Missionary Society's Hospital at Yunnan-fu, in South China.

Dr Thompson spoke of the sudden growth of race consciousness among the backward races, and of the unsettlement of the Chinese mind particularly consequent upon the introduction into such a province as Yunnan of modern things like the railway, the telephone, wireless, and the aeroplane. The beliefs of the Chinese were being undermined by these introductions, and there was great need for the West to give the Chinese a gesture of goodwill. What better gesture could be given than the provision of medical help? In the south of China there were actually French government hospitals, with doctors paid by the French Government, the motive of which was to persuade the Chinese people of French goodwill. If the Chinese could be persuaded that the British also were there with a similar intention it would all serve to act as a strong ballast to the Chinese national character, which would steady down in a remarkably short space of time. Dr Thompson spoke of the beginnings of the work now carried on at Yunnan-fu, the first operations were done in a tumbledown cottage, but now there was a well equipped hospital with fifty beds, an out-patient department and an x-ray and electrical installation. He told an amusing story of how, on first arriving at the city, he found that the French doctor on the principle that what people could get for nothing they would value lightly was charging one dollar for attendance. Desiring time to study the language, Dr Thompson thought

to reduce the number of his own patients by charging three dollars. But this had the opposite effect. His reputation was made at once. People said that the French doctor charged one dollar, the English doctor three dollars, and therefore the English doctor must be three times as good! He went on to give several illustrations of the relief afforded by medical work, and of its value as an adjunct to the spiritual enterprise. It would be out of the question, of course, for even the whole of Europe to send sufficient doctors to China, and the latest idea was to establish native medical schools. Something was being done to cope with the need by way of a kind of itinerant practice in market towns, he had himself seen in one day 250 patients. That travel in China was not without excitement he proved by describing a journey he had undertaken to the borders of Tibet when he lost all his supplies to bandits, and was himself a prisoner in their hands for several days. He left with his helpers a picture of the great spaces of China which were without medical help. From Yunnan in one direction the nearest hospital was fourteen days' journey away—that is, a Chinese day's journey, which is about twenty-five miles—and in another direction twenty-eight days' journey. The province of Yunnan was larger than England, Scotland, and Wales put together, and it had not a single isolation hospital, nor a single institution for the many blind. In the whole of China, he believed, there were only two asylums for the insane.

The breakfast was organized by Dr. T. Wilson Smith.

GOLF COMPETITIONS AT THE ANNUAL MEETING

On Thursday, July 23rd, the annual golf competitions for the Ulster and Childe Cups took place at the Stram Castle Golf course at Bath. There was a very satisfactory entry for both competitions, fifty-nine players in all taking part. Dr. G. Brand of Glasgow won the Ulster Cup, and Dr. W. V. Wood, M.C., of Yatton, Somerset, won the Childe Cup. Both players returned a score of "all square with bogey."

On Friday, July 24th, the final stage of the Treasurer's Cup Competition was held on the Lansdowne Golf Club course, sixteen winners of the Branch stage were present and play was of a fairly high order, all entrants, with the exception of one, returning a net score of somewhere between 70 and 80. As will be seen from the following list, the winner of the competition was Dr. W. V. Wood, M.C., of Yatton, Somerset, who returned a net score of 69. The best scratch score was that by Mr. N. Duggan of Worcester (handicap 1), who returned a gross score of 72.

Name and Branch	Gross Score	Handicap	Net Score
Dr. W. V. Wood, M.C. (Bath and Bristol) <i>Winner</i>	93	24	69
Dr. F. Norman (Tassex)	81	14	70
Mr. N. Duggan	72	1	71
Dr. F. B. Rush (Norfolk)	96	24	72
Dr. W. Stobbs, O.B.E. (Oxford and Reading)	79	6	73
Dr. A. Alcock (Gloucestershire)	92	18	74
Dr. I. " "	92	17	75
Dr. I. " "	89	13	76
<i>Inner Groups</i>			
Mr. Garnet Wright (Lancashire and Cheshire)	91	18	76
Dr. J. P. J. Jenkins (South Wales and Monmouthshire)	79	3	76
<i>Professor A. Fullerton, C.B. M.C. (Ulster)</i>	87	10	77
Dr. " " (England)	89	12	77
Dr. C. " "	79	2	77
Dr. V. " "	81	10	73
Dr. I. " "	83	9	79
Dr. I. " "	—	6	—

* No return

Players in all three competitions expressed their appreciation of the kindness and courtesy of the Bath Golf Clubs in placing the facilities of the clubs at the disposal of members of the Association attending the Annual Meeting.

EXHIBITORS' CONCERT

The exhibitors' concert was held this year in the Assembly Rooms on Thursday evening, July 23rd, when there was a large attendance, including many ladies. The chair was taken by Mr. J. G. Percy (Messrs. Down Bros.) and the vice chair by Mr. Lionel Cooper, while the musical arrangements were under the direction of Mr. D. Steele. A very fine programme was provided. The Chairman, in the course of a few remarks, welcomed the presence of Mr. W. G. Mumford, who was acting as deputy to the President, Dr. Thomson (unfortunately prevented from attending the meeting through illness). Dr. Brackenbury, Dr. Cox (the Medical Secretary) and Mr. Lewis Scott (the Financial Secretary). Mr. Percy acknowledged on behalf of the exhibitors the great assistance rendered them by the officials of the Association in connexion with the Annual Exhibition. He asked Mr. Mumford to convey to Dr. Thomson the sympathy of the exhibitors, and to express the hope that he would soon be restored to health. Mr. Mumford in responding paid a tribute to the usefulness of the exhibition, which enabled the profession to become personally acquainted with the latest improvements in medical and surgical appliances and medications. He thanked those present for the vote of sympathy to Dr. Thomson, which he knew would be much appreciated. After proposing the health of the Chairman, Mr. Lionel Cooper expressed the thanks of the exhibitors for the great assistance rendered them by the Corporation authorities through Mr. Hatton.

British Medical Association.

CURRENT NOTES

THE ROYAL OPENING CEREMONY, *Greetings from Tasmania*

At the reception after the Royal Opening of the Association's New House, on July 13th, the following message of greetings from the Tasmanian Branch was conveyed by Dr. W. N. Robertson, Vice-Chairman of the Australian Federal Committee:

*To the President, British Medical Association,
Tavistock Square, London*

We the Council and Members of the Tasmanian Branch of the British Medical Association in Australia, hereby express our fealty to you and your Council, and forward our salutations to the Association on the occasion of the formal opening of the new Home of the British Medical Association at Tavistock Square, London.

We are entrusting the carriage of these greetings to the Delegate of the Federal Committee of the Association, Dr. W. N. Robertson, C.B.E., one of our leading members in Australia, who is not only prominent in his profession but has materially forwarded in our Commonwealth the ideals of the Association, and we are entrusting him to convey not only the formal expression of loyalty to the Council but also personally the hearty greetings from all the members of our Branch.

Signed on behalf of the Tasmanian Branch of the British Medical Association in Australia,

E. BETTINGHAM MOORE
President Elect
TERENCE C. BUTLER,
Vice President
A. W. SHUGG,
Secretary

Representative of Northern Ireland

In our report of the proceedings in connexion with the Royal Opening on July 13th we regret that the name of Dr. W. R. Dawson was omitted from the list of those present. Dr. Dawson, as Chief Medical Officer to the Ministry of Home Affairs in the Government of Northern Ireland, represented the Minister of Home Affairs and his Department at the ceremony.

MOH for Selkirkshire.

It was only as recently as April, 1924, that the Selkirk County Council proposed to appoint a medical officer of health at a salary of £700 per annum with annual increments of £25 to £800. Under the new salaries scale the minimum salary for this appointment was £800 a year. The advertisement was, therefore, refused and became the

subject of an "Important Notice" In spite of this, however, someone was found who was willing to take the appointment. The holder, after a twelve months' trial, has now resigned, and the authority is again seeking to fill the post on the same terms. The fact that two medical officers of health have resigned this appointment in a period of less than two years should suffice to warn intending applicants to have nothing to do with it. The new scheme sero in its final form was unanimously adopted by the Annual Representative Meeting at Bath, and the position of the Association is also strengthened by the fact that the Ministry of Health considers the scheme reasonable and is prepared to support it. Furthermore, a number of authorities in England have adopted the scheme, and there is no reason why those in Scotland should not also do so, particularly if the necessary professional backing is forthcoming.

Association Notices

BRANCH AND DIVISION MEETINGS TO BE HELD

CAPE OF GOOD HOPE (WESTERN) BRANCH—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday, August 28th at 8 p.m. when there will be a symposium on the diagnosis of intracranial tumours arranged by Mr D. J. Wood. Among the speakers will be Dr J. D. M. Claessens, Mr T. F. Petersen, and Dr A. W. S. Siebel.

SUFFOLK BRANCH WEST SUFFOLK DIVISION—A combined clinical and social meeting of the West Suffolk Division will take place on Thursday August 6th when Dr Wood has very kindly offered to entertain the Division once more at Woolpit. Tea in his garden will follow a clinical meeting at the Institute.

Meetings of Branches and Divisions

NORFOLK BRANCH

The annual meeting of the Norfolk Branch was held at the Norfolk and Norwich Hospital on July 8th. Dr A. J. CLEVELAND took the chair for the preliminary business and then inducted the new President Dr CECIL JEFFERY MURIEL.

The following officers were elected:

President Elect Mr William Henry Fisher. *Vice Presidents* Dr F. W. Burton Fanning and Dr C. A. Owens.

A very learned and interesting address was given by His Honour Judge HENRY SMITH LL.D., county court judge on the law and procedure of workmen's compensation. Afterwards at the invitation of Dr and Miss Muriel members and their wives were entertained at tea in the hospital grounds.

NORTH OF ENGLAND BRANCH

The annual meeting of the North of England Branch was held on July 2nd at the Medical Institute, 7 Windsor Terrace, Newcastle upon Tyne when the President Dr D. I. Tonn was in the chair.

The following officers were elected for the ensuing year:

President Dr J. Hudson. *President Elect* Mr W. S. Dickie FRCS. *Vice Presidents* Dr F. Beaton and T. J. Kirk. *Honorary Secretary* Mr Norman Hodgson. *Honorary Scientific Secretary* Dr Henry Evers.

At the conclusion of the business meeting the members present adjourned to the Northumberland Golf Club, Gosforth Park, where they were entertained to luncheon by Dr Hudson after which the annual golf competition for the cup presented by Dr Todd took place. This was won by Dr W. Seymour of Newcastle upon Tyne.

NORTHERN COUNTIES OF SCOTLAND BRANCH

The annual meeting of the Northern Counties of Scotland Branch was held at Largsmouth on June 27th. At the business meeting held in the Stelfield Hotel Dr J. MUNRO MOIR the retiring President installed his successor Dr D. GRAHAM CAMPBELL in the chair. It was resolved to hold the annual meeting for 1926 at Tain. The following officers were elected for the coming year:

President Dr D. Graham Campbell (Flinn). *President Elect* Dr F. K. Mackenzie (Tain). *Vice Presidents* Dr J. M. Moir (Inverness) and Dr Taylor (Elgin). *Joint Honorary Secretaries and Treasurers* Dr J. M. Moir and D. Macfadyen (Inverness).

A discussion took place on the difficulties due to its large area in carrying out the present rules of the Branch, and a committee was appointed to go over the rules and report to the Branch Council what amendments of them were desirable. A discussion also took place as to the best time and place to have the British Medical Association Lecture, and it was decided that it should be held at Inverness in October.

After the business meeting the members and their friends, along with members of the Aberdeen Branch adjourned for lunch when the President Dr CAMPBELL presided over a company of about sixty. After lunch a golf match took place between members of the Branch and members of the Aberdeen Branch resulting in the defeat of the latter. Other members and their friends under the guidance of the President visited several places of historical interest in the vicinity of Lossiemouth. The weather was perfect and altogether a very enjoyable day was spent.

ONE DAY IN THE LIFE OF A COUNTRY DOCTOR

By A NORTH COUNTRY PRACTITIONER

THE other evening just before I went to bed I picked up a book from my shelf to read. It was *The Diary of a late Physician*, by Wriren, long out of print. It is a book of rather lurid tales, rather tall stories, creaky boots, cordials top hats, horse broughams, gramps sepsis, and a vein of religion of the Early Victorian Protestant type. Still in a more modern frame, the pictures would not all be out of date. But apart from the Victorian sob stuff it is interesting as a semi-professional novel. After one or two chapters I put the book down, and said to myself: "Blest if I don't put down a record of to-morrow's work. I did so, the next evening, with the following result."

Aroused from my bed at 7 a.m. to sign off a panel patient who wished to return to work and could not be bothered to come at my proper hours. As I was too bemused with sleep I did so without any comment. Then morning bath but in the midst of it to answer telephone—Oh yes we have telephones now in the country—Just testing the line. Breakfast at 8 with advertising circulars, bacon and eggs, moneylender scripts, samples, marmalade and toast hills to be paid and what riles me a letter of expostulation from a patient about my inordinate fee of four guineas. I certainly only paid two visits but I had to go fifty-two miles to do it.

Surgery from 9 to 10. Nobody to attend there so run through visiting list. This works out at a twenty-seven mile journey for the morning's round to see four patients excluding of course those who call me in on the way or stop me on the road. Get into travelling kit but just on the stroke of 10 in saunters a farm labourer, a case of cattle ringworm plus the stink of farm excrement on his boots. Treat him give directions but he insists on a bottle to cool the blood.

Start up, but have to stop as a patient arrives in emporhated furs. Strip off travelling kit and return. It is a case of nerves with a long rigmarole of what Dr X—said and what Sir Bunkum I he advised. After a process of diagnosis by elimination find it is servant troubles. Advise suggestion treatment and bolt without a fee and half an hour late. Stopped within a mile by farmer who says: "Yer've got to go and see my missus she's badly. Remind *agricola cantantians* that he has owed me money for two years and refuse to go unless he dubs up. He produces some dirty Treasury notes out of a dirtier pocket so go. Case of starvation though farmer and wife are well to do yet very grasping and close. Give advice directions as to food but no bottle consequently shall be turned down in future but will be no loss. Across some fields to a whitlow. Find it is of ten days duration and has been treated with hard cold bread poultices sugar spread on brown paper. This is the thecal form so get out tools sterilizer and ethyl chloride spray. Just ready when patient tries to faint refuses operation and says she will go on with the good old fashioned treatment. After great loss of time in argument leave in disgust even at the risk of being told I had mismanaged the case.

Then to three old cerliscantitis patients of ancient standing. One has been on his cloob for nearly fifteen years. Now, I confess to an interest in matters archeological but not in him. Still, I appear interested it is necessary for such patients can do one a deal of harm in a country practice. Four miles further then walk through three fields with the mud up to my knees to see a farmer's wife lately parturient. Nice plucky little woman. Farmer good sort. Pass me and says my work was worth double my fee. Stopped on the road by a road mender who says he wants to go on my panel. Congratulate him on his choice when he says: "Yes and yer've got to go and see Mrs B—s boy. They say he's dying. That means two miles back but go. Find case of paraphimosis which I reduce with some difficulty without an anesthetic. Cruel but no hospital within sixteen miles and nearest assistance for anesthetic eight miles. Next to an old bedridden chronic of the remini cent type. On tearing myself away daughter consults me. Leucorrhoea of some months standing. An article by Professor (no no he's had enough advertisement) in the (no no you can buy the periodical) on the examination of such cases with the cystoscopes sigmoidoscopes electric light specula swabs for bacteriological examination etc flashes across me. I haven't all these scopes neither an electric light of any kind except a flashlamp so suggest she should come and see me. No. I want a bottle and it's too far to come and I can't get away. So leave it at that.

Home by 2 p.m. for lunch but have to see a gentleman (maid says he is a stranger and she's put him into the drawing room). A nobleman by his dress but selling cheap prints. Show him the door and then to lunch. At 3 visit village patients: cancer of oesophagus traumatic catarrh in a boy, myxodema two

CURRENT NOTES

Port Elizabeth Branch

THE inaugural dinner of the Port Elizabeth Branch of the British Medical Association was held on June 29th, the President, Dr H Ellis Brown, taking the chair, supported by Mr A Linton, the mayor, Mr D Ladie, the chief magistrate, Mr J W Couldridge, the president of the Port Elizabeth and District Chemists' Association, and Dr H St J Randell, president of the Port Elizabeth and District Dental Association. After the usual loyal toasts the president proposed "The Old Port Elizabeth and Uitenhage Medical Society," which was enthusiastically received. The chief magistrate, Mr D Ladie, proposing the toast of "The British Medical Association with its new Branch," gave an account of the objectives of the Association, and commented on the unselfish ideals and the valuable services that characterized the society. He had been surprised to find how much useful work had been performed by the Association in connexion with legislation and other matters of supreme public importance, such as public health, food adulteration, medical laws, and the Factory Acts. He considered that the advice of the Association must be of the greatest value to law makers throughout the empire. Dr Ellis Brown in his reply, explained how the Association encouraged the pursuit of knowledge, and gave general assistance in medical concerns. Great credit, he said, was due to Dr R M Leith for the assistance he had given in the formation of the new Branch. Dr Andrew Steward proposed the health of "Our Guests," interspersing his speech with many humorous anecdotes. He made reference also to the many problems concerning public health with which they were faced at the present time. The mayor, Mr A Linton, in his reply to this toast eulogized the work of the Association in combating disease of all kinds and commented on the rapid strides which medical science was making to do so. He believed that the great advance made by the city of Port Elizabeth during the last twenty years would be considered negligible compared with the progress that seemed probable during the coming twenty years. Dr H St J Randell also replied to the toast, and referred to the presence of representatives of the law and the chemists at this inaugural dinner of the new Branch. He also alluded to the fine record of the Association, and

congratulated the Branch on its choice of Dr Ellis Brown for its first president. The proceedings terminated with a very cordial tribute of thanks to Dr Ellis Brown.

Communications to Medical Secretary during the Month of August

The Medical Secretary, Dr Cox, is at present on holiday and will not return to the office until August 31st. Until that date letters requiring attention should be addressed to the Medical Secretary officially and not to Dr Cox personally.

ANNUAL MEETING, BATH, 1925.

EVENING ENTERTAINMENTS

Receptions and Dances

ON the night of Tuesday, July 21st, after the adjourned Annual General Meeting at the Palace Theatre, a brilliant Reception was given in the historic Assembly Rooms by the President and Mrs F G Thomson. The entrance hall, the octagon, and other parts of the building had been beautifully decorated with flowers. The fine apartment inadequately described as the "ter room," was used for dancing to excellent music by the Clifford Essex orchestra. In the absence of the President, owing to his illness, the guests were welcomed by Mrs Thomson and Mr Malcolm Thomson, their son, who had read the Presidential Address with such grace and effect earlier in the evening. Mrs Thomson carried a bouquet of fine carnations, presented to her by Lady Stothert on behalf of the Ladies Executive Committee. Among the company who attended the reception were the Mayor of Bath (Alderman Chivers), the Mayoress (Madame Sarah Crand), the Viscountess of Bath, Field Marshal Lord Methuen and Lady Methuen, Lady Grant-Duff, Sir Percy Stothert and a very large number of members of the British Medical Association and ladies. Most of the medical guests wore academic robes which looked well in the Georgian setting. A special service of omnibuses ran from the Palace Theatre to the Assembly Rooms by way of Cox Street, Queen Square, and The Circus. This route looked charming in the glow of Chinese lanterns, and the foliage of the Queen Square trees was lit up by beams of soft light from hidden lamps.

Reference was made in a leading article last week to the magnificent Civic Reception given by the Mayor of Bath (Alderman Chivers) at the Grand Pump Room on the evening of Wednesday July 22nd. Through the generous enterprise of the host the price available for the

great gathering, which numbered some 2,500, had been increased by the erection of a large temporary reception hall, with annexes, in the Abbey Churchyard. With the aid of these extensions the accommodation in the Pump Room and Roman Bath suite was amply sufficient, and as every part (except the water in the Roman Bath) was under cover the rain which fell late in the evening did not damp enjoyment. All the guests were received in person by the Mayor and the Mayoress (Madame Smith Grand). At the east end of the great Roman Bath, from 8.30 to 9.30 o'clock, the band of the 2nd Battalion Argyll and Sutherland Highlanders (93rd Highlanders), with pipers and dancers, played music by modern composers, and in the Pump Room a number of performers from the Palace Theatre gave a musical entertainment. At 9.30 the Citizen House Players presented in the Old Pump Room a picturesque series of costume scenes entitled "A Ballad of Bath Ghosts of the Eighteenth Century." The first scene showed the Orange Grove at nightfall in 1704, the burial of Richard Nash, and his acceptance of the position of Master of Ceremonies, rendered violent by the death of Captain Webster, killed in a drunken brawl. The second scene showed a ball in progress in the Grand Pump Room in 1728, with Ben Nash at the height of his power and prestige. The third scene introduced Richard Binsley Sheridan, longing for a glimpse of Lizzy Linley in the Vauxhall Gardens of Bath in 1772, and ended with their elopement. The fourth and last scene was set in the Orchard Street Theatre of Bath on the night, in 1782, when Miss Siddons made her farewell bow before leaving for Drury Lane Theatre. Among the illustrious characters present at the performance were Dr. Samuel Johnson, with Fanny Burney and Miss Thrale. After rendering an act of homage to the dead actor, David Garrick, Miss Siddons delivered a monody entitled "Thrice Heroism for Leaving Bath," and the scene closed upon the great actress and her three children on the stage together. The representation of the Bath Ghosts was repeated twice to large audiences later in the evening. Lion shortly before 10 o'clock until after 1 a.m. there was dancing in the concert room of the Grand Pump Room to music by the Clifford Essex band. At dusk the Roman Baths (in the language of a programme drawn up and printed in admirable taste) were "illumined by a thousand lights," and charming views of the eighteenth century King's Bath could be seen from the Terrace and Pump Room windows. In the Roman Museum many objects of interest found during the excavations were on view, also a case of flint arrow heads and implements found on Lansdown. On the North Terrace there was in exhibition of the wood engravings executed by Horace Gerard for the *Boal of Bath*, and in the West North, and East Corridors were collections of water colour drawings and aquatints of Bath and its neighbourhood. Refreshments were served in the large marquee stretching from Stall Street to the Abbey, and on the Terrace.

The fine set of rooms, permanent and temporary, arranged for the Mayor's reception on Wednesday was again in use on Thursday evening for a delightful Reception given by the Bath Division of the British Medical Association. The guests were received on arrival by Dr. and Mrs. Dupont. A very good concert was provided in the Old Pump Room by Miss E. Hobday, pianist, Miss Jean Robley, violinist, and Miss Molly O'Moore, soprano. From 10.30 o'clock a dance was held in the concert room, where the Clifford Essex orchestra again played excellent music, and for those to whom dancing appeared less than cards, 500 tables were provided in the drawing room and dining room.

The last evening entertainment was a ball held at the Assembly Rooms by invitation of the Ladies Executive Committee. Brief reference to this enjoyable occasion will be found among the paragraphs headed "Ladies' Entertainments." Our information on this point is not first hand, but we have been led to believe that the dancing went on that evening to an even later hour than on Tuesday, Wednesday or Thursday, from which the success of the ball given by the ladies of Bath may be judged to have been complete.

Gala Performances

Other evening entertainments, all attended by as many people as could possibly be got into the space available, were the gala performance at the Palace Theatre on Monday, July 20th, and a representation of Bernard Shaw's play, *The Doctor's Dilemma*, on Thursday, July 23rd, by the Leni Ashwell Players at the Theatre Royal. Medical Freemasons were entertained on the evening of Friday, July 24th, at the Masonic Hall, Old Orchard Street, by their Bath brethren, who gave a demonstration of the working of a Lodge of Ancients in 1760.

The evening entertainment offered at the Spa Hotel on the Saturday of the Representative Meeting was of a varied character. Those who earnestly welcomed the opportunity of seeing a demonstration by the London Team of the English Folk Dance Society before proceeding, according to inclination, to the dance or the smoking concert. Some, indeed, who came to dance, and were diverted to the concert, remained there throughout the evening, held by the unusual excellence of the programme provided by Miss Valérie and Mr. George Christopher, Miss Dorothy Reid, Mr. L. H. Head, and Mr. L. C. Baker of the Bath Operatic Society, together with Mr. Thomas and Dr. Ray Laidridge. The spontaneity and vigour of their rendering, and their happy selection of old favourites and unexpected and original diversions, were warmly appreciated by the guests.

LADIES' ENTERTAINMENTS

From the opening of the Club in Queen Square on the first day of the Representative Meeting the provision made for the comfort and entertainment of ladies attending the meeting was of unvarying excellence, and the Ladies' Committee is to be congratulated on the success of its organization. In spite of the fact that Mrs. Donald Ackland, M.B.E., honorary secretary of the Ladies' Council and Executive Committee, and also of the Dinners and Receptions Subcommittee, was prevented by the grave illness of Mr. Ackland from taking an active share in the final execution of the arrangements she had so ably planned, and that her place had to be filled at the last moment by Miss Kathleen Harper, who was already fully employed as secretary of the Social Club, there was no hitch in the arrangements from beginning to end of the meeting.

The Social Club, with its inquiry bureau, bridge room, drawing rooms and rest and dressing rooms, invited its pleasant extravagance by the attractive furnishing and decoration carried out by firms whose names are household words in the West Country, it proved a most convenient centre whether for rest and refreshment or as a starting point for the various excursions.

Of the special entertainments provided, including visits to the chief features of interest in the neighbourhood as well as in Bath itself, and of the private and public hospitality offered on so lavish a scale, it is impossible to speak in detail, but special mention must be made of the Ladies' Dinner on the first night of the Representative Meeting. The guests were received at the Spa Hotel by Mrs. F. G. Thomson, who welcomed them to Bath, hoping they would enjoy a very happy holiday, and make the fullest use of the Ladies' Club and of the facilities so willingly placed at their disposal by the people of Bath. The service of dinner at small tables, each presided over by a hostess, ensured an informal and enjoyable evening, which was further enlivened by a varied selection of music.

The opportunity of watching a demonstration of Morris and country dancing, given by the London Team of the English Folk Dance Society in the Sydney Gardens on the afternoon of July 18th, was keenly appreciated. The display was given under ideal conditions before a large and enthusiastic audience, which included many children. The trees and lawns of the gardens afforded just the right setting for the rhythmic movements of the dancers to the music of piano and violin. Altogether the display was one of which Cecil Shaple himself might well have been proud.

At the Ladies' Ball—when Mrs. Langdon-Down, at the request of Mrs. Bolam, who had already left Bath, presented Mrs. F. G. Thomson with a bouquet and a bag on behalf of the ladies attending the meeting—an occasion was found

A full programme of sports and games for ladies during the week of the meeting had been arranged with much care and skill by a special Ladies' Sports Subcommittee.

A NOTWORTHY feature of the meeting was the number and variety of the excursions arranged for the afternoons. The list of the places of interest visited during the course of the meeting (and a blue list must suffice) is eloquent testimony to the foresight and care which found means to provide for every taste and interest—a foresight and care equalled only by the general success of the arrangements made, and the pleasure given to all concerned. The hermits of the country itself, the charm of the Wilts and Somerset villages amongst which Cistle Canbe, in its wooded hollow, and Lincok, with its timbered houses and mullioned windows, stand out as typical the historical associations and architectural interest of the great houses, the churches, in so many of which the inspiration of the mother Abbey of Bath may be clearly traced, and the varied industries of the district alike contributed to so happy a result. Beyond all this, the warmth of the hospitality extended on every side to members of the Association will long remain a grateful memory. The weather also was kind to garden parties at Longleat, the Palace at Wells, Ashwicle Hall, and Newton Park, to name some amongst many.

The beauty of Messis Blael more and Langdon's nurseries at Foston can be appreciated, not only by those who actually visited them, but by all who enjoyed the wonderful display of flowers at the Mayor's Reception. The prime source of "Gold Blaes" at Bristol needed no recommendation to a medical audience, and industriously made the Association equally welcome at the Samidile chocolate factory, where music by members of Messis Blael's staff was a feature of the entertainment provided at the Pitman Press, at the Bath Aircraft's cabinet factory at Swerton, and at Messis Stothert and Pitt's great engineering works, where all departments are happily fully employed in spite of the prevailing trade depression.

It was fitting also that the schools of the Bath district should take part in the entertainment offered. The heads of the Benedictine Community at Downside Abbey, with its great modern public school of the Wesleyan Foundation at Kingswood, daughter and successor of the original Kingswood founded by John Wesley, of Prior Park College, where these latest guests must now take their place in memory with those "most substantial shadows," of Pope, Fielding, and Pitt, and of the Lycombe Hall School for Bickford Children, all gave generous hospitality. Nor must the entertainment offered by the Flaxbridge Division at Bradford, by the Savage Club at Bristol, by the Oxford Division at Queen's College, by Dr. Wilcox at Glastonbury, and by Dr. and Mrs. Binstowe at Winton, pass without mention.

Different memories will stand out most clearly for each individual, but some must be given a place of honour by all, and amongst these the great Gothic West Front of Wells Cathedral, the towering heights of the Cheddar Gorge, and the delicate fields of decoration in its caves, the quiet beauty of the terraced gardens of St Catherine's Court the Avon Gorge, seen from the Suspension Bridge on Clifton Downs, and Glastonbury, the yet beloved vale of Avalon, will surely remain, together with the Tithe Barn, the Saxon church at Bradford-on-Avon, and the Mass Chapel on the beautiful old bridge there.

The last Saturday was, as usual, given up to whole-day excursions, and again a generous choice of direction was allowed, parties visiting Bournemouth, by way of Salisbury and Shaftesbury, Oxford, by Milnesbury and Farnford, Tintem the Wye Valley, and the Forest of Dean Mundehead, Farnoor, and the Valley of the Exe, and the New Forest, by way of Salisbury and Lyndhurst.

GARDEN PARTY AT GREAT CHALFIELD MANOR

A party of fifty, composed mainly of those who had been taking part in the Medical Sociology Section, and led by

Dr C F S Flemming, the President of the Section, visited Great Chilfield Manor on Friday afternoon, July 24th, by kind invitation of Mr. and Mrs. Robert Fuller. The Manor is a beautiful house its predecessors date back to Domesday after a period of decadence it has been beautifully and reverentially restored by Major Fuller, who has furnished the house throughout in a most appropriate manner. The party were received by Major and Mrs. Fuller, and were first shown round the sheds which are devoted to the production of milk under the most perfect conditions. This is one of Major Fuller's hobbies, and has rightly placed him in the forefront of the pioneers in providing a pure milk supply. The party, which contained many milk experts, saw the operation of milking, cooling, and bottling, and were much impressed by the excellence of the arrangements. After this the party adjourned to the garden of the house, where they were entertained to tea, and then Major Fuller gave a short but most interesting description of the house and of the families who had owned and occupied it. Finally the house itself was shown to the visitors. A vote of thanks to the hosts was moved by the Medical Secretary and heartily acclaimed by those present.

In this review of the 86 stands at the Annual Exhibition held during the Meeting at Bath no attempt is made to catalogue everything that was to be seen. We have merely selected for brief comment some of the newer or more interesting objects shown by each exhibitor.

The first of the stands devoted to chemical and pharmaceutical preparations which met the visitor's eye on entering the Exhibition was that of Burroughs, Wellcome and Company (Snow Hill Buildings, E.C.). The exhibit embraced several recent additions to the list of tablet products, including iodokim which is iodine on a chocolate base offered for the treatment of goitre in children. A new member of the resorcinol series also appeared under the name of chlorisulphin to be given hypodermically or intramuscularly. A section of the exhibit was devoted to organotherapy and the various stages from the fresh gland to the tablet product of the desiccated gland substance were ingeniously demonstrated. The stages in the manufacture of this firm's brand of insulin were shown in the same way.

Grand products were also the principal exhibits at the stand of the New York chemical house G. W. Criminal Company, whose London distributors are Bood's and Whitnott, Limited (40 Lexington Street, W.). One of these substances was the pluri-indular tablet called hormoneone and another the product typosogen. Emphasis was laid in displaying these and other products upon the care taken in every manufacturing process.

Among the preparations exhibited by Pule Davis and Company (50, Beak Street Regent Street W) was dibromine crystalline substance containing a large percentage of bromine and used in dilute solution for dressings irrigations douches and gargles. There was the usual exhibit of adrenaline and its various combinations, also of neo protosil or silver iodide in colloidal combination offered in various forms and of pituitrin and other products. A selection was also made from the series of vaccines prepared in the department for therapeutic inoculation. St Mary's Hospital for which products this firm is the distributing agent.

Allen and Hanbury's Limited (Bethnal Green) in addition to an exhibit of surgical instruments (to be separately noticed) showed numerous laboratory preparations including a selection of therapeutic serums and vaccines issued by the Lister Institute. Protein therapy products were shown and also a purified colloidal krolm prepared by electrodialysis. The well known foods for infants were once again on view together with the supplementary food biontore, a granular powder containing, among other ingredients bone marrow and yeast extract.

Another comprehensive display of fine chemicals and medicinal preparations appeared at the stand of Boots Pure Drug Company Limited (Nottingham). It included insulin, pituitary extract and gonococcal vaccines, a core of fine chemical preparations and a wide range of compounded tablets of drugs. This stand like those already mentioned illustrated the ingenuity of the modern chemist not only in working out substances but in preparing them for exhibition and in convenient and attractive forms.

Yet another exhibit of fine wooden specialties appeared under the name of A and M Zimmermann, Limited (S. Lloyd's

Association Notices

Avenue, E.C.). The newest preparation here was a gonococcal vaccine, to which the name arthogen has been given, among the older products were atophin (phenylephrin hydrochloride) and its methylester (novatophin), the latter is tasteless, and is said to have the same therapeutic action and indications as the original product Medinal and various other drugs figured at this exhibit and a gold preparation (Lysolgin) for tuberculosis.

The British Dyestuffs Corporation, Limited (Manchester), placed in the forefront of a most effective exhibit two drug sup 36 and sum 36. Mr J. E. R. McDonagh recently described in these pages (April 4th 1925 p. 654) the development of these drugs from isono benzene bismuth, and in the treatment of gonorrhoea. Both drugs were made at Manchester preparations, and their use in the chemotherapeutic treatment of gonorrhoea.

The business of the chemist is not only to produce drugs but to ensure their efficient administration, and Oppenheimer Son and Company Limited (Queen Victoria Street, E.C.), showed their cocooids, small pills containing standardized quantities of medicaments incorporated into a sweet base, their quantities, in which the medicaments are in a finely powdered form without excipient, and their hypodermic tablets, moulded but not compressed, and therefore readily soluble in the barrel of the syringe. Among the other objects shown here was a vaporizer for the extremely fine division of medicine.

At the exhibit of Hoffmann-La Roche Chemical Works, Limited (Isle of Llandudno, E.C.), attention was principally drawn to chocolate tablets containing a small but definite amount of iodine in organic combination. Tablets like these have been used in a routine prophylactic measure in schools in Switzerland and in various districts and are now it was stated, being used for the same purpose in certain parts of England. Another exhibit here was an ampoule syringe, comprising syringe, needle, and solution in one unit, ready for instant use.

An ultramicroscope at the stand of Buridges and Company, Limited (East Ham), invited the visitor to examine the very vigorous brownian movement of certain colloids (Cooper's medicinal colloids) which this firm was making its principal exhibit. The range included silver, iodine, manganese, and sulphur colloids, the last for both medicinal as well as for internal administration. Among the other preparations shown by this firm was carbon tetrachloride for the treatment of hookworm.

The brownian movement was also demonstrated at the stand of Crookes Laboratories, British Colloids, Limited (Chenies Street, W.C.). Amongst the latest additions to the list of colloids was colloidal aluminium hydroxide claiming to be of value in dyspepsia and also to serve as a colloid ichthol from of value in interesting product was colloid ichthol from wash. Another exhibit of British origin, Ichthol the original a natural ichthol oil preparation, was also the exhibit of sulphonated ichthol oil preparation. Among the other preparations shown by this firm was carbon tetrachloride for the treatment of hookworm.

At seven stands liquid paraffin was a principal exhibit. The Deshells Laboratories, Limited (150 Southampton Row, W.C.), concentrated on their petiolagin, an emulsion of liquid paraffin with agar agar. This preparation appeared in four forms—the first plain, for ordinary cases of constipation in all ages, for phenolphthalein, for chronic cases the third without sugar, for for cases of hyperacidity and the fourth appeared at the stand of the Anglo American Oil Company, Limited (Albert Street, Camden Town), also in a pleasantly flavoured form combined with agar agar to overcome the objection some find to plain paraffin. Another preparation here was mistal, combining menthol, emphor and eucalyptol with a mineral oil, for inflammatory conditions of the nose and throat. Paraffin was also the entire exhibit of the Sempolm Company, Limited (Lenther Lane, E.C.). Sempolm is a paraffin oil emulsion, offered as a vehicle for various therapeutic agents in toxemia and gastro-intestinal disorders. The firm also showed an emulsion containing certain additions to make it suitable for infants needing a mild laxative and correctives.

Peris and Company (Bristol) had general exhibits of pharmaceutical preparations. Here, in addition to antiseptics and ointments were shown some very convenient dressings cabinets for surgical dressings. A wide range of preparations was also to be seen on the stand of C. J. Hewlett and Son, Limited (Charlotte Street, E.C.), they included various tinctures, creams and lotions, a soft paraffin for intestinal lubrication, and some plurigranular extracts. Lionel Cooper (14, Henrietta Street, W.C.) had a range of chemical products, the first place in which was given to a sheet of aluminium, claimed to be of physiological purity, it appeared a white, odourless, and tasteless powder. It was advised for various intestinal troubles and was said to have, on account of its purity, advantages over kaolin and similar products.

Teves Sanitary Compounds Limited (64 Cannon Street, L.C.), had then familiar cylinder products, which now run into a long list and include, in addition to preparations for immediate medical and surgical use, soaps, powders, gauze, and sanitary towels impregnated with 5 per cent cylinder. One came upon the refreshing, bower of I no s Fruit Silt but at this time of dry that effervescent laxative needs no description.

(To be continued)

Association Notices.

FURTHER EXTRAORDINARY GENERAL MEETING

A FURTHER Extraordinary General Meeting of the British Medical Association was summoned to be held at the Herd Office, British Medical Association House, Tavistock Square, London W.C.1 on Tuesday August 4th, 1925, at 2.30 p.m., to consider, and if thought fit to confirm, the special resolution for alteration of Articles which was passed by the requisite majority at the Extraordinary General Meeting held in the Concert Hall, Grand Pump Room, Bath, on Friday, July 17th, 1925. At the August 4th meeting the Chairman of the Representative Body, Dr H. B. Bland, was in the chair but the necessary quorum not being present the meeting stood adjourned to Tuesday, August 11th, 1925, at the same place and hour, pursuant to By-law 34.

By Order of the Council

ALFRED COX,

Medical Secretary

L. FRANK SCOTT

Financial Secretary and
Business Manager

August 4th, 1925

BRANCH AND DIVISION MEETINGS TO BE HELD

CAPE OF GOOD HOPE (WESTERN) BRANCH—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday August 28th at 8 p.m. when there will be a symposium on the diagnosis of intracranial tumours arranged by Mr D. J. Wood. Among the speakers will be Dr J. D. M. Christens, Mr F. F. Petersen and Dr A. W. S. Sichel.

KENT BRANCH—The quarterly meeting of the Kent Branch will be held on Wednesday August 12th at 8 p.m. by kind invitation of Dr R. A. O'Brien, C.B.E. and the medical staff of the Wellcome Physiological Research Laboratories at Langley Court, Beckenham. A demonstration will be given of the work of the laboratories in the preparation control and standardization of antitoxins testing of extracts and toxine injection of horses etc. Tea will be kindly provided.

Meetings of Branches and Divisions.

ASSAM BRANCH

The proceedings of the Assam Branch at the annual meeting held in Jorhat on March 2nd have now been published. The President, Dr E. T. JAMESON, in his address reported on the proposal which had been made a year previously for the manufacture of vaccines for the treatment of pneumonia by the Pasteur Institute in Shillong. The Assam Government and the director of the Institute had not found themselves able to approve the suggestion. It was tentatively as such work had now been transferred to the School of Tropical Medicine and decided to approach the Calcutta School of Tropical Medicine and view the matter and whether it would be willing to risk the comparatively small expenditure in obtaining these vaccines which might prove to be most beneficial that any grievances should be submitted to the Council with a view to negotiation and settlement with the agencies concerned.

A very pleasant meeting of the Branch had been held at Dibrugarh in the course of the year. It was reported that considerable improvement had been brought about in the general circumstances of medical practice in the terai regions. Medical research work was however still handicapped by economic considerations and by the ignorance and superstitions of the coolies. The Pasteur Institute still wanted investigation in assistance but many problems still awaited investigation including those of the greatest gastroenteritis. Travelling laboratories might prove of the greatest assistance in the much needed study of these diseases. Dr G. C. RAMSAY contributed his impressions on some diseases of Assam including the local circumstances which conduced to pneumonia the mild nature of syphilis in Assam.

of serum treatment of bacillary dysentery and the need of further medical research work. The address given by Lieut. Colonel F. J. Palmer on the treatment of epilepsy by metallic salts of which an extract appeared in our columns of May 9th (p. 884), printed in full together with a summary of some typical cases, in account of present knowledge regarding the transmission of malaria in nature was contributed by Lieut. Colonel S. R. Christie M.C. Major H. E. Stuart and Mr. P. I. Barnard of the Malaya Commission. Dr. I. W. O'Connor described the use of the electrical sigmoidoscope in cases of amoebic dysentery in tea-garden practice. Dr. C. STRICKLAND, professor of medical entomology in the Calcutta School of Tropical Medicine delivered an address on the mosquito factor in the malaria of Assam with special reference to preventive work.

BIRMINGHAM BRANCH BROMOCRYNE DIVISION

The annual meeting of the Bromocryne Division was held at the Smallwood Hospital, Redditch, on July 22nd.

The following officers were elected for the ensuing year:

Chairman Dr. C. L. Haxton. Vice-Chairman Dr. E. Prothrope Smith. Secretary Dr. H. Warburton Lewis.

It was decided that arrangements should be made for clinical lectures to be given to the Division during the coming winter on dates to be arranged as far as possible before Christmas in order that the winter's work should not cause small attendance. A vote of thanks to the house committee of the hospital for the use of the board room was passed unanimously. The meeting terminated with tea.

CAMBRIDGE AND HUNTINGDON BRANCH

The eighty-first annual general meeting of the Cambridge and Huntingdon Branch was held on July 10th at Downing College, Cambridge, by kind permission of the Masters and Fellows. In the unavoidable absence of Dr. Stephens (President), Dr. ALBERT WARRICK took the chair. The balance sheet was adopted. The newly elected President Dr. E. LLOYD JONES, succeeded to the chair, and the following officers were elected:

President Elect Dr. H. Hyslop Thom. Vice-presidents Mr. W. H. B. Wainwright and A. C. S. Waters. Honorary Secretary and Treasurer Dr. G. S. Haine.

The President Dr. Lloyd Jones kindly entertained sixty members at luncheon in the College Hall, after which he delivered his presidential address on the diagnosis of pulmonary tuberculosis. On the motion of Professor BRADBURY a vote of thanks to the President for his hospitality and for his instructive address was carried by acclamation.

METROPOLITAN COUNTIES BRANCH GREENWICH AND DEPTFORD DIVISION

The Greenwich and Deptford Division held a garden party on July 8th at Charlton House, S.E. about 100 members and guests being present after the reception by the chairman of the Division the Rev. S. D. Bhabha M.D. the house (which is one of the finest examples of Jacobean architecture in the neighbourhood) and the surrounding gardens which were much admired were carefully explored. Dr. COURTNEY LORR, Assistant Medical Secretary of the British Medical Association, gave an account of the new headquarters of the Association at Tavistock Square and outlined the benefits of belonging to a well organized powerful body such as the British Medical Association. He urged all non-members to join and hoped that every medical practitioner in the Division who either a member or not would visit the new headquarters where they would receive a welcome and assistance in any matter connected with professional life and practice. A vote of thanks to the Mayor and Borough Council of Greenwich for permitting the meeting to be held at Charlton House was moved by Dr. W. H. BAYNE, seconded by Dr. P. QUINN and cordially agreed to. Dr. E. G. ANNE, the medical officer of health was asked to convey the resolution to the borough council.

NORTHERN COUNTIES OF SCOTLAND BRANCH CAITHNESS AND SUTHERLAND DIVISION

The annual meeting of the Caithness and Sutherland Division was held at Helmsdale on July 11th when Dr. J. B. SIMPSON was in the chair.

The following officers were elected:

Chairman Dr. A. Dingwall Kennedy (Wick). Vice-Chairman Dr. J. McLachlan (Dornoch). Honorary Secretary Dr. A. A. Her (Thurso).

The meeting considered the Annual Report of Council for 1922 also the Supplementary Report and instructed the representative on various points in connexion therewith. It was not considered desirable that the Association should take up the question of medical defence as this was very ably managed at present by existing societies. Dr. SIMPSON and the SECRETARY reported as to the meeting of delegates in London in connexion with the evidence submitted by the British Medical Association to the Royal Commission on National Health Insurance. Dr. SIMPSON reported on negotiations of the Highlands and Islands Subcommittee of the British Medical Association and the Scottish Board of Health and intimated that the remuneration had been fixed at the same amount as last year. Satisfaction was expressed with the settlement.

SOUTH MIDLAND BRANCH

The annual meeting of the South Midland Branch was held at Fenny Stratford on June 25th. Prior to the meeting the members were entertained to luncheon by the President Elect Dr. W. Bradbrook.

Dr. I. D. McCRIMBLE M.O.H. Northampton was on the nomination of the Council elected a member of the Council as representing the public health service.

Dr. BRADBROOK having succeeded Dr. BAXTER in the chair delivered his presidential address entitled "Medical men and matters of the past in South Bucks." He spoke first of the unhappy circumstances in which he had become President through the death of Dr. Benson and mentioned several ex-presidents of the Branch who had died in the past year. He gave details of a great number of distinguished men, mostly County physicians of the seventeenth century who had been associated with North Bucks. The address was listened to with great interest and a vote of thanks to Dr. Bradbrook proposed by Mr. NASH seconded by Dr. WICKHAM was carried by acclamation.

Sir JAMES BERRY gave an address. He began by questioning whether the adenoid operation was not done a little too often it was new in his time and he thought that under the present school system the tonsils and adenoids were taken out without sufficient indications. He protested against the routine performance of enucleation of tonsils and said that in his opinion it was often sufficient to slice the tops. Sir James went on to discuss the question whether in acute appendicitis should always be operated on when diagnosed. He pleaded for a better knowledge of the pathology of the condition and for a policy of expectant treatment in cases seen on the third or fourth day. He quoted some very interesting statistics by Love surgical registrar of the London Hospital purporting to show that in 2,000 cases of appendicitis the mortality of those operated on on the third day was double of those cases operated on after a few days delay. He pointed out that the gross mortality of appendicitis had risen from 8.291 in the five years 1901-05 to 12.418 in 1916-20. He discussed whether this could be due to an increasing frequency of occurrence of appendicitis and left the question open. He compared the cases of an English Royal personage and a recent German president contrasting the treatment and result. He quoted Sir Frederick Fiees in favour of delayed operation, and Grey Turner of Newcastle as saying that the recurrent advocacy of delayed operation was always followed by increased mortality and again his own early writings in favour of delayed operation.

A lively discussion followed in which eight members took part. There was considerable difference of opinion as to the advisability of delayed operation two members speaking very forcibly against the delayed operation and one in favour. Mr. GRIFFITH NASH and Dr. BOVE were strongly in favour of immediate operation. Mr. NASH gave statistics showing that the mortality since the cases were seen and operated on early had fallen in his hospital from 40 to 6 per cent and gave his own private statistics of 244 consecutive cases without a death. He deplored Sir James Berry's paper as he had been trying for years to get the general practitioners to send the cases into hospital early. Dr. BOVE spoke to the same effect. He regarded the first day as better than the second second than third third than fourth and so on. Dr. BROUGHTON BAXTER questioned whether it was ever defensible to remove deliberately only part of the tonsil and suggested that it were better to remove ten adenoids unnecessarily than to leave one pad to produce deformity. In his opinion many more cases were left which should be treated than were dealt with unnecessarily. Dr. WILLIAMS spoke in favour of waiting operation on suitable cases of appendicitis. He pointed out that it was the younger generation of doctors who should have heard Sir James Berry's address. Dr. MURRAY (Blackley) spoke of appendicitis being less common in the last seven years than heretofore. Dr. BAXTER said that appendicitis was increasing in frequency and recently had been increasing very fast. Dr. ROSSON spoke of the expectant treatment of appendicitis adopted twenty-five years ago with very good results in his opinion appendicitis was far less common then than now. The President said he had a very fortunate experience of having at first treated cases by expectant methods and recently having had all cases of appendicitis operated on without being able to remember a single case of death.

Sir JAMES BERRY replied advocating his plan and was able to point to Mr. NASH as an excellent example of a patient of his who had done extremely well on expectant treatment though he deplored the fact that Mr. NASH still had his appendix.

During the discussion the President had tea served to the members. Thirty-three members and three guests were present. 18 from Northamptonshire 10 from Bedfordshire and 5 from Buckinghamshire.

SOUTH MIDLAND BRANCH BEDFORDSHIRE DIVISION

The annual meeting of the Bedfordshire Division was held at the Swan Hotel Bedford on July 15th. Previous to the meeting members were entertained to luncheon by the Chairman Dr. G. T. BULL. The annual report for 1922 showing a membership of 89 Bucks and a balance in hand of £717s. 1d. was adopted. The percentage of members to the total of the medical men in the county (excluding retired non-members) was 74.3 as compared with the average for England and Wales of 59.5. The Honorary Secretary reported that he had attended the official opening of the new British Medical Association House on July 13th as representative of the Division.

The following officers were elected for the ensuing year:

Chairman Dr. H. N. Little (Donstable). Vice-Chairman Dr. W. L. Carter (Amphill). Honorary Secretary Dr. F. R. Fauchant (B. Herts).

The Division nominated Dr. F. S. Lloyd O.B.E. (Luton) for the presidency of the South Midland Branch for 1926.

Dr. FAVORHAR BLIZZARD gave an instructive address on some problems in prognosis illustrating his remarks by cases of disseminated sclerosis paralysis agitans and neurasthenia.

SOUTH WALES AND MONMOUTHSHIRE BRANCH SWANSEA DIVISION
A MEETING of the Swansea Division was held on July 9th. Instructions were given to the representative to the Annual Meeting at Bath. The Annual Report of Council was discussed. It was decided to ask local members of Parliament to support the Summer Time Bill then before Parliament.

SUFFOLK BRANCH

THE annual meeting of the Suffolk Branch was held at the Felix Hotel on July 17th. Dr ASKIN MBE JP the new President entertained about thirty guests to a luncheon. Two excellent papers were read, one by Sir G. LEVTHAL CHAMBER on pathological states of the breast and their practical significance, and one by Dr C. M. HYNES HOWELL on encephalitis lethargica. The papers were well discussed. Tea was served on the lawn of the Felix Hotel at the kind invitation of Dr. and Mrs. Askin.

YORKSHIRE BRANCH HUNTERSFIELD DIVISION

At the annual meeting of the Huntersfield Division held on July 15th the following officers were elected:

Chairman, Dr J. Rafter; Vice-Chairmen, Dr R. S. Clark and Dr I. Rafter; Representative in Legislative Body, Dr J. Rafter; Deputy Representative, Dr Park; Honorary Secretary and Treasurer, Mr A. Latimer Walker.

The annual report of the Division showed that five meetings of the Division and six meetings of the executive committee had been held during the year, together with two general meetings with Local Medical and Panel Committees to consider the evidence submitted by the Association to the Royal Commission on National Health Insurance. The report stated that satisfactory replies had been received from the parliamentary candidates for Huddersfield and the Colne Valley at the last general election regarding the British Medical Association policy. It was reported also that the fees for certification of lunatics and for midwives had been raised by the board of guardians from 10s. to 21s. The social functions held during the year had been successful, and showed a credit balance, as did also the general fund of the Division.

National Insurance.

ROYAL COMMISSION ON NATIONAL HEALTH INSURANCE

EVIDENCE OF THE COUNCIL OF BRITISH OPHTHALMOLOGISTS

FURTHER evidence on the vexed question of ophthalmic benefit was heard by the Royal Commission on National Health Insurance from the Council of British Ophthalmologists. We have already given a summary of the evidence tendered by the Institute of Ophthalmic Opticians (SUPPLEMENT, July 4th, p. 10), which set forth the qualified opticians' point of view. Evidence of similar tenor was given by the Joint Council of Qualified Opticians and by the British Optical Association immediately before the evidence of the Council of British Ophthalmologists.

The witnesses who appeared in support of the evidence of this last body were Mr E. Treacher Collins FRCS President, Mr J. Herbert Fisher, FRCS and Mr S. Mayou, FRCS. It was explained that the council consisted of twelve permanent members who were presidents or past presidents of the Ophthalmological Society, the Section of Ophthalmology of the Royal Society of Medicine or the Oxford Ophthalmological Congress, and that ten members were elected annually from those bodies.

The council expressed the strong opinion that the examination of the eyes should be carried out by qualified medical practitioners. It approved and supported the recommendations in this respect recently formulated by its subcommittee in conjunction with representatives of the British Medical Association. Asked by the Chairman of the Commission (Lord Liversidge of Kingsgate) whether the general practitioner would be acting improperly in advising a patient to go direct to an optician, Mr Collins said that that must be left to a large measure to the general practitioner himself. If he accepted the responsibility of stating that the case was one which required only the care of an optician, he would be taking upon himself a very large responsibility. An optician might in some cases be capable of ascertaining the figures representing an optical defect but the determining of the glasses which should be worn was quite another matter and one which required medical as distinct from optical training. Asked whether he considered that there were sufficient medical practitioners versed in ophthalmic work to meet the requirements should this benefit be extended to the whole insured population, Mr Collins said that his council had associated itself with the British Medical Association and the Ophthalmic Benefit Committee in this matter. The British Medical Association had drawn up a list of some 500 ophthalmologists prepared to see

insured persons at a uniform fee of 1 guinea on behalf of approved societies. The supply would also tend to increase with the demand. The Chairman asked what evidence there was of real danger which had arisen in consequence of the very common practice of going straight to an optician. Mr Collins replied that his council had plenty of evidence which could be divided under three heads: overlooked diseases, patients unnecessarily alarmed about their condition, and unnecessary glasses frequently supplied. The Chairman said that earlier that day the Commission had received evidence from bodies representing the opticians to the effect that opticians were capable of acting as a court of first instance—if he might put it in that way—in 95 per cent of cases. Mr Collins insured that there the ophthalmologists must join issue. Miss Tuckwell, a member of the Commission, suggested that it would get over the financial difficulty if clinics were instituted where ophthalmologists could treat insured persons. Mr Collins thought there would be insuperable difficulties to the adoption of a clinic system. He believed that the British Medical Association was against such clinics. The Association took exception to specialists doing work at the very cheap rate which clinic practice involved. He agreed that there was an established scale of fees for such specialized services in connexion with pensions work, but as to whether the British Medical Association was likely to take exception to a similar scale being applied in this wider connexion, 'you had better ask the British Medical Association that question.' Many other questions were put to the witnesses with regard to the adequacy of ophthalmology in the medical curriculum and there was a good deal of cross-table discussion on the competence of the optician. A characteristic passage was the following:

Professor Gray: Are there any things or drugs which the optician may not use which you may use?

Mr Collins: Drugs he should not use.

Professor Gray: He tells us he does. I think.

Mr Fisher: He may do that at his peril. I suppose.

Professor Gray: What is the peril he does it at?

Mr Fisher: He might make the patient blind in twelve hours if he uses drugs unwisely.

Professor Gray: But so might an ophthalmologist of course if he uses it unwisely. It comes back to wisdom there. There is no special privilege which protects you in the way in which the optician is not protected?

Mr Fisher: No. I should think we are worse protected than they are because we are supposed to possess a higher degree of skill and if an error is made our liability is greater.

The witnesses reaffirmed their opinion that if ophthalmic benefit were brought in under the Act there would be a sufficient number of capable men in the medical profession to carry out the requirements.

EVIDENCE OF THE OPHTHALMIC BENEFIT COMMITTEE

The Ophthalmic Benefit Committee, which was stated to represent more particularly the younger members of the medical profession who had had post graduate special training in eye diseases and were actively engaged already in the type of work which would be carried out under ophthalmic benefit, also gave evidence. The witnesses were Mr H. L. Eason, chairman of the committee, Mr G. H. Pooley, a member, and the late Dr C. I. Harford, honorary secretary.

The evidence of these witnesses was similar to that given by the Council of British Ophthalmologists, its general purport was that prescription by a qualified medical practitioner should be an essential in any approved scheme of ophthalmic benefit. They strongly supported Appendix III (Ophthalmic Benefit) of the statement of evidence of the British Medical Association. They thought there was some misunderstanding, as to the supposed difficulty of obtaining sufficient ophthalmic medical practitioners and they cited some recent developments in connexion with ophthalmology and the public services to show that there was no increasing unavailability of such practitioners.

Some account of the practice of Continental nations was furnished by Dr Harford. In France anything like examination and prescribing glasses by an optician was illegal and punishable. In Belgium opticians were only allowed to supply glasses according to the prescription given by the patient's doctor. In Italy he thought patients went first to the specialist and then to an optician. In America, and he believed also in Germany, the practice was different, some of the British colonies also recognized what they called optometry. Asked by Professor Gray why in America so much more power had been given to opticians than was the case on the Continent, Mr Eason replied: 'I can only say that the United States of America is the home of every quack. Any quack can flourish better in America than in England.' Dr Harford added that it was not only a question of quacks, but there were large numbers of medical schools in the States which were not up to the standard.

Mr. Eason put in documentary evidence—in the form of letters—of a number of cases in which retail him had been done to patients as a result of the common practice of going straight to the optician without the intervention of a medical practitioner. Professor Gray said that it had been put to the Commission that the great bulk of the population had gone to opticians to get treatment, and at the same time many of these people had been under their insurance practitioners, yet there were no complaints against the opticians by the latter. Mr. Eason said that he and his colleagues could not speak for insurance practice, they could only speak for their own end of the machine, but they saw the mistakes and disasters which happened and those were many.

Some questions were next asked on remuneration. The Chairman supposed that the witnesses would desire the insurance practitioner to do the preliminary work within his present contract, the ophthalmic specialist to be remunerated by a fee, and the optician to be paid for the appliances according to a prescribed scale. Mr. Erson said that he would like to avoid answering the first part of that question, because that was a matter for the British Medical Association. All that he would say was that the ophthalmic specialist should be remunerated by a fee, and the optician paid for appliances. Asked whether the provision of clinics might not meet the financial difficulty as between treatment by an ophthalmologist and the ordinary services of an optician, he said that he did not think the specialist would ever take up clinic treatment under the Act. The grave defect in the clinic system was that it was a contract system whereby so many persons had to be seen in 1 session. He thought that this type of contract practice was not satisfactory in the case of a specialist. Dr. Harford also pointed out that in calculating the cost of the clinic system, the cost of administration and equipment must be taken into account, whereas under the system whereby ophthalmologists who are names were on a list agreed to see insured persons at a uniform fee this cost would not arise. Comment was made by members of the Commission on the apparently inadequate number of ophthalmologists—some 580—on the list, covering the whole country, prepared by the British Medical Association. Dr. Harford said that the number on the map showing the distribution of these men were misleading, because many capable ophthalmologists were so sceptical about anything being done that they neglected to send in their names. He believed it would be found if the scheme materialized that most of the areas remaining vacant or sparsely served would be filled up. Mr. Erson added, in reply to further questions on the subject of clinics, that the question of clinic or no clinic was to him and his colleague of secondary importance compared with the main point—namely, that of providing the best possible attention for the insured person when he went to the clinic or anywhere else. If this first point was accepted, the machinery could be devised.

EVIDENCE OF THE CHARTERED SOCIETY OF
MASSAGE AND MEDICAL GYMNASTICS

Evidence was also taken from the Chartered Society of Massage and Medical Gymnastics, for which Sir Cooper Peir, chairman of the council, and Dr James Mennell appeared as witnesses. The proposal of the chartered society was that massage and electrical treatment should be included as an additional benefit to be provided by approved societies, when prescribed, for persons under the National Health Insurance scheme. The witnesses stated that over 5,400 misseuses and misseurs were now registered, and the majority were qualified to administer, under medical directions, the treatment by massage, remedial exercises and medical electricity now so generally ordered for a variety of medical and surgical conditions. The growth of physiotherapeutic departments in hospitals was pointed to as illustrative of the increasing appreciation of these forms of treatment. The witnesses were of opinion that it should not be difficult by the selection of suitable cases, for this proposed benefit to recoup the expense of the treatment in the amount saved by the reduction of sickness. In view of the number of hospital departments and clinics at which this treatment was already available it would be easy to arrange for the treatment of insured persons, at all events in London and the large towns. In an appendix to their evidence the witnesses added some testimonies from eminent orthopaedic surgeons and others to the value of this treatment and the increasing use of it.

Mr. Cooper Perry stated that those he represented believed that 2 per cent of the insured population were likely to require this additional treatment. This estimate was based on the experience of two hospitals and one approved society, though he admitted that with extended facilities a progressive increase in the popularity of the treatment might be expected. It was estimated that the average cost per case would be £5 10s, and this, supposing that 300,000 persons received such

treatment in a year would work out at 2s 2½d per head of insured persons. The people who required massage were a pretty definite class. In very many cases the treatment was sequenced in consequence of injuries, but he thought that the medical would outnumber the surgical cases. He agreed with a suggestion by Sir Humphry Rolleston that massage and gymnastic additional benefit might in many cases be advantageously combined with the additional benefit of nursing.

The Royal Commission on National Health Insurance, having held forty meetings at weekly or shorter intervals since October last for the hearing of oral evidence, has now adjourned until October next, when the final evidence from representatives of the Government departments will be taken after which the Commission will proceed to consider its report.

Proof copies of the oral evidence and the relative statements submitted at the meetings of June 25th and 30th and July 2nd and 7th 1925 may be obtained from H M Stationery Office, Adastral House Kingsway, London, WC2 on remittance of cost (3s for June 25th and 2s 3d for each of the three subsequent days) plus postage

Volume II of the Minutes of Evidence from January 15th 1925 to March 26th (twenty three days inclusive) is now on hand and may be obtained from H.M. Stationery Office, 10, Bedford Square, London, W.C.1, or any bookseller. Price 12s 6d and postage.

LONDON PANEL COMMITTEE

At the meeting of the London Panel Committee on July 21st with Dr H J CARDALE in the chair Dr I C Betch was appointed a member of the committee as representative of the women practitioners on the panel and Dr W H Payne Dr H B W Morgan and Dr H H Mills were appointed to fill three vacancies on the committee. Fifteen members of the committee were appointed to constitute a roster to accompany regional medical officers in the survey of prescribing which is at present proceeding under Article 37 of the Medical Benefit Regulations. The committee held it to be desirable that either the secretary of the committee or a member of the roster should accompany the regional medical officer when interviewing practitioners under this survey.

Clearance of Lists—A letter was read from the clerk of the Insurance Committee with regard to a recent resolution of the Panel Committee urging the general clearance of the lists of all practitioners in London. The letter stated that the subcommittee dealing with this matter was prepared to recommend a general clearance of all medical registers but it understood from the Ministry of Health that owing to revision in connection with the work of the Central Index Committee it was desirable that the work of clearance should be commenced for the period of a year. The subcommittee was therefore of opinion that pending such clearance the present practice with regard to transferred lists should be continued—that is that upon transfer the list should be examined and the successor should receive credit in respect of persons whose title to medical benefit was established. The Panel Committee expressed by resolution its view that the present practice with regard to transferred lists operated inequitably upon practitioners succeeding to practices and should be discontinued. It was also agreed that the Panel Committee should approach the Insurance Committee with a view to a conference on the retention of forms of medical record by practitioners succeeding to practices.

Antedating of Certificates.—The ease was mentioned of a practitioner who was recently ofore the Medical Service Subcommittee, on a charge of failing to attend and treat an insured person. During the hearing of this case it transpired that the practitioner issued a certificate stating that the patient was incapable of work but dated it two days earlier than his actual examination. When questioned with regard to this the practitioner said that he was allowed to antedate a certificate up to three days. The Finance Subcommittee subsequently interviewed the practitioner and pointed out to him that official certificates must not be antedated in any circumstances. Dr. F. Dugon asked whether it was correct that a certificate must not in any circumstances be antedated. He understood that according to the regulations it might be antedated twenty-four hours. The Chairman pointed out that there were on the certificate two lines for dates. If a practitioner saw a patient on Monday and did not give a certificate before Tuesday at the time specified that he had seen the patient on Monday and at the same time dated the certificate for the Tuesday on which he issued it that was not technically antedating. Dr. S. Partridge thought that the sentence to which Dr. Dugon had called attention was misleading. The Chairman could not date a certificate earlier than the sentence to which Dr. Dugon had called attention was understood that antedating meant dating a certificate earlier than one had actually seen the patient and such antedating was not permitted in any circumstances whatever. After some further discussion it was decided that as there appeared to be a good deal of doubt in the minds of members with regard to the exact procedure to be followed in the dating of certificates an explanatory article should be published in the Panel Committee Gazette.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE

Surgeon Commanders J. O'Leary and I. R. Townsend are placed on the retired list with the rank of Surgeon Captain.

Surgeon Commanders A. B. Clark to the *Colossus*, C. Ross to the *Birmingham*, and as Fleet Medical Officer from date of joining A. H. Joy to the *Constance* on re-commissioning, R. Willan to the *Benbow*, R. Kennedy to the *Blenheim*, L. A. Moncrieff to the *Covenry*, and as Squadron Medical Officer from date of joining T. W. Miles CB to the *Hood* as Squadron Medical Officer, F. J. Bolton to the *Fgmont*, additional for RN Hospital Malta and for specialist duties, F. I. Smith to the *Lembrope*, additional for RN Barracks Chatham temporary.

The seniority of Surgeon Commander C. J. Adhead is antedated to February 19th 1918 with effect from July 1st 1925.

Surgeon Lieutenant Commanders V. W. North to the *Agamemnon*, I. S. Cross OBE to the *Constance* on re-commissioning, I. H. Vay to the *Queen Elizabeth*, R. A. W. Ford to the *Caro*, G. H. M. Cimbelle to the *Victory*, Elizabeth for RN Hospital, and as instructor to Sick Berth Staff, J. I. Carroll to HM Dockyard Devonport.

Surgeon Lieutenant H. A. W. Whitty to the *Fingham*.

Surgeon Lieutenant C. Keating has transferred to the permanent list. A. S. Burns has entered as Surgeon Lieutenant for short service and appointed to the *Victory* for RN Hospital, Haslar for course of instruction.

ROYAL NAVAL VOLUNTARY RESERVE

F. A. McLaughlin, R. R. B. Roberts and J. H. Hutchinson entered as Probationary Surgeon Lieutenants and attached respectively to the 1st Division List 1, the 2nd Division List 1, and the Scottish Division.

Probationary Surgeon Sublieutenant H. O'Connor to be Surgeon Sublieutenant with seniority of May 28th 1924.

ROYAL AUSTRALIAN NAVY

Surgeon Commander I. Darby to the *President* for one month's course of instruction at Medical Department Admiralty.

ROYAL ARMY MEDICAL CORPS

Lieut Colonel C. G. Thum on DSO retires on retired pay on account of ill health July 1st 1925 (Substituted for notification in the *London Gazette* June 30th 1925).

Major and Brevet Colonel T. S. Coates OBE to be Lieutenant Colonel, Lieut Colonel C. G. Thum on retired pay on account of ill health. Major G. O. Chambers MC retires receiving a gratuity, and is granted the rank of Lieutenant Colonel.

Major A. C. Vidal DSO, half pay list late RA MC retires on account of ill health.

The following Majors retire on retired pay: F. L. Moss CMG MC (and is granted the rank of Colonel), F. C. Anthony (and is granted the rank of Lieutenant Colonel), M. Evans OBE, C. H. Rice.

The following from the Regular Army Reserve of Officers to be temporary Captains: Lieut Colonel W. Owen, Richard and relinquishes the rank of Lieutenant Colonel, Captain S. Simon and relinquishes the rank of Captain.

Captain I. Vallance MC, retires receiving a gratuity, and is granted the rank of Major.

ROYAL AIR FORCE MEDICAL SERVICE

Squadron Leader J. M. A. Costello MC to RAF British Hospital, Irl.

Flight Lieutenants T. C. St. C. Morton and E. A. H. Gray are promoted to the rank of Squadron Leader.

Flight Lieutenants P. A. Hall to RAF Hospital Cranwell, I. B. Woodrow to No. 41 Squadron Duxford (Honorary Squadron Leader).

W. R. Reith to Inspector of Recruiting.

Flight Lieutenant A. E. Trench relinquishes his temporary commission on ceasing to be employed, and is permitted to retain his rank.

Flying Officer G. Clark is transferred to the Reserve Class D2.

REGULAR ARMY RESERVE OF OFFICERS

SUPPLEMENTARY RESERVE OF OFFICERS, ROYAL ARMY MEDICAL CORPS.

Lieutenant W. S. Dawson to be Captain.

Captain A. G. Henderson late temporary Captain RA MC to be Lieutenant.

TERRITORIAL ARMY

ROYAL ARTILLERY MEDICAL CORPS

Lieutenant Colonels to be Brevet Colonels: C. C. E. Simpson, OBE.

J. H. Ray.

Major (prov.) W. F. Denning is confirmed in his rank.

Major A. Topping late RA MC to be Captain with precedence as from February 22nd 1918 and to relinquish the rank of Major.

Captain C. D. Lacey RA MC to be Divisional Adjutant 52nd (Lowland) Division RA MC TA and School of Instruction, vice Captain R. C. Aitchison RA MC.

Captain G. I. Linlithgow OBE from General Hospital List, to be Captain with precedence as from September 18th 1915.

Captain H. Pinto Leite to be Major (prov.).

Captain F. E. H. Keogh to be Major.

Captain E. M. Douglas Morris TD to be Major (prov.).

Captain E. M. Jenkins is retired and retains his rank.

To be Captains: Captain H. I. W. Adams (late RA MC) with precedence as from February 17th 1918, Captain J. P. J. Jenkins (late RA MC Special Reserve) with precedence as from June 3rd 1919.

Lieutenant C. Atkinson resigns his commission and retains his rank.

To be Lieutenants: Second Lieutenants H. W. M. Williams (late South Wales Borderers), H. E. Suter (late Middlesex Regiment), C. E. Fenton and T. A. Samuel (late 1st London Rifles).

General Hospitals: Lieut Colonel R. C. Dun having attained the age limit is retired and retains his rank with permission to wear the prescribed uniform. Captain A. F. I. Shields (late RA MC Militia) to be Captain with precedence as from April 1st 1915.

Superintendents for Service with OTC: Captain H. H. Woollard to be Major (prov.) University of London Continent (Senior Division).

Artyl S. Gough to be Lieutenant for service with the Medical Unit University of London OTC.

TERRITORIAL ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Lieut Colonel (Brevet Colonel) W. Howler MC, from active list to be Lieutenant Colonel (Brevet Colonel).

Major E. J. Boone TD from active list to be Major.

W. M. Robert on (late Lieutenant RA) to be Lieutenant.

VACANCIES

CAMBRIDGE UNIVERSITY—Two Resident Medical Officers (mal s) Salary at the rate of £155 and £125 per annum respectively.

DORSETSHIRE COUNTY COUNCIL—Assistant School Medical Officer and Tuberculosis Officer Salary £650 per annum, rising in 1926.

JERSEY COUNTY HOSPITAL AND POOR LAW INFIRMARY—Resident Medical Officer Salary £200 per annum.

LIVERPOOL COUNTY BOROUGH—Junior Assistant School Medical Officer Salary £603 per annum.

ROYAL FREE HOSPITAL, Gray's Inn Road, W.C.1—Casualty Officer Salary £153 per annum.

ST. PETERS HOSPITAL FOR SKIN, ETC. Henrietta Street, W.C.—Honorary Surgeon Salary at the rate of £75 per annum.

WEST END HOSPITAL FOR NERVOUS DISEASES (Cloucester Gate) W.—Senior House Physician (male) for inpatients Salary at the rate of £150 per annum.

CERTIFYING FACTORY SURGEON—The appointment of Certifying Factory Surgeon for the (Clamorgan) is vacant. Applications to the Chief Inspector of Factories, Home Office, Whitehall, S.W.1.

This list of vacancies is compiled from our advertisement columns where full particulars will be found. To ensure notice in this column advertisements must be received not later than the first post on Tuesday morning.

APPOINTMENTS

BUSBY W. H. I.M.S. SA, Certifying Factory Surgeon for the Chumleigh District, Co. Devon.

DOLGELLY DANIEL MC MD (Vet) Honorary Assistant Gynaecological Surgeon to the Manchester Royal Infirmary.

MANCHESTER ROYAL INFIRMARY—House Physician: F. H. Smith MB ChB, C. T. Marshall MB ChB, N. Young MB ChP and S. I. Nucklow MB ChB, House Surgeons: C. I. Langford MB ChB, N. W. Bolton MB ChB, G. H. Booth MB ChB, R. Wood MB ChB and N. F. Seed MB ChB, House Surgeon to Special Department: H. L. Leman, MB ChB, 1st Assistant in the Dental Department: I. B. Mumford MB ChB, Clinical Assistant (Surgical): Miss M. John on MB, ChB.

CURRENT NOTES

Membership of the British Medical Association

The membership of the Association on August 11th was 30,068. This is higher by 1,637 than the previously recorded highest figure (year 1924).

Agricultural Scholarships in Australia

In a Current Note published in the SUPPLEMENT of June 6th (p. 245) it was stated that Miss C. Paterson, the wife of Dr. William Paterson, Honorary Secretary of the Wilkesden Division, had drawn, in the ballot organized by the Fellowship of the British Empire Exhibition, the right to nominate a candidate in the first series of agricultural scholarships for New South Wales, and that she had asked the Association to help in choosing a suitable boy who was a relative of a member of the Association. A vacancy has unexpectedly arisen in respect of this scholarship, and the Medical Secretary, on behalf of Mrs. Paterson, is open to receive applications from members interested, with a view to nomination by her of a boy who is a relative (or orphan) of a member of the Association. The Medical Secretary will accordingly be glad to receive from any member the name of a lad aged from 15 to 17½, of good character and physique, with a view to possible nomination. To be accepted, a candidate will have to pass the tests, including the medical tests, imposed by the Australian Government, and must be approved by the Central Committee of the Fellowship of the British Empire Exhibition. After passing the tests the nominee will be given a free passage to Australia and one year's training at an agricultural college there, and will afterwards be placed in suitable employment on the land, with a view to his acquiring ultimately a farm of his own. The scholarship thus represents a good start in life for a suitable boy. The candidate must be someone whose folk are well known to the member of the Association suggesting him, and for whose good character the member can personally vouch. Any member of the Association desiring to suggest a candidate is asked to communicate with the Medical Secretary as early as possible.

Dr. A. Balguy, of the Kensington Division, a member of the Association who was also successful in the recent draw among the members of the Fellowship of the British Empire Exhibition, has nominated William Anthony Flynn, son of the late Dr. Denis Flynn of Cork.

PROCEEDINGS OF COUNCIL

A MEETING of the Council was held in the Grand Pump Room, Bath, on July 20th, with Dr. R. A. BOLAN in the chair. The other members present were:

Dr. H. B. Brackenbury (Chairman of Representative Body), Mr. J. Basil Hall (President), Mr. N. Bishop Harman (Treasurer), Dr. C. O. Hawthorne (Deputy Chairman of Representative Body), Dr. T. Ridley Bailey, Dr. H. S. Peacock, Dr. J. W. Bone, Dr. H. C. Bristowe, Dr. G. F. Buchan, Dr. H. G. Dunn, Dr. J. S. Darling, Dr. C. E. Douglas, Mr. W. McAdam Eccles, Dr. C. E. S. Fleming, Dr. T. W. H. Gristang, Dr. F. J. Gomez, Dr. F. W. Goodbody, Dr. T. Dunne in Greenlees, Dr. R. Wallace Henry, Dr. T. Lustre Hill, Dr. G. B. Rillman, Dr. R. Langdon Down, Dr. David Lawson, Dr. E. K. Le Fleming, Dr. R. W. Leslie, Sir Richard H. Luce, M.P., Dr. Arnold Lyndon, Dr. J. G. McCutcheon, Dr. J. A. Macdonald, Dr. S. Morton Mackenzie, Major General Sir W. Macpherson, Dr. A. Manknell, Dr. Hugh Miller, Dr. Christine Muriel, Mr. A. W. Nuthall, Lieut. Colonel F. O'Meara, Dr. W. Paterson, Dr. R. C. Peacocke, Dr. F. Riddell, Lieut. Colonel J. W. I. Rait, Dr. C. Sanders, Mr. H. S. Souttar, Dr. John Stevens, Dr. W. F. Thomas, Dr. G. Clark Trotter, Mr. E. B. Turner, Sir Jenner Veirall, Dr. J. F. Walker, and Dr. Denis Walsh.

Decoration of the Great Hall

The Chairman brought before the Council a communication he had received from Sir Edwin Lutjens, R.A., architect of the new House, offering to present a portrait painted by Mr. William Nicholson to occupy the central disc in the Great Hall, and so start the series of distinguished men. Sir Edwin Lutjens asked for the name of the man whom the Council would wish to commemorate, and whether, if living he would sit.

Dr. Morton Mackenzie suggested that the consideration of this matter should be held over until the October meeting of Council. The question of the scheme of decoration for the Great Hall was one which should have fuller discussion than was possible during the pressure of the Annual Meeting. There were other forms of decoration to be considered besides portraits and even if portraits were decided on it would be an extremely difficult matter to choose whom they should represent. Dr. Manknell supported the suggestion that the matter be postponed. Mr. Bishop Harman said that comment had been made on the novelty of the discs, but that there was nothing really novel about them, and the same style of thing might be seen in the William and Mary court at Hampton Court. Others had expressed the opinion that the spaces should be filled with portraits but painted in a conventional style something after the Wedgwood fashion. Sir Edwin Lutjens's idea was that a single conception should run through the whole of the portraits. He (Mr. Bishop Harman) was of opinion that if portraits were chosen they should lean with the great medical figures of antiquity, and come down to modern times, including certainly Sir Charles Hastings.

The Chairman stated that it was due to pressure of time that the spaces had been left blank, the intention of the

architect was to cover them with a film of almost transparent white. He added that the Editor, who had much taste and judgement in these matters, had suggested that the portraits should represent, not all and sundry in medicine, nor merely men who had been prominent in medico-political activity, but British masters in medicine, and he had suggested offhand some twenty or thirty names for such a gallery.

It was resolved to postpone the further consideration of the matter to the October meeting of Council, and the Chairman was asked to explain to Sir Edin Lutyens the reason for the delay in making the decision, and to tender to him in the meantime the Council's very best thanks for his kind offer.

Summer Time

In view of the heavy expenditure incurred by the Early Closing Association in its campaign in favour of a permanent six months summer time period, the Council agreed to make a further contribution on behalf of the Association. Dr Garstang said that he had represented the Association at the meeting of bodies interested, and the fact was brought home to him that an enormous amount of work had been entailed to bring the campaign to the point of success. Sir Richard Luce, in supporting the increased vote, said that medical opinion on this subject had had a considerable influence in deciding the question.

The Association's Scholars and Grantees

Dr Hawthorne (Chairman of the Science Committee) moved certain recommendations for appointments to Association scholarships and the making of new and renewed grants. It was agreed to appoint Dr Helen Mackay as Ernest Hart Memorial Scholar for one year, to reappoint Dr Alice Bloomfield as Ordinary Research Scholar for a second year, and to appoint Dr J. M. Duncan Scott and Dr Percy Charles Rayment as Ordinary Research Scholars for one year. Renewed grants, totalling to £160, were made to five persons, and new grants, totalling to £190, to six persons. Certain researches were specified in the case of each scholar and grantee. Dr Hawthorne also reported that his committee had considered the instruction of the Council to promote research with a view to investigation of the factors which constituted, and the conditions which varied resistance to disease, particularly as regards pregnancy and the puerperium, but in the opinion of his committee the best body to determine the lines of such research was the Committee on Puerperal Morbidity and Mortality, and it hoped that the Council would make funds available for this purpose, by the institution of a special scholarship or otherwise, on lines suggested by the special committee. If the Science Committee could assist it would be glad to do so.

Food Preservatives

Dr Pidley Bailey presented for the Public Health Committee the recommendations on the matter of food preservatives which were subsequently submitted to and adopted by the Representative Body (SUPPLEMENT, August 1st, p. 59). He explained the reason for haste in this matter, which was that certain vested interests were putting pressure on the Government and Parliament not to adopt certain of the recommendations of the departmental committee which had recently reported. Dr Hawthorne said that he had no criticism to offer on the recommendations themselves but the preamble of the Public Health Committee in introducing the recommendations did not appear to him to be wholly acceptable. Dr Dam also, while agreeing with the recommendations, thought that not every statement in the preamble could be endorsed. Dr Eustace Hill admitted that the preamble was not as well considered as it might have been were it prepared in circumstances of less pressure, but he held strongly that the statements on which the actual recommendations were based were accurate in every particular.

On the motion of Sir Jenner Verrall, it was agreed that the recommendations be submitted to the Representative Body, and that instead of submitting the preamble the chairman of the committee should make a general statement as to the reasons which led the committee to bring the recommendations forward.

Drug Addiction

Dr Bone moved the approval of the report of the Committee on Drug Addiction and spoke at length on the provisional findings of the Home Office committee, upon which he served

as representative of the Association. A long discussion took place in Council, and the report of the Committee as approved later in the same day Dr Bone brought the matter forward before the Representative Body, which arrived at certain decisions as a result of Dr Bone's guidance (SUPPLEMENT, August 1st, p. 60). As the report of the Home Office committee is not yet available the discussion in the Council, like that in the Representative Body, cannot, with propriety, be published.

The Position of R. A. M. C. Officers

Sir Richard Luce, chairman of the Naval and Military Committee, gave an account of the progress of negotiations with regard to the pay of officers of the R. A. M. C., similar to the account he gave subsequently to the Representative Meeting (SUPPLEMENT, August 1st, p. 63). He mentioned the proceedings following the deputation to the War Office, and his reference of the matter to a committee of the Cabinet. He said that there was still no guarantee, in spite of the favourable attitude of the War Office itself, that the matter would be adjusted in the way the Association desired. He proposed, with the Council's consent, to bring a resolution before the Representative Body.

The report of the Committee was approved.

A second meeting of the Council was held in the Grand Pump Room on July 22nd, Dr Bolam again presiding. This was the first meeting of the incoming Council, and the Chairman welcomed the new members who were present—namely:

Mr R. G. Hogarth (President-Elect), Dr Percroft Anderson, Dr D. E. Finlay, Dr James Hudson, Dr J. C. Matthew, Dr G. W. Miller, and Dr Lockhart Stephens.

The resolutions of the Representative Meeting were considered from the point of view of the necessity of taking a referendum, and it was decided that this course was not necessary in any case. The dates for the Council and Committee meetings were then considered and a time-table agreed to.

Place of Meeting 1928

The Council had before it invitations from several centres for the Annual Meeting of 1928. In most of the cases the invitation was for 1928 or as soon thereafter as the Council might find convenient. In reply to a question as to when the next meeting could be held in London now that the new House was available the Chairman said that it was thought the centenary year of the Association—1922—would provide the most suitable opportunity and there might be possible a pilgrimage to Worcester, the Association's birthplace.

Dr W. E. Thomas warmly supported an invitation to Cardiff for 1928. He referred to the great improvements which had taken place at Cardiff since the Association last visited that city. The Cardiff of today, he said, did not exist thirty or forty years ago. The municipal halls, the technical school, and the Welsh National Museum were all in one great block. There was also a young medical school. The Welsh were a long suffering little race, who had been sadly neglected so far as the Association's choice of meeting places was concerned. The invitation to Cardiff was given on behalf of the whole of South Wales and Monmouthshire. Dr Douglas asked whether the meetings would be bilingual or whether interpreters would be provided. Dr Thomas replied that there could be no Welsh spoken, but that Dr Douglas would have an opportunity of speaking in Gaelic if he wished. Dr Padcliffe urged the claims of Manchester, and made a point of the fine and appropriate buildings available. Some discussion took place on the possibility of a Canadian meeting and the question was asked whether it was a condition of the Canadian invitation that the meeting should take place in Winnipeg. The Chairman said that on account of the central position of Winnipeg it had been promised that if the Association went to Canada that should be the place of meeting. Sir Jenner Verrall said that Winnipeg was very keen on having a visit, and the Association would be well advised to go to Winnipeg if it saw its way to visit Canada at all. The Canadian people thought nothing about distances, and the profession in Montreal would go to Winnipeg for the meeting without any question. Dr Morton MacLennan hoped that a further postponement of the Canadian invitation would not be misunderstood in Canada but in the meantime he thought it very desirable to accept the invitation to Cardiff.

pecially in view of the young medical school now existing here. The Chairman said that the Canadians recognized the difficulties and would not be offended. Sir J. J. Verill said he had been much struck by the kindly and sensible attitude of the Canadians with regard to this matter. At a meeting which he had to put forward some of the difficulties, and a point out that the difficulties now were far greater than those which existed when the Association went to Montreal and Toronto, the position was fully appreciated by the Canadians.

It was agreed that the choice for 1928 must lie between Cardiff, Manchester and Bournemouth, and on a show of hands it was decided to recommend to the Representative Meeting for the Annual Meeting for 1928 be held at Cardiff. It was agreed that the other Divisions which had sent invitations should be thanked and asked to renew them, if possible, for a later date.

Appointment of Special Committees

The Council agreed not to appoint certain of the committees whose purpose was discharged, though it was stated that it rests across the Committee on the Insurance Acts Royal Commission, for instance, could be reconstituted. The other committees which were not reappointed were the Non-Paid Committee, the Committee on Lunacy Law and Administration, the Committee on Drug Addiction, and the Medical Benevolent Funds Committee (whose work would be taken over by the new Medical Charities Committee). It was also agreed that there was no longer any necessity to reappoint representatives at a conference with representatives of the Society of Medical Officers of Health. The committees reappointed were the Committee on the Lee Commission, the Ophthalmic Benefit Committee, the Puerperal Morbidity and Mortality Committee, and the Post-Graduate Committee. The Council appointed as its representatives on the Medical Charities Committee Dr. C. L. Douglas, Dr. C. O. Hawthorne, and Mr. H. S. Soutter. (The Representative Body had already selected as its representatives Dr. W. L. Dearden, Dr. J. A. Macdonald, and Dr. J. F. Walker.)

It was agreed to defer until the October meeting of Council the nomination of two representatives to the Society of Medical Officers of Health for election to the council of that body. Dr. Ridley Bailey said that he desired to express his appreciation of the great courtesy of that society to the representatives of the Association during the year. The suggestion had been made with which he was in entire agreement that the representatives chosen should be general practitioners, and not medical officers of health even part-time ones.

The Council concluded its business in time for the members to attend the various meetings of Sections.

Meetings of Branches and Divisions

Sussex Branch Brighton Division

The Brighton Division held a supper at the Royal Café on July 2nd, when Mr. G. Morgan, the chairman of the Division, presided over a company of forty. Mr. W. E. Hempton, Solicitor to the British Medical Association, after the supper, gave an address on "Some pitfalls of medical practice."

Pitfalls of Medical Practice

Mr. Hempton said that his connexion with the Medical Defence Union began in 1892, and his coming visit to Bath would be the twenty-fifth Annual Meeting he had attended as adviser to the British Medical Association. As the result of this experience of over thirty-three years he had come to the conclusion that the practice of medicine and surgery was not beset by any special legal pitfalls, except for allegations of malpractice against medical men and defamatory statements concerning them in which two respects medical practitioners were certainly exposed to danger. He had defended some 1,200 actions based on allegations of malpractice, and in only a small percentage of cases were damages awarded. There being no fixed science in medicine or surgery, the law operated in aid of the medical practitioner when his skill and judgement had been prudently exercised. A large majority of these actions were inspired by speculative solicitors whose advice had been sought by the litigants. Some twenty years ago in a colliery district an epidemic of actions against medical practitioners was conclusively brought to an end by one of the cases being fought to a conclusion regardless of expense, a verdict being

obtained in favour of the medical practitioner. These actions usually started when the professional account was rendered, the hope being that the claim would in consequence not be pressed. If the medical practitioner then showed weakness he placed himself in a very dangerous position. So far as concerned defamatory statements of medical men, no neighbourhood was entirely free from local gossip and scandal, which was rife in very many. Mr. Hempton had had to investigate and deal with many hundreds of these cases. His uniform advice was that the source of the mischief should be traced and the offenders caused to suffer so severely as to prevent any recurrence of the evil. He had always been opposed to the suggestion of obtaining a form of indemnity before a surgical operation was undertaken, since he believed that, if an action were brought later, such an indemnity might prove to be in the element of prejudice rather than of assistance. From a legal point of view the relationship between doctor and patient was one of contract, the patient who called in a doctor undertook to pay his proper fees, and the doctor was under obligation to bring reasonable care and skill to bear. No doctor undertook to perform a cure or to use the highest possible degree of care and skill. Every doctor must, however, keep himself reasonably abreast of advances in medical and surgical knowledge. Controversy had often arisen during the trial of an action as to whether the doctor did or did not recommend some particular form of treatment which the patient or the relative refused, and no conclusive evidence had been obtainable. Such a contingency must often occur in medical practice, and Mr. Hempton advised that the simple precaution of recording the recommendation in a letter to the patient, and retaining a copy, might prevent serious trouble thereafter. There was a sharp dividing line between the civil and the criminal responsibility of the doctor. Mr. Hempton then referred to the cases of Dr. Hadwen and Dr. Bateman pointing out that he had confidently predicted acquittal in the first case. In the Barnett case it had become apparent that the law had proved to be well founded, Section 350 of the Lunacy Act of 1890 affording protection to the medical practitioner. In that section the word "skill" did not appear and the law only required for the protection of the medical man that he should have acted in good faith and with reasonable care. This provision had now been interpreted by the judgement of the House of Lords in its widest and broadest sense. Mr. Hempton then referred to the case of Dr. Leeming (*British Medical Journal*, June 27th 1925, p. 1200) and advised that the lecture by Mr. Joy, K.C. on the medical witness (*ibid.*, June 27th, 1925, p. 1159) should be carefully read since it contained much useful information with regard to such matters as professional secrecy. Here the privilege to be established was that of the patient concerned, and the proper attitude of the medical witness was to make his protest and submit to the ruling of the Court. Mr. Hempton approved the suggestion to form a medico-legal institute in London to investigate medico-legal cases and teach medical jurisprudence, such an institute to be under the control of the Home Office, and educational supervision to be supplied by the Board of Education, the University of London, and the Royal Colleges of Physicians and Surgeons. In conclusion he reiterated his contention that apart from the exceptions discussed there were no special legal difficulties associated with medical practice, and that an individual practitioner, by exercising due care and making use when necessary, of the advice of colleagues, rendered himself immune from either civil damages or criminal proceedings, provided a fair trial was accorded to him.

At the conclusion of the address a discussion followed, in which Drs. PARRY, GOTHERGILL, MACKINROSH, and others took part. A vote of thanks was accorded to Mr. Hempton with enthusiasm, and a most successful evening terminated with a vote of thanks to the chairman.

Association Notices

BRANCH AND DIVISION MEETINGS TO BE HELD

CAPE OF GOOD HOPE (WESTERN) BRANCH.—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday, August 28th at 8 p.m. when there will be a symposium on the diagnosis of intracranial tumours arranged by Mr. D. J. Wood. Among the speakers will be Dr. J. D. M. Claessens, Mr. F. F. Petersen, and Dr. A. W. S. Siebel.

OXFORD AND READING BRANCH, OXFORD DIVISION.—In place of the complete post-graduate course which has been temporarily postponed a series of ward and out-patient demonstration under the auspices of the Oxford Division will be given by members of the honorary staff of the Radcliffe Infirmary on the afternoons of the week commencing October 5th. The demonstrations will be open to both members and non-members of the British Medical Association. To those notifying Dr. William Stobie (honorary secretary) 340 Banbury Road, Oxford, of their intention of being present on any afternoon a detailed programme will be sent toward the end of September. There are no fees.

THE ANNUAL EXHIBITION, BATH, 1925

[SECOND NOTICE]

Food Preparations

It is not easy to draw the line between the chemical and pharmaceutical preparations, noticed in the last issue, and the food preparations which formed the principal exhibit at a dozen or more stands. Some firms, including a number who are best known for certain food products, exhibited on this occasion preparations which might have been included in the former notice.

Virol, Limited, in addition to the product which goes by the firm's name had virolin, which is an emulsion of liquid paraffin. The Glaxo firm, by the side of their dried milk products, exhibited an extract of cod liver oil suspended in glycerin which has been placed upon the market under the name of osteolin as a prophylactic against rickets and other wasting disorders. Oxo, Limited, showed not only the familiar fluid beef preparations, together with hospital Oxo and beef essences for invalids, but also a number of endocrine

extracts, under the name of "oxoid," in tablet and fluid form. Benger's Food, Limited, showed a range of other products, including peptonized beef jelly, extract of red marrow, and essence of rennet. Armour and Company, Ltd., also showed a series of digestive ferments together with a number of endocrine preparations which are guaranteed to have been manufactured from absolutely fresh and unimpured glands. Finally, in this group, Carnation, Limited, showed not only sanotogen, a tonic food, but also a number of de-fatted vaccines and antisepsics.

There were a number of other exhibits to which no extended reference is needed save because the products are already well known. This applies to Cadbury's Bournville cocoa and chocolate, to Horlick's malted milk, and to Allenburys' food for infants. A number of milk and other foods were exhibited, including, Hoolet's malted milk, the Devonshire dried milk of Ambrosia, Limited (London), the Benger food and malted milk of Monongahie and Company (Glasgow), the "human milk" full cream and milk of Finfood, Limited (Wrenbury), who also showed a pure, sweet whey in powder form, and, finally, Mead's infant diet materials (the London agents for which are Bloor's and Warburton, Ltd.) consisting principally of a malt sugar for use in cases in which sugar is necessary as in addition to the diet, and certain reconstructed milk powders to suit different types of infants. The Food Education Society, formerly the National Food Reform Association, had a stand on which various publications were exhibited intended for the education of the public in cookery and food hygiene.

If drinks may be included under the head of foods three stands have to be noticed. Ingram and Rattle Ltd., again had in exhibit of the French mineral water Vichy Celestins, and of the mineral water of Carlsbad and other Continental springs. The Stowers lime juice and similar preparations, which have been known for nearly a hundred years, were shown, for those who liked a stronger beverage, though not too strong, Cymer's cider, which has a reputation extending back for nearly thirty years, was available.

Surgical Instruments and Material and Hospital Equipment

An operation table with an oil pressure pump for raising and lowering, and a screw for lateral tilting was in the forefront of the exhibit of Down Brothers, Ltd. (St. Thomas's Street, E.C.). Other objects of interest in the extensive range of instruments at this stand, many of them made in stainless steel, were Child's skin suturing forceps, Pairs' crushing clamps for stomach and intestines, a new pattern of guillotine for tonsil excision, the latest model of an intratracheal apparatus, and Cheever Jackson's instruments for bronchoscopy and oesophagoscopy, modified by Mr. W. G. Howarth. The Howell Mosley suction and etherization apparatus was again shown, with an electric motor.

Another comprehensive collection of surgical instruments appeared at the stand of Allen and Hanbury, Ltd. (48 Wigmore Street, W.), whose pharmaceutical exhibit has already been noticed. Among the instruments for examination was a universal diagnostic illuminator, a combination which it not literally bearing out its title served the purpose of at least half a dozen instruments, also an improved ophthalmoscope giving an even illumination of the fundus without any shadow or reflection of the lamp filament. Among other exhibits at this crowded stand were horizontal and upright models of a high pressure sterilizer, and the St. Bartholomew's hospital table, in which some improvements have recently been made in the better adjustment of shoulder supports and in other particulars.

Instruments for bladder and kidney surgery were found in considerable variety at the stand of the Genito Urinary Manufacturing Company, Ltd. (64 Great Portland Street, W.C.), but the exhibit was not limited to the class of instruments suggested by the firm's name; it included instruments for the examination of the throat and the oesophagus, as well as for other purposes. Here, too, we saw the only diathermy apparatus that we happened to notice in the exhibition.

Another large assemblage of instruments was at the stand of Arnold and Sons (50-52, Wigmore Street, W.), the most prominent being the operation table on an oil pump basis, which has previously been described in dealing with the manufactures of this firm. Other interesting devices were a syringe for regional anaesthesia and a new self-retaining abdominal retractor. There was also a good selection of gynaecological and obstetrical instruments and of surgical material.

John Weiss and Son, Ltd. (287, Oxford Street, W.) exhibited a very large number of instruments, principally of the smaller kind—needles, scissors, various forms of forceps, clamps, gouges, chisels, tenotomes, suturing instruments, and so forth. The newest manufactures exhibited were some models of cystoscopes and some glass syringes of an original pattern, with metal protection caps. Many of the instruments were in stainless steel.

* The first notice was published on August 8th. SUPPLEMENT D 79

Instruments for orthopaedic surgery and aluminium splints for various purposes were shown by Mayer and Phelps (59 61, New Cavendish Street W.) This firm also exhibited skin grafting instruments, lumbar puncture needles, syringes—on of these a combined urological syringe—oesophageal intubation tubes and many other designs. Here also were to be seen radium applicators and diathermy electrodes. In the forefront was the "Empire" operation table to which reference was made last year.

The hospital beds of Hoskins and Sewell, Ltd (Birmingham), have been frequently described when shown at previous exhibitions. The new feature this year was an obstetric bed designed by Dr Remington Hobbs for use at St Mary Abbott's Hospital, Kensington. The bedstead is made in two separate halves, each half having four legs and castors. When needed, the foot end half can be unfastened and pulled away, and stirrups put in the other half. Several other beds or bed attachments were shown at this stand, including what must surely be the simplest device for lifting up a bed foot and locking it in the tilted position.

Several exhibitors confined themselves to surgical dressings and other requisites. Lissett and Johnson Ltd, showed the adhesive plasters, absorbent cottons, surgical ligatures, and other articles more familiarly known under the name of Seabury goods. Mention may be made of their rubber self-adhesive plaster spread on strong cotton cloth, and their medicated plasters of Indian rubber.

The Thermogene Company Ltd (Harrow Heath) again showed their impregnated cotton wool, and antiphlogistine, the poultice, was the exhibit on which the Denver Manufacturing Company (Bow) concentrated.

Apparatus for Light and Heat Treatment

Quartz lamps for ultra violet radiation treatment were demonstrated by the British Hanover Quartz Lamp Company, Ltd (Slough). It was stated that over 60 000 of this firm's alpine sun lamps are in use. The lamps displayed were of three principal models: the Kromayer lamp (which is the best known) for the intensive treatment of small areas, the standard model of the alpine sun lamp, adapted chiefly for general irradiation, and the Jesionek lamp, which is so constructed as to send out its rays in a horizontal direction, and is designed for use in batteries of such lamps so as to get the effect of diffused sunlight. The firm also showed a lamp for the prolonged local application of luminous heat rays.

A new lamp of considerable interest was shown by the Holborn Surgical Instrument Company, Ltd (26, Davies Inn, E.C.1), it was called the Jupiter sun lamp, it consisted of a carbon arc, fitted with carbons of a special composition and producing a light with a strong ultra violet as well as an infra red element. At the recent International Congress of Radiology this lamp formed the subject of one of the papers in the Physics section, and the claim was made for it that its light had a spectral value approaching more nearly to that of the natural solar rays than any other lamp made. This firm also showed a wide range of surgical instruments, lamps for diagnostic purposes and hospital furniture.

The manner of using radiant heat was again demonstrated by the Dowsing Radiant Heat Company, Ltd (Baker Street W.). The apparatus this firm had on view comprised a radiant heat bed complete with lamps and connexions for tiering the whole body, a large tunnel apparatus for treating the trunk or a limb, and a small apparatus, for use with the hand, for directing the light on any local area.

Instruments of Measurement and Laboratory Equipment

Clinical thermometers of various types and patterns were shown by G. H. Zeal, Ltd (75 77, John Street, E.C.) The difficulty sometimes experienced in shaking down a clinical thermometer was overcome in some of these types by a simple device for resetting quickly. Another design was for a thermometer which could be carried in an antiseptic solution without disfiguring the engraving. It was stated that the bulbs for all these thermometers were blown from glass which does not contract with age, and that the permanent accuracy of the instrument is thus ensured.

The Trecos sphygmomanometer, which has been previously described in these columns, again appeared at the stand of Short and Mason, Ltd (Walthamstow) in both the surgery and the portable types, and attention was drawn to the complete control and accurate calibration of this instrument. This firm also showed a large variety of clinical thermometers as well as instruments for recording temperature of a sick room and variations of atmospheric pressure.

Some interesting instruments for colour analysis and other purposes of measurement, which have been noted on other occasions, were shown by Tintometer, Limited (Salisbury). Among the newer instruments was an improved form of Oliver's haemoglobinometer, and a red cell suspensionometer.

The British Drug Houses, Ltd (Graham Street, N.) exhibited their indicator for colorimetric determinations of the hydrogen ion in concentration. They showed a capillitor in the form of a series of capillary tubes described as a pocket size laboratory for the rapid determination of pH values. A number of standard stains for microscopic purposes, tested histologically and guaranteed to be true to type, were also exhibited.

The progress which has been made in the fashioning of the microscope could be studied at the stand of Charles Heaton and Company, Ltd (Willow Walk, S.E.), where microscopes of many kinds to suit all purposes, from the extreme demands of the pathological laboratory to the ordinary necessities of the student were exhibited. Other laboratory apparatus, in the shape of incubators, sterilizers, centrifuges, and the like, which this firm has exhibited in past years, were again on view, generally with some new refinement.

An excellent display of laboratory equipment was also to be seen at the stand of Band and Titchlock, Ltd (Cross Street E.C.) including centrifuges, sterilizers, apparatus for the Wassermann reaction, for the manufacture of calf lymph, for gas analysis and indeed for most of the requirements of modern laboratories.

Kodak Limited (Kingsway) had a display of dupli-tized x-ray film negatives, x-ray prints and enlargements on their special bromide paper, and x-ray transparencies. This exhibition represented a very high standard of radiography on its technical side. All the accessories of the dark room were shown here, including some ingenious devices.

A cabinet heated by electricity for the drying of x-ray or ordinary negatives was one of the two principal exhibits of O. Sichel, Ltd (52 Bunhill Row, E.C.) This was a large and elaborate affair, with special devices for hanging the plates or films and for sending a current of air in such a way as to act on the whole of the sensitive surfaces and bring about rapid drying. Their other exhibit was the kinograph something, like an ordinary photographic enlarger (for which purpose, indeed, it can be used) acting as camera and illuminant for the photography of any part of a living subject or pathological specimen, with the minimum of trouble in placing and focusing.

Ophthalmological Apparatus

The beautifully coloured lantern slides of the fundus were the outstanding exhibit of Theodore Hamblin, Ltd (15, Wigmore Street, W.) The instrument to which particular attention was drawn at this stand was the Lister hand projection lamp, which can be readily balanced in the hand, and projects a disc of even and intense illumination up to 120 c.p. This was only one of various patterns of lamps and other apparatus for eye testing. The newest device was an astigmatic test in which the important factor of the amount of illumination falling on the chart had been considered and the correct area of the immediate background used for a standard illumination.

Another excellent selection of ophthalmoscopes and outfits for sight testing was to be seen at the stand of Rymer and Keeler Ltd (Kemp Town, Brighton). Here the newest device was an operating lamp mounted on a ceiling support and so arranged as to project three beams which combined and thereby minimized the shadows. There was also a single beam lamp mounted on a stand with a wide range of adjustment for height and giving a very intense illumination. Among other ophthalmic instruments was a slit lamp apparatus and a rapid test for stereoscopic vision.

Hague and Son (Bath) had an exhibit of ophthalmic instruments, together with some microscopes, and another Bath firm Melson Wingate Ltd, had an exhibit of lenses in various stages of completion.

(To be concluded)

Naval and Military Appointments

ROYAL NAVAL MEDICAL SERVICE

SURGEON CAPTAIN W. W. KAIR CMG to the *Egmont* additional and to the *Egmont* additional for hospital ship *Harne* on joining.
SURGEON COMMANDER R. B. SCHERER has been placed on the retired list with the rank of Surgeon Captain.
MR J. S. FILIOT has been entered as Surgeon Lieutenant Commander.
MR R. W. J. DOODS, C. R. MOORE and T. F. CREIN have entered a Surgeon Lieutenant and have been appointed to R.N. Hospital H.M.S. for four years.

ROYAL NAVAL VOLUNTEER RESERVE

SURGEON COMMANDER D. D. MACINTYRE to R.N. Hospital H.M.S. for fourteen days training.
SURGEON LIEUTENANT S. D. BORTHWICK to R.N. Hospital H.M.S. for fourteen days training.
SURGEON SUB-LIEUTENANT R. RAU all to R.N. Hospital H.M.S. for fourteen days training.
DR R. F. BARHAM and R. WEAR promoted to Surgeon Lieutenant.

ROYAL ARMY MEDICAL CORPS

Major W. C. NIMMO from half pay list retire on retired pay.
Captain J. A. W. EBDEN retire receiving a gratuity.

CURRENT NOTES

The Association's Scholarships and Grants

On page 94 of this issue will be found particulars as to the work done by the Association's scholars for 1924-25. The Science Committee is much indebted to the following gentlemen for having kindly acted on its behalf as visitors in connection with the work of the Association's scholars and grantees: Dr J G Adam (Liverpool), Dr H H Dalo (London), Professor W T Dixon (Cambridge), Sir David Drummond (Newcastle-on-Tyne), Professor J B Lethley (Sheffield), and Professor J Lorrain Smith (Edinburgh).

Awards for 1925-26

On the recommendation of the Science Committee the Council of the Association has appointed the following as scholars, and has made the undermentioned grants, for the year 1925-26.

SCHOLARSHIPS

1 Ernest Hart Memorial Scholarship (value £200)
Dr Helen M M Mackay for research into secondary (alimentary) anaemia in infancy and the use of ultra violet light in its prevention and treatment

2 Ordinary Research Scholarships (three—each of the value of £100)

Mrs Alice Bloomfield FRCS (second year) for continuation of research into the bearing of embryological detail on certain pathological conditions arising in the female genito-urinary tract.
Dr P C Rayment for research into the significance of the changes of the inorganic radicals of the blood in cases of chronic haematuria, gout and allied diseases.

Dr J M Duncan Scott, for further investigation of medullary reflexes. The investigation of the effect upon medullary reflexes of cauterization of limited areas of the medulla and also of application of drugs thereto, also the effect of deep stimulation of the medulla.

GRANTS

Grants were renewed to

Mr Hamilton Bailey FRCS and Mr George P B Huddy FRCS (jointly) (£50)
Dr Dorothy C Hare (£35)
Dr Mary F L Heene (£50)
Mr F C Pybus, MS FRCS (£25)

New grants were made to

Dr G P Crowden (£20)
Professor Winifred C Cullis (£50)
Mr W S Duke Elder FRCS (£20)
Dr G R James (£30)
Dr T McWalter Millar (£20)
Dr Robert Platt (£20)

Ophthalmic Benefit

It has recently come to notice that a certain approved society is endeavouring to enter into an arrangement with ophthalmic surgeons in different parts of the country for attendance on all the members of the society in the area of each of the practitioners concerned who may require ophthalmic treatment. This, it is maintained, is not only contrary to the spirit of the Regulation which has recently been framed to deal with this matter, but is also contrary to one of the main principles of the Insurance Acts—that

is, free choice of doctor. It is sincerely hoped that practitioners will not enter into any such arrangement as that mentioned above, but will hold themselves free to treat any insured member of an approved society who may desire to consult them under the scheme of ophthalmic benefit now in operation.

Treasurer's Cup Golf Competition

The Central Golf Committee appointed by the Secretaries' Conference at Bath for the purpose of the Treasurer's Cup golf competition is as follows: Dr C J Kail (Drillington), Dr E K Le Fleming (Wimborne, Dorset) and Dr J G McCutcheon (Glasgow). The committee has decided that no change shall be made in the rules for the ensuing year, except that the limit handicap allowed will be 18. Any member with a handicap of over 18, of course, competes, but he will not receive more than 18. The earlier date for the handing in of entries—namely, October 1st—will enable secretaries this year to make the necessary arrangements in order that some of the preliminary ties may be played off before the very short days set in. The first stage must be completed by February 1st. All members of the Association who wish to enter for the competition are urged to send their names to the Honorary Secretaries of their respective Divisions not later than October 1st. It is hoped that the competition will include every Division in the United Kingdom. The rules and regulations governing the competition for this year are as follows.

RULES AND REGULATIONS

To be Played for in Three Stages Entrance Fee, 2s 6d
Open to all Members of the British Medical Association
in the United Kingdom

First Stage—Entries to be handed in to the Secretary of the local Division by October 1st. Arrangements for the eliminating rounds to be in the hands of a special Golf Subcommittee or rounds to be in the hands of the Executive of the Division. Competition to be failing thus the Executive of the Division. Competition to be a knock-out competition under handicap rules members club a handicap to be accepted (limit handicap 18). The handicap under which a competitor enters cannot be altered at any time during the three stages of the competition. Draw to be arranged by the Golf Subcommittee. Matches to be played upon ground mutually agreed upon by the players. Failing agreement the matter to be referred to the Golf Subcommittee for decision. Eliminating rounds to be arranged so that the first stage will be completed by February 1st.

Second Stage—Division winners in the area of the Branch to engage in knock-out competition. This stage to be completed by June 1st. Committee in charge—the Branch Council or a special Golf Subcommittee of the Branch Council. Arrangements as in first stage. For the purposes of this competition the Metropolitan, Counties Branch Inner and Outer Group will count as separate Branches. In some Divisions or Branches it may be convenient to play out or more of the rounds on one day—making a field day for golfing members.

Third Stage—The winners of the Branch stage will play off under medal play condition (handicap on the Firth) (July 25) during the Annual Meeting of the Association at Nottingham. Winner to be the one who returns the lowest score under handicap. Arrangements for this stage to be made by Central Committee appointed by Secretaries' Conference.

All disputes to be settled by the Committee responsible for completion of each stage. Date must be strictly adhered to. No extension of time can be given.

THE ANNUAL EXHIBITION

Acoustical Apparatus

The Government has appointed a blind man on the Committee on Bioridensing, it would have been a further touch of imagination to have appointed a deaf man. Mr R H Dent (95, Wigmore Street W), in showing his newest aids to hearing, emphasized the usefulness of the portable telephone—which is what his instrument really is—in enabling persons suffering from middle ear deafness to enjoy music and speech transmitted by wireless. We experimented and pleased at the ardent response, and were surprised and pleased at the results. The sounds were magnified without being distorted. Moreover, the instrument collected sounds from all round the listener, and not from one point only. This instrument is attached to the ear in such a way that its presence is scarcely noticeable either to the wearer or anyone else.

Acousticon aids for the deaf were shown at the stand of General Acoustics, Limited (77, Wigmore Street, W). The Acousticon has now a good many years behind it, and has been progressively improved and made more sensitive and more adjustable to different degrees of deafness. The important and of recent developments has been to make the low sounds louder while giving to the loud sounds only the minimum increase. Emphasis was laid upon the range of acousticons now available and the methods of testing patients to ensure accuracy, also upon the neatness, lightness, and elegance of the instrument. A multiple acousticon was shown, enabling a number of deaf people to hear in a public meeting, this instrument, it was stated, has been fitted in over 300 churches in England and Scotland.

Trusses and Orthopaedic Appliances
H. E. Curtis and Son, Ltd (7, Mandeville Place W), exhibited their abdominal support, and a modification for the tropies which was distinguished for its lightness. Among other devices at this stand was a colostomy support (or a truss where no general support was required. This firm, in addition to its exhibition of appliances of its own manufacture, made a feature this year of the karyleno preparations for intestinal strasis and colic liquid paraffin, of which it is the distributor. An exhibit of Domet belts was furnished by the company of that name (456, Strand, WC), some of these designs were intended for pregnancy or for restoring shapeliness after confinement, others for pendulous abdomen or unbalanced hernia. These were less in evidence than in former exhibi

Artificial limbs were less in evidence than in former exhibitions, but Pedestros, Limited (10, Conduit Street, W.), had a display of light all metal legs, including five models of the Desoutter type. A feature of this limb is a swivel and pivoting device whereby the strain of the limb is eliminated during the quick turning of the body as in sport or active bodily work. Mr B Smith (Bath) illustrated the artificial limbs and surgical appliances of various kinds which have been fitted during and since the war at the Bath War and Ministry of Pensions Hospital.

Medical Publications

Half a dozen bookstalls added to the pleasure of a stroll around the exhibition. The Oxford University Press (Warwick Square) showed a number of standard works, the largest of which was the fifth edition of Tweedy's *Practical Obstetrics*, running into well over 600 pages. A third edition of H C Cameron's *The Nervous Child*, and a second of Groves's *Surgical Operations*, were shown at this stand, together with many other volumes. H K Lewis and Company, Ltd (136 and 140, Gower Street, W C), had their own very full display of standard works, embracing such subjects as orthopaedic surgery, radiography, school medicine nursing, medical climatology, medical jurisprudence, public health, surgical pathology, and tropical diseases, many of which have been reviewed in these columns. The firm showed also a number of office requisites, ledgers, case books, and so forth. Constable and Company, Ltd (10 12, Orange Street, W C), placed in the forefront their modern medical monographs, edited by Professor Hugh Macleay, three volumes of which—one on syphilis and gonorrhoea, another on pulmonary tuberculosis, and a third on the toxæmias of pregnancy—were available. W B Saunders Company (9, Henrietta Street, W C) showed examples of recent American medical literature, including the *Collected Papers of the Mayo Clinic, 1924*, and the work on pediatrics, edited by Professor Abt of Chicago, running into eight octavo volumes, with a total of 8,000 pages and 1,500 illustrations. Among the large selection of volumes at the stand of J and A Churchill (7, Great Marlborough Street, W) special attention was drawn to *Recent Advances in Medicine* by Beaumont and Dodds, *Midwifery* by Eden and Holland, and *The Diabetic Life its Control by Diet and Insulin*, by R D Lawrence. Here was to be seen also, of course, the

unfailing and indispensable *Medical Directory* Among the newly published works shown by John Wright and Sons Ltd (Bristol), was *Leprosy*, by Sir Leonard Rogers and Dr Ernest Minn, *Some Encouragements in Cancer Surgery*, by G Grey Turner, and *Rheumatic Heart Disease*, by Carv I Ceombs The ninth edition of *Pies Surgical Handcraft* and the seventh of *Hey Groves's Synopsis of Surgery* were also to be seen This firm showed a number of card index registers and medical account books Another book stand was that of Stanley Phillips (Brondesbury Road, N W), who showed a number of recent books issued by publishing firms in London, Edinburgh, and Philadelphia Our contemporary the *Lancet* also occupied a stand

Miscellaneous

Three spas ventured to assert their claims within hearing of the Bath waters. Harrogate proclaimed the diversity of its springs and the progress of its spa department, Droitwich, its famous brine and the recommendation of its bathing establishment, Buxton, its radio active thermal water, its lately reconstructed baths, and the wonders of the Peak district.

Two stands were devoted entirely to dentifrices. At the stand of Pep odent, "the pioneer tooth dentifrice, attention was drawn to the value of the polishing agent. The Kolynos dental cream called the microscope to its aid to illustrate its cleansing properties.

The hygienic clothing had a stand in which the merits of its various articles were proclaimed, not only in

Jaeger hygienic clothing had a stand in which the merits of this underwear and outerwear were proclaimed, not only in respect to health, but to style and comfort.

this underwear and outerwear were produced
 respect to health, but to style and comfort.
 An apparatus declared to be new in this country was the
 Appen inhaling apparatus, shown by the Inhaling Drug and
 Apparatus Company (30 Grosvenor Place, S.W.). It is de-
 signed to transform any liquid into a thin vapour which can be
 breathed, thereby distributing drugs through the respiratory
 organs. An English translation of a German pamphlet on
 inhalation therapy was handed to inquirers.
 The Medical Sicknes, Annuity, and Life Assurance Society,
 Ltd (309, High Holborn, W.C.), advertised the various forms
 of assurance it undertakes, including partnership and educa-
 tional assurances some of which have novel features.
 The Medical Insurance Agency (British Medical Association
 House, Tavistock Square, W.C.) brought before medical men
 the advantages of insurance through its office, such as its
 expert advice which is the result of long experience, the allow-
 ance of rebate on practically all classes of policies passing
 through its hands, and the considerable benefit to medical
 charities which has resulted from its business.
 This concludes a brief and cursory summary of an exhibition
 which was full of interest, even though outstanding novelties
 were few.

Ichthol

In the notice of the exhibition at the Annual Meeting in our issue of August 8th (p 80), a passing reference was made to the exhibit of W Dederich, Ltd (Dean Stanley Street, Westminster), who showed the sulphonated ichthol preparation.

Ichthol Messrs Dederich desire to state that ichthol is a trade name registered and protected in this country, and refers to the preparation, of which here they are the sole distributors, manufactured from the oil distillate of a mineral deposit near Seefeld in the Tyrol.

BRANCH AND DIVISION MEETINGS TO BE HELD

CAPE OF GOOD HOPE (WESTERN) BRANCH—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday August 28th at 8 p.m. when there will be a symposium on the diagnosis of intracranial tumours arranged by Mr D J Wood Among the speakers will be Dr J D M Claassens, Mr F P Petersen and Dr A W S Siehel

SOUTH AFRICAN MEDICAL ASSOCIATION—The Chairman of the South African Medical Association is Mr J. Lodee

NORTH OF ENGLAND BRANCH CLEVELAND DIVISION —The Chairman
and Mrs. Body will be at home to members at Cleveland Lodge
Grove Hill Middlesbrough on Friday, August 28th, from 3.30 to
6.30 p.m. (garden party and tennis)

OXFORD AND READING BRANCH OXFORD DIVISION—In place of the complete post graduate course which has been temporarily suspended a series of ward and out patient demonstrations under the auspices of the Oxford Division will be given by members of the honorary staff of the Radcliffe Infirmary on the afternoons of the week commencing October 5th. The demonstrations will be open to both members and non members of the British Medical Association. To those notifying Dr William Stobie (honorary secretary), 340 Banbury Road Oxford of their intention of being present on any afternoon a detailed programme will be sent towards the end of September. There are no fees.

Meetings of Branches and Divisions

BORDER COUNTIES BRANCH

The fifty fourth annual general meeting of the Border Counties Branch was held at the Cumberland Infirmary, Carlisle, on July 10th when Dr M. Bryson, the retiring President, was in the chair. The Branch Council report and financial statement were adopted and the election of the following officers confirmed:

President Mr Norman McLaren 1st Vice President Dr P. Murray Kerr 2nd Vice President Dr M. Bryson and Dr C. B. Murray Honorary Secretary and Treasurer, Dr G. T. Wilson Assistant Honorary Secretary Dr R. Connell

A very hearty vote of thanks was accorded to Dr Bryson for the able way he had filled the office of President and Dr Bryson, in vacating the chair, called on Mr Norman McLaren for his presidential address entitled 'The Cumberland Infirmary—Past, Present and Future.' This was illustrated by numerous paintings, engravings, plans and documents of great interest. It was much appreciated by the meeting which passed with acclamation a vote of thanks to the new President. At Mr McLaren's invitation tea was then taken in the nurses' dining hall.

ESSEX BRANCH

The annual meeting of the Essex Branch was held at the Palace Hotel, Southend-on-Sea, on July 30th.

After the routine business of the meeting had been completed Dr Percival Wells (Chelmsford) gave an address on fatal syncope. He mentioned two recent cases of sudden death in patients who had shown no signs or symptoms of dangerous illness. In one case he ascribed the cause of death to interference with the heart by a dilatation of the stomach. In one case a post mortem revealed a healing gastric ulcer. Other speakers mentioned that indigestible food such as white, cockles or crab was likely to be a contributing factor.

Dr G. Norman Meacher read a paper on the justifiability of the present expenditure on tuberculosis in which he dealt with the value and the limitations of sanatorium treatment, the need of more systematic search for early cases of the disease and the benefits that have been already derived from the campaign against tuberculosis. Drs F. Miles R. H. Vercoe J. Waller, Grant Pugh, and Rowland took part in the subsequent discussion.

A keen debate on birth control was opened by Dr R. H. Vercoe, medical officer of health for Chelmsford. Several different points of view were taken by the speakers and no definite conclusions were reached. The members were entertained to tea by the President Dr Hinks and after an interesting and pleasant afternoon the meeting broke up at 5.30 p.m.

KENYA BRANCH

A special meeting of the Kenya Branch was held at the Native Civil Hospital, Nairobi, on May 13th when the President stated that a minute of the meeting of the deputation with the Colonial Secretary had been circulated to all members of the Branch. He added that the matter was being dealt with by the Dominions Committee of the Association. Dr Kauntze explained the position of Government medical officers in the Union of South Africa. After discussion it was resolved, on the motion of Dr Burkitt, seconded by Dr Kauntze:

That the whole of the correspondence in connexion with the matter should be sent to the headquarters of the Association for their information and needs any action.

The rules as to the question of election of members were amended. The President stated that he was of opinion that the Branch should reconsider the Professional Licences Bill. Although the Colonial Secretary had given an assurance that the Government did not propose to proceed with the bill for the present he understood that the bill had been referred back to a Government Committee and that it might be reintroduced at any time. It was resolved to send the whole of the correspondence in connexion with the matter to headquarters, accompanied by a covering letter from the secretary explaining the present position.

Dr Kauntze read a paper on the plague problem in South Africa and a general discussion followed in which the majority of members took part. A hearty vote of thanks was accorded to Dr Kauntze for his most interesting paper.

A further meeting of the Branch was held on June 10th at the Native Civil Hospital, Nairobi.

The Secretary reported that a considerable amount of information regarding medical defence had now been collected and suggested that a small subcommittee should be appointed to consider the whole question and report. After discussion it was resolved on the motion of Dr Paterson, seconded by Dr Gilks, that the matter should be considered by the Branch Council.

Dr Jex Blake was unanimously elected Representative and Dr P. A. Clearkin Deputy Representative, of the Branch for the Annual Representative Meeting at Bath.

Dr Wilson opened a discussion on African diets and gave a brief account of the work that had been done on this subject in the medical department up to date including information collected during the war. His remarks were illustrated by a number of charts and diagrams. A general discussion followed in which the majority of the members took part. The President in thanking Dr Wilson for opening the discussion emphasized the importance of the subject but pointed out the impossibility of making much advance without an increase of staff and particularly of trained research workers and biological chemists.

SHPORSHIRE AND MID WALES BRANCH

The President of the Shropshire and Mid Wales Branch, Mr C. G. Russ Wood and Mrs Russ Wood, entertained members and their wives at St Mary's Hall, Shrewsbury, on the afternoon of August 6th when music was rendered at intervals by an orchestra. Many members and their friends were present and much enjoyed this opportunity of meeting socially.

SUFFOLK BRANCH WEST SUFFOLK DIVISION

A meeting of the West Suffolk Division was held at the Institute, Woolpit, on August 6th at the invitation of Dr O. R. M. Wood.

In the absence of the Chairman and Vice Chairman, Dr J. S. HINWELL at the request of the meeting presided. Dr HERBERT FRENCH opened a clinical discussion on the following subjects: (1) Concerning blood letting in chronic cases and a simple needle and bottle method of doing it. (2) The causation of acute nephritis and its bearing upon treatment. (3) The treatment of recurrent severe sick headache, especially in women. (4) The gist of insulin treatment in diabetes. Dr French's opening remarks in each case were very practical and interesting, and led to a brisk discussion under each heading in which many members and visitors took part. The discussion lasted for some two hours and Dr French was then obliged to close without finishing the programme. On the motion of Dr HINWELL seconded by Dr WILKIN, a very hearty vote of thanks was accorded with acclamation to Dr French. It was generally felt that an afternoon of this kind was far more interesting and instructive than a set paper on one subject and those present hoped that Dr French would attend on another occasion to complete the programme. After the clinical meeting members adjourned to Dr Wood's garden, where tea was provided. There was a good attendance of ladies, wives and daughters of members and those present agreed that the reputation of Woolpit for hospitality had been well maintained.

National Insurance

ROYAL COMMISSION ON NATIONAL HEALTH INSURANCE

EVIDENCE OF THE SOCIETY OF MEDICAL OFFICERS OF HEALTH

EVIDENCE on behalf of the Society of Medical Officers of Health was tendered by Dr R. A. Taster, President, and Dr J. J. Buchan. It was stated that the society numbered about 2,000 members.

The witnesses maintained that the insurance system was so isolated from kindred branches of public work that it suffered great limitations. In their view there was need for a closer relationship between the scheme and other activities of a like kind. For the purpose of distributing payments in money (sickness and disablement benefits) the grouping of insured persons in approved societies formed a not unsatisfactory instrument but greater advantages would follow a grouping, in approved societies established on the same territorial lines as public health administration. The witnesses preferred was for one local approved society to each area, if more than one approved society operated in an area a council of approved societies should be set up for negotiation and consultation with the local authority.

They considered that Insurance Committees were faulty in constitution that they did not command sufficient local respect, and that their health functions were very indefinite. Their duties would be more effectively carried out by the local health authority, and a committee of the local authority should be appointed, with provision for the representation of the other interests involved. This criticism of Insurance Committees was questioned by members of the Commission, who said that they had evidence from other quarters pointing to the general success of these bodies. Dr Buchan said that the Committees had done very well according to their abilities and opportunities, but they were far from attaining such improvement in health matters as was prophesied. The Insurance Committee was the poorest sort of authority in an area. In the minds of the people it was made up of club agents and persons of that description and could carry out no effective propaganda.

It was a further part of the society's proposal to set up Local Medical Committees representative of all registered medical practitioners to undertake the duties of the existing Panel and Local Medical Committees and to be available for consultation with the local authority on medical matters.

With regard to the administration of benefits the witnesses had some novel proposals to make. They suggested that sickness and disablement benefits should not be administered at a uniform rate but within prescribed limits in accordance with the needs of the insured and that they should in certain circumstances be paid in part even when the insured person was partly employed—for example in the case of a man recovering from illness and able to do part time work. Maternity benefit should no longer be administered by approved societies but by the local authority, when in turn should be made a timely

responsible for providing medical attention. "The attendance upon maternity cases should not be an obligation upon a panel practitioner." Medical benefit should be administered by local authorities through their committees, and should be extended so as to provide insured persons with all necessary treatment and nursing in illness. The programme of extension would take years to complete, but a commencement should be made by including the following:

(a) Facilities to the medical profession for laboratory diagnosis (b) specialist advice and treatment (c) dental treatment, (d) treatment in general hospitals and other like institutions (e) further accommodation for the treatment of tuberculosis (especially surgical) (f) treatment in convalescent homes (g) home nursing when required (h) all other necessary medical advice and treatment (including the provision of such nursing, dressings, and equipment as may be necessary).

The witnesses held that medical benefit should be administered in such a way that the good work done by medical practitioners in the preservation of health should be rewarded. They explained that by this they meant that medical practitioners should in future be given a direct interest in the maintenance of the patient's health. Varying payments should be made to practitioners for work in this capacity, the funds for such payments being constituted from any saving resulting from decreased sickness or disablement payments. Sir Alfred Watson, referring to a proposal for the health supervision of persons not already ill, hoped that the intention was not to put the whole population under a periodical medical survey. The witnesses explained that they meant supervision only, this would not be compulsory, but as time went on insured persons would go to the doctor more frequently to talk over their illnesses and their health. Sir Alfred Watson remarked that with payment on a capitation basis there was nothing to prevent insurance practitioners now from devoting themselves to preventive health service if they chose.

With regard to the finance of their proposals, on which they had to face a lengthy fire of questions from Sir Alfred Watson from the actuarial point of view, the witnesses were of opinion that the present Government grant (two ninths) should be allocated to local health authorities as a nucleus to start a proper medical service, and that this should be supplemented from local rates and from other sources which do not appear to be specified. They saw no injustice in making a Government subsidized and rate aided benefit available only to persons below a certain income limit, it would amount merely to a form of indirect income tax. The insured persons' contributions and part of the contributions of employers should be left to the approved societies for the financing of cash benefits, but this should not be supplemented by Government contribution. They did not agree that if Government money was withdrawn the societies would be justified in claiming the withholding of Government control from their finance.

The total effect of these proposals would be to lift the medical service out of the Insurance Act, but that part of the service—certification mainly—which had to do with sickness and disablement benefit should be financed out of the moneys at the disposal of the approved societies. The cost of medical benefit, apart from certification, was almost met at present by the Government grant, and, no doubt, with a unified local service, there would be economies in administration, but the extensions contemplated would, of course, make necessary a call upon local rates. The witnesses believed that the advantages of medical benefit should be made available to dependants as far as possible, and to those to whom the Poor Law system at present applied. They did not presuppose a change in the system of remuneration of the profession. "We recognize definitely," said Dr Lyster, "that whole time salaried service is not practical politics in the mean time. The fact is that as nearly as good as one can get is probably the panel service. Otherwise, if one tries to impose any particular whole time service—although it has many attractions and one could do things possibly much more perfectly—the whole thing would topple down."

In reply to the Chairman (Sir Arthur Worley), Dr Lyster said that he looked forward to a great development of clinics under the scheme. Team work was only possible at clinics, and the ground it could cover was very large.

EVIDENCE OF THE TRADE UNIONS

Important evidence was submitted to the Commission on behalf of the National Association of Trade Union Approved Societies and it was stated that the witnesses were able to speak also for the General Council of the Trades Union Congress and the Executive Committee of the National Labour Party. The witnesses were Mr F Kershaw, J.P., Mr E Corbey, Mr G W Carter, and Mr G P Blizard.

The witnesses stated that, although they saw several defects in the approved society system, on a balance of considerations they desired that system to be retained. They did not think it practicable to recommend the abolition of approved societies

at the present time, mainly for the reason that the advocates of the change would find it difficult to present their case to the insured population, and so counter the agitation which would be aroused by the agents of the collecting societies and also by those who retained a pathetic belief in the necessity of maintaining the traditions of mutual thrift organizations. But the witnesses believed that a completely efficient co-ordination of all health services was impossible under the approved society system. As immediate recommendations they submitted that control by members of approved societies should be made more real, also that national valuation should take the place of approved society valuation, or, failing national valuation, that a national equalization fund should be created. They considered that the present system of segregating the insured population into valuation units seriously militated against the full development of the objects of the Act.

With regard to the categories of persons in insurance, they were of opinion that employment within the meaning of the Act should commence at the statutory school leaving age instead of 16 years, that the income limit for persons in insurance should be raised to £350 a year, and that the provision for exempting persons with a private income of £26 a year should be repealed.

Coming to the large question of medical benefit, the witnesses agreed that the medical profession as a whole had rendered competent and conscientious service to insured persons. Such criticisms as might be made were directed, not against insurance practitioners as such, but rather against the defects and limitations of the system. The limitations of the present range of service were a grave defect. The collective maximum skill of medical practitioners should be at the disposal of insured persons rather than the minimum skill of one individual practitioner. It was an anomaly that specialist treatment should be provided only when a person was a hospital inpatient. On the character of the medical services in general the following passages took place between the Chairman of the Commission (Lord Lawrence of Kingsgate) and the leading witness (Mr Kershaw):

You are of opinion that the medical profession as a whole has rendered competent and conscientious service to insured persons?—We do not say that the malpractices of a few do not warrant a condemnation of the whole. We desire however to emphasize that we mean competent and conscientious service within the limits of the present range of service.

And speaking for over a million insured persons in our great industrial centres you do not think there is anything in the allegations sometimes made in the press and elsewhere that the panel service is inferior to that given in private practice by the general practitioner?—We cannot admit that there is nothing in the allegations. We believe that whether or not a limitation is imposed by individual medical men in practice the limitations imposed by the regulations and terms of service quite naturally will give the impression that private patients get a more complete service than panel patients.

Do you suggest that each individual insurance practitioner should be required to render to any insured person on his list the full extent of medical service which he is competent to render?—Yes.

Would such a requirement be reasonable under a uniform capitation rate of payment, and, if not, on what basis do you suggest that payment should be made?—We suggest that the method of overcoming the difficulty of fixing an equitable payment in all cases is one for the medical profession to solve. An equitable flat rate for an unrestricted range of service should be fixed. We cannot agree that the present capitation fee is equitable in all cases, but as laymen we cannot judge of the professional standards of medical men.

With regard to the size of practitioners' lists, the maximum number of insured persons allowed to a practitioner should bear some relevance to the extent of his private practice. The term "medical benefit" should include everything that medical and surgical science could command for the prevention and cure of sickness. It should include consultant and specialist advice and treatment, dental treatment, and hospital and convalescent home treatment and nursing. Medical benefit should be extended to wives and dependants, and should include treatment and attendance before, during, and after confinement. The witnesses also made some recommendations for increased sickness and disablement benefit. Asked in what order of priority the witnesses would place these extensions supposing that on account of the cost involved it was not possible to have them all at once, Mr Kershaw gave the following order:

- 1 Extension of scope of medical benefit
- 2 Extension of medical benefit to dependants
- 3 Full provision for maternity
- 4 Medical attendance at confinement
- 5 Payment of full benefit during illness
- 6 Increase in rate of sickness benefit

He added that the association took the view that the future medical service should make available to the whole population, irrespective of age or wealth, all that medical surgical science could provide, and that the cost should be borne by rates and taxes in a manner similar to that of education and other public

AUG 22, 1925]

It was admitted, however, that the nation was probably not ready for this development, nor was it clear that the medical profession would undertake whole-time State service. Payment of the doctor by salary on a whole-time basis as the servant of the local authority was not an essential part of their scheme. Asked if the suggestion behind this was that a whole-time salaried man did not give as good service as the man who was paid by results, Mr. Kerishaw replied:

The objections to a State service are usually illogical and based upon an inadequate study of the subject. We submit that the history and traditions of the medical profession show that it stands out as one in which devotion to duty to science and to public welfare takes first place. We cannot agree that the make-up of medical men would be transformed if they became public servants instead of the servants of the public. We would refer the opponents to the services of the existing public medical officers. It would be proper to observe also that this change would be part only of a very much greater change in which are incorporated opportunities for medical study and research which are denied the average practitioner to-day.

On the question of hospitals the witnesses repeated the policy of the Labour party on this subject, and a number of other administrative points were put forward including a suggestion by the witnesses that Insurance Committees should be reconstituted on a broader representative basis, to bring in every interest directly associated with public health and medical services and should be renamed health committees or medical services committees.

THE PROBLEM OF THE TUBERCULOUS INSURED PERSON

Sir Henry Gauvain and Dr. G. Lissart Cox submitted evidence on behalf of the Joint Tuberculosis Council, a body which they stated, represented the collective views of tuberculous medical officers, medical superintendents of sanatoriums and other members of the profession engaged in the special treatment of tuberculosis.

The suggestion which the council urged upon the Commission was that the period of sickness benefit should be expiable or extension in the case of tuberculous persons. The present limit of twenty-six weeks had led to the interruption of treatment and a premature return to work. The council was also of opinion that sickness and disablement benefit should continue to be paid, of course at a diminished rate, during part-time employment in the case of tuberculous persons. Such a scheme would assist the gradual return of such persons to full economic employment when their health permitted.

Asked what extension of sickness benefit the council had in mind, Dr. Lissart Cox said that ideally it would be for as long as the patient required it, but a definite step for and would be to extend the full benefit from twenty-six to fifty-two weeks, and, if possible, to allow half benefit for another fifty-two weeks. In reply to a question as to what the council thought of the Papworth scheme as a basis for wider colonization Dr. Cox said that the Papworth experiment was a very real success, but it only settled a fraction of the men—he believed about 25 per cent—who in the first place went to the institution. Moreover, it depended for its success upon the genius of Dr. Varrier Jones, a man of excellent business ability and it was under private management, with no difficulties with regard to public finance. He doubted whether it could be copied throughout the country.

Dr. Lissart Cox admitted that the payment of part benefit in the case of various illnesses would be administratively very difficult, but he thought that tuberculosis exceptionally called for some such scheme on the ground that it was a long chronic disease that in a large number of cases the patient got better and then graduated to work of a light kind was actually part of the medical treatment of such patients. Mrs. Harrison Bell said that her knowledge of employers did not lead her to expect that they would be likely to attempt a reorganization of their part of their industry to provide for these people. Sir Henry Gauvain replied that that might be true of many employers, but it did not necessarily apply to all.

Further evidence with regard to the Papworth scheme was submitted by Dr. P. C. Varrier Jones, medical adviser to the Cambridgeshire Tuberculosis After-care Association and Mr. Bunnell, a member of the committee of management. The special point of this evidence also was to urge the need for modified sickness benefit in the case of tuberculous insured persons on their discharge from sanatoriums to take up part-time employment. The witnesses considered that one of the best safeguards against abuse would be the tuberculous village settlement like the one at Papworth, where medically graded persons were employed and a resident medical officer exercised supervision. Even in cases not covered by the village settlement the tuberculous officer who had quite a different relation to these patients from the ordinary medical attendant would prevent possible abuses. With more eradication of employment tuberculous patients might return in time to a fully self-

supporting position, meanwhile some form of subsidy to bring their economic earnings up to the level of a living wage was very desirable, and if they were in the sheltered employment of a settlement such subsidy might be regarded as a premium for insurance against the infection of the community by the return of the infected person to ordinary employment.

Dr. Varrier Jones, at the request of the Commission described in detail the organization and financial arrangements of the Papworth settlement. The industries were launched under philanthropic auspices; they were not a commercial proposition, because these people suffering from disease could not work at full efficiency, and the consequent lowering of output made commercial profits impossible. The concern remained solvent because no interest had to be paid on capital and there were no directors' fees, but obviously the conditions could not obtain in industry generally. Hence the need for the continuance of a modified sickness benefit on discharge from sanatoriums. The witnesses also explained the need for certain modifications in the rules which govern the payment of sickness benefit to insured persons, without dependants, while under treatment in residential institutions.

Mr. C. H. Walmisley, chairman of the Public Health Committee of the London County Council, gave evidence in elaboration of a resolution passed by the council that grants should be made from insurance funds in aid of approved work centres at which post-sanatorium cases could be employed under the supervision of the tuberculous officer. That the statutory maximum period of sickness benefit should be extended in the case of tuberculous persons and that allowances should be made from the funds to tuberculous insured patients capable of part-time but incapable of whole-time work. The Public Health Committee was also of opinion that approved societies surplusage might be devoted in part to benefits in kind, including financial aid, for tuberculous insured persons on a similar basis to the provision made for ex-service men by the British Red Cross and United Services Fund.

Correspondence

Wages and Tuberculosis

SIR,—At the Annual Representative Meeting of 1921 I submitted that the high tide of wages was probably turning and that 1923 or 1924 would see a rise in the phthisis mortality. Sir George Newman's report shows that for 1924 this was true, and in attributing it to unemployment he says in a circuitous way what I said plainly as a warning. Four correct forecasts since 1911 surely in logic throw the burden of proof on opponents when I say, as with growing confidence I do say, that the Insurance Act was the last and deciding factor in the change from an almost stationary into a rising rate, just as freeing the board schools may have been the final blow to put the brake in 1896 on a rapidly falling rate. I know no country where a rapid fall in mortality is not preceded by a rising wage, or where a falling wage rate has not resulted, according to depth of fall in a slackened decrease or an increase in mortality, the Act has depressed wages. The rise in 1924 is serious, mainly because it marks the turning point the rate will probably rise slowly up to 1929-30, when Mr. Churchill's budget will meet its response in a formidable total of deaths. The Association seems to have buried its boots. The preface to the evidence before the Commission states that the Act is not even probably the best way to secure national health. But after this sop to uneasy conscience the evidence is concerned wholly with extension of the principle found wanting. You Sir have acknowledged in a leader that it is just to say that in 1896 we had reason to expect that phthisis would by now have become a negligible item in the national mortality. It was then plainly being prevented it has ceased to be prevented, except for the break due to the high wages during and shortly after the war. That from 1896 to 1924 very many thousands of lives have been sacrificed to the fetish of State collectivism is not a theory, but an exercise in arithmetic. Yet it is but a type disease—an index of malnutrition on the national scale. How long is the Association to acquiesce in this sacrifice to a policy, and helplessly to watch the State render nugatory a great part of the advance in treatment? I have been a member and a member jealous for the Act for a long time. I have felt ashamed when in 1923, as in 1912 at meetings to discuss the Act I was forbidden to allude to its national bearing to hear the Annual Representative Meeting spend hours in debating how at the supreme crisis in our history to add to the already staggering national burden while it turned down contemptuously the single scheme proposed to lighten it. I confess to an anxiety to see even yet, the Association take a lead in a matter profoundly affecting the future of England. The economic aspect is important. The Commission was prepared to discuss it with the Association.

ROYAL COMMISSION ON NATIONAL HEALTH
INSURANCEEVIDENCE OF THE LONDON INSURANCE
COMMITTEE

MR. HENRY LESSER, vice chairman of the London Insurance Committee, gave evidence on behalf of that body. His committee recommended that the medical service under the Act should be extended, and a complete general practitioner service be made available to insured persons. The treatment to which an insured person was entitled should not be limited by a formal definition of medical service but should include all such treatment as an insurance practitioner was able to provide, the insured person should be required to pay a fee only if it was necessary for him to consult a specialist as such. Professor Gray said that this plan would be open to the objection that a practitioner with special skill in some particular direction would be unduly called upon by one kind of patient, this might discourage practitioners with some specialist knowledge from going on the panel.

The London Insurance Committee also urged that it should be empowered, after consultation with the Panel Committee to reject the application of a practitioner for admission to the medical list, subject to appeal by the practitioner to the Minister of Health. It should not be obligatory on the committee to state to the practitioner the ground of its refusal but such ground would have to be disclosed under privileged conditions to the Minister in the event of an appeal. Professor Gray pointed out that this would put the Minister in an extremely delicate position, he would be a target for the press if he could be represented as having turned down a doctor against whom nothing could be said. Mr. Lesser said that cases of this kind occasionally arose in which doctors who had been found to be undesirable persons (apart from medical skill) in their own locality migrated to London to avoid unpleasant consequences and in London were more or less concealed. If such a doctor asked to go on the medical list the Insurance Committee at present was practically bound to admit him. Again there were doctors who were in senile decay or suffered from physical infirmities which prevented the efficient carrying on of their practices, and it was desirable here also that the Insurance Committee should have the power to reject. Sir Arthur Worley suggested that the onus might be thrown more on the medical side—that the Insurance Committee should admit subject to recommendation of the Panel Committee. In the opinion of the committee the maximum number of insured persons to whom a doctor was permitted to include in his list should be reduced universally to a figure below 2,500. No difficulty would arise in London from such limitation. Mr. Lesser also thought that the Minister should define the distance away from his surgery at which a practitioner should be permitted to live. There were several cases in London in which a practitioner lived say at Bromley or Kew, and practised at Stepney or Bermondsey. The number of practitioners in London who did not reside at their surgeries was 531, and in many cases there was no telephonic communication.

During the period 1913-24 the number of complaints against practitioners substantiated by the Medical Service Subcommittee was 550 and the number not substantiated 464. In 18 cases the committee made a representation that the continuance

of a practitioner on the medical list would be prejudicial to the efficiency of the service in 7 of these cases the name was removed and in the others a fine was imposed. The committee was in favour of the time limit for complaints being extended from six weeks to three months for insured persons were often unaware that they must give notice within a certain period from the date of the incident. Power should also be given to the subcommittee to require witnesses to give evidence on oath. In the case of an appeal by the practitioner costs should be awarded to follow the result of the appeal. Mr. Lesser touched on two recent cases in which the London Insurance Committee had been concerned in disciplinary action against doctors. He said: "We should like to make it clear that the issue here is not the ordinary common law issue of negligence but it is whether or not the doctor has conformed to his terms of service, and it is on that ground that the fine is imposed." In reply to a question, Mr. Lesser said that his committee had no evidence to show that the general practitioner service in London generally was inferior; it was fair and an improving one. The limelight is put on to the cases by the London press whenever they get a chance. The panel service is a favourite stunt for London newspapers, and while there may be every justification for their comments in a particular case it is very unfortunate if the impression gets abroad that it is anything like general.

The committee favoured the principle of statutory dental benefit but thought it desirable that further experience should be obtained as to the probable ultimate cost by a continuance of the present administration of dental benefit as an additional benefit through the approved societies. Another recommendation was that the hospital medical service should be coordinated with the general practitioner treatment of insured persons, so that a medical record of a particular patient in which there was now often a hiatus corresponding to his period in hospital, might be made complete.

VENEREAL DISEASES AND NATIONAL INSURANCE

Evidence on behalf of the British Social Hygiene Council (until recently the National Council for Combating Venereal Diseases) was submitted by Mr. E. B. Turner, F.R.C.S., chairman of the executive committee. Dr. Otto May, honorary medical secretary and other officers. The council asked for the amendment of Section 26 of the Act so as to make it possible for approved societies or Insurance Committees to make subscriptions or donations to societies or other organizations approved by the Ministry of Health which are engaged in medical research or the combating or amelioration of disease. It was urged that the economic consequences of venereal diseases were often concealed from approved societies owing to the fact that these diseases in their early stages were rarely incapacitating but that a very large proportion of disabling illness was due to this cause.

Dr. Otto May submitted in tabular form the experience of a large group of approved societies of which he is consulting medical officer. In these societies with an approximate membership of just over 3,000,000 the cost arising from incapacity due to venereal diseases during the six months July to December 1924 was given as £3,015. These cases included however referred only to group in which venereal disease was almost certainly the origin of the disability. This did not include the very large number of cases of heart disease, other headngs—such as rheumatism, arthritis, heart disease and so forth—in which it was impossible to estimate what

With regard to the men managing these institutions, Dr Hamilton stated (according to the official report of his evidence) There are very few genuine working men amongst them. They are mostly little tradespeople. They are regular tyrants—the same class of men as you get amongst the deacons in the Nonconformists. Special complaint was made of the Friendly Societies Medical Alliance which, it was stated had always ignored any representation help or advice from the medical officers on any matters presented to the Minister.

Its dominant policy is a sinister one to the medical profession, the enslavement of medical men under whole time contracts with penal clauses against any attempt to start in practice in the neighbourhood. Certain recommendations were put forward if the institutions are to be continued, the medical officers should be liable to answer personally to any complaint to the duly constituted tribunal for insurance practitioners, no agreement should be valid which in any way infringed the right of insured persons to free choice of doctor in the event of a medical officer leaving the institution and the capitation payments to institutions should be of the same kind and made at the same time as the payments to insurance practitioners generally. One member of the Commission pointed out that the severe criticisms levelled against the institutions by the witnesses seemed to be an argument for their abolition. Dr Holmes replied that he had made use of the expression.

They are to be continued because he had regard to the somewhat overwhelming importance generally given to what the British Medical Association recommended. There was no doubt that a considerable number of these institutions were not worth retaining but there were others—a few—which were excellent. A special exception was made in the case of the Coventry Provident Institution which Dr Holmes said was entirely different from other so-called medical societies or medical aid institutions, there the doctors always had a voice in the management. Another consideration in favour of retention was that if dependants were brought into national insurance the institutions would be specially favourably placed on account of their generous waiting room and other accommodation whereas ordinary medical men who had large insurance practices would find themselves in a difficulty. It was complained that some of the institutions were very expensively administered with a paid committee running into forty or more members. What the union wanted was that the medical officers might be taken from the control of the secretaries and committees of the institutions and put in a position similar to that of other insurance practitioners.

The contention by the witnesses that in an institution the expense of equipment and so forth was greater than in private practice was taken up by Professor Cray who asked whether there was not something to be said on the other side. With three or four doctors working together in one building was there no economy with regard to apparatus, waiting rooms and so forth as compared with a similar number of doctors working in separate houses. Dr Holmes replied that the experience of those for whom he spoke was quite the opposite whereupon Professor Cray asked why the medical profession should be the only kind of trade in which apparently on this evidence the expenses became heavier with a large scale of production. Dr Holmes who is connected with the Coventry Dispensary said that he had—what was rare among medical officers—in ordinary insurance practice and he found that the payment in the case of the institution insured patients worked out at something like 1s 7d a head less than in the case of his outside insurance patients. The Chairman asked whether the lessened working expenses in connexion with institution patients had been taken into account but no direct answer was given.

The Friendly Societies Medical Alliance—a lay body—urged in its evidence that the embargo on new institutions should be removed that the payments to them should be on the full capitation and drug tariff rates that the insured members should enjoy the same freedom of transfer as the ordinary insured person that representation on Insurance Committees should be granted and that these institutions should receive their proper share of the capitation fees for unallocated persons. Asked what was the relation between the Medical Alliance and the British Medical Association the witnesses for the alliance said that it was not unfriendly. The medical officers at many institutions were members of the Association, and were consulted by the Association's local representatives. There was only one Warning Notice relating to an institution. When the same question was put to the witnesses for the Medical Officers Union Dr Roberts replied that the attitude of the British Medical Association was very hostile to the institutions and to the officers in them though not all the institutions were blacklisted.

The case of the Luton Medical Institute was mentioned by both sets of witnesses. The Medical Alliance said that at Luton there was now a membership of 6,000 insured persons, that three whole time medical officers were in the service of the

institution that there were three surgeries open morning, afternoon, and evening and that two motor cars and chauffeurs were provided for the service of the medical staff. The witnesses for the Medical Officers Union on the other hand criticized the Luton institution, suggesting that it had made savings to the point of off of its mortgage at the expense of the doctors whom it employed. The Chairman said That is rather put up to us as a good institution, to which Dr Hamilton replied If you trace its origin you will see that it was not such a good one. It was rather fatal to offend the secretaries.

DENTAL BENEFIT

THE BRITISH SOCIETY OF DENTAL SURGEONS

Sir Frank Colver and Dr E. W. Fish gave evidence on behalf of the British Society of Dental Surgeons, a body which was founded to represent only qualified dentists at a time when the British Dental Association proposed to admit to its membership those known as dentists 1921. (The question of the admission of these dentists to the association has now been postponed for two years.)

The British Society of Dental Surgeons urged that dental benefit should be made statutory. Money should be allocated in the first place for the education of the public in prevention. Sir Frank Colver said that a widespread system of education from childhood to adult age would get rid of 85 per cent of dental disease. Dental benefit proper should consist of extraction of tender or hopelessly infected teeth under suitable anaesthetics and the scaling of the remainder. A service restricted in this way would be directed solely towards the eradication of infection from the mouth and would not be concerned with aesthetic details. The witnesses believed that a capitation fee of 3s per insured person would cover the cost of this treatment with an additional 6d for administration and propaganda, but of course such a fee would have to be open to revision at an early date. The capitation fee appeared to them to be the most satisfactory form of payment. (Witnesses on behalf of the British Dental Association had previously stated that in their view a capitation fee must be ruled out owing to the absence of data on which it could be assessed.) Other matters urged by the society were the principle of free choice of dentist, and the need for the addition to the medical capitation fee of a sum to make it possible for patients to obtain the services of their insurance practitioners for the administration of anaesthetics. The first extension of the scheme when funds permitted, should be to include in this partial scheme the children of insured persons. Later extensions might be the provision of fillings for children and adults, and finally the supply of dentures necessary for the patient's health. Some members of the Commission appeared to challenge the scheme on the ground of its restricted character, and asked whether the provision of dentures could rightly be regarded as only an aesthetic detail without any important effect on health. Asked if reasonable dentures, in addition to other services, could not be provided for a capitation fee of 5s, Dr Fish replied that this was not possible. Sir John Anderson pointed out that in the estimates which the witness had placed before the Commission no allowance had been made for filling, and he asked whether it was conceivable that a national scheme could be recommended to the insured public which while making provision for extractions and scaling made none for fillings. Dr Fish replied that he thought a scheme capable of being reasonably financed could be drawn up for extractions and scaling and that this would interest the whole public and incidentally educate them and with the consequent improvement of health the number of fillings would be small and capable of being dealt with. But to attempt to cope with the question of fillings at present would be impossible unless you had the coffers of Croesus.

THE IVORY CROSS

Evidence was tendered by Mr W. J. Mellersh and other officers on behalf of the Ivory Cross society founded in 1914 for the supply of dental treatment to soldiers, sailors and recruits. Since its organization it had dealt with 106,000 dental cases. The methods which had been found most satisfactory in ensuring the supply of thoroughly efficient dental treatment consisted in the first place of the appointment of a committee of surgeon dentists who selected from a roll a surgeon to deal with each case presented for treatment (in practice the nearest available practitioner). To this practitioner a dental chart for diagnosis was sent and was returned by him after he had seen the patient showing the treatment he recommended. A dental committee consisting of at least six dental surgeons of experience then examined and criticized this chart and if they thought well, issued a certificate authorizing treatment at the fees allowed. In the view of the witnesses dental benefit could be made available for the whole insured population without utilizing the so-called dentists 1921, provided that all surgeon dentists were willing to take up insurance work.

CURRENT NOTES

Badges for Branch and Division Officers

It will be remembered that the Council has approved the idea of the provision of badges for officers of Branches and Divisions of the Association, not only as a means of distinguishing these officers at meetings which are attended by members who do not know them, but in the belief that such badges will add to the dignity of the office. It is hoped that officers' badges will be provided either by a voluntary subscription from members of the Association units, or as a gift from previous or present holders of offices. The badges are now available at prices which vary in accordance with the material of which they are made. Particulars may be obtained from the Financial Secretary, British Medical Association House, Tavistock Square, London, W.C.1.

Care of Certificate Books

The Ministry of Health has issued to Insurance Committees a circular stating that a case has recently come to light in which sickness benefit was fraudulently obtained over a long period by an insured person by means of forged medical certificates, the blank forms having apparently been stolen from the doctor's consulting room. The Ministry's Insurance Committees to draw the attention of practitioners to the importance of certificate books being kept under conditions which will prevent the blank forms falling into the hands of unauthorized persons. The warning applies, of course, not only to insurance practitioners and to insurance certificates, but to all practitioners and their certificates, and it would be well if all doctors who keep any kind of printed form of certificate would see that such forms are not kept in a place where they can easily be appropriated and used by unauthorized persons.

Treasurer's Cup Golf Competition

The attention of Division secretaries and members of the Association generally is drawn to the rules and regulations appearing in the *SUPPLEMENT* of August 22nd, 1925, regarding the Treasurer's Cup golf competition, from which it will be seen that the first stage of the competition begins on October 1st, by which date all intending entrants must notify their intention to the secretary of the local Division.

THE THERAPEUTIC SUBSTANCES ACT

THE Therapeutic Substances Act, which received the Royal Assent on August 7th, is intended to provide for the effective control of the quality and the authenticity of such therapeutic substances as cannot be adequately tested by direct chemical means. In such substances three groups may be distinguished. The first includes the preparations described in the U.S.A. Regulations of 1919 as "biologic products"—namely, vaccines, serums, toxins, antitoxins, and antigens, the second the group of synthetic substances comprising salvarsin and its analogues, and the third consists of insulin and preparations of the pituitary gland intended for use by injection. Provision is, however, made for the addition to the schedule of further substances.

The position in respect of these preparations has hitherto been increasingly unsatisfactory. The standards of the *British Pharmacopoeia*, based solely upon physical and chemical tests, are inapplicable to the substances included in the first two groups, and there is a general feeling that a number of products actually included in the *British Pharmacopoeia*, such as digitalis, strophanthus, cranialis indica, and ergot, require the additional safeguard of a physiological standard. In the case of the first group in particular the only guarantee of potency and authenticity available hitherto has been the name of the supplying firm and while the reputation of many British manufacturers is deservedly high, it must not be forgotten that the law demands from the individual manufacturer no proof of competency, and that the free import of these products from abroad is an additional risk.

The difficulty of the position was recognized by the General Medical Council as early as 1909, when the question of the edition of the *British Pharmacopoeia* published in 1914 was under consideration. At that time the President of the General Medical Council was authorized by the Pharmaceutical Committee to approach the Government with a suggestion for a public institution for the standardization of potent drugs and serums. No action was taken on these representations at the time, but when Dr. Addison became Minister of Health he appointed a departmental committee under the chairmanship of Sir Macdonald Chilmead to consider and advise upon the legislative and administrative measures to be taken for the effective control of the quality and authenticity of such therapeutic substances offered for sale to the public as cannot be tested adequately by direct chemical means. The committee examined a number of witnesses, including representatives not only of scientific bodies, but of the chief

firms engaged in the manufacture and sale of these preparations, and reviewed the systems of control adopted in America and on the Continent. Its inquiries showed that in the majority of European countries and in the United States official standards had been adopted and strict control was already in force, while British manufacturers were compelled in cases requiring biological assay to adopt foreign standards. A further result of the absence of control in this country was that products rejected as unsatisfactory by the competent authority in the country of origin could be sold freely in the United Kingdom, in competition with the home products.

The witnesses examined showed a remarkable degree of unanimity as to the nature of the problem and the method of its solution. Three things were clearly necessary for definition of standards, the provision of machinery for ensuring rigid adherence to those standards, and protection against the import of inferior foreign products. The committee reported in December, 1920, outlining a scheme for ensuring the desired result and bills drawn on the lines of its recommendations were introduced in the House of Lords in 1923 and 1924. Notwithstanding the uncontroversial nature of the measure and the general support it received from all the interests affected it failed to reach the House of Commons. Meanwhile the appropriate department of the League of Nations had gone into the general question, and the League had recommended its constituents to take steps which, in the absence of the imposition of adequate standards in this country, would exclude British products of this class from the European market. This fact doubtless contributed to the better success of the bill introduced by Lord Onslow last March.

The Act, which applies to England, Scotland, and Northern Ireland, seeks to provide for the definition of standards and the control of manufacture and import. The manufacture of the scheduled substances is to be conducted only by persons and on premises specially licensed for the purpose, and under such conditions as may be laid down by the licensing authority. The licensee may be laid down by the Act may at any time be suspended or issued under the Act may at any time be suspended or revoked subject to appeal to the courts. The licensing authority under the Act is for England, the Minister of Health, for Scotland, the Secretary of State for Scotland, and for Northern Ireland, the Minister for Home Affairs. The task of securing the desired uniformity is entrusted to a Joint Committee, consisting of the three authorities, named, or deputies appointed by them for the purpose, and acting after consultation with an expert advisory committee, consisting of one member appointed by the Minister of Health (chairman) and one member each appointed by the Scottish Board of Health, the Minister for Home Affairs of Northern Ireland, the Council of the Pharmaceutical Society of Great Britain, the Council of the Institute of Chemistry of Great Britain and Ireland, and the British Medical Association.

The Joint Committee is empowered to make regulations prescribing the standard of strength, quality, and purity of any substance to which the Act applies, the tests to be used for determining whether that standard has been attained, the units of standardization to be employed, the form of the licences, and the conditions of their issue. These conditions include provision for the inspection of premises, plant, and processes of manufacture, and the taking of samples. The Committee may also, by regulation, add to the schedule of which cannot be adequately tested by purely chemical means, an important proviso in view of the very narrow limits of the existing schedule. All imports must be consigned to a person licensed for the purpose by the appropriate authority, and must in addition satisfy the authority that they comply with the standards in force for the home product. The effective application of this restriction is provided for under the terms of the Customs Consolidation Acts.

The Joint Committee is further empowered to require that if any of these substances is advertised for sale as a proprietary medicine or contained in any such medicine a name descriptive of its true nature and origin shall

appear on the label, that the date of manufacture shall be stated on all containers, that no such substance shall be sold after the expiration of a given period from the date of its manufacture and that containers of a certain character, labelled in accordance with the regulations, shall be used.

At three points care has been taken to restrict the application of the Act. In the first place, the medical practitioner has been ensured full freedom to prepare any of these substances for the use of an individual patient. In the second, a provision is made for the issue of special licences to import to persons engaged in research, such licences permitting the import of experimental standards, and lastly, the Joint Committee is empowered to make regulations necessary to exclude from the application of the Act substances intended exclusively for veterinary use. Offences under the Act and Regulations will be punishable on summary conviction by fine not exceeding £100, or in the case of a second or third offence by imprisonment with or without hard labour, together with the forfeiture of any goods in connection with which the offence was committed, and, of course, revocation or suspension of licences where these have been granted.

It is intended that the work incidental to the determination of the required standards shall be carried out in the laboratory of the Medical Research Council and under its direction. The ordinary routine tests will be left to the individual manufacturers, but such control tests and such inspection of premises and processes of manufacture as may be thought necessary will be conducted by the Council's staff. Accordingly the expenses of administration will be borne on the vote for the Medical Research Council, and the policy adopted is thus made subject to periodical parliamentary review. All regulations under the Act will be laid before both Houses, and subject to modification or annulment under the ordinary procedure on presentation of an address by either House. The Act will be brought into operation by Order in Council not earlier than one and not later than two years from its original date.

SOUTH AFRICAN MEDICAL CONGRESS

The twentieth South African Medical Congress was held at Pietermaritzburg from July 6th to 11th, by the invitation of the Natal Inland Branch of the British Medical Association. The President of the Congress was Dr. D. Campbell Watt, president of the Natal Medical Council and a Vice-president of the British Medical Association. He was the general secretary of the Congress last year at Grahamstown. There were five sections, and presidents were not expected to give opening addresses, in their place a series of special introductions to the discussions was arranged. This has been the practice of the British Medical Association at its Annual Meetings for a good many years, and was followed at the South African Medical Congress at Johannesburg in 1912. The discussions were timed so as to avoid clashing with other sectional meetings, thus making it possible for every member of the Congress to be present.

PRESIDENTIAL ADDRESS

Dr. Campbell Watt referred to the previous South African Medical Congress in Pietermaritzburg twenty years before, and then discussed the subject of professional unity, illustrating his points by the example of co-ordination and unity elsewhere in nature. He said that the human body was rapidly becoming a miniature Westminster Abbey for the commemoration of the names of illustrious physicians and surgeons, such as Scrip's triangle, McBurney's point, Romberg's sign, and the Argill Robertson pupil were becoming so numerous that the body almost bristled with memorials. Although South Africa had long been notorious for its quack remedies, the legal position of medicine from the earliest settlement had always been that medical practice without a preliminary education and licensing should be prevented. He recalled the fact that in and prior to the fifteenth century unlicensed practitioners had been liable to excommunication by the Church, and that in 1511 a civil law was passed

prohibiting the practice of all quacks, though it was shortly afterwards repealed in consequence of popular clamour. The quack was much beloved by the general public, and even now there were to be found not a few otherwise intelligent people moving heaven and earth to obtain recognition for practitioners of strange methods from the United States and other countries. It was difficult to educate many members of the public, who were too prone to be influenced by the unorthodox, mystery, and copious advertising of new cures, despite the willingness of the medical profession to investigate any new theory or any new method of treatment, and to adopt it if found beneficial. The State had extensively and necessarily committed itself to the recognition of the medical profession, as regards both the treatment and the prevention of disease. It, therefore, could not logically extend its recognition to any class of institution of which the doctrines and methods were fundamentally opposed to orthodox principles and practice. The medical profession was a great democracy, and ruled itself within certain wide limits laid down by the State, each practitioner being free to hold any theory he approved and to practise any method he considered advisable. The principle of unity in the profession was evinced by the establishment of many voluntary associations for the promotion of the science and art of medicine, and for schemes of benevolence and defence. The greatest and most powerful of such societies within the Empire was the British Medical Association, under whose auspices the Congress was being held. The Association was not comparable with a trade union, since a society could only be legally registered as a trade union if its main objects were the material interests of its members as workmen. In contradistinction to this the main objectives of medical institutions were the promotion of the welfare of humanity through the advancement of medical science and the maintenance of the honour of the profession, while the actual work performed by medical societies was almost entirely scientific in nature. In fact, the constitution of the Association expressly prohibited the support of any objective which would make the Association a trade union. Dr Campbell Watt pointed out that the principle of unity as applied to various occupations was exemplified by the formation of the "guilds" in the Middle Ages. These institutions had begun in England in the seventh century, and on the continent of Europe in the eighth century, though previously there had been trade corporations in the later Roman period, preceded by somewhat similar Greek and Roman institutions. With the rise of national as against civic authority in the sixteenth and seventeenth centuries these guilds began to decline in authority and importance, but notable survivals of the guilds of physicians, surgeons, and barber surgeons were to be seen in their lineal descendants the Royal College of Physicians of London, the Royal College of Surgeons of England, and the corresponding institutions of Scotland and Ireland. The medical guilds did not seem to have arisen until early in the fourteenth century, probably because for centuries prior to that time the practice of the art of healing lay chiefly in the hands of the clergy, although from time immemorial physicians and surgeons had existed apart from the priesthood. During the reign of the Dutch East India Company at the Cape the chief surgeon had had to certify the fitness of any person applying for leave to practise, and examinations were held from time to time. A Supreme Medical Committee was formed in 1807, and re-established in 1825, five years later a Colonial Medical Committee was appointed to examine applicants for a licence to practise. It imposed a penalty of £30 on any person practising without a licence. This ordinance was superseded in 1891 by the existing Medical and Pharmacy Act, under which was formed the Colonial Medical Council. In Natal a similar committee had been formed in 1850, and the Natal Medical Council was constituted in 1896. In the Transvaal it was not until 1881, under the British occupation, that medical practice was properly regulated by law, five years later the Republic appointed a Medical Committee of the South African Republic, and in 1904 the present Transvaal Medical Council was established. In the same year a Medical and Pharmacy Council of the Orange Free State was appointed. A Capetown Medical Society existed from

1828 to 1847, and besides the reading of scientific papers it drew up ethical rules, established a widows' and orphans' fund, and framed a tariff of fees, for a time it acted as a Medical Council and court of arbitration. In 1883 the South African Medical Association was formed, which in 1888 became the Western Province Branch of the British Medical Association. Since that time the Association had increased in members and prestige, until now it included nearly one-half of the practitioners of South Africa. The President appealed to the other smaller voluntary societies existing in various parts of the country to unite with the Association. He emphasized the principle that unity was strength, and concluded by pointing out the present need for strength and vigorous activity in all parts of the medical profession, medical congresses were a valuable means to such ends, and promoted fraternity, while affording full opportunities for the free discussion of scientific and professional problems.

INaugural Address

Sir John Dove-Wilson, Judge President of the Natal Division of the Supreme Court, delivered the opening address of the Congress which was entitled "Bench, Bri, and Medicine." He described the way in which the judicial courts and the medical profession were jointly concerned in the fulfilment of a high and onerous duty to society. It depended he said to a large extent on the guidance received from medical men whether the administration of the law resulted in justice. After illustrating the way in which medical practitioners were expected to co-operate the speaker explained what the law required of the medical witness in the great variety of cases in which his assistance was necessary. He then referred to the question of actions brought against medical practitioners and defined the underlying principles. After dealing with the difficult point of professional secrecy, he acknowledged the great debt owed by the law to medicine for its local co-operation.

SECTIONS

The five sections of the Congress were Medicine and Mental Hygiene, Surgery, Public Health, Special Subjects, and Obstetrics and Gynaecology. A discussion was held in the Medical Section on focal infection, and in the Surgical Section on the treatment of carcinoma of the breast. The Public Health discussion related to the public health aspects of the milk supply, and in the Special Subjects Section the work of the laboratory in relation to the practice of medicine was considered. The causation and prevention of foetal death was the primary subject in the Section of Obstetrics and Gynaecology.

BUSINESS MEETINGS

Business meetings were held on two days. An invitation from the local branches of the British Medical Association and the South African Medical Association to hold the next Congress at Pretoria was accepted after some discussion as to whether it was in accordance with the rules to accept an invitation from other than a Branch of the British Medical Association. Other matters considered were childhood welfare organization, the notification of arrested leprosy, the great need for district work in the obstetrical training of medical students and pupil midwives, and some problems relating to medical ethics.

ENTERTAINMENTS

A large number of receptions and excursions had been arranged, and visits were paid to the Howick Falls, the South African Paper Factory, the Natal Museum, and other places of interest. Various recreations, including golf and tennis tournaments, boating on the river, bowling, and croquet, were also provided. A popular lecture, which was a new feature of these Congress meetings, was delivered by Dr Shadeli Higgins, medical officer of health for the City of Capetown, who took as his subject "Public health in relation to social welfare." An interesting trades exhibition attracted much attention.

The *South African Medical Record*, in its issue of July 25th, gives an account of this Congress. In addition to publishing in full the pre-sidential and inaugural addresses, the issue includes the introductory speeches of the discussions in the Sections of Medicine and Obstetrics.

CURRENT NOTES

The New House of the Association

MEMBERS in or visiting London are cordially invited to inspect the new House of the British Medical Association in Tavistock Square. On application to the porter at the gate arrangements will be made to show them round, together with any friends they may bring with them. Large accommodation is available while members are using the building.

The British Medical Association Charities Fund

An old member of the Association, who had arranged in his will some years ago to leave something to medical charities, has been led by the discussion which took place at the Annual Representative Meeting at Bath¹ to alter his dispositions so that the sum of £1,000 will be left at the disposal of the British Medical Association Charities Committee. The member called at the office to make inquiries, and, after coming to the decision that in this way his money would be best used in the interests of the profession and of the Association, he gave permission for his intention to be announced, in the hope that it might encourage others to do likewise.

Treasurer's Cup Golf Competition

The attention of Division secretaries and members of the Association generally is drawn to the rules and regulations appearing in the SUPPLEMENT of August 22nd 1925 (p. 93) regarding the Treasurer's Cup golf competition, from which it will be seen that the first stage of the competition begins on October 1st, by which date all intending entrants must notify their intention to the secretary of the local Division.

Assistant Medical Officer and School Medical Officer
Wigan

In the list of appointments appearing under the heading "Important Notice" in our advertising columns will be found the post of assistant medical officer and school medical officer to the county borough of Wigan. The advertisement for this appointment was tendered to the Journal and refused, because the corporation is only offering £500 per annum while requiring a high degree of

experience and competence. The appointed officer will have, *inter alia*, to do maternity and child welfare work, the medical inspection and treatment of school children, and certification and supervision of mental defectives. Candidates must have had special experience in diseases of women and children, obstetrics, and child welfare work, and the possession of a Diploma in Public Health and experience in refractions are stated to be desirable. It is earnestly to be hoped that practitioners possessing the necessary qualifications will, by refraining from applying for this post, assist the British Medical Association in its mission of improving the conditions of public health officers in this country. It must not be forgotten that the proportion of senior posts to junior in the public health service is such that only about one in five of those who enter the service can ever expect to reach a senior post, the salaries of which average between £800 and £1,000. Most of the junior officers are entering what is virtually a blind alley service, and therefore it is essential that the commencing salary should be a reasonable one.

Conference of Representatives of Local Medical and
Panel Committees

In connexion with the first Panel Conference to be held in the British Medical Association House, Tavistock Square, on Thursday, October 22nd next, the attention of honorary secretaries is drawn to the following dates:

September 21st Last date for receipt of motions for inclusion in Provisional Agenda of Conference.

September 30th Issue of Provisional Agenda of Conference which will include motions sent in by Committees and by the Insurance Acts Committee and be accompanied by the Insurance Acts Committee's annual report.

October 12th Last day for receipt of motions for inclusion in the Final Agenda.

October 15th Issue of Final Agenda.

Election of Direct Representatives upon Insurance
Acts Committee

It is desired to draw attention to the fact that nominations for the twenty-three direct representatives upon the Insurance Acts Committee for 1925-26 must be by Local Medical and Panel Committees as such, and must reach the Medical Secretary, British Medical Association House, Tavistock Square, W.C.1, on form M 2/1925-26 (copies of which will be furnished upon application) not later than the first post on October 12th, 1925. Nominations by Scottish County Panel Committees for four county panel representatives on the Scottish Sub-committee or the Insurance Acts Committee must be made on nomination paper M 3, and by Scottish Burgh Panel

¹ SUPPLEMENT August 1st 1925 (pp. 59-62)

Committees for four burgh representatives on the Scottish Sub-committee must be on nomination paper M 4, and must reach the Medical Secretary by the first post on October 12th.

An Oversea Opening

The Medical Secretary has been told of an opening in Newfoundland for a young, keen, and active doctor who would enjoy a life which the Medical Secretary's correspondent describes as a "rugged" one. Any medical man who feels attracted by the prospect is invited to write to the Medical Secretary for further particulars.

Meetings of Branches and Divisions

DORSET AND WEST HANTS BRANCH WEST DORSET DIVISION

The last meeting of this Division took place on September 9th. It was a social meeting to which members brought their friends of both sexes. The party which numbered between 60 and 70 met at Milton Abbey at 2.30 p.m. and inspected it by kind permission of Sir Eric Hambro and under the guidance of the Rev. H. Pentin, who had been Vicar of Milton for thirteen years. Afterwards the party proceeded through the grounds and climbed to St. Catherine's Chapel, which was also inspected. Later Abellingham Hall was visited and tea was provided there by the generosity of the owner Mr. G. Cochrane. After tea, members and their friends strolled round the beautiful house and gardens. A pleasant afternoon terminated at about 6.15 p.m.

YORKSHIRE BRANCH YORK DIVISION

A MEETING of the Division was held on August 26th in the York Medical Society's Room with Dr. J. G. Craig in the chair.

The HONORARY SECRETARY stated that the medical officer of health Dr. P. R. McNaught had drafted for publication a leaflet on cancer and had submitted it to the Executive Committee. A number of suggestions were made and accepted by the medical officer of health and the leaflet is amended and with the approval of the Committee. It was not intended to broadcast the leaflet but that it should be handed to people asking for advice. Dr. McNaught thanked the Division for its assistance.

Dr. H. E. KILG RAY, who acted as spokesman of a deputation to the Health Committee of York Corporation on the subject of hospital accommodation, reported that several individual cases had been gone into in detail and he thought some impression had been made. The Medical Officer of Health said that plans for extension of the fever hospital were being produced and that considerable improvement in accommodation would result particularly in the shape of a cubicle block for miscellaneous infectious disease.

The HONORARY SECRETARY reported on the presentation of a flag representing the Division for the decoration of the Great Hall in the Association's new house in London. He was instructed to use another circular asking the members who had not subscribed to the Flag Fund to do so.

Dr. PETER MACDONALD referred to the meeting of the Yorkshire Branch on September 26th and to the exhibition of human embryos (transparent) which he had seen at the Annual Meeting at Bath. He said the specimens were excellent. The Department of Embryology, University College, was appealing for further specimens of embryos, abortions, tubal pregnancies, etc. and he hoped members would forward any specimens which came into their hands. Dr. MacDonald then fully reported on the Annual Representative Meeting at Bath dealing more particularly with items of interest to the Division. In concluding Dr. MacDonald announced that he had been reappointed a member of the Insurance Acts Committee and of the Central Ethical Committee. In answer to Dr. MILLS Dr. MACDONALD stated that members who subscribed through the British Medical Association Charities Committee would be able to earmark amounts for various charities (national or local). In answer to Dr. LATH he expressed the opinion that it would be well for the Division to pass a resolution on the question of the payment of medical staffs of hospitals in respect of certain accident cases in the form recommended by the Council of the Association and after discussion the following resolution was passed *unanimously*.

That the Medical Board of the York County Hospital should be asked to consider the following resolution adopted by the Representative Body of the British Medical Association:

That in all cases of accident where medical attendance is given at a voluntary hospital and such medical attendance is covered either directly or indirectly by insurance the hospital authorities should recover from the insurance company the full cost of maintenance and treatment of such patient. That where patients who would ordinarily be considered as private patients are admitted to hospital solely on account of accident or emergency they should be considered as private patients.

A hearty vote of thanks to Dr. MacDonald for his excellent services as Representative of the Division was carried with acclamation.

The HONORARY SECRETARY read an extract from a circular by the Medical Secretary on the inadvisability of practitioners sending patients to opticians and he was instructed to issue a circular on similar lines to all members of the profession in the area of the Division warning them against this practice.

Dr. LOUISE FRASER (consultant medical officer to the York Maternity Hospital) opened a discussion on puerperal pyrexia and

mortality and expressed the opinion which was emphasized by statistics that there was great urgency to take some steps to reduce this mortality particularly in the direction of improved antenatal care on the part of medical practitioners. Dr. MACDONALD proposed that the matter be referred to the Executive Committee to see what steps could be taken and to take what ever steps seemed advisable. In seconding Dr. McNaught gave statistics of the maternal deaths in York during the last five years which showed that the general rate of maternal mortality in York was 4, as compared with 4.68 per 1000 for England and Wales. The resolution was carried.

Association Notices

BRANCH AND DIVISION MEETINGS TO BE HELD

BIRMINGHAM BRANCH WEST BROMWICH DIVISION—The fourth regular meeting for 1925 of the West Bromwich Division will be held in Parish's Restaurant, Lombard Street, West Bromwich, on Tuesday, October 6th, at 8 p.m. The meeting will take the form of a supper, and Mr. B. T. POSE, F.R.C.S., of Birmingham, will read a paper on surgery in general practice.

BORDER COUNTIES BRANCH DUMFRIES AND GALLOWAY DIVISION—The next meeting of the Division will be held in the Royal Infirmary, Dumfries, on Thursday, September 24th, at 3.30 p.m. when Dr. John Marshall, M.C., of Glasgow and Dumfries will deliver a lecture on the iris and pupil illustrated with stereoscopic slides and cases. Dr. Livingston and others will exhibit specimens.

CAPE OF GOOD HOPE (WESTERN) BRANCH—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday, October 30th, at 8 p.m. when there will be a symposium of neuro-symphyls arranged by Dr. J. H. HOOPER. Among the speakers will be Dr. J. S. du Toit, Dr. A. Reith Fraser, Mr. J. Lückhoff, Dr. W. P. Mulligan and Dr. E. W. D. Swift.

LANCASHIRE AND CHESTER BRANCH STOCKPORT MACCLESFIELD AND EAST CHESTER DIVISION—A meeting of the Division will be held on Thursday, September 24th, in the Mayor's Parlour, Congleton (by kind permission of the Mayor) at 4 p.m. A report from Dr. L. J. Pielon will be received in the Annual Representative Meeting at Bath.

METROPOLITAN COUNTIES BRANCH WEST HERTS DIVISION—A meeting of the Division will be held at the Lister Institute, Ulster, on Thursday, September 24th, at 3 p.m. After the meeting there will be a short address on the work of the Institute by Dr. Petrie, followed by a demonstration of the methods employed for the production and testing of sera and antitoxins. Tea will be provided at the Institute.

MIDLAND BRANCH DERBY DIVISION—A meeting of the Derby Division will be held at the Devonshire Hospital, Buxton, on Wednesday, September 23rd, at 5 p.m. Papers—(1) Dr. J. Barnes, Burt physician to the hospital, various types of chronic arthritis and their treatment illustrated by cases. (2) Dr. Eric Riddle, bacteriologist to the hospital, indications and scope of vaccine treatment in arthritic disease. Cases of special interest will be shown by members of the hospital staff. After tea there will be a discussion.

NORTH OF ENGLAND BRANCH SUNDERLAND DIVISION—A scientific meeting will be held at the Royal Infirmary, Sunderland, on Wednesday, October 7th. All medical practitioners in the area of the Sunderland Division, whether members or not of the British Medical Association, are invited to be present. The annual address will be given by Dr. Crichton Miller on Thursday, November 12th, and the annual dinner will be held the same evening.

NORTH WALES BRANCH—A special joint meeting of the North Wales Branch with the members of the North Wales Division of the National Veterinary Medical Association will be held at the Queen Hotel, Chester, on Tuesday, September 22nd, at 1.45 p.m. The subject for discussion is clean and pure milk and the administration of the Milk and Dairies Consolidation Acts and the Tubercle Ordinance 1925. Speakers will deal with the following subjects: the Veterinary Mr. J. S. Lloyd F.R.C.V.S. (Sheffield), the Medical Officer of Health Dr. E. L. Parry Edwards (Carmarvon), the General Medical Practitioner Dr. J. C. Davies (Wrexham), the Agricultural Mr. G. Jones B.Sc. (Llangefni), the Public Analyst Mr. H. F. Lowe M.Sc. F.I.C. (Chester), the Bacteriologist Dr. W. H. Grace (Chester). A general discussion will follow. It is hoped that there will be a good attendance of members.

OXFORD AND READING BRANCH OXFORD DIVISION—In place of the complete post graduate course which has been temporarily suspended a series of ward and out-patient demonstrations under the auspices of the Oxford Division will be given by members of the honorary staff of the Radcliffe Infirmary on the afternoons of the week commencing October 5th. The demonstrations will be open to both members and non-members of the British Medical Association. To those notifying Dr. William Stobbs (honorary secretary), 310 Banbury Road, Oxford, of their intention of being present on any afternoon a detailed programme will be sent towards the end of September. There are no fees.

SOUTHERN BRANCH—A meeting of the Branch will be held at the South Western Hotel, Southampton, on Thursday, September 24th, at 2.5 p.m. Agenda: Correspondence, financial statement, letter from Honorary Secretary, Isle of Wight Division, and letter from Sir S. Guise Moore, K.C.B., C.M.G., accepting the office of President. Fleet paper by Dr. L. P. Firman Edwards (Ryde) on the significance of blood counts, to be followed by a discussion.

THE MEDICAL REGISTER UNTRACEABLE PRACTITIONERS, 1925

We are requested by the Registrar of the General Medical Council to publish the following list of medical practitioners who have not replied to his inquiries as to the accuracy of their addresses. Anyone who finds his or her name included in this list should communicate immediately with the Registrar of the General Medical Council, 44, Hallam Street, Portland Place, London, W 1, otherwise the name will be omitted from the next issue of the Medical Register

CURRENT NOTES

The Council Dinner

THE fourth Council Dinner will be held in the Great Hall of the Association's House on Wednesday, October 21st, at 7 for 7.30 p.m. The price of the tickets will be 12s 6d, exclusive of wine, and early application is strongly recommended. There are many difficulties to be surmounted in this the first attempt to hold such a function in the new House and whether the experiment can be repeated or not will depend very largely on the support which the Council gets on this occasion. Members may bring friends, and ladies will be welcomed. Application, accompanied by a cheque, should be made to the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W.C.1.

Flags for the Great Hall

As previously announced, it is hoped to hang in the Great Hall of the New Headquarters Building a flag from each place in which an Annual Meeting of the Association has been held and those who have seen the Great Hall will realize how much these flags add to the impression made on every visitor to the Hall. There is, moreover, reason to believe that the flags will have a distinctly good influence on the constitution of the hall and it is therefore hoped that the vacant niches for flag-staffs will soon be filled. We have previously announced the effect of flags from the following: Aberdeen, Bournemouth, Bradford, Edinburgh, Glasgow, Leicester, London (City of), Montreal, Nottingham, Toronto, Worcester, and Birmingham. Carlisle, Newcastle-on-Tyne, Sheffield, and Swansea. Of these the first twelve have already been received and are hung. Those from Birmingham, Carlisle, Newcastle, Sheffield, and Swansea are it is believed on the way. Flags from Cardiff, Liverpool, and Manchester, not previously mentioned in our

columns, have been delivered and are now hanging in the hall, and Brighton has just announced its intention of presenting a flag. The Council would be glad to hear from other areas which are not yet represented in the Great Hall.

Badges for Branch and Division Officers

It will be remembered that the Representative Body has approved the idea of the provision of badges for officers of Branches and Divisions of the Association, not only as a means of distinguishing these officers at meetings which are attended by members who do not know them, but in the belief that such badges will add to the dignity of the office. It is hoped that officers' badges will be provided either by a voluntary subscription from members of the Association units, or as a gift from previous or present holders of office. The badges are now available at prices which vary in accordance with the material of which they are made. Particulars may be obtained from the Financial Secretary, British Medical Association House, Tavistock Square, London, W.C.1. The accompanying illustration shows the type of badge designed for an honorary secretary of a Branch or Division.

Care of Certificate Books

The Ministry of Health has issued to Insurance Committees a circular stating that a case has recently come to light in which sickness benefit was fraudulently obtained over a long period by an insured person by means of forged medical certificates, the blank forms having apparently been stolen from the doctor's consulting room. The Ministry asks Insurance Committees to draw the attention of practitioners to the importance of certificate books being kept under conditions which will prevent the blank forms falling into the hands of unauthorized persons. The warning applies of course not only to medical practitioners and to insurance certificates but to all practitioners and their certificates and it would be well if all doctors who keep any kind of printed form of certificate would see that such forms are not kept in a place where they can easily be appropriated and used by unauthorized persons.

The New House of the Association

Members will be glad to hear that the Members' Lounge or Common Room is ready for use. The room is a large one and the accommodation very comfortable, light refreshments are available both at lunch and tea time at very reasonable prices. Those who are unfamiliar with the location of the Association's new House in Tavistock Square will no doubt welcome the following information as to means of access which has been compiled by the Financial Secretary and Business Manager:

Omnibus Routes

The Carmarthenshire Education Committee and its Assistant School Medical Officer

It is satisfactory to note that the Carmarthenshire Education Committee has resolved to offer £600 a year for an experienced assistant school medical officer, or £500 a year, during a probationary period for one with less experience. The decision came after an attempt to secure an officer at a commencing salary of £400. Eight applications were received for the post, but the chairman of the sub-committee concerned believed that, in consequence of the representations of the British Medical Association, several of the candidates would withdraw. According to a local newspaper the usual complaints about the "arbitrary action" of the British Medical Association were made, one gentleman talked about dying in the last ditch rather than give way to the threat of the Association. But the wiser members of the committee held that it would pay the county to have a full choice of medical officers specially qualified for this work, and, in particular, to have one who would be able to work in complete harmony with the local profession. The Carmarthenshire Education Committee is to be congratulated on this far-sighted action, which may cost the ratepayers a trifle more at the beginning, but is much more likely to secure the kind of medical officer that is wanted than the offer of a salary which at once excludes all loyal members of the British Medical Association.

Association Notices**BRANCH AND DIVISION MEETINGS TO BE HELD**

BIRMINGHAM BRANCH—The annual meeting of the Birmingham Branch will be held at the Medical Institute Birmingham on October 15th at 3.30 p.m.

BIRMINGHAM BRANCH WEST BROMWICH DIVISION—The fourth regular meeting for 1925 of the West Bromwich Division will be held in Linn's Restaurant Lombard Street West Bromwich on Friday, October 10th at 8 p.m. The meeting will take the form of a supper and Mr. B. T. Pocklington F.R.C.S. of Birmingham will read a paper on "Urgency in general practice."

CAPE OF GOOD HOPE (WESTERN) BRANCH—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday, October 10th at 8 p.m. when there will be a symposium on neuro-syphilis arranged by Dr. F. H. Keen. Among the speakers will be Dr. J. S. Tait, Dr. A. Reith Fraser, Mr. J. Luckhoff, Dr. W. P. Mulligan and Dr. E. W. D. Swift.

METROPOLITAN CITIES BRANCH WILLESDE DIVISION—A Christmas meeting of the Willesden Division will be held at Park Road Hospital, Acton Lane on Friday, October 10th at 3.15 p.m. and will be conducted by Dr. W. E. Turner, the resident medical officer. Entries for the Treasurer's Cup golf competition should be sent to Dr. Pughan, Town Hall, Dene Road N.W.6, before October 11 at 2 p.m.

NORTH OF ENGLAND BRANCH CLEVELAND DIVISION—Mr. J. Paull Hall M.Chir. F.R.C.S. of Bradford, Ex-President of the Association will address the Cleveland Division in Middlesbrough on Thursday, October 22nd. The subject of the address will be "Announcement of later Members of neighbouring Divisions are cordially invited."

NORTH OF ENGLAND BRANCH SUMMERLAND DIVISION—The annual address will be given by Dr. Crichton Miller on Thursday, November 12th and the annual dinner will be held the same evening.

NORTHERN COUNCIL OF SCOTLAND BRANCH PART II ELGIN AND NAIRN DIVISION—The autumn meeting of the Banff, Elgin and Nairn Division will be held in the Grand Hotel Elgin on Friday, October 2nd at 6.30 p.m. As matters of great importance to the Division will come up for discussion a full attendance of members is requested (particularly of those from the Banff area). The annual dinner will thereafter be held at 7.30 p.m. So that members may bring guests especially if these be practitioners in the area who are not members of the Association.

OXFORD AND PLAINING BRANCH OXFORD DIVISION—Outpatient demonstrations and ward visits (by kind co-operation of the honorary staff) will take place at the Padellet Infirmary each afternoon (except Sundays) from Monday, October 5th to Wednesday, October 10th. Members and non-members of the Association are invited. There are no fees. Tea will be provided each afternoon.

SURREY BRANCH CROYDON DIVISION—A general meeting of the Croydon Division will be held at the Croydon General Hospital on Tuesday, September 23rd at 8.30 p.m. Matters for consideration include badges for officers' report of Representatives at Annual Representative Meeting 1925, report of Secretary on Conference of Secretaries at Bath.

SURREY BRANCH GUILDFORD DIVISION—The first meeting of the winter session of the Guildford Division will be held at the Royal Surrey County Hospital, Guildford on Thursday, October 8th at 1.30 p.m. Tea will be served at 4.15 p.m. Dr. W. Langdon Brown will give an address on the future of ophthalmology. The annual dinner will be held after the meeting at the Angel Hotel, Guildford at 6.30 p.m. (morning dress). Tickets 5/- 6/- exclusive of wine.

National Insurance**OPHTHALMIC BENEFIT FOR INSURED PERSONS**

From time to time references have been made in the JOURNAL to the arrangements which the British Medical Association is making with the Ministry of Health for the provision of ophthalmic benefit for insured persons. It will now be useful to summarize the present position.

In consequence of the efforts of the Association, in co-operation with the Council of British Ophthalmologists and the Ophthalmic Benefit Committee, and with the help of the Ministry of Health, an arrangement came into force on July 1st, 1925, under which members of those approved societies which provide ophthalmic benefit must, in the first instance, consult their insurance practitioners who, in accordance with a new Regulation, is under obligation to give a recommendation in writing, if so desired by an insured patient, as to the need for ophthalmic treatment which is not within the scope of the practitioner's duties. The obligation applies to any insured person who, in the opinion of the medical practitioner, requires ophthalmic treatment, whether or not he is incapable of work. There is no official form for the purpose, and the practitioner is not entitled to demand a fee for giving such a recommendation. This recommendation is then sent by the insured person to his approved society, and the approved society, if it has adopted the new scheme, will take appropriate action. The member will be instructed by the society how to proceed.

A list of registered medical practitioners having special experience of ophthalmic work, who are willing to advise on such cases and prescribe spectacles at a fee of £1 is has been drawn up by the British Medical Association, and this list is available for the use of societies, and copies will be supplied to them by the Ministry on request. It is expected that insured persons will be instructed to make

an appointment for examination by one of the nearest available practitioners on the list.

The memorandum (Memo 288) of the Ministry of Health dealing with this question, which has been issued to the societies, says:

For any ophthalmic treatment including examination and prescription for glasses in respect of which the benefit is granted the society will under the scheme pay the whole cost. The Committee may also pay the members travelling expenses and it is recommended that this should be done at any rate where the amount is more than a few pence.

The circular then goes on to describe the dealings of the approved society with opticians as regards the provision of glasses.

A good deal of correspondence has been reaching the Medical Secretary which shows that many practitioners whose names are on the special list do not realize that the societies which have at present adopted the new scheme represent a comparatively small number of insured persons, though there are a considerable number of these societies. The schedule relating to this benefit is at present applicable only to those societies and branches which have been valued as at December 31st, 1922. These societies are, speaking generally, the smaller societies, and upwards of 600 of them have adopted ophthalmic benefit, in addition to a large number of branches of the affiliated Orders, the membership in each case being in general a small and localized one. The larger societies are valued as at December 31st, 1923, and then new schemes of additional benefits will only come into operation in July, 1926. As the new schedule relating to ophthalmic benefit is not incorporated in the existing schemes of these large societies, which cover by far the greater number of insured persons, uniformity in the schemes will not be obtained before the middle of next year.

The special list has been sent, not only to approved societies on application, but to the Insurance Committees. The first list contains some 550 names, and additional names will be sent by the Association to the Ministry of Health on the first of every month. The Ministry is promised to circulate these additional names to the societies concerned at frequent intervals, probably every two months.

In answer to a question as to how the specialist might expect to obtain payment for his services, the Ministry states:

This is a matter the details of which are left in the hands of the committee of management of each individual society or branch administering the benefit. Ordinarily the insured member would be furnished with an ophthalmic benefit letter by which the society authorizes the member to go in a suitable case to one of the medical practitioners on the list. The production of the society's letter of authorization will indicate the procedure it has adopted and should be sufficient authority for the medical practitioner and it does not appear that the retention by the practitioner of any document should be necessary. Normally it is believed the society will itself pay the fee of £1 1s to the practitioner after the member's treatment has been completed subject to the member having given the necessary formal authority to the society to make the payment.

Practitioners who are asked to recommend patients to obtain ophthalmic treatment will in general be required to do this by means of a note to the approved society, but sometimes a form will be presented to them in which the practitioner may be asked to sign a recommendation that the patient should be sent to an optician. All that need be done in this case is to make an alteration in the form indicating that the patient should go to a registered medical practitioner on the list. It should also be observed that it is not in order for insurance practitioners formally to recommend particular names on the list. The list has been established by the Association with the view of giving free choice of consultant to the insured person, and it is expected that the patient will be allowed by his society to select the specialist to whom he intends to go. There is of course, no reason why the insurance practitioner should not in conversation recommend his patient to choose the specialist whom the practitioner would himself select.

Naval and Military Appointments

ROYAL NAVAL MEDICAL SERVICE

SURGEON COMMANDERS A. J. SHELDON and J. P. SHORTEN D.S.C. to the Resident for R.N. Medical Store Depot Deptford for twenty-eight days. N. S. CURRENT NOTES

The Association's New House A French Impression

THE September issue of *Le Medecin Syndicaliste*, the official organ of the Union des Syndicats Medicaux de France, contains an article by the president of the union, Dr Fernand Decourt, giving an appreciative account of his visit to London last July, as the representative of the union, for the Royal opening of the British Medical Association's new House. On receipt of the friendly invitation from London, Dr Decourt says, it was decided to accept it so as to take the opportunity of drawing closer the relations between the two great national groups. "Thus it was that I had the honour of representing the practitioners of France at this family festival, along with the presidents and secretaries of other medical bodies representing in like manner the practitioners of their respective countries." Before passing on to outline his hope for the future—the setting up of an international union of medical practitioners—Dr Decourt expresses his thanks to the British Medical Association and particularly to the Medical Secretary (of whose warm courtesy he already had personal knowledge) for the friendliness of the welcome he received here. Something more than ordinary polite applause during his presentation to the King and Queen, as the representative of France made him feel clearly the sincere and vibrant sympathy of the British medical profession for France and French practitioners and on behalf of his 16,000 fellow members of the Union des Syndicats Medicaux de France he thanks them. British comrades. Dr Decourt records his astonishment at the size and splendour of the new House and, above all, at the magnificent Great Hall (its columns capitals and nave calling up memories of some Romanesque church), where under the heraldic flags of its Branches more than 600 representatives of the Association can sit in comfort. Thus, on his return home, has made him regret the more that the practitioners of France have not backed up better the praiseworthy efforts of his friend Dr Thoiry Secretary of the Association Generale, who has so ardently put forward the idea of establishing in Paris a common centre

where could be housed under one roof the manifold activities, now scattered, of the French medical profession. In France, he says, they act in open order, in England in solid formation and he holds up as an example to his fellow members the British Medical Association, which with its service in so many different directions, combines the functions of a number of scientific and professional bodies, metropolitan and provincial, and has grouped the British profession into a compact yet flexible mass, able to act as a whole "while we in France jealously keep ourselves scattered, fragmentary."

The Sir Charles Hastings Clinical Prize for General Practitioners

The Council of the British Medical Association has decided to establish experimentally an annual prize—"The Sir Charles Hastings Clinical Prize"—of fifty guineas for an essay or lecture for the purpose of stimulating systematic observation, research, and record in general practice. The Council believes that systematic observation by general practitioners, along selected lines of clinical study, may result in the production of practical contributions of great value by those who are in a favourable position for following disease through its various stages.

The first prize will be awarded in 1926, and the conditions governing its award as adopted by the Council on April 16th, 1924, are as follows:

Regulations

1 This prize is established by the Council of the British Medical Association for the promotion of systematic observation, research, and record in general practice, it includes a money award of the value of fifty guineas.

2 Any member of the Association who is engaged in general practice is eligible to compete for the prize.

3 The work submitted must include personal observations and experience of the candidate collected in general practice, and a high order of excellence will be expected. If no essay entered is of sufficient merit no award will be made.

4 Essays, or whatever form the candidate desires his (or her) work to take, must be sent to the Medical Secretary, British Medical Association, B.M.A. House, Tavistock Square, W.C.1, not later than December 31st, 1925, and

[1109]

BRANCH AND DIVISION MEETINGS TO BE HELD

BIRMINGHAM BRANCH—The annual meeting of the Birmingham Branch will be held at the Medical Institute, Birmingham, on October 15th, at 3 30 p m.

BIRMINGHAM BRANCH West Bromwich Division—The fourth regular meeting for 1925 of the West Bromwich Division will be held in Pugh's Restaurant, Lombard Street West Bromwich on Tuesday, October 6th at 8 p.m. The meeting will take the form of a supper and Mr B T Rose, F.R.C.S., of Birmingham will read a paper on surgery in general practice.

- 5 If any question arises in reference to the eligibility of the candidate or the admissibility of his essay, the decision of the Council on any such point shall be final
- 6 Each essay must be distinguished by a motto, and must be accompanied by an envelope marked with the same motto and enclosing the candidate's name and address
- 7 The candidate who gains the prize shall be invited to deliver the Annual General Meeting

7 The candidate who gains the ward shall, if the Council so desires, publish his paper in the BRITISH MEDICAL JOURNAL or deliver a lecture on the subject thereof at a meeting of the Association

8 Inquiries relating to the

8 Inquiries relative to the prize should be addressed to
the Medical Secretary, B.M.A. House, Tavistock Square,
London, W.C.1

MOH for Selkirkshire

In a Current Note headed "MOH for Selkirkshire" published in the SUPPLEMENT of August 1st, attention was directed to the fact that the Selkirk County Council was, for the second time in twelve months, seeking to fill the post of medical officer of health at the old salary—£100 less than the minimum approved by the British Medical Association. The hope was expressed that no applicants would be forthcoming, but, according to a report in the *Southern Reporter* of September 17th, there were no fewer than ten candidates for the post, and one of them has been appointed. It is discouraging to observe that members of the medical profession can still be found willing to accept a parsimonious local authorities in keeping down the remuneration for important public posts. The list of authorities which, with more regard for the real interests of the public health, have fallen in with the scale approved by the Association and the Ministry of Health is steadily winging, but Scotland may take what encouragement it can in the fact that its health authorities appear to be less anxious to get a full and free choice of suitable candidates than their colleagues on the other side of the border.

Under the heading 'Clean Advertising' Dies" our contemporary, the *Journal of the American Medical Association* recently printed a short editorial article, which we venture to quote in full for the encouragement of those newspaper proprietors and advertising agents in this country who, under the influence of the British Medical Association's campaign, are becoming ashamed of the worst forms of patent medicine advertising in British periodicals. The paragraph runs as follows:

In the recent death of Victor T. Lawson publisher of the *Chicago Daily News* the cause of public health has suffered a great loss as has that of clean journalism. As one of the greatest newspaper properties in the United States if not indeed in the world the *Daily News* carries and has for years carried an enormous amount of advertising. About ten years ago much of the present medicine advertising in the *Daily News* was open to serious criticism. A letter written to Mr. Lawson was open headquarters office of the American Medical Association calling his attention to the character of some of the patent medicine copy resulted in a drastic change in the methods governing the acceptance of advertisements of this type. Mr. Lawson immediately went to the expense of having analyses made of scores of patent medicines whose advertisements were offered to the *Daily News*. The chemists' reports were then turned over to the personal physician who passed on the therapeutic claims made for the products in the light of the composition as shown by his analyses. If the physician's report was unfavourable as in many many instances it was the advertisement was turned down. Mr. Lawson's physician was in constant touch with the Bureau of Investigation (Propaganda Department) of the American Medical Association getting from it all the available information regarding widely advertised nostrums. While some of the medical advertisements in the *Chicago Daily News* are still open to criticism the paper can furnish of pregnant as one of the cleanest in medical copy in the world. More recently—in fact just before his death—Mr. Lawson's diagnosis of the Papersonian interest and the service of his patient was in and exposure made by the Bureau of Investigation and the American Medical Association. The firm selling the medicine should inspire confidence and the future should lead those who have been misled by the Chicago Daily News in the future.

Wednesday, October 14th Members and non members of the Association are invited There are no fees Tea will be provided each afternoon

SOUTH WALES AND MONMOUTHSHIRE BRANCH SWANSEA DIVISION—The annual dinner of the Swansea Division will be held on Thursday, October 8th at 7.15 p.m. at the Hotel Metropole Wind Street Swansea Price of tickets 12s 6d each (exclusive of wines) Ladies may be invited To facilitate arrangements it is hoped that all those who desire seats to be reserved will apply immediately No places can be reserved after Monday October 5th The dinner will be served at separate tables Parties of members and their guests will be arranged for on application being made Applications for seats accompanied by cheque must be sent to Dr H R Tighe 36, Lion Street Swansea Medals and decorations (miniatures) to be worn Cars may be left at the Auto Garage Company Fisher Street

Meetings of Branches and Divisions

YORKSHIRE BRANCH

The autumn meeting of the Yorkshire Branch was held at the Royal Hotel Whitby on September 26th and was largely attended The Branch Council elected forty-three new members to the Association An Ethical Committee for the Branch was also elected It was resolved that in future reports of Branch meetings should be reported by the honorary secretary of the Divisions in which the meeting was held

Demonstrations were given by Dr Leo Rowden Professor of Visceral Surgery at St. Mary's and Dr H H Raw Tapers were read by members on the following subject (1) The surgical treatment of trigeminal neuralgia as exhibited in seventeen consecutive cases by Mr Basil Hughes F.R.C.S. (2) Twist and spirals in medicine and surgery by Mr W S Dickie F.R.C.S. (3) Section in its clinical aspects by Dr M Foster F.R.C.P. (4) Cerebral tumours by Dr R N Wilson (5) A case of acanthosis nigricans by Dr H H Raw (6) Warning signs of impending perforations of peptic ulcers by Mr R St Ledger Brockman F.R.C.S.

By the kindness of Dr and Mrs Rawter was provided for members and their wives and the thanks of the Branch for a very successful meeting are due to Dr Raw

Correspondence

In urance Certificates

Sir,—The bulk of the trouble connected with insurance certificates arises from the fact that the approved societies to cut down their office work, wish to have continuation certificates dated to run in periods of seven days If the annual continuation certificate could be reworded to recognize this fact it would reduce the friction over certificates automatically

The dates for examination and signing should be on the second date should be renewal certificate due or some such wording, and should be subject to the same limitation as in the footnote of the present form—I am, etc.,

Crickhowell Sept 25th

CURRENT NOTES.

The Autumn Dinner on October 21st

MEMBERS are again reminded of the necessity for applying early for tickets for the Autumn Dinner, which is to be held in the Great Hall of the Association's new House in London on Wednesday, October 21st, at 7 for 7.30 p.m. The Council confidently expects that members will support it on this occasion by an exceptionally large attendance and will bring their friends. Decorations will be worn. The price of tickets is 12s. 6d. each exclusive of wine, and application, accompanied by a cheque should be made to the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W.C.1.

The Association's Annual Handbook

The Annual Handbook of the British Medical Association for 1925-26 is now ready. Though primarily intended as a book of reference for honorary secretaries and other workers of the Association, the Handbook is also of interest and assistance to all members. The new edition has been completely revised. It contains the decisions of the Representative Body of the Association on questions of policy, particularly of the new London and Scottish Houses of the Association, information as to the British Medical Journal, the circulation of which is now over 35,500 copies weekly, and lists of the officers and officials of the Association and of its Council and Central Committees. Copies of the Handbook can be had by members, gratis and post free, on application to the Medical Secretary, British Medical Association House, Tavistock Square, London, W.C.1. To non-members the book is on sale at 2s. 6d. (post free 2s. 9d.).

Temporary Transfer of Membership

Members intending to be resident for a length of time whether for post-graduate or other purposes, in areas other than those which contain their home address, are reminded that it is within their option to transfer temporarily to the membership list of the Division and Branch in which they will temporarily reside. By doing so, they become full members, for the time being, of the Division and Branch into the area of which they move, including the opportunity of sharing in all the activities of these bodies, social, clinical and scientific as well as medico-political, in addition to receipt of the British Medical Journal at the new address. Applications for such transfer should be addressed either to the Honorary Secretary of the member's home Division or Branch or to the Financial Secretary and Business Manager.

REPORT OF INSURANCE ACTS COMMITTEE, 1924-25

I—ADMINISTRATIVE MACHINERY

DIRECT REPRESENTATIVES ON INSURANCE ACTS COMMITTEE

1 As a result of the voting by Members of Local Medical and Panel Committees the following were elected as direct representatives upon the Committee for the Session 1924-25:—
Dr J. G. McCutcheon (Glasgow and Dr D. Horie D.S.O. (Glasgow, Aberdeenshire (Group A) Dr R. H. Dix, Sunderland (Group B) Dr G. B. Hillman M.B.E. Wakefield and Dr G. H. Sedgwick Rotherham (Group C) Dr R. G. McGowan Manchester Dr H. F. Oldham M.B.E. Morecambe and Dr F. Radcliffe Oldham (Group D) Dr J. C. Davies Wrexham and Dr W. E. Thomas Lestrade Rhondda, Glam. (Group E) Dr C. J. Palmer, Mansfield Woodhouse (Group F) Dr T. Ridley Bailey, Bilton Staffs (Group G) Mr E. Lewis Lilley Leicester (Group H) Dr John Steed Hereford (Group I) Dr D. G. Greenfield Rushden Northants (Group J) Dr J. P. Williams Freetman Andover (Group K) Dr T. Wood Locket Westbury, Wilts (Group L) Dr P. V. Fry East Molesey and Dr G. C. Garratt Chichester (Group M) Dr C. H. Panting Leyton and Dr H. Rose Wendover Bucks (Group N) Dr H. J. Cardale and Dr E. A. Gregg London (Group O).

ATTENDANCES AT COMMITTEE AND SUB COMMITTEE MEETINGS

2 A list of attendances at Insurance Acts Committee meetings and Sub Committees during the Session from the 1924 Annual Conference to September 24th, 1925, is circulated with the report.

CHAIRMAN

3 Dr H. Guy Dain of Birmingham was appointed Chairman of the Committee for the session.

REPRESENTATIVES OF OUTSIDE BODIES

4 The following nominees of outside bodies were appointed members of the Committee for the past session.—Dr Mah. I. Ramsay Plymouth (Medical Women's Federation) Dr W. I. Howarth C.B.E. London (Society of Medical Officers of Health) Dr A. E. Cope London (Poor Law Medical Officers Association) Mr H. S. Sontar C.B.E. was re-appointed by the Hospital Committee of the Association as a representative of the Staff of a Voluntary Hospital.

MEMBERS APPOINTED BY THE ANNUAL REPRESENTATIVE MEETING 1925

5 The five members of the Committee elected by the Annual Representative Meeting 1925 of the British Medical Association, are as follows:—

England and Wales.—Dr H. S. Badley, Pomfret Dr J. A. Bone, Luton Dr H. Guy Dain, Birmingham Dr P. Macdonald, York.

Scotland.—Dr R. W. Craig, Edinburgh.

ELECTION OF DIRECT REPRESENTATIVES ON THE INSURANCE ACTS COMMITTEE

6 As a result of the Committee's consideration of the following Minute 46 of the 1924 Annual Conference —

46 Resolved That the Insurance Acts Committee be requested to enquire into the disparity which at present exists between certain areas in numbers of their electors at Insurance Acts Committee elections and to suggest a remedy,

representations are being made to one Committee whose number of voters was strikingly disproportionate in comparison with the other Committees in the Group in the hope that it will bring its number into line with the rest of the Group and so obviate that general rearrangement of the whole scheme of the election of direct representatives which would otherwise be necessary

SUB COMMITTEES

7 The Committee re-appointed its Insurance Acts Sub-Committee (Scotland) and Rural Practitioners Sub-Committee with the same references as before. It also appointed an Emergency Sub-Committee, consisting of three members, to which was referred matters arising out of Medical Service Sub-Committee crises upon which the advice of the Committee was sought and any other matter of detail upon which the Head Office might desire to obtain advice between meetings of the Committee

8 With reference to the Rural Practitioners Sub-Committee, it was considered that this might be made more representative of the rural areas if its membership included a rural representative from each Group (excluding London and Scotland) not otherwise represented, and the constitution of the Sub-Committee has accordingly been altered to allow of this. The effect will be that those Groups which elect a rural representative to the parent Committee will be represented on the Sub-Committee by that representative. Groups not so represented will be asked to nominate a rural practitioner for appointment on the Sub-Committee. This will be done through the Group Standing Joint Committees, and nominations will be required within three weeks of the result of the election of direct representatives upon the full Insurance Acts Committee. Where a Group Standing Joint Committee does not exist the appointment will be made by the Rural Practitioners Sub-Committee

MINISTRY OF HEALTH DISTRIBUTION COMMITTEE

9 Dr C L Bateson, the Secretary of the London Panel Committee, has been nominated by the Insurance Acts Committee to fill the vacancy upon the Distribution Committee caused by the death of Dr R J Farnham, and has been duly elected. The Committee's representatives upon this Committee are now as follows —

Dr H G Dain (Birmingham) Dr E Lewis Lloyd (Merioneth), Dr C L Bateson (London), and the Deputy Medical Secretary, together with Dr W Baigent (Northampton) Dr H C Jones (Barnstaple) and Dr J P Williams Freeman (Andover) when questions concerning mileage are under consideration

II—ROYAL COMMISSION ON NATIONAL HEALTH INSURANCE

10 The events which led up to the appointment of the Royal Commission and the preliminary steps taken to prepare the Association's evidence before that Commission were fully outlined in the Committee's report to the 1924 Annual Conference and it is proposed here to deal only with the events which followed the appointment by the Council of a Special Committee to deal with this matter

11 The Special Committee, it will be remembered, consisted of 31 members 12 of whom were appointed by the Insurance Acts Committee. Much of the groundwork of the Committee was delegated to Sub-Committees consisting not only of members of the Special Committee but of other practitioners who were specially qualified to deal with the subjects referred to the Sub-Committees. The reports of these Sub-Committees were fully discussed by the Special Committee and at intervals meetings were held jointly with the Insurance Acts Committee which had also been discussing from a slightly different point of view the question of the future development of National Health Insurance

12 A first draft of the Association's Memorandum of Evidence was then prepared and submitted to the Council of the Association. After revision by the Council this report was printed in the Supplement to the *B M J* of January 3rd 1925 and copies were circulated through local Secretaries to all non members. The object of this was to enable meetings to be called in every area in Great Britain to which the whole of the local profession could be invited so that when the Evidence was placed before the Royal Commission it could be said to be representative of the opinion of the whole of the profession. Secretaries of Divisions and Local Medical

and Panel Committees were asked to co-operate in the calling of local meetings, and members of the Special Committee and the Insurance Acts Committee as well as the Medical and Deputy Medical Secretaries attended a large number of the meetings to explain the draft Memorandum in detail. In order to facilitate consideration of the draft Memorandum, a set of questions dealing with the main principles set out therein was issued and local meetings were asked to vote upon these questions and to forward their views upon any other part of the Memorandum where those views were in conflict with the Memorandum. These local meetings were, generally speaking, very successful and from the replies received to the questions the draft Memorandum appeared to have received very careful consideration throughout the country

13 The collective views of the profession, as represented by these replies, were then considered by a further joint meeting of the Special Committee and the Insurance Acts Committee and due regard was paid to all suggestions for the variation of the Memorandum. The amended Memorandum was then submitted to a special meeting of the Council and afterwards published in the *B M J* Supplement of February 28th, 1925. As before, copies were circulated to non members of the Association and local Secretaries were asked to call further meetings of the local profession if deemed necessary, with a view to instructing their representatives who were to attend a conference between the members of the Representative Body of the Association and the members of the Conference of representatives of Local Medical and Panel Committees. This conference, the largest ever held under the auspices of the Association was held on March 12th 1925 and was representative of every branch of the profession. The revised draft Memorandum of Evidence was carefully considered and, except for some small amendments and suggestions was approved and recommended to the Council for submission as the considered opinion of the medical profession upon the various subjects dealt with therein

14 The Council, at its meeting on March 25th 1925, proceeded to its final consideration of the draft Memorandum and amended it in the light of the suggestions made at the joint conference referred to above. The Memorandum in its final form was submitted to the Royal Commission on April 3rd 1925

15 The Association's witnesses in chief (Dr R A Bolam, LL.D., Chairman of Council Dr H B Brakenbury, Chairman of the Representative Body Dr H Guy Dunn, Chairman of the Insurance Acts Committee and Dr Alfred Cox, OBE, Medical Secretary) appeared before the Royal Commission in support of the Association's Memorandum of Evidence on April 30th and May 7th, 1925. They were accompanied by Dr H J Cardale who gave evidence as regards the special conditions in London, Dr J P Williams Freeman, Andover, on rural conditions Mr N Bishop Farnham, London, on the question of Ophthalmic Benefit and Dr J R Drever the Scottish Medical Secretary who advised on Scottish matters. In the course of the first day's evidence the Royal Commission expressed a desire to hear evidence upon the Manchester and Salford system of 'payment per attendance' and the Manchester Panel Committee was asked to appoint a representative with the result that Dr Stanley Hodgson of Salford attended on the second day and gave evidence

16 A full report of the oral evidence of the Association's witnesses appeared in the Supplements to the *BRITISH MEDICAL JOURNAL* of May 23rd and 30th, 1925

EVIDENCE OF BRITISH SOCIAL HYGIENE COUNCIL

17 The Committee was asked for its observations upon a letter received by one of the Association's Branches from the above body (lately the National Council for Combating Venereal Diseases) concerning certain extracts from the Social Hygiene Council's draft Memorandum of Evidence to the Royal Commission. The letter from the Social Hygiene Council referred to the fact that syphilis was considered to be outside the scope of an insurance practitioners' agreement and that the treatment of gonorrhoea was at present by the ruling of the Ministry of Health within the competence of the general practitioner but that the lengthy special treatment and the large number of specialised instruments and apparatus required rendered success in a majority of cases an impossibility

18 The matter was brought by the Committee before the Council of the Association, which passed the following resolution and brought it to the notice of the British Social Hygiene Council —

That the Association maintains the principle that the treatment of any disease as such should not be removed from the province of general practitioners as a class, and that syphilis and gonorrhoea do not call for special modification of the principle

III—MISCELLANEOUS

OPHTHALMIC BENEFIT

19 Panel Committees are doubtless aware that as a result of the second valuation of Approved Societies, a considerable sum of money will now be available for expenditure by Societies upon additional benefits. Several Approved Societies have for some time recognised the need for examination of the eyes and the provision of glasses where necessary and have been administering what was known as 'optical benefit' which often consisted of referring the insured person to an optician. This is of course contrary to the policy of the Association, as it is considered that the eyes can only be properly examined by medical practitioners who are specially qualified to undertake this work.

20 The reasons given by Approved Societies for the employment of opticians were (1) that they could not afford to pay the fees for the advice of ophthalmologists and (2) that the number of these was too small and their distribution throughout the country too uneven to allow of their employment even if the provision of the fee were practicable.

21 The situation thus created led to the appointment by the Council of the Association of a Special Committee to consider matters specially affecting ophthalmic surgeons and their relation to the public and this Committee has co-operated with the Insurance Acts Committee in the action which has been taken to place this matter upon a more satisfactory basis.

22 Steps were at once taken to show that the reasons given by the Approved Societies were fallacious, by forming a list of ophthalmologists who would be willing to treat insured members of Approved Societies at a uniform fee of £1 1s to cover each complete case of refraction. The result is that over 600 practitioners who are regarded as specialists in this class of work have agreed to give their services on the terms just mentioned. In order that there could be no doubt as to the standing and experience of those on the list each applicant was required to satisfy one or more of the following criteria:

(a) that he has held hospital or other appointments affording special opportunities for acquiring special skill and experience of the kind required for the performance of the service rendered, and has had actual recent practice in performing the service rendered or services of a similar character or

(b) That he has had special academic or post graduate study of a subject which comprises the service rendered and has had actual recent practice as aforesaid or

(c) that he is generally recognised by other practitioners in the area as having special proficiency and experience in a subject which comprises the service rendered.

23 The Ministry of Health was then approached in co-operation with the Council of British Ophthalmologists and the Ophthalmic Benefit Committee (a body which more particularly represents junior ophthalmologists and refraction assistants) urging the necessity from the public standpoint for the employment of ophthalmologists instead of opticians being made an essential part of the Ministry's approval of additional schemes. Various discussions took place upon the matter and the Ministry eventually submitted the following draft provisions for the observations of the Association—

(1) In all cases the insured person must first consult his panel doctor.

(2) The panel doctor—

(a) if he is satisfied that the case is one only of a simple error of refraction either prescribes glasses or informs the Society of the necessity for glasses.

(b) if he is doubtful or if he considers that further medical opinion is necessary he refers to a specialist on the approved medical list other than himself.

(3) The above action of the panel doctor is admitted to be within competence of the present contract.

(4) The approved medical list will be drawn up in Insurance Committee areas and maintained by the British Medical Association consisting of persons satisfying the three criteria quoted above.

(5) It will be sent to the Ministry and circulated to Societies and Insurance Committees for distribution to practitioners in their areas—alterations to be similarly circulated.

24 The Ministry was informed that while appreciating the interest the Ministry was taking in the matter and its attempts to bring about an understanding between the profession and the Approved Societies in regard to a matter of very great importance the Association could not accept paragraphs (2) and (3) above mainly because of what might flow from the acceptance of 2 (a). Under that paragraph the practitioner would have to satisfy himself that the case was one of simple error of refraction that is to say an error which would justify him (not being an expert) in prescribing glasses or suggesting to the Society that the provision of glasses (presumably by an optician) would meet the case.

Also, the practitioner, not being possessed of expert knowledge would be taking a great responsibility inasmuch as he might be wrong in his diagnosis of a simple error of refraction, and the case might turn out to be something much more serious.

25 The Ministry was further informed that the Association could not accept the position that a registered medical practitioner should in any way lay himself open to the charge of recommending an insured person to be treated by an unqualified person and that the recommending that an insured person should be sent to an optician for the examination of his eyes would be equivalent in the opinion of the Association to the covering of unqualified practice.

26 Serious objections were raised to parts 2 (a) and (b) and the following paragraph was suggested to replace them—

If the insurance practitioner from his general examination of the patient concludes that the symptoms found arise from defect of the eyes or call for examination and report upon the eyes, he should so inform the Approved Society and recommend that the Approved Society should refer the patient to an ophthalmologist upon the approved list.

This if adopted would place the onus of using the optician instead of the ophthalmologist on the Approved Society, would enable the Society to use any practitioner on the special list and would allow the insured person to have some choice of specialist not excluding his own insurance practitioner if he happened to be on the list.

27 Further discussions took place between representatives of the Association and the Ministry and the latter subsequently intimated (1) that the suggestions of the Association had been placed before the Consultative Council of Approved Societies, when the Societies were strongly urged to recognise the danger to individual insured persons which might arise if ophthalmic treatment or optical appliances were supplied without the advice of a properly qualified medical man (2) that there was a strong body of opinion among Societies in favour of the employment of specialists and no special difficulties were encountered with regard to the proposals on the understanding that the certificate or recommendation which the insurance practitioner would give was to be treated as part of his obligation under the terms of service. This obligation the Insurance Acts Committee has accepted on behalf of insurance practitioners.

28 Regulations have since been issued providing that if the condition of the patient is such as to require ophthalmic treatment which is outside the practitioner's contract he shall if the patient so desires furnish him with a recommendation in writing that such treatment should be obtained. The procedure will then be for the insured person to obtain from his Society the necessary authority to visit one of the ophthalmic surgeons on the approved list. This list was sent to the Ministry who printed and circulated it to Approved Societies as well as to Panel and Insurance Committees. As fresh names are added to the list they are sent to the Ministry and supplementary lists will from time to time be circulated.

29 Most of the Societies eligible to join the scheme have done so but this class was limited to those whose second valuation had taken place at December 1922, with the result that the scheme at present only applies to a group of the smaller Societies with a total membership of some 1,600,000. The remaining Societies including most of the large ones will not be eligible to join the scheme until July, 1926.

30 The importance of this development to insurance practitioners to ophthalmic and other specialists to the medical profession and to the public can hardly be overestimated. Insurance practitioners are mainly interested because for a large number of their patients an efficient ophthalmic examination and correction of refraction or other troubles has been or will shortly be secured. The specialist is interested if he is an ophthalmologist because the scheme opens out a field of remunerated work, most of which in the past has been done by opticians or at hospitals or not done at all. Other specialists are interested because it provides an example of procedure in dealing with other special fields of practice if and when they come to be included in medical benefit or given as additional benefits. The medical profession as a whole must welcome the scheme.

by many of the Approved Societies at the Ministry of the value of qualified and s opposed to the fitting of glasses by opticians who however well qualified as opticians have no general clinical experience and have never been trained to treat the eye as part of the body and not merely as an optical instrument. The precedent is of immense value to the public in giving official recognition to the doctrine that insured persons are entitled to treatment by fully qualified persons.

you over a number of years it was found that the average worked out not unfavourably to the doctors, and he has undertaken that if in any one year there is a surplus at the end of that year he will consult the Insurance Acts Committee before disposing of such surplus. From the explanation given the Committee is satisfied that the Pool as at present constituted covers all the persons for whom insurance practitioners throughout the country are at risk.

APPOINTMENT OF CHAIRMAN OF MEDICAL SERVICE SUB COMMITTEE

46 The Committee influenced by unfortunate incidents in the London and some other areas, has for some time past urged upon the Ministry the desirability of improving the machinery for appointment of the Chairman of the Medical Service Sub Committee and the Minister issued a Regulation amending Article 27 (2) (iii) of the principal Regulations so as to provide that the Chairman shall be appointed by the unanimous vote of the members of the Sub Committee present at a meeting to be specially summoned for the purpose, and that failing unanimity the Chairman shall be appointed by the Minister. The Regulation appeared to meet satisfactorily the difficulties experienced in certain Insurance Committee areas in regard to this matter.

47 While the draft Regulations containing the above mentioned amendment were lying on the table of the House of Commons for the necessary period which must elapse before they become law a motion for their annulment was tabled by a number of Members of Parliament. The Office immediately wrote to every medical Member of Parliament (1) describing the position and pointing out that the draft Regulation was made by the Minister of Health with the full knowledge and approval of the Insurance Acts Committee in order to cope with difficulties which had occurred in one or two areas under the old Regulation and (2) asking them to use their influence to prevent the motion for annulment being carried. The motion was eventually withdrawn upon an undertaking by the Minister of Health that the draft Regulation in question would be amended. The effect of the amendment will, it is understood, be that the Chairman of the Medical Service Sub Committee should in the first instance, be appointed by a majority of the votes of the Sub Committee. If he cannot be appointed because the two sides of the Committee are voting in opposite ways the Committee being divided in equal numbers so that no majority can be obtained or if the Committee fails to function by reason of the fact that the Chairman appointed is unacceptable to some of the members of the Committee, the matter will be referred to the Insurance Committee. The latter would then appoint a Chairman who would not necessarily be a member of the Committee. He would, however, in the latter event be co-opted a member of the Committee. In the event of the Sub Committee declining to accept him as Chairman, and again declining to function it is proposed that the Insurance Committee should make representations to the Minister who after consultation with the Insurance and Panel Committee would himself appoint a Chairman. This procedure would seem to secure what is wanted namely, the appointment of a Chairman who could fairly be regarded as impartial.

48 Up to the date of the meeting of the Committee on September 24th no statement had been received from the Ministry of Health of the above action or of any proposed amendment of the Regulation but on that date the Committee was informed that the Ministry had had under consideration an amendment of the Regulation and had in fact consulted a member of the Committee thereon in another capacity. The Committee has called the attention of the Ministry of Health to the fact that, while as a central negotiating body on behalf of insurance practitioners the Committee was consulted as to the wording of the original draft Regulation it had not been consulted as to the subsequent amendment thereto and enquiring the reasons therefor.

REMUNERATION OF ASSISTANTS IN GENERAL PRACTICE

49 At the request of the Medical Students and Newly Qualified Practitioners Sub Committee of the Association's Organisation Committee the Insurance Acts Committee has had under consideration the question of the remuneration of assistants in general practice and of what action it may the Association should take in the matter. The Committee was asked for its opinion on the subject from the point of view of the insurance practitioner and made the following recommendations which have been approved by the Representative Body of the Association—

- (a) That on general principles the employment in suitable cases of assistants by practitioners is in the interests both of the general public and of the profession.
- (b) That it is not desirable for a principal to employ an assistant where he is unable to exercise adequate personal supervision over the latter, and, in some types of branch practice in such circumstances a partnership is to be preferred.

(c) That the offer or promise of a future partnership should not be made a reason for paying a lower salary to an assistant.

(d) That the minimum for a newly qualified inexperienced assistant is £240 per annum with the addition of board and lodging and in the case of such a practitioner employed on an outdoor basis the board and lodging value should be estimated from £120 to £160 per annum according to the circumstances of the individual case, that the only exceptions or possible exceptions to the foregoing should be in the case where, owing to arrangements made for study leave or to physical disability or other reason the assistant is not able to give full time to the work.

(e) That a whole-time assistant should be entitled to not less than two weeks holiday a year on full pay.

(f) That no steps should be taken for the present to make the foregoing expressions of opinion the policy of the Association but they should be used for the assistance of the office in advising on points connected with the terms and conditions of the work of assistants. Where an advertisement is offered for insertion in the Journal in connection with an assistantship not in accordance with the foregoing opinions the attention of the advertiser should be drawn to them in the hope that the advertisement will be amended but the advertisement should not if otherwise eligible be refused.

50 It is believed that the general acceptance of these principles will be of advantage to insurance practitioners as improving the status of assistants when these have to be employed. Their general acceptance will certainly be regarded with satisfaction by the younger members of the profession, and will make them more willing to undertake a post graduate experience of this kind which is such an excellent training for them.

UNIFORM CERTIFICATE FOR MATERNITY BENEFIT

51 Minute 38 of the last Annual Conference instructed the Insurance Acts Committee to take steps to have established a uniform certificate for all Approved Societies for the purpose of certifying for Maternity Benefit with the result that the following form has been submitted to the Ministry of Health as a suitable model form—

Medical Certificate in respect of Maternity Benefit

I certify that I attended the above named woman in her confinement at the address stated above when she was delivered of a * ^{male} _{female} child on the ^{day} of 19 and that the child was born ^{dead} _{alive}

* ^{dead} _{after a period of pregnancy lasting not less than 28 weeks}

Date _____ Signature _____

Qualifications _____

(If certified midwife add Registered Number) _____

Address _____

* Strike out words not required

ALTERATION OF CERTIFICATE IN AN APPROVED SOCIETY OFFICIAL

52 The attention of the Ministry was drawn to the action of a local Secretary of an Approved Society in altering the date of a certificate given by an insurance practitioner, and a request was made that the Ministry would take a serious view of the case in view of the consequences which follow breaches of the certification rules by an insurance practitioner. The Ministry replied that it had been in communication with the General Secretary of the Approved Society in question from whom it was understood that the local Secretary acted under a misapprehension that he fully appreciated the seriousness of the offence and had given an undertaking that it would not occur again. The Committee is not satisfied with this reply and has given instructions that the Ministry's attention be drawn to the contrast between this complacent leniency and the severity of the Ministry towards even minor breaches of the Certification Rules by an insurance practitioner.

SPECIAL INTERMEDIATE CERTIFICATES

53 In view of a statement by the Ministry of Health that the interpretation of a week in Certification Rule 5 was not applicable to the phrase 'specified intervals' in Rule 12, representations have been made by the Committee accepting this interpretation of the wording of Rule 12, but urging that the Rule be so amended as to provide that a practitioner who gives a special intermediate certificate for a specified interval shall be allowed to give his next special intermediate certificate on any day of the first week of succeeding 'specified intervals'.

MEDICAL RECORDS

54 The subject matter of the following Minute 52 of the 1924 Annual Conference has been fully discussed with representatives of the Ministry of Health but as with many other delicate

points the Ministry holds out no hope of any change in the present requirements until after the Royal Commission has reported —

52 Resolved That this Conference, while fully appreciating the value of careful Clinical Notes and essential dates on Medical Records, considers that it is unnecessary to record all attendances, etc. in chronic cases (except where practitioners have agreed to keep full records of work done for statistical purposes), inasmuch as in many cases the continuation Record Cards overload the Record Envelopes and seriously diminish the utility of the Clinical Notes

The Committee intends to keep this matter alive and therefore recommends the Conference to reiterate the foregoing opinion

FEES FOR ANAESTHETICS

53 The 1924 Annual Conference instructed the Committee to prepare a full statement upon the question of fees for anaesthetics and to circulate such statement to Panel Committees. The Committee accordingly prepared a full statement of the circumstances under which it considered that an anaesthetist's fee could or could not be charged to the Local Practitioners' Fund or the patient. This statement was issued to Local Medical Panel Committees on 4th June, 1925 (M. 23), and is appended to this Report

DISPENSING CAPITATION FEE

56 Minute 45 of the 1st Annual Conference, asking the Committee to enquire as to the adequacy of the capitation fee of 2s for dispensing, has been under consideration. It was noted that the Accountant-General of the Ministry of Health, in his evidence before the Royal Commission, stated that the cost of drugs per insured person for 1924 exceeded 2s 3½d, and had exceeded 2s from 1922 onwards. Further action in connection with the Conference minute has, however, been deferred, because it is believed that up to date statistics as to cost of drugs and attendances upon insured persons will be submitted by the Ministry to the Royal Commission in October, and such figures may well provide convincing arguments as to the inadequacy of the 2s dispensing fee

POST GRADUATE FACILITIES FOR INSURANCE PRACTITIONERS

57 Minute 53 of the 1924 Annual Conference, instructing the Committee to approach the Council of the Association with a view to the provision of post graduate facilities in those areas which require them, was referred by the Council to the Science Committee of the Association. A Special Committee has since been appointed by the Council of the Association with a view to exploring the possibility of including, among the Association's activities, post graduate study for all branches of the profession. Such a scheme would, naturally, include insurance practitioners. The Minister of Health has also appointed a committee to draw post graduate medical education centred members of which Committee are the R. A. Bolam and the Chairman of the Insurance Acts Committee (Dr H. Guy Dain). The Committee will await its opportunity for useful action

DISPENSING BY PRACTITIONERS

58 The Committee decided after consideration that it was impossible to take any useful action in connection with the following Minute 42 of the 1924 Annual Conference —

Resolved That in considering the evidence to be presented before the Royal Commission the Insurance Acts Committee be requested to take into consideration the question of dispensing by medical practitioners in collectory or other special areas

A UNIVERSAL HEALTH INSURANCE FORMULARY

59 The Committee was asked to consider the desirability of the introduction of a universal formulary which could be issued by the Ministry of Health for use by all insurance practitioners throughout the country. Owing to the difficulties, however, of compiling a formulary which would not be too extensive and which would, at the same time, satisfy the needs of all areas, the Committee did not think that the suggestion was a practicable one. It was known at the time that two large areas were revising their formularies, and they were asked to see whether it would not be possible to combine the two and thus form the basis of a national formulary. Both Committees reported, however, that the divergency between the two formularies was so great that it was not possible in any way to combine them. The Committee has therefore not proceeded any further in the matter

QUANTITY AND QUALITY OF DRUGS

60 The Ministry of Health recently prepared after discussion with the Retail Pharmacists Union a scheme for the testing of drugs and appliances supplied by insurance chemists and submitted the draft scheme for the observations of the Insurance Acts Committee. The only part of the scheme which affects insurance practitioners is that which requires an insurance practitioner to supply a prescription which is to be used for the purpose of a test, and as the Committee was satisfied that the prescriptions used by practitioners who would be asked to supply them would be a matter upon which the Panel Committee would be consulted, together with the local Pharmaceutical Committee, the Insurance Acts Committee informed the Ministry that it raised no objection to the scheme

tioner to supply a prescription which is to be used for the purpose of a test, and as the Committee was satisfied that the prescriptions used by practitioners who would be asked to supply them would be a matter upon which the Panel Committee would be consulted, together with the local Pharmaceutical Committee, the Insurance Acts Committee informed the Ministry that it raised no objection to the scheme

ADDITIONS TO THE LIST OF PRESCRIBED APPLIANCES—SPECIALLY EXPENSIVE DRUGS

61 As a result of representations by the Committee the following appliances have now been added to those contained in the Second Schedule to the Medical Benefit Regulations —

Ring pessaries, eye droppers, eye baths, triangular bandages, hypodermic syringes and needles for self-administration of insulin

62 With the exception of triangular bandages it has been agreed with the Ministry of Health that the whole of the foregoing shall be added to the list of specially expensive drugs in Part II of the Distribution Scheme, thus excluding them from the drugs and appliances in respect of which a dispensing surcharge practitioner accepts liability

FEHLING'S SOLUTION FOR TREATMENT BY INSULIN

63 The Committee took up with the Ministry of Health the question of Fehling's Solution, for use in the treatment by Insulin, being a proper charge upon the Drug Fund, but was unable to persuade the Ministry that it should be so chargeable. The Ministry holds that Fehling's Solution in these cases is a means of diagnosis and not of treatment. The Committee has now informed the Ministry that it is the duty of the doctor to prescribe, in certain cases, Fehling's Solution to be used by the patient as an essential part of the treatment by Insulin, in which case the cost is in the opinion of the Committee properly chargeable against the Drug Fund, and that, in the event of the Ministry maintaining its present attitude in this matter the Committee would have no option but to advise insurance practitioners that if they prescribed Fehling's Solution for use by the patient, the patient would have to pay for it himself, as the Ministry had decided that it was not a proper charge upon the Drug Fund

CERTIFICATION—INCAPACITY FOR WORK

64 The following Minute 37 of the 1924 Annual Conference was dealt with in paragraph 53 of the Association's Memorandum of Evidence before the Royal Commission —

37 Resolved That the Insurance Acts Committee be instructed to take whatever steps it may deem desirable and necessary to obtain an authoritative ruling as to the meaning of 'incapable of work' as defined in the Medical Certification Rules in order that there may be greater uniformity in practice in dealing with the question of incapacity for work

The ambiguous character of the phrase was dealt with and the Commission asked to find another phrase. The question is one of great difficulty, but the Committee awaits the report of the Commission in the hope that something useful may be suggested

1924 CENTRAL POOL FINAL FIGURES

65 The Central Practitioners' Fund (England) for 1924 was finally determined at £5700,300. The final amount in 1923 was £5836,000. Taking into account the difference in the amount of the capitation fee for both years, the 1924 figure represents an increase of 338,912 insured persons

SEAMEN'S NATIONAL INSURANCE SOCIETY

66 The Committee has given consideration to Minute 50 of the last Annual Conference, in which it was asked to support in every possible way the Executive Council of the National Association of Insurance Committees in its endeavour to secure that the members of the Seamen's National Insurance Society shall henceforth receive their medical benefit by and through Insurance Committees and has had before it information as to the method of administering medical benefit by the Society

Conversations with the Seamen's National Insurance Society and the Medical Political Committee of the Association in reference to the fees paid by the Society to medical practitioners for treatment of members of the Society seemed to indicate that sailors as a class can only be dealt with under the normal panel system with great difficulty. The majority of sailors apparently object to placing their name on the list of any particular doctor until they are sick and when they become sick they have a great tendency to go to certain doctors who are well known to seamen. If this be true and that a few doctors in any port have to attend practically the whole of the sick seamen it would appear to be unfair that the whole of the money available for their medical benefit should go into the local medical pool and be divided amongst the

whole of the doctors in that area. The Seamen's Society being well acquainted with the habits of seamen came to the conclusion that it would be much better that medical practitioners should be paid for work done on a scale of fees which is at present the subject of negotiations.

The Committee, therefore, has come to the conclusion that the peculiar nature of the occupation of the members of that Society is a good reason why they should receive their medical benefit as they do and not through Insurance Committees. The Committee therefore recommends

Recommendation That having considered the question of the method of administration of medical benefit for members of the Seamen's National Insurance Society, the Conference is of opinion that the present method whereby members of the Society obtain their medical benefit through the Society is more in the interests of the insured persons concerned and the medical profession than would be the administration of their medical benefit through Insurance Committees.

RECIPROCITY BETWEEN INSURANCE PRACTITIONERS AND MINISTRY OF PENSIONS MEDICAL OFFICERS

Since 1922 efforts have been made to arrange for some closer co-operation between Ministry of Pensions Medical Officers and insurance practitioners in connection with the treatment by the former of insured pensioners. Notwithstanding repeated pressure by the Committee it has never been found possible to get the Ministry of Pensions to arrange for a Conference until June last. At this Conference, however, it did not appear that the Ministry of Pensions officials appreciated the position of insurance practitioners in this matter, and did not seem at all anxious for any reciprocity. As there has been a great decline in the Pensions Medical Service since the matter was first raised, the Committee is of opinion that no further action need be taken.

APPENDIX

FEES FOR ANAESTHETICS

- | | |
|---|---|
| 1 Where the operation is 'inside the contract' and is performed by the insured person's insurance practitioner with a second practitioner administering the anaesthetic (provided the giving of the anaesthetic is not itself a specialist service) | Fee payable from Practitioners Fund |
| 2 Where the operation is 'inside the contract' and is performed by a second doctor, and the insured person's insurance doctor administers the anaesthetic (provided the giving of the anaesthetic is not itself a specialist service) | Do |
| 3 Where the operation is "outside the contract" and is performed by the insured person's insurance doctor who possesses special skill and experience of a degree or kind which general practitioners as a class cannot reasonably be expected to possess, and a second practitioner administers the anaesthetic (provided the giving of the anaesthetic is not itself a specialist service) | Do |
| 4 Where the operation is outside the contract and is performed by a second doctor and the insured person's insurance doctor administers the anaesthetic (provided the giving of it is not itself a specialist service) | No fee chargeable to Practitioners Fund or to patient (If assistance in addition is necessary fee for assistance is payable by patient) |
| 5 Where the operation is 'outside the contract' and is performed by a second doctor and the insured person's insurance doctor gives assistance (three practitioners being involved) | Fee for anaesthetic (whether itself a specialist service or not) chargeable to the patient. |
| 6 Where the giving of the anaesthetic is itself a specialist service in connection with an operation 'inside or outside' the contract | Fee chargeable to patient |
| 7 Where the operation is in respect of a confinement | Do |
| 8 Where the operation is a dental operation | Do |

APPLICATION TO HOSPITALS

It is open to the Panel Committee of any area to arrange, so far as its locality is concerned that the foregoing principles apply in connection with the administration of anaesthetics for operations performed in a hospital where any general practitioner may treat his own patients or choose his own anaesthetist. Any hospital with a selected medical staff would, of course, be debarr'd from this arrangement.

THE PANEL CONFERENCE, 1925

The Annual Conference of Representatives of Local Medical and Panel Committees will be held on Thursday, October 22nd, at 10 a.m., in the Great Hall of the British Medical Association House, Tavistock Square, London, W.C.1.

The following Motions for consideration at the Conference have been received since the printing of the Provisional Agenda (Document M 9, already circulated)

Cases referred to Regional Medical Officers

Motion by HASTINGS That when a patient has been referred to the Regional Medical Officer by the Society and the Regional Medical Officer is of opinion that he or she is capable of work the Regional Medical Officer should before sending in his report, see or communicate with the practitioner connected with the case if the latter was unable to be present at the examination.

Election of Direct Representatives on the Insurance Acts Committee

Motion by HERTFORDSHIRE That this Conference agrees to the division of Group 'N' (now returning two members to the Insurance Acts Committee) into two Groups each Group returning one member: it such division is agreed to by all the Panel Committees composing Group 'N' and that any division so agreed upon shall become operative for the election of 1926.

Investigation of Complaints by Insurance Practitioners against Approved Societies

Motion by WARWICKSHIRE That in the opinion of the Conference article 28 (2) of the Medical Benefit Consolidated Regulations 1924 should be so amended as to make it clear that the Medical Service Subcommittee shall, at the request of the Panel Committee investigate any complaint made by a practitioner against an approved society or its agent arising in the discharge by the practitioner of his duties under the terms of service.

Association Notices

BRANCH AND DIVISION MEETINGS TO BE HELD

BIRMINGHAM BRANCH—The annual meeting of the Birmingham Branch will be held at the Medical Institute, Birmingham on October 15th, at 3.30 p.m.

BIRMINGHAM BRANCH COVENTRY DIVISION—The annual dinner of the Coventry Division will be held at the Masonic Hall on Tuesday, October 13th at 7.30 for 7.45 p.m. Price of tickets including wine 18s without wine 14s. Members are requested to notify the Secretary regarding tickets not later than October 6th. Every effort is being made by the committee to ensure that the dinner shall be a success. Bridge tables, etc., will be provided.

CAPE OF GOOD HOPE (WESTERN) BRANCH—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday, October 30th, at 8 p.m., when there will be a symposium on neurophysiology arranged by Dr F. H. Hooy. Among the speakers will be Dr J. S. du Toit, Dr A. Reith Fraser, Mr J. Luckhoff, Dr W. P. Mulligan, and Dr E. W. D. Swift.

EDINBURGH BRANCH SOUTH EASTERN COUNTIES DIVISION—An ordinary meeting of the South Eastern Counties Division will be held in the Railway Hotel, Newtown St. Boswells, on Wednesday, October 14th, at 3 p.m. Address by Colonel William Glen Leitch on the help afforded by clinical pathological examination.

METROPOLITAN COUNTIES BRANCH CITY DIVISION—The following meetings have been arranged for the session—Tuesday, November 3rd at 4.30 p.m., at St. Bartholomew's Hospital British Medical Association Lecture by Mr John Fraser, M.C., Professor of Clinical Surgery, Edinburgh University. Sympathetic disturbances of the abdominal viscera in relation to surgery. Tuesday, December 1st, 9.30 p.m. at Metropolitan Hospital Mr Comyns Berkeley. Treatment of eclampsia. Thursday, December 3rd, 7.15 for 7.30 p.m., Annual Dinner Holborn Restaurant. Tuesday, January 5th 1926, 9.30 p.m. at Public Library, Holloway Road, N. Lieut. Colonel Mort. Interesting surgical cases in relation to general practice (with photographs). Tuesday, February 2nd 9.30 p.m. at Public Library, Holloway Road, N. Professor J. McIntosh. Dental decay. Tuesday, March 2nd, at Metropolitan Hospital Mr H. S. Scott. Some modern advances in chest surgery. Thursday, March 25th. Dinner and fancy dress dance. Crown Hall Holborn Restaurant. 7.30 p.m. to 2 a.m. Tuesday, April 6th 9.30 p.m. at Metropolitan Hospital, General Meeting. Tuesday, May 4th at 9.30 p.m., at Metropolitan Hospital President's address. Tuesday, June 1st, 9.30 p.m. at the Metropolitan Hospital, Annual General Meeting. Tuesday, July 6th, 9.30 p.m., Dr T. H. G. Shore. Pathological specimens with clinical notes. In conjunction with the Aesculapian Society clinical afternoons will be held at the Metropolitan Hospital on the second Friday in the month, commencing October 9th and concluding on July 9th 1926. Tea is provided at 4 p.m. and the demonstration commences at 4.15. members are invited to show cases of interest.

METROPOLITAN COUNTIES BRANCH ST. PANCRAS DIVISION—The first meeting of the winter session of the St. Pancras Division will be held in the British Medical Association House, Tavistock Square, W.C. on Tuesday, October 13th at 4.30 p.m. Dr John S. Fairbairn, obstetric physician, St. Thomas's Hospital, will deliver

in address on puerperal sepsis in general practice, its causes and prevention. A very interesting discussion is expected, and members are invited to make a special effort to attend.

METROPOLITAN COUNTIES BRANCH SOUTH WEST ESSEX DIVISION.—The following are the arrangements for meetings during the session 1925-26.—October 20th at Walthamstow Hospital, paper by Mr J Howard Russell M.S. F.R.C.S. Cancer of the breast. November 3rd at Livingstone College Knott's Green Leyton, paper and lantern demonstration by Dr H G Adamson Lezoma. December 1st, at Wesleyan Schoolrooms High Road Leyton paper by Dr M Culpin. The handling of nervous patients. March 16th, 1926 at Whipp's Cross Hospital Leytonstone. Clinical demonstration by Dr J C Muir medical superintendent. April 6th, at Walthamstow Hospital paper by Dr J Sorley. The significance of early signs and symptoms in pulmonary tuberculosis with special reference to children. May 4th, at Claybury Mental Asylum, demonstration by Dr C P Braham medical superintendent. June 1st at Wesleyan Schoolrooms High Road Leyton Annual General Meeting. The meetings will be held at 3.30 p.m. unless otherwise notified. Visitors are cordially invited to attend the scientific meetings.

METROPOLITAN COUNTIES BRANCH WILKESDEN DIVISION.—A clinical meeting of the Wilkesden Division will be held at 11th Royal Hospital Acton Lane on Friday October 16th at 3.15 p.m. and will be conducted by Dr W E Turner the resident medical officer.

NORTH OF ENGLAND BRANCH CLEVELAND DIVISION.—Mr J Basil Hall M.Chir. F.R.C.S. of Bradford Ex-President of the Association will address the Cleveland Division in Middlesbrough on Thursday October 22nd. The subject of the address will be announced later. Members of neighbouring Divisions are cordially invited.

NORTH OF ENGLAND BRANCH DARLINGTON DIVISION.—The annual general meeting of the Darlington Division will be held in the Lord Room Greenbank Hospital on Thursday, October 15th, at 8.30 p.m. Agenda: Election of officers, selection of lecturers for the session, Representative's report of business done at Annual Representative Meeting.

NORTH OF ENGLAND BRANCH SUNDERLAND DIVISION.—The annual address will be given by Dr H Crichton Miller on Thursday November 12th. The annual dinner will be held the same evening at 7.30 at the Palace Hotel Sunderland.

OXFORD AND READING BRANCH OXFORD DIVISION.—Out patient demonstration and ward visits (by kind co-operation of the honorary staff) will take place at the Radcliffe Infirmary each afternoon (except Sunday) up to Wednesday, October 14th. Members and non-members of the Association are invited. There are no fees. Tea will be provided each afternoon.

SHROPSHIRE AND MID WALES BRANCH.—The fifteenth annual general meeting of the Shropshire and Mid Wales Branch will be held at the Royal Shrop Infirmary on Tuesday October 27th at 3.30 p.m. The President Elect Dr Whitley, will deliver an address. The annual dinner will take place the same evening at the Raven Hotel Shrewsbury at 7 o'clock. As the occasion will mark the jubilee of the Branch a very large attendance is looked for and every member is urged to make a special effort to attend.

SOUTHERN BRANCH WINCHESTER DIVISION.—A meeting of the Winchester Division will be held on Wednesday October 14th at the Red Lion Hotel Basingstoke at 3.15 p.m. At 3.30 Dr G C Anderson Deputy Medical Secretary of the British Medical Association will give an address on the Association's policy affecting hospitals. Non-members particularly those holding hospital appointments, are cordially invited to be present.

SOUTH WALES AND MONMOUTHSHIRE BRANCH SWANSEA DIVISION.—The following programme of meetings has been arranged by the Swansea Division for the session 1925-26. The meetings will take place at the General Hospital, Swansea, at 8.15 p.m. October 22nd—Dr Daniel E Evans. The diseased heart in pregnancy. November 5th—Surgical clinic. November 19th—Dr White of Messrs Puke, Davis and Co. Some recent aspects of gland therapy. December 3rd—Medical clinic. December 17th—Ophthalmic meeting. Members desirous of reading papers or of showing cases and specimens are requested to communicate with the honorary secretaries of the Division not later than seven days before date of meeting.

SURREY BRANCH CROYDON DIVISION.—The next general meeting of the Croydon Division will be held at the Croydon General Hospital on Tuesday October 27th at 8.15 p.m., when Dr H Britly Shaw will give an address on early treatment by artificial pneumothorax of pulmonary suppuration.

SURREY BRANCH REIGATE DIVISION.—T has been arranged for the session 1925-26.—Mr R P Rowlands. The acute abdomen. 8th—Dr H C Cameron. Some complaints. January 12th 1926—Sir Henry Gairdner. In non-pulmonary tuberculosis. Tuesday. Hutchison. The chronic abdomen. Dr Frank Cook. Pelvic inflammation in women. Tuesday April 13th. Clinical meeting. Tuesday, May 11th. Divisional meeting. Wednesday June 2nd 3.45 p.m. Annual meeting. All meetings will be held at the East Surrey Hospital at 8.45 p.m. unless otherwise stated.

YORKSHIRE BRANCH BARNLEY DIVISION.—A meeting of the Barnley Division will be held at the Central Cafe Market Hill Barnley on Friday October 30th. Supper will be served at 8.30 p.m. prompt. Mr Graham Simpson (Sheffield) will give an address on a survey of renal surgery (with lantern demonstration).

Those intending to be present should notify the honorary secretary Dr J B Fisher, King Street, Hovind, not later than Monday, October 19th.

YORKSHIRE BRANCH DUNSFORD DIVISION.—The following lectures and meetings have been arranged for the session 1925-26. November 3rd—Sir Berkeley Moynihan, Bt (Leeds) 1st lecture (subject to be announced later). December 1st—Dr Burrows (Leeds) Refracted from a diagnostic standpoint. January 12th 1926—Dr W Letcher Shaw (Manchester) Chronic pelvic pain. February 2nd—Mr A M Council (Sheffield) Demonstration of treatment of injuries of the lower limb. March 2nd—Dr W Vining (Leeds) Acidosis. April 6th. Open night. May 4th. Annual dinner. The meetings will be held in the Main and Saddle Restaurant Dunsford. Supper will be provided at £15. Members from neighbouring Divisions will be welcomed.

YORKSHIRE BRANCH HARRGATE DIVISION.—A meeting of the Harrgate Division will take place at the Royal Bath Hospital on Wednesday October 14th at 4.30 p.m. Dr Alfred Cox Medical Secretary of the Association, will open a discussion on Is the HVA any use to the non-panel doctor? Tea will be provided at the hospital at 4.15 p.m. by the Chairman. A dinner will be held at the Majestic Hotel (price 8s 6d) at 7.30 p.m. After dinner it is expected that Dr Cox will reply to the toast of the Association. As this is a special occasion the executive hopes that members will make every endeavour to be present, and to persuade as many non-members as possible to attend.

YORKSHIRE BRANCH WAKEFIELD, PONTEFRACT AND CASTLEFORD DIVISION.—The following programme of lectures arranged by the Wakefield, Pontefract and 1925-26. October 15th—Mr J A Coupland. A notable rate of operations for intestinal. 12th—Dr J S Bollen (Wakefield Mental Hospital) Diagnosis and certification of mental diseases. Sunday, December 13th—Colonel L W Harrison (special medical officer for venereal diseases to Ministry of Health) British Medical Association Lecture. The management of syphilis (illustrated by a cinematograph film). January 14th, 1926—Discussion. The role of the general practitioner in preventive medicine. To be opened by the Chairman (Dr William Sisson). February 11th—Dr William Mitchell (Bradford) The therapeutic value of electric and allied methods of treatment. March 11th—Mr E W Bain F.R.C.S. (Leeds) Middle ear suppuration. April 15th—Dr A E Pearson (medical superintendent of the City Hospital, Leeds) The diagnosis of infectious diseases with special reference to the tests in diphtheria and scarlet fever. The above meetings (except that on December 13th) will be held in the Bull Restaurant, Westgate, Wakefield. Supper will be served at 7.45 p.m. (charge 2s 6d) and the lectures will commence at 8.30 p.m. prompt. Colonel Harrison's lecture on Sunday December 13th, will be given in the Pavilion Westgate Wakefield at 3.30 p.m. The meetings are open to all medical practitioners of the district whether members of the British Medical Association or not and the lectures are to be followed by open discussion.

Meetings of Branches and Divisions

BORNER COUNTIES BRANCH DUMFRIES AND GALLOWAY DIVISION

A MEETING of the Dumfries and Galloway Division was held in the Royal Infirmary Dumfries on September 24th. It was agreed that the next meeting should be held in Castle Douglas Hospital in November when, *inter alia*, Dr Welsh (Castle Douglas) will demonstrate the newly installed x-ray apparatus.

Dr JOHN MARSHALL M.C. of Glasgow and Dumfries delivered a lecture on the iris and pupil, which was illustrated with diagrams and stereoscopic slides. The subject was dealt with in a practical and lucid manner. Drs LIVINGSTON and REICHERT discussed the paper and thanked Dr Marshall for the trouble he had taken to put the subject so clearly before the Division. After tea Dr LIVINGSTON exhibited two patients who had suffered motor accidents. One had both liver and kidney severely injured and the other kidney torn and ruptured. He also exhibited specimens of ectopic gestation successfully operated on and other pathological specimens. Dr LAWRIE showed a heart the apex of which was completely detached, showing both ventricles, as the result of an accident in which the patient had been run over. He also exhibited a fractured spine removed from a man who had had a motor accident.

LANCASHIRE AND CHESHIRE BRANCH ST HELENS DIVISION

A MEETING of the St Helens Division was held at the Fleet Hotel on September 18th when Dr HANWELL was in the chair. The question of the membership and activities of the Division was discussed and certain decisions arrived at. A proposal to hold a dinner was referred to the Dinner Committee for report to the November meeting. The Divisional competition for the Treasurer golf cup will take place at Formby on October 21st at 10 a.m. A letter from the secretary of the St Helens Hospital concerning an eye, ear and throat clinic for the Lancashire Education Committee was discussed and it was decided to form a committee similar to that in force for the St Helens Education Committee.

SURREY BRANCH CROYDON DIVISION

A GENERAL meeting of the Croydon Division was held at the Croydon General Hospital on September 29th when Dr J H THOMPSON was in the chair. The request for the transference of three members from the Reigate Division to the Croydon Division was directed to be brought before the Surrey Branch. It was resolved that bridge should be obtained for the chairman and honorary secretaries. The mode of payment to be arranged by the Executive Committee.

The Representatives, Mr E M COWELL and Dr G G O SCUDAMORE, reported on the proceedings of the Annual Representative Meeting at Bath and Dr Scudamore gave an account of the Secretaries Conference, they were heartily thanked for their reports. The HONORARY SECRETARY reported that there were ten candidates for election by the next Branch Council.

MEANS OF ACCESS TO THE ASSOCIATION'S NEW HOUSE

Those who are unfamiliar with the location of the Association's new House in Tavistock Square will no doubt welcome the following information as to means of access, which has been compiled by the Financial Secretary and Business Manager.

Omnibus Routes

From—	Buses	Time
Victoria to Tavistock Square	No 44	25 mins
Charing Cross to Tavistock Sq	Nos 77 177	15
Waterloo to Tavistock Sq	Nos 69 163 169*	15
London Bridge to St Pancras Church	No 18 118	5
St Pancras to Tavistock Sq	Nos 77 177	20
King's Cross to Tavistock Sq	No 77 177	8
Paddington to St Pancras Church	No 27 or 127 to Baker Street then 18 118 or 10*	20
Liverpool St to Tavistock Sq	No 9 or 11 to Strand (Gaiety Theatre) then 77 177 68 168 or 169*	25

* These include the A B C and D services running under these numbers

Tube Routes

From—	Tube	Time
Victoria to Euston	District Rly to Charing Cross change to Hampstead Rly	20 mins
Charing Cross to Euston	Hampstead Rly	15
Waterloo to Euston	Bakerloo change Charing Cross to Hampstead Rly	20
Waterloo to Russell Sq	Bakerloo to Piccadilly change to Piccadilly line	15
1	City and South London	15
1	Metropolitan	15
1	District to Charing Cross change to Hampstead Rly	25
Liverpool St to Euston Sq or King's Cross	Inner Circle	20

Walking Distances

From Euston Station to Tavistock Square	5 mins
St Pancras Station to Tavistock Square	7
King's Cross Station to Tavistock Square	10

Members will be glad to hear that the Members' Lounge or Common Room is now in use. The room is a large one and the accommodation very comfortable, light refreshments are available both at lunch and tea time at very reasonable prices.

THE SIR CHARLES HASTINGS CLINICAL PRIZE FOR GENERAL PRACTITIONERS

THE Council of the British Medical Association has decided to establish experimentally an annual prize—"The Sir Charles Hastings Clinical Prize"—of fifty guineas for an essay or lecture for the purpose of stimulating systematic observation research, and record in general practice. The Council believes that systematic observation by general practitioners, along selected lines of clinical study, may result in the production of practical contributions of great value by those who are in a favourable position for following disease through its various stages.

The first prize will be awarded in 1926, and the conditions governing its award, as adopted by the Council on April 16th, 1924, are as follows.

Regulations

1 This prize is established by the Council of the British Medical Association for the promotion of systematic observation, research, and record in general practice, it includes a money award of the value of fifty guineas.

2 Any member of the Association who is engaged in general practice is eligible to compete for the prize.

3 The work submitted must include personal observations and experience of the candidate collected in general practice, and a high order of excellence will be expected. If no essay entered is of sufficient merit no award will be made.

4 Essays, or whatever form the candidate desires his (or her) will in title, must be sent to the Medical Secretary, British Medical Association, B.M.A. House, Tavistock Square, W.C.1, not later than December 31st, 1925, and

the prize will be awarded at the Annual General Meeting of the Association. The first award will be made in 1926.

5 If any question arises in reference to the eligibility of the candidate or the admissibility of his essay, the decision of the Council on any such point shall be final.

6 Each essay must be distinguished by a motto, and must be accompanied by an envelope marked with the same motto and enclosing the candidate's name and address.

7 The candidate who gains the award shall, if the Council so desires, publish his paper in the *BRITISH MEDICAL JOURNAL* or deliver a lecture on the subject thereof at a meeting of the Association.

8 Inquiries relative to the prize should be addressed to the Medical Secretary, B.M.A. House, Tavistock Square, London, W.C.1.

IRISH FREE STATE

COMMISSION ON THE RELIEF OF THE DESTITUTE SICK AND POOR

At a recent meeting of the Poor Law Commission of the Irish Free State, Mr W. L. Micks, a former Commissioner in the Local Government Board, outlined a scheme of reform as follows.

1 The funds for expenditure on local government purposes should no longer be raised by local rates varying in poundage in each existing local area, but by a uniform tax either equally over the Free State at large, or with a different rate of tax for certain large urban and for rural and minor urban areas. For special important local undertakings loans with appropriate areas of charge might be sanctioned by the Local Government Department.

2 All existing local honorary bodies should be dissolved.

3 In future local administration should be in the hands of members of a permanent civil service of the Free State. These civil servants with their subordinate officials also civil servants should be subject to the control of the Ministry of Local Government.

4 The executive civil servants in each county or county borough (the only proposed units for local government) should be advised by small councils elected by the voters of local taxes in each county or county borough.

In support of these suggestions Mr Micks made the following statement.

Money for the expenditure of local administrative bodies should be levied by a State tax to be apportioned according to the Poor Law valuation, and to be payable by such persons or bodies as are now liable to pay poor rate and other local rates. It was a question whether, having regard to the more costly requirements of towns, the tax should be uniform over rural areas and such populous cities and towns as may be scheduled as urban. Disbursements for local requirements would be made by the Ministry of Finance from time to time upon the requisition of the local administrators in each county or county borough, subject to the approval of the requisition by the Local Government Department. Estimates of receipts and expenditure for the following year should be furnished by the local administrators to the Local Government Department for approval or variation on or before a date to be fixed by the Ministry of Local Government. These estimates, when approved, should be transmitted to the Ministry of Finance in order that the rate of tax should be fixed. Mr Micks thought that the amount now expended upon local services was capable of very great reduction in the total (and, therefore in the amount to be paid by every occupier) owing to the contemplated diminution in the number of local officials consequent upon the amalgamation of a large number of districts. Efficiency also would be promoted and unnecessary expenditure curtailed by the employment of paid responsible trained officials not influenced by a desire to secure local support or favour. In poor areas with a low valuation the local payments would be much reduced, while satisfactory administration in such areas would be possible for the first time. Owing to high poundage rates on low valuations it was impossible in very poor districts to maintain satisfactory institutions or to administer efficiently services under the Poor Relief, Public Health and Medical Charities Acts. He considered that a very great reduction could be made in the number of local administrative bodies, including urban councils and similar municipal bodies. A reduction in the number of local bodies would entail a very large reduction to be made in the number of the more highly paid local officials. If local officials were dispensed with as suggested there might be a very large immediate saving even allowing for due compensation to the holders of abolished offices. Subordinate civil servants would cost far less than the present local officials many of whom in their responsible situations without any official superiors were paid high salaries. There would be only one local administration in each county or county borough though for some important and populous places it might no doubt be found desirable to have subsidiary local areas subordinate to the administrators of counties or county boroughs. It was a question how far it would be equitable to have a uniform or identical tax over the whole Free State affecting equally urban and rural areas. He contemplated the abolition of all local bodies whether acting under charters or otherwise and the transfer to county or county borough official administrators of all the property rights and duties of existing local bodies. The ancient municipal charters as used by the Crown or by bishops or peers were granted for purposes that

were now obsolete. Apart from a natural veneration for antiquity, there did not appear to be any reason why cities, towns, and urban corporate bodies should not be included in a system of local government suitable to Ireland. Their existing system of local government like most other Irish institutions was founded and maintained on English lines. He suggested the dissolution of all local elected bodies of which the members discharge their functions voluntarily and without salary. The duties of such bodies should be carried out by civil servants, aided by advisory councils for each county or county borough. Civil servants were appointed by open competitive examination from which, however, in the transitional period it was presumed that transferred existing officers of the present local bodies would be exempt, while their pensions would count in calculating their pensions.

Mr. Hicks suggested that there should be a Free State Medical Service, the medical officers of which should discharge all medical duties paid for out of public funds. Following the recommendation made in the report of the Vice-regal Poor Law Reform Commission in 1906 the medical service would be entered by competitive examination and promotions therein would be made by the Local Government Ministry acting with a professional medical council. Special regulations would also be desirable as regards the qualifications, appointment and tenure of engineers, architects, and sanitary officers to be employed in local administration. It was contemplated that the proposed advisory councils should not be given any administrative functions or powers. Such councils would however discharge useful and important consultative and critical duties with reference to the proposals and acts of the local administrative officials in their respective areas. The membership of councils should be small in number (say about a dozen), and the members should remain in office for a few (say three or five) years. They would be elected by the voters of local rates in their respective areas. It was probable that the members of the advisory councils of counties and county boroughs would be selected ultimately if not at first on account of their character, intelligence, and knowledge as regards the requirements of efficient and prudent local administration.

National Insurance

EXTENSION OF HEALTH INSURANCE SERVICES IN SCOTLAND

At the thirteenth annual conference of the Scottish Association of Insurance Committees held at Rothesay on September 26th, under the chairmanship of Sir Henry S. Keith an address on national health insurance problems in relation to medical service was delivered by Sir James Leishman of the Scottish Board of Health. The Board of Health, he said, was troubled about the drug position in Scotland because it was under the impression that the people of Scotland in the past two years had taken too much medicine without any corresponding benefit. It was desirable, in so far as there was waste and expense, to hear from time to time of countless money for everybody in the national health insurance scheme—for the chemist, for the doctor, and for the official. Such an idea was the enemy of economy, and there was not plenty of money, for what was available for any particular purpose was comparatively limited, although he was quite satisfied that the scheme as a whole was solvent with something over. New proposals for alterations or extensions would have to come within the limits of the present scheme. No additions or new provisions, no matter how small, could be faced. A very important extension of the insurance principle was about to start in connexion with the widows' and orphans' scheme, which had a proper place in the feelings of everyone, but incidentally had absorbed a good deal of the money that might have been available for any other kind of social service. Sir James Leishman referred to the experiments which had been made in connexion with the Islands and Highlands Medical Service, whereby some expert surgeons had been maintained in remote portions of the country, most encouraging accounts of the value of the work done by surgeons in such out-of-the-way places as Stornoway and the Shetlands had been received. This encouraged an extension of the scheme when means and opportunities were suitable. Times were difficult and there was no particular sign of improvement in trade and industry. After the Napoleonic wars the amount of public burdens was about 52 millions a year for a population of about half the present population. On this basis the public burdens to-day should be about 100 millions but they were ten or twelve times that amount. Nearly a million a day was being spent on the public social services and next year it was expected more would be spent. He thought it might be assumed that social insur-

ance would develop in the future, probably on a contributory basis. It must have as a primary and important portion of it work a medical system. He held that the present general practitioner service was very good. The number of practitioners in Scotland who were not as satisfactory as they ought to be was very small, while the really good general practitioners were in a vast majority. Particularly in the country districts he had found hard working, careful, competent advisers giving of their best in the way of advice, treatment, and attention, with a degree of unflinching skill that had impressed him very much. His own opinion was that the insured person was getting better service than the private patient, and he said this after having got information in the most complete and thorough way. He believed as the result of twelve years' experience, that the medical service was not only essential but should be extended and developed to cover all that advanced up-to-date medical services could cover. He thought, therefore, that the ordinary general practitioner and his patient should have a chance of consultations and the benefit of specialist aid in diagnosis, of additional treatment, and of nursing and convalescent services. It was highly probable that the Hospitals Department Committee would report that there was an insufficiency of hospital accommodation. There was no proper standard as to the number of beds that should be available in any particular locality. The relation of the local authority and its advisers to hospitals would have to be considered, and he thought for example, that more provision must be made for non-pulmonary tuberculosis. With regard to the relation of approved societies to extended medical service, including hospital treatment, there were great difficulties. It might be necessary to draw upon a central fund or some other fund to enable certain societies to pay the usual benefits, and it might be necessary to pool reserves. The voluntary hospitals had done very great service in the past, but he doubted if they were the last word in management, organization, or development.

NATIONAL ASSOCIATION OF INSURANCE COMMITTEES

The programme has been issued for the annual meeting of the National Association of Insurance Committees to be held at the Lytton Hall of the Mansion House, London, on Thursday and Friday, October 22nd and 23rd. The proceedings will open on October 22nd at 3 p.m. and after the transaction of formal business Mr. T. D. Achard, chairman of the Dental Board of the United Kingdom, will speak briefly on the importance of dental health to the insured population and the opportunities for propaganda work open to Insurance Committees in conjunction with the Dental Board. At the resumption on Friday morning Mr. W. A. Platt will deliver a presidential address.

LONDON PANEL COMMITTEE

At a meeting of the London Panel Committee on September 22nd with Dr. H. J. Cardale in the chair, Dr. Cardale and Dr. E. A. Giegg were appointed representatives of the committee on the Insurance Acts Committee during 1925-26 and the same two gentlemen together with Dr. C. L. Battenon, H. W. Palmer, and H. Roberts were appointed representatives of the committee at the forthcoming Conference of Local Medical and Panel Committees.

Chairmanship of Medical Service Subcommittee

In accordance with the resolution passed at the last meeting of the Panel Committee the chairman of the committee had reported to the General Purposes Subcommittee the action which had been taken during the recess in the matter of the new regulation providing for certain changes in the method of appointment of chairmen of Medical Service Subcommittees. This arose out of the recent deadlock in London. Objection was taken to the new regulation by the Insurance Committee at its meeting in July and since then the chairman of the Panel Committee had interviewed medical members of Parliament and others in order to secure that any amended regulation should be satisfactory to the profession. The General Purposes Subcommittee regarded the pledge recently given in the House of Commons by the Minister of Health (British Medical Journal August 8th p. 273) as satisfactory and the amended regulation which had been framed embodied the principle for which the committee had contended.

The committee approved the action taken by the chairman during the recess and on the motion of Dr. A. Davis seconded by

Dr Gregg, a vote of thanks was recorded to Dr Cardale for the manner in which he had conducted the whole of the negotiation. The Chairman, in expressing his appreciation of the vote of thanks, said that he thought the new regulation when it came into force would be quite satisfactory to the Panel Committee and would certainly prevent the recurrence of any such deadlock as had been lately experienced in London. (The amended regulation provides that in the event of the subcommittee being unable to agree upon its chairman, or if the chairman appointed is unacceptable to some members of the subcommittee the matter is referred to the Insurance Committee itself which appoints the chairman, who may be specially co-opted for the purpose. In the event of non-receipt by the subcommittee of the chairman so appointed, representations may be made to the Minister who may make an appointment after consultation with both the Insurance and the Panel Committees.)

Pharmacists Hours

It was reported that in response to a suggestion recently made by the Committee that a late roster system should be adopted by the pharmacists in each district in the London area in order to obviate any difficulty in the dispensing of urgent prescriptions after the usual closing hour, the Pharmaceutical Committee had forwarded a list of chemists in each metropolitan borough who were usually available after 8 p.m. for the dispensing of urgent prescriptions. The Pharmaceutical Committee stated that it was satisfied that the facilities were adequate in every area and that there should be no difficulty in obtaining urgent medicine up to a reasonable time say 9.30 or 10 p.m., provided the scripts were marked Urgent.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE

SURGEON COMMANDER G. G. VICKERY OBE to the Admiralty. Surgeon Lieutenant Commanders G. S. Harvey, W. H. Murray, and G. H. Hayes have been promoted to the rank of Surgeon Commander.

ROYAL NAVAL VOLUNTEER RESERVE

Probationary Surgeon Sublieutenant D. R. Burbury to the Victory for R.N. Hospital Haslar for fourteen days training.

ROYAL ARMY MEDICAL CORPS

Major T. W. Stallibrass retires on retired pay. Captain F. H. Tomlinson retires receiving a gratuity. C. F. McLean to be temporary Lieutenant.

ROYAL AIR FORCE MEDICAL SERVICE

Squadron Leader F. C. Cowtan to R.A.F. Depot. Flight Lieutenant J. C. Osburne is granted a permanent commission in the rank stated. Flying Officers G. J. Hanly to R.A.F. Depot, R. J. K. Chatter to Research Laboratory and Medical Officers School of Instruction, Harrogate. Albert F. Cook is granted a short service commission as a Flying Officer for three years on the active list with effect from and seniority of September 16th 1925.

INDIAN MEDICAL SERVICE

Lieut. Colonel R. McFarrison C.I.E. is appointed temporarily to the Medical Research Department. Lieut. Colonel Alexander Tanton to be Colonel vice Colonel Peter Dee. Majors to be Lieutenant Colonels B. E. M. Newland, L. A. H. Lack, S. Sodhi, M. C. W. C. Gray. The services of the following officers are placed temporarily at the disposal of the Government of Bengal: Captains B. H. Singh, M. C. P. Banerjee and H. E. Murray.

MILITIA

ROYAL ARMY MEDICAL CORPS

Captain S. W. Howland to be Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Lieut. Colonel C. H. S. Redmond to be Brevet Colonel. Captain R. C. Aitchison (Retiree of Officers) to be Major (prov.) with precedence as from June 27th 1924. Captain H. F. W. Adam late R.A.M.C. to be Captain with precedence as from February 17th 1918. (Substituted for notification in the London Gazette July 31st 1925). General Hospitals—Lieut. Colonel A. H. Gosc to be Brevet Colonel.

TERRITORIAL ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Captain R. J. D. to be from Active List to be Captain.

VACANCIES

BURTON URBAN DISTRICT COUNCIL—House Surgeon to the Accident and Surgical Hospital. Salary £200 per annum. BRIGHTON HOSPITAL, Lambeth Road, S.E.—Two Resident House Physicians (male unmarried). Honorarium at the rate of £25 per quarter. BRIGHTON CITY—Assistant Medical Officer at one of the City Mental Hospitals. Salary £550 per annum rising to £600. BRIGHTON EMPIRE LEPROSY RELIEF ASSOCIATION, Delhi—Leprosy Research Worker. Salary £1,000 to £1,200 per mensem. CAMBRIDGE ADDENBROOKS HOSPITAL—Casualty Officer and Resident Anaesthetist (male). Salary £130 per annum.

CENTRAL LONDON THROAT NOSE AND EAR HOSPITAL, Gray's Inn Road, W.C.1—A Assistant Outpatient Registrar. CHELSEA PARISH—Third Assistant Medical Officer (male) for St. Luke's Hospital. Salary £325 per annum. EDINBURGH ROYAL EDINBURGH HOSPITAL FOR SICK CHILDREN—Physician in Hospital for Consumption and Diseases of the Chest, Brompton, S.W.3—Two House Physicians. HOSPITAL OF ST. JOHN AND ST. ELIZABETH, 40 Grove End Road, N.W.8—(1) House Physician, (2) House Surgeon. Salary £100 and £75 per annum respectively. HULL EDUCATION COMMITTEE—Assistant School Medical Officer (male). Salary £600 per annum. IPSWICH COUNTY BOROUGH—Assistant Medical Officer to the Mental Hospital. Salary £300 per annum rising to £350. MANCHESTER ROYAL INFIRMARY—House Surgeon (male) to Aural, Cannical, Ophthalmic and Ophthalmic Departments. Salary at the rate of £50 per annum. CURRENT NOTES

The Autumn Dinner on October 21st

MEMBERS are again reminded of the Autumn or Council Dinner, which will be held in the Great Hall of the Association's new House on Wednesday, October 21st, at 7 for 7.30 p.m. It would be very helpful to those who are arranging for the dinner if tickets were applied for at once instead of waiting until the last day or two. A member may bring any number of guests, up to the limit of the room, and ladies are welcomed. Orders and decorations will be worn. It has been arranged that the dinner shall end about 10.30 p.m., and from then until midnight there will be dining in the Hastings Hall. Applications for tickets, price 12s. 6d. each, exclusive of wine, should be made to the Financial Secretary, British Medical Association House, Tavistock Square, W.C.1.

Committee on Causation of Maternal Morbidity and Mortality

This committee of the British Medical Association held its first meeting of the session on October 8th. The chief item of business was the consideration of the first draft of the interim report on the position and on the steps which should be taken to reduce the death rate due to puerperal sepsis. It is proposed eventually to submit this report to Divisions and Branches of the Association for their consideration, together with a questionnaire designed to elicit information which will be helpful in completing the final report. It is hoped that the interim report will be available early in January next. Meanwhile Divisions and Branches, which are contemplating holding British Medical Association Lectures, might well choose the subject of puerperal sepsis and arrange for lecturers who would be willing to address them on this matter.

G.M.A. and B.M.A.

In the Canadian Medical Association Journal for September an account is given of the opening of the new House of the British Medical Association in London, illustrated by a photograph and a ground plan. The Editor, Dr. A. D. Blackader, includes also an abstract of Mr. Munro Little's lecture on the history of the site. In another part of the same issue Dr. A. H. Gordon gives a flattering account of the Annual Meeting in Bath. He records his opinion that the leaders of British medicine there represented showed an almost uncanny ability to expose the essentials of the subjects under discussion in such a way that they might be understood by the less learned. Although the number of social events, tea parties, golf competitions, and excursions seems to have caused him a little embarrassment, the visit left Dr. Gordon with the impression that Bath is unique, not only in its architecture, but also in its civic character and the warmth of its hospitality. Under the heading of "Editorial Comments"

the papers of Dr. Gao and Mr. Bernard in the Section of Pathology are discussed at some length by Dr. D. Fraser Harris. An abridged version is also given of the opening paper by Sir Humphry Rolleston in the discussion on rheumatoid arthritis in the Section of Medicine, which was published in full in the *British Medical Journal*, October 3rd (p. 589).

The Association's Annual Handbook

The *Annual Handbook of the British Medical Association* for 1925-26 is now ready. Though primarily intended as a book of reference for honorary secretaries and other workers of the Association, the *Handbook* is also of interest and assistance to all members. The new edition has been completely revised. It contains the decisions of the Representative Body of the Association on questions of policy, particulars of the new London and Scottish Houses of the Association, information as to the *British Medical Journal*, the circulation of which is now over 33,500 copies weekly, and lists of the officers and officials of the Association and of its Council and Central Committee. Particulars are also given of the library and lending library, as to some new publications of the Association, the scholarships, grants and prizes given by the Association, and a summary of some of its recent work. Copies of the *Handbook* can be had by members, *gratis* and post free, on application to the Medical Secretary, British Medical Association House, Tavistock Square, London, W.C.1. To non-members the book is on sale at 2s. 6d. (post free 2s. 9d.).

Absence from Home of Insured Persons

It often happens that an insurance practitioner has occasion to recommend a change of air for one of his insured patients. If the insured person takes the advice of the doctor in this matter it is his duty, according to the statutory rules of his society, to notify his intention to the secretary of that society, and failure to do so will probably mean that sickness benefit will not be forthcoming when next the insured person applies for it. A friendly hint by the doctor to the insured patient, to the effect that the patient's intention to be absent from home for a period should be intimated to the society concerned before he leaves home and that the society's approval should be obtained, would be in the interest of the patient, and might save considerable trouble for the society concerned. The patient's position is safeguarded if the doctor states under "remarks" on the ordinary intermediate certificate that such change of air is necessary.

Dispensing Capitation Fee

In a circular letter issued on October 6th to all Insurance Committees the Ministry of Health gave effect to an arrangement agreed to by the Insurance Acts Committee of the British Medical Association at its last meeting—namely, the addition to the list of drugs and appliances appended to the Distribution Scheme of the following: Ring pessaries, eye droppers, eye baths, hypodermic syringes and needles.

for self-administration of insulin. The result of this addition is that the articles in question are not included among those which a dispensing practitioner is expected to supply out of his 2s ex-patiation dispensing fee.

Association Notices.

ELECTION OF MEMBERS OF COUNCIL, 1926-27, BY BRANCHES OUTSIDE UNITED KINGDOM

NOTICE is hereby given that **Nominations** of Candidates for election as Members of Council by those grouped Branches outside the United Kingdom in which there are vacancies (see below) for a period of either three, two, or one year, as prescribed by By-law 56 (2), **must be forwarded** in writing so as to reach the Medical Secretary on or **before February 13th, 1926**.

Nominations must be signed by not less than three Members of any Branch in the Group, and must be in the following form or in one to the like effect:

NOMINATION FORM

By not less than Three Members of the Grouped Branches

We, the undersigned, hereby nominate

of [Full name and address to be given] for election by the [State the names of the Branches in the Group] Branches as a Member of the Council of the Association for the period of _____ years [State whether for 3, 2, or 1 year].

Signatures and addresses of Nominators
Branches

Date 192

The elections, where contests occur, will be by voting papers, containing the names of all duly nominated Candidates, issued from the Head Office, British Medical Association House, Tavistock Square, London, W.C.1, to each member of each Branch in the Group.

A notice will be published by the Council in the JOURNAL as soon as possible after January 13th, 1926, as to any Group for which only one candidate has been nominated and is thereby elected. Not later than the second week in June, 1926, a notice will be published by the Council in the JOURNAL, giving the result of the elections for those Groups where there have been contests.

BRANCH AND DIVISION MEETINGS TO BE HELD

BIRMINGHAM BRANCH DUDLEY DIVISION—The annual meeting and dinner of the Dudley Division will take place on Thursday, October 29th, at the Saracen's Head Hotel, Dudley, at 8 p.m. The price of the dinner will be 9s, payable at the time and exclusive of wines. Dr. G. C. Anderson will be the guest of the evening. Members of neighbouring Divisions will be welcome.

BIRMINGHAM BRANCH NUNEATON AND TAMWORTH DIVISION—The following programme has been arranged for the session 1925-26: Thursday, October 22nd at Tamworth General Hospital—Inaugural address by Chairman. Report of Representative in Representative Body. Wednesday, November 18th at Nuneaton General Hospital—Dr. M. S. F.R.C.S. Notes from the 20th 1926 at Nuneaton General Hospital—Mr. Bernard G. Goodwin F.R.C.S. Some modern methods in the diagnosis and treatment of surgical diseases of the urinary system. Friday, 24th at Atherton—Arranged by Mr. D. S. Price and date of the March meeting will be announced later. It is hoped that a demonstration by Dr. P. J. Housburgh M.O.H. Nuneaton, to be given in May.

BORDER COUNTIES BRANCH—A general meeting of the Border Counties Branch will be held at Tullic House, Carlisle, on Friday, October 23rd at 4 p.m. The silk banner to commemorate the Association's visit to Carlisle in 1896 will be handed to the Mayor of Carlisle (Alderman P. Burns J.P.) for exhibition in Tullic House before being sent to London. Tea. Ladies are specially invited. The Branch Council will meet at 3.30.

CAPE OF GOOD HOPE (WESTERN) BRANCH—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday, October 30th at 8 p.m. when there will be a symposium on neurosyphilis arranged by Dr. F. H. Hooy. Among the speakers will be Dr. J. S.

du Toit, Dr. A. Reith Fraser, Mr. J. Luckhoff, Dr. W. P. Mulligan, and Dr. E. W. D. Swift.

KEYS BRANCH ISLE OF THANET DIVISION—The next meeting of the Isle of Thanet Division will be held on October 20th at 4.30 p.m. at the Cottage Hospital, Laversham, Dr. H. M. Raven in the chair. Address on obstructive disease of the colon by Prof. or C. A. Pinnett, F.R.C.S., surgeon to St. Mary's Hospital, London. Members are cordially invited to tea at the hospital at 4 p.m.

LEICESTER AND CHESHIRE FRANCH SOUTHPORT DIVISION—A meeting of the Southport Division will be held to-day (Friday, October 16th) at 52, Highton Street at 8.15 p.m. The matters for consideration include: Report of Annual Meeting at Bath by the Representative; Huddersfield's 'Practitioners' Mutual Help Scheme'; Chairman's bridge, golf competition, and social function.

METROPOLITAN COUNTIES BRANCH CITY DIVISION—A meeting of the City Division will be held at St. Bartholomew's Hospital, E.C., on Tuesday, November 3rd, at 4.30 p.m. Mr. John Fraser, Professor of Clinical Surgery, Edinburgh University, will deliver a British Medical Association Lecture on sympathetic disturbances of the abdominal viscera in relation to surgery.

METROPOLITAN COUNTIES BRANCH KENYOTON DIVISION—A clinical meeting of the Kenyot Division will be held at St. Mary's Hospital, Paddington, by kind permission of the Committee of Management, on Wednesday, October 28th at 8.30 p.m. Cases will be shown by members of the hospital staff, and a discussion will follow.

METROPOLITAN COUNTIES BRANCH LEWISHAM DIVISION—The first meeting of the session of the Lewisham Division will be held at the Parish Room, St. Lawrence, Venerable Bromley Road, Catford, S.E.6, on Tuesday, October 20th at 8.45 p.m. Dr. M. Godwin Chase will occupy the chair. Agenda—Lecture: Some recent aspects of gland therapy by Dr. J. Stanley White (illustrated by lantern slides); consider proposed dinner, points in regard to panel practice.

METROPOLITAN COUNTIES BRANCH SOUTH WEST ESSEX DIVISION—A meeting of the South West Essex Division will be held at the Wallhamston Hospital on Tuesday, October 20th at 3.30 p.m. when Mr. Russell J. Howard M.S., F.R.C.S., will read a paper on cancer of the breast.

METROPOLITAN COUNTIES BRANCH WILLESDEN DIVISION—A clinical meeting of the Willesden Division will be held at Park Royal Hospital, Acton Lane to-day (Friday, October 16th) at 3.15 p.m. and will be conducted by Dr. W. E. Turner, the resident medical officer.

MIDLAND BRANCH CHESTERFIELD DIVISION—The following is the programme of meetings arranged by the Chesterfield Division for the winter session 1925-26—Friday, November 13th—Discussion: Small pox, to be opened by Dr. Garraway. Friday, December 11th—Address on passive immunity by Dr. J. S. C. Douglas, Professor of Pathology, University of Sheffield. Friday, January 8th 1926—Address on pelvic pain in women by Mr. A. M. Webber F.R.C.S., honorary surgeon, Nottingham General Hospital. Friday, February 12th—Paper: The functions of the thyroid secretion, by Dr. Good. Wednesday, March 17th—Annual dinner. Friday, April 9th—British Medical Association Lecture by Professor F. Langmead. Friday, May 14th—Clinical and pathological evening—demonstration of cases. With the exception of the annual dinner, all the meetings will be held at the Maternity Hospital, Chesterfield, at 8.15 p.m., tea and coffee will be served at 8.

NORTH OF LANCASHIRE BRANCH CLEVELAND DIVISION—Mr. J. Basil Hall, M.Chir., F.R.C.S., of Bradford, Past President of the Association, will address the Cleveland Division in Middlebrough on Thursday, October 22nd. The subject of the address will be announced later. Members of neighbouring Divisions are cordially invited.

NORTH OF ENGLAND BRANCH NORTH NORTHUMBRIA DIVISION—Sir David Drummond will give a talk to the members of the Division on our mistakes in diagnosis and how and why we make them, on Thursday afternoon, October 29th, in the Berwick Infirmary. This early preliminary notice is given in order that members may keep that date free. Further details of the meeting will be issued nearer the time.

NORTH OF ENGLAND BRANCH SUNDERLAND DIVISION—The annual address will be given by Dr. H. Orlinton Miller on Thursday, November 12th. The annual dinner will be held the same evening at 7.30 at the Palatine Hotel, Sunderland.

SHERIFFS AND MID WALES BRANCH—The fiftieth annual general meeting of the Shropshire and Mid Wales Branch will be held at the Royal Salop Infirmary on Tuesday, October 27th, at 3.30 p.m. The President, Dr. Dr. Wheatley, will deliver an address. The annual dinner will take place the same evening at the Raven Hotel, Shrewsbury, at 7 o'clock. As the occasion will mark the jubilee of the Branch, a very large attendance is looked for, and every member is urged to make a special effort to attend.

SOUTH WALES AND MONMOUTHSHIRE BRANCH SWANSEA DIVISION—A meeting of the Swansea Division will be held at the General Hospital, Swansea, on Thursday, October 22nd, when Dr. Daniel F. Evans will discuss the diseased heart in pregnancy.

SOUTHERN BRANCH PORTSMOUTH AND ISLE OF WIGHT DIVISIONS—A joint meeting of the Portsmouth and Isle of Wight Divisions will be held at the Queen's Hotel, Southsea, on Wednesday, November 11th, at 3 p.m. Dr. G. C. Anderson, Deputy Medical Secretary, will give an address on the British Medical Association's Hospital Policy.

SURREY BRANCH CROYDON DIVISION—The next general meeting of the Croydon Division will be held at the Croydon General Hospital on Tuesday, October 27th at 8.15 p.m. when Dr. H. Batty Shaw will give an address on early treatment by artificial pneumothorax of pulmonary suppuration.

QUEEN - 110 FIRST FOR CHILDREN, Hackney Road E2-4A Infant Surgeon

CURRENT NOTES

Bethnal Green and its Medical Officer of Health

It is necessary to draw attention to certain features of an advertisement for a medical officer of health recently submitted by the Bethnal Green Borough Council. This metropolitan borough has a population of 117,238, and under the scale approved by the Ministry of Health a salary of £1,100 should be offered for the post. From the terms of its advertisement the borough council appears to be under the impression that it can get this work properly done for £800 a year, rising by annual increments of £50 to a maximum salary of £900, and, as if to emphasize the council's opinion of the value of such services, it adds that "the salary is inclusive of all services of any kind whatever and no bonus will be paid." To make the insult more complete, the advertisement states that the successful candidate must be, or on appointment become, a member of a trade union. It need scarcely be said that this advertisement does not appear in the *British Medical Journal*, the *Lancet* or the *Medical Officer*, and we find it difficult to believe that any practitioner with such experience as might encourage him to aspire to the responsible position of medical officer of an important metropolitan borough would apply for the appointment, or that even if such applications were made, the Ministry of Health would be willing to approve the payment of a salary so manifestly inadequate on conditions so incongruous. The attempt to force medical men to join a trade union ought to be even more efficacious in deterring the right kind of man from applying. Anything more likely to estrange good men than an attempt to break down their professional traditions cannot well be imagined. So far as we know, medical men have no intention of joining trade unions or of adopting many of the methods of trade unions, and Bethnal Green and other corporations which are inclined to regard membership of a trade union as the seal of efficiency should be made aware that the test of efficiency is registration by the General Medical Council, and that doctors consider membership of their own professional organizations, which are not trade unions, quite adequate, not only for their protection but for the satisfaction of any desire a local authority may have that its officers should belong to an organization capable of conducting collective bargaining should the need arise.

All India Medical Licentiates Association Conference

The President of the All-India Medical Licentiates' Association has sent a cordial invitation to any members of the British Medical Association who are likely to be in the East this winter to attend the conference which that association is holding at Rangoon in the month of December. The president (Dr K. M. Hiranandani), in extending this invitation, recalls happy recollections of the Annual Meeting at Bradford in 1924, which he attended. Any member who

is likely to be able to accept this invitation should write to the President of the All-India Association c/o The Editor of the *Indian Medical Journal*, Meerut, India, and also advise the Medical Secretary of his intention.

Meetings of Branches and Divisions

GLASGOW AND WEST OF SCOTLAND BRANCH

Reception to New Graduates

The customary reception to new graduates given by the Glasgow and West of Scotland Branch was held on October 14th in the University Union, when Dr GEORGE A. ALLAN, President of the Branch presided.

The new graduates were received by the President and other members of the Branch Council and entertained to afternoon tea followed by a musical programme of half an hour.

Dr HUGH MILLER, Chairman of the Scottish Committee, in a convincing address on "Pitfalls in general practice" gave most excellent advice to the new graduates which if followed will certainly considerably help them in their future career. The President also spoke to them on the subject of the British Medical Association and what it can do for them and what it is able to do for members of the profession. Of the seventy-five new graduates who attended the function sixty-four signed the application form for membership before leaving. Those unable to be present at the reception were approached on the morning of the graduation ceremony and a further thirty-five signatures were obtained representing in all 87 per cent of those who graduated at this time.

Association Notices

BRANCH AND DIVISION MEETINGS TO BE HELD

BIRMINGHAM BRANCH DUDLEY DIVISION—The annual meeting and dinner of the Dudley Division will take place on Thursday, October 22nd at 8 p.m. at the Saracen's Head Hotel, Dudley. Dr G. C. ANDERSON, Deputy Medical Secretary, will be present and will give an address. Members of neighbouring Divisions and non-members of the Division will be welcomed. The price of the dinner is 9s. (exclusive of wine) payable at the dinner. Members are requested to notify the honorary secretary (Dr L. D. Roberts, The White House, Wordsley, near Stourbridge) on or before Saturday, October 24th whether they will be able to attend and if they wish to bring a guest.

CAPE OF GOOD HOPE (WESTERN) BRANCH—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday, October 30th, at 8 p.m. when there will be a symposium on neuro-psychics arranged by Dr I. H. KOOP. Among the speakers will be Dr J. S. du Toit, Dr A. Reith Fraser, Mr J. Lückhoff, Dr W. I. Mulligan, and Dr E. W. D. Swift.

GLASGOW AND WEST OF SCOTLAND BRANCH GLASGOW NORTH WESTERN DIVISION—A meeting of the Glasgow North Western Division to which all practitioners within the area of the Division are invited will be held in the Bacteriological Department of the Glasgow Corporation, 20 Cochrane Street, on Wednesday, October 28th at 8 p.m. A demonstration on the methods employed in the bacteriological diagnosis of infectious diseases will be given by the chairman of the Division, Dr F. M. BUCHANAN. Tea will be served from 8 till 8.20 p.m.

LANCASHIRE AND CHESHIRE BRANCH HINE DIVISION—A supper dinner will be held in Hyde Town Hall on Friday, November 13th, at 8.30 p.m. Tickets, price 15s. each, may be had from the honorary secretaries. Members should apply early for their tickets as the number is limited.

[SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL]

of the neighbouring Divisions (Horsham Brighton etc) with their wives and other guests are cordially invited. The price of dinner tickets is 7s, exclusive of wines. Members are asked to apply to the honorary secretary Dr Duncan Mackintosh for dinner tickets enclosing remittance, before October 28th.

YORKSHIRE BRANCH BARNSELEY DIVISION—A meeting of the Barnsley Division will be held at the Central Cafe, Market Hill, Barnsley, on Friday, October 30th. Supper will be served at 8.30 p.m. prompt. Mr Graham Simpson (Sheffield) will give an address on a survey of renal surgery with lantern demonstration.

YORKSHIRE BRANCH SHEFFIELD DIVISION—A general meeting of the Sheffield Division will be held at the Chureli House, St James Street, Sheffield, on Friday, October 30th, at 8.30 p.m. The representatives will present their report. It is hoped that all members will make a special effort to attend.

meeting of the Shropshire and Mid Wales Club at the
the Royal Shrop Infirmary and Mid Wales Club
The President Mr Dr. Williams on Tuesday
annual dinner will be held on Tuesday
Shrewsbury.

BRANCH Oxford Division.—A meeting of the Branch will be held at the Radcliffe Infirmary on Tuesday, October 28th at 2.30 p.m. (Chm at cases Professor Peters' recent researches in tickets (lantern illustrations)).

SHROPSHIRE AND MID WALES BRANCH.—The fifth annual general meeting of the Shropshire and Mid Wales Branch will be held at the Royal Shrop Infirmary on Tuesday, October 27th at 3.30 p.m. The President will take place the same evening at the Raven Hotel annual dinner will take place the same evening at the Raven Hotel Shrewsbury at 7 o'clock. As the occasion will mark the jubilee of the Branch a very large attendance is looked for, and every member is urged to make a special effort to attend.

SOUTHERN BRANCH Southampton and Wiltshire.—A combined meeting of the Southampton and Wiltshire Branch will be held on Wednesday, October 29th at 7.30 p.m. at the South Western Hotel, Southampton. The meeting will be held at the hospital premises.

The fifth annual general meeting of the South Western Branch will take place on Tuesday, October 27th at 3.30 p.m. The branch will deliver an address. The occasion will mark the jubilee of the branch, and every member is urged to make a special effort to attend.

SOUTHERN BRANCH SOUTHAMPTON AND WIMBORNE DIVISIONS—A combined meeting of the Southampton and Winchester Divisions will be held on Wednesday, October 28th at 3.30 p.m. at the South Western Hotel Southampton for the purpose of discussing the hospital policy of the Association.

SOUTH WESTERN BRANCH—The autumn inter-district meeting of the South Western Branch will be held at Plymouth on Wednesday, November 6th at 3.30 p.m. Mr. McCrankin will deliver the address.

South Western Hotel Southampton and Winchester Divisions.—A
meeting will be held at the South Western Hotel Southampton on Wednesday October 28th at 3.30 p.m. at the
purpose of discussing the hospital policy of the Association

South Western Branch.—The autumn intermediate meeting of
the South Western Branch will be held at the Plymouth on Wednesday November 4th at 4 p.m. when Dr
W. McC Wanklyn will deliver an address entitled "The route
of pneumonia" provided it is with special reference to small pox Tea will be
provided at 3.40 p.m.

Surrey Branch Croydon Division.—A general meeting
of the Surrey Division will be held at the Croydon on Tuesday
October 27th at 8.30 p.m. The speaker will be Dr H. Batty Shaw F.R.C.P. The route
of pneumonia pneumothorax of the lung

Sussex Branch Brighton Division.—A general meeting
of the Sussex Division will be held at the Brighton on Tuesday
October 27th at 8.30 p.m. The speaker will be Dr H. Batty Shaw F.R.C.P. The route
of pneumonia pneumothorax of the lung

Wednesday, November 4th at 4 p.m. when Dr
 Wanklyn will deliver an address entitled "The acute
 anthrax with special reference to small pox. Tea will be
 provided at 3.40 p.m."

STREYD BRANCH Croydon Division.—A general meeting of the
 Croydon Division will be held at the Croydon General Hospital
 on Tuesday, October 27th at 8.30 p.m. An address will be given
 by Dr H Batty Shaw F.R.C.P. An address will be given
 on artificial pneumothorax of pulmonary suppuration treatment by
 F.R.C.P.

SUSSEX BRANCH Brighton and Worthing Division.—The
 autumn meeting of the Brighton and Worthing Division will be
 held at Warner's Hotel, Brighton, on Wednesday, November 4th
 at 7 p.m. On this occasion the Division will give a
 dinner a la carte to the public authorities on human nature of
 members will be given.

A general meeting of the Croydon General Hospital
 will be held at 8.30 pm on Wednesday November 11th
 at 7 pm. An address will be given
 on the early treatment by
 Dr. Habberton Lulham
 of the Division of
 Chest and other guests and members
 will be entertained.

Group 'U' (Surrey, Sussex—East and West, Kent and County Boroughs therein where 2 are required), the following being the candidates nominated

Dr J J Day Canterbury
Dr E R Fothergill Hove
Dr P V Fry, East Molesey Surrey

INSURANCE ACTS SUBCOMMITTEE (SCOTLAND), 1925-26

The following being the only candidates nominated by Burgh Local Medical and Panel Committees will become members of the Insurance Acts Subcommittee (Scotland)

Dr W Lawson Glasgow
Dr G W Miller DSO, Dundee
Dr John Orr Edinburgh
Dr James Todd, Glasgow

The following seven practitioners having been nominated by Scottish County Local Medical and Panel Committees for the four seats upon the Subcommittee allotted to direct representatives of County Committees, voting papers were posted from the Medical Department on October 22nd to every member of those County Panel Committees the personnel of which has been reported to the Medical Secretary

Dr R Bruce DSO, Culter, Aberdeenshire
Dr D E Dickson, MC, Lochgelly, Fife
Dr C E Douglas Cupar, Fife
Dr N P Farrar, Innerleithen, Peeblesshire
Dr J W Little Newmans, Lanarkshire
Dr W R Martine Weston, Haddington
Dr James Wilson Irvine, Ayrshire

AN INSURANCE INQUIRY

An inquiry was held at Exeter on October 7th to investigate a representation which had been made to the Minister of Health by the Exeter Insurance Committee, 'that the continuance of Dr Bernard Kelly upon the medical list is prejudicial to the efficiency of the medical service of insured persons

Mr E H Tindal Atkinson (presiding), Dr E Collingwood Andrews (London) and Dr A Forbes (Sheffield) composed the Committee of Inquiry. The Exeter Insurance Committee was represented by Mr Theo Mathews (instructed by Mr J L Pengelly), and Dr Kelly was represented by Mr Rayner Goddard, KC, and Mr W Blake Odgers (instructed by Messrs Le Brasseur and Oakley, solicitors to the London and Counties Medical Protection Society)

At the outset of the inquiry Mr Rayner Goddard took the objection that the representations made by the Exeter Insurance Committee were not confined to the facts as found by the Medical Service Subcommittee which, according to the Regulations, were binding upon local Insurance Committees

Mr Mathews, opening the case for the Committee, said the representations made followed upon a complaint by Mrs Ellen Stevens that Dr Kelly had failed to provide adequate medical diagnosis and treatment to her husband, Sidney Septimus Stevens, in consequence of which he died on April 1st last. Stevens died of strangulated hernia and intestinal obstruction and Dr Kelly's diagnosis was gastroenteritis for which he treated Stevens until April 1st. Dr Kelly was called in on March 27th, and on the fifth day Mrs Stevens was so distressed at her husband's condition that she insisted on a second opinion. Another doctor came, and ordered Stevens' removal to the hospital, where he was operated upon. It was necessary to prove that the doctor had not made a mistake that might fairly have been made and it was contended that from what he knew of Stevens—who had been his patient for many years—he ought to have guessed that the man's condition might have been due to hernia, from which he had previously suffered. The doctor was given a specific account of an incident to Stevens which ought to have shown him, quite apart from the man's history, that he was suffering from hernia. In addition, what the doctor was told daily by Mrs Stevens should have convinced him of the complaint. There appeared to have been symptoms which any medical man would have regarded as characteristic of the man's condition. There was also a small lump in the groin. When Dr Kelly saw Stevens on March 29th he was in pain and was vomiting, and the doctor said to Mrs Stevens 'It is a pity he was not operated upon years ago. It would have saved all this bother.' It was suggested that Dr Kelly had been grossly negligent.

Mr James Long, dispenser to Dr Kelly for eleven years in his evidence said that on the Friday afternoon when Stevens' brother-in-law called at the surgery and told him the symptoms and mentioned that Stevens had previously suffered from hernia he (witness) himself wrote on a slate for Dr Kelly a note 'Stevens, strangulated hernia'. The same evening Dr Kelly asked him who had diagnosed the case, and the witness replied that he himself had.

Dr Howell, house surgeon at the Royal Devon and Exeter

Hospital during March and April, said he attended the operation on Stevens for intestinal obstruction caused by hernia. Stevens died the day following the operation, and he (witness) gave a certificate to the effect that death was caused by strangulated inguinal hernia and intestinal obstruction. It was not a true strangulation, but it was what he had always understood as strangulation. It was not such a typical strangulation as he had seen.

Mr Rayner Goddard, opening the case for Dr Kelly, said the operation upon Stevens revealed that it was a remarkable and obscure case, and Mr Lock would say that he had come across only one similar case in the whole of his experience, and that was subsequent to the present case. Dr Kelly's attention was never directed to anything unusual until the Tuesday morning when the nature of a vomit by Stevens told him there was intestinal obstruction. He examined Stevens on more than one occasion without finding any trace of hernia, the symptoms were those of gastroenteritis. While a mistake had been made, Dr Kelly could have done no more in the case.

Dr Bernard Kelly, in his evidence, said he qualified in Ireland in 1912 and commenced practice in Exeter in the following year. There were 2,400 insured persons on his list. This was the first occasion on which any complaint had been made concerning him, either on the panel or in private practice. When Mrs Stevens came to him on the morning of March 27th she said nothing about her husband having had a strain. In the afternoon, on reaching his house, he saw on his slate, 'Stevens, "strangulated hernia," and he went to see Stevens immediately. Stevens was in bed, and witness took his temperature and pulse and examined him carefully. Stevens reminded him that ten years previously he sent him to the hospital for rupture. The temperature and pulse were normal, and witness satisfied himself that no acute condition was present. He formed the opinion that the complaint was gastroenteritis. He was rather terse with Mrs Stevens. He was in a hurry because of another urgent case. He objected to having a diagnosis thrust upon him by people not competent to make a diagnosis and he thought, quite wrongly, that it was Mrs Stevens who had sent the message and not the dispenser. He asked Mrs Stevens what the vomit was like, and she replied, 'Curded milk.' Later he found that the diagnosis had been made by his dispenser, and when Mrs Stevens called in the early morning he apologized to her and said he would call again that evening. He did so, and found there was no change in the patient's condition. He saw the patient again on Saturday, Sunday, and Monday, and examined him every time for hernia but could detect nothing. Each time he was told that the vomit was the same. On the Tuesday he saw the vomit, and at once concluded that intestinal obstruction was present. He asked Mr Lock to see a case of intestinal obstruction, saying at the same time that he did not know the cause. Witness was present at the operation, and he had never seen a similar one.

Cross-examined, the witness said that if the operation had been performed earlier the patient would probably have had a better chance of recovery. Hernia was ever present in his mind and had he found any symptoms of strangulated hernia he would have sent the case to hospital. He asked Stevens all the questions a medical man would ask and did all that a medical man should do for a patient. There was nothing in his treatment of Stevens that he regretted. He watched Stevens carefully.

Mr Norman Loel, consulting surgeon, in his evidence, said he was called in by Dr Kelly and examined Stevens. Apart from the fact that his face looked pinched there was no physical sign of any serious illness. The operation revealed no sign of strangulation in the technical sense of the word. From the point of view of the general practitioner it was a very obscure case. He knew of only one other in the whole of his experience.

The Chairman announced that the Court would report in due course.

VACANCIES

ABERDEEN, ROYAL INFIRMARY—Assistant Surgeon to the Ear, Nose and Throat Department.
BOLTON COUNTY BOROUGH—Assistant Medical Officer of Health and Assistant School Medical Officer. Salary £600 per annum.
CITY OF LONDON HOSPITAL FOR DISEASES OF THE HEART AND LUNGS (Victoria Park, E.2)—House Physician. Salary at the rate of £100 per annum.
COACHESTRA, SEVERALLS MENTAL HOSPITAL—Second Assistant Medical Officer (male). Salary £60 per annum rising to £705. Diploma of Psychological Medicine carries £50 per annum extra to the scale.
DARLINGTON GENERAL HOSPITAL—Honorary Surgeon to the Ear, Nose, and Throat Department.
DURHAM COUNTY ROYAL MENTAL HOSPITAL—Clinical Pathologist. Salary £400 per annum increasing to £700.
DURHAM COUNTY COUNCIL—(1) School Dentist (whole time). Salary £500 per annum rising to £600. (2) School Dentist (part time) for Bishop Auckland School Clinic. Remuneration £11s 6d per school session.
EASTROPPE, PRINCE'S ALICE MEMORIAL HOSPITAL—Male Resident House Surgeon (unmarried). Salary at the rate of £175 per annum for six months rising to £200 if appointment extended.

British Medical Association.

FOURTH AUTUMN DINNER

THE Great Hall of the British Medical Association House received what one of the speakers described as a "house-warming" on the evening of Wednesday, October 21st, when a company of about three hundred members and guests assembled there for the Annual Council or Autumn Dinner. Although the hall is primarily designed for an auditorium, with the dais at one end, it served admirably the purpose of a banquetting chamber, at all events from the scenic point of view, if the acoustics were not all that could be wished in the case of speakers who addressed the gathering from their different places at the tables, the difficulty was overcome to some extent by getting them to stand on their chairs. The tables were decorated with yellow chrysanthemums, and the dais, from which a programme of music was rendered, was a bank of palms and baskets of flowers. The presence of many ladies added to the pleasure of the occasion.

The chair was taken by Dr R. A. BOLAN, Chairman of Council with the retiring President, Mr J. Basil Hall, who was the principal guest of the evening, on his right. Besides the speakers whose names appear below, and the officers and members of Council, the following were among those present:

Lieut. General Sir W. B. LUSHMAN (Director Army Medical Service), Air Vice-Marshal D. MUNRO (Director Royal Air Force Medical Service), Mrs. IVANS (President Medical Women's Federation), Sir St Clair THOMSON (President Royal Society of Medicine), Sir Frederick METT (President Medical Psychological Association), Dr G. F. BUCHAN (President Society of Medical Officers of Health), Dr Vincent DICKINSON (Master Society of Apothecaries), Mr P. F. ROWSELL and Sir W. Glyn-Jones (President and Secretary Pharmaceutical Society), Mr J. H. Bidecock (President British Dental Association), Dr C. Hubert BOND (Medical Council Board of Control), Dr J. R. KAYE (President, Association

of County Medical Officers of Health), Dr Watkins Pitchford and Dr Orenstein (South Africa), Mr John HATTON (Director of Bath's Bath), Sir Philip Magnus, and the following members of Parliament: Mr A. V. DAVIES, Dr F. E. FREEMANTLE, Dr Haden GUEST, Sir Henry JACKSON, Dr E. G. GRHAM LITTLE, Sir Richard LUCE, Dr T. WATTS and Sir H. KINGSLEY WOOD.

Apologies for absence were received from Sir Cecil Newman and Sir Arthur Robinson.

The Retiring President

After the toast of "His Majesty" had been fittingly honoured in the hall of the building he had so recently opened,

Sir Richard Luce proposed the health of the retiring President. He said that the British Medical Association was happy in the system whereby it obtained distinguished recruits. From the area in which its Annual Meeting was to be held it selected one of its councils very often the most distinguished medical man of the locality, and in this way often brought into the work of the Association, to their own good as well as for the good of others, consultants and specialists who might previously have taken no part in Association affairs. Mr Basil Hall had had an adventurous run of office. It had been marred by the opening of the new headquarters and also by his visit in a representative capacity to Canada and the United States. Much was heard in these days about imitations of Empire, but in recent years several officers of the Association had gone on ambassadorial tours to the profession in the Dominion greatly to the advantage of the profession both overseas and at home.

Mr BASIL HALL, in response to the toast, which was very heartily received, said that when, a little more than two

years ago, he came up to London for a meeting of the Arrangements Committee he felt himself rather a fraud, because that was the first occasion on which he, the President-to-be, had been intimately concerned in the work of the Association. The only thing he really knew at that time about the Association was that it had in office called Dr Cox, whom he had subsequently found to be a safe anchor in time of need. But it he had been reassured in the past he hoped he had atoned (Applause) He felt deep gratitude towards the Association and its Council. He had had two years of real enjoyment. He had been very fortunate in his year of office because it had been so pleasantly eventful. His tour in Canada and the United States made him acquainted with the overwhelming hospitality of the "other side." It had been a valuable experience to attend the Council meetings. Some of them might perhaps have been briefer, but there had been no disorderly scenes of the kind with which Sir Richard Luce must be familiar in the House of Commons. The Council meetings were always worth attending by anyone who was interested in human nature. The Chairman of Council filled him with astonishment on account of his inexhaustible good nature and untried patience. For a long time he never could understand how he had developed that patience, and then it occurred to him that he was a dermatologist! If in Dr Belam the Council had *suaviter in modo*, in Dr Brackenbury it had *fortiter in re*. Dr Brackenbury appealed to the speaker, who was a Yorkshireman, for his fighting qualities. During the war a sergeant had said to him, "If you want someone to make a dash and take a position, give me a Highland regiment, but if you want someone to hold a trench and stick it to the last, give me a few West Riding men." Dr Brackenbury's stubborn fighting spirit had evoked his immense admiration. After a humorous illustration contrasting the successful methods of the two chairmen in debate, the President concluded with an expression of thanks for the extraordinary kindness he had received on every side during his term of office. (Applause)

The Common Health

SIR THOMAS HORDER, in proposing the "Common Health," said that he liked the term better than "Public Health," because it suggested a closer approach to the individual and involved less of the State. He wished it could be one word, like "Commonwealth," which was in no respect more important. Speaking from a detached point of view, as one who did not belong to the body of general practitioners and as one also who was not connected with governmental or municipal bodies, he could testify all the more freely to the steadily increasing robustness of the "patient" who was under this combined charge, and give honour where honour was due for some splendid achievements. The infant mortality rate had steadily decreased, so that the figure in 1924 was a little less than half that of 1900—a great testimony to the infant welfare work and to other activities supervised by the Ministry of Health. The death rate from tuberculosis had come down within the same period almost in the same degree. The rehousing of the people seemed now in a fair way to solution. The rate at which it was proceeding in Great Britain would stand comparison with that of any other country in the world. The question of general hospital provision was harked up with the question of Poor Law reform, and concerning this the Ministry had pledged the Government to action. Two very important Royal Commissions were now sitting—one of them on the lunacy laws, the other on national health insurance. Possibly, with regard to the latter, the Pensions Act had disposed of any hope of further contributions towards insurance from the State, the employer, or the insured person, but the accumulated wealth of the approved societies, due very largely to the good work of the doctors, might still serve as incentive to the Commission to hammer out a plan of improvement and extension in health services. There were still those, outside and inside the profession, who considered that the National Insurance Act was "sown in dishonour"; they might live to see it "raised in honour." Many a politician had bumbled better than he knew. It might well emerge that 14,000 insurance practitioners practising for twelve years a system by which they were better paid when their patients were well than when

they were ill, constituted an experience and training in preventive medicine such as nothing else could afford. Sir Thomas Horder went on to refer to post-graduate education, and said that at last there seemed to be hope that this belated service to the common health might be rendered in that efficient manner which it so fully deserved. There was much in the art of medicine which could not be taught to the undergraduate, burdened as he was by an over-full curriculum on the scientific side, and there was much in the science of medicine which changed so rapidly with the growth in sister sciences as to make the education most desirable and important. Another more thorny problem was the education of the public in health. There was now a tendency, which he regarded as healthy, to relax the iron rules of etiquette so jealously demanded by those bodies which guarded the medical traditions. In the past the hungry sheep had looked up and had not been fed—for that could scarcely be called food which was supplied by "Our medical correspondent," by whom doctors turned journalists, or even by the editor's own practitioner when he yielded to the pressure put upon him to contribute 2,000 words upon a disease of which he had had no personal experience! Turning to matters less debatable, Sir Thomas Horder instanced the need for the maintenance of a pure milk supply, for some diastolic alteration in the design and mode of operation of the municipal dustcart, and for effective tackling of the smoke nuisance. The London fog seemed nobody's business and yet it was, literally as well as figuratively, a blot upon civilization. Obviously it was not the doctor's job, for he was too busy trying to keep the carbon-laden lungs of his patient artificially aerated. Dr Cox, always cheerful and confident, had told him that he had hopes of some Government action should three Cabinet Ministers die on one day and the death certificate state in each case that the death was the effect of fog! (Laughter.) The greater hope was not in Governments, but in teaching the public and stimulating it to make its own reasonable demands and make them imperative. The common health was best relieved along the lines of education, organization, and co-operation. No one individual or party in this complex machine could relieve anything worth having, but working together they could relieve all things. (Applause)

Captain O. E. WARBURG (Chairman, London County Council), whose name was associated with the toast, said that he had always regarded the health services of London as a great partnership between the Ministry of Health, the municipal bodies, the voluntary bodies engaged in health services, and the medical profession. Those responsible in the London County Council for health matters, in administering the various services had endeavoured to maintain close co-operation with the medical profession, to take advantage of the latest results of medical education and research, to encourage and not to stifle initiative, and to weld together into one common whole all those great health services which were administered partly by municipal and partly by voluntary effort. The early interests of municipal bodies in health matters were concerned almost solely with environmental conditions. Fifteen years ago no treatment was being undertaken by public authorities except through hospitals for infectious diseases and through the Poor Law medical service. Since that date the London County Council had instituted a service for the medical treatment of school children, a scheme of treatment of venereal diseases, and various other measures. Since 1906 the death rate of the citizens of London had been reduced by one-fourth, the death rate from tuberculosis by one-third, and the infant mortality rate by one-half, and he looked forward to further triumphs.

Mr S. P. VIVIAN (Registrar General), who also responded to the toast, said that although he was supposed to think of nothing but statistics he did not propose to wear the company with them on that occasion. Figures of speech were more suitable to a banquet than speeches of figures. But he wished to define the relation between the service for which he was responsible and the great purpose of the common health. He had some difficulty in other spheres in maintaining the view that the vital and medical statistics which he produced were important and necessary, but in the present gathering he need not argue a point like that

I had been his good fortune to be associated, throughout a large part of his official career, with the medical profession. He was pitched into the controversies of 1912, now "unhappy, far-off things." To him, an outsider it was given to enter the inner sanctuaries of 429 Strand, as liaison officer between the National Service Ministry and the Central Medical War Committee. No doubt the stress of war made even the Association forget that "civil communications corrupt good manners." In his experience he had never found the medical profession respond other than favourably and with the fullest measure of co-operation to any proposition that promised real progress in scientific knowledge and its application to the needs of the people. He liked to describe the service for which he was responsible as part of the scientific equipment of the medical profession. The results obtained by that service were designed to assist the medical profession in all its branches to prosecute its labours more successfully. The material for that service in the shape of great groups of mortality and other statistics, was drawn directly from information provided by the medical profession itself. All that the Registrar General's office did was inspired by an almost functional honesty in the desire to furnish nothing which was not trustworthy, nothing capable of misleading, and he thought the profession and the public could rely upon that office not to be moved by any controversial aspect of the material with which it dealt. (Applause)

The Guests

Mr F B TURNER proposed the health of the guests, and referred to some of the distinguished visitors. With regard to the two guests present from South Africa, Dr Watkins-Pitchford and Dr Orenstein, he remarked that they were being given by the Association a guest and valuable trust. To them was being handed over the Medical Secretary, and he hoped they would label him carefully and treat him with care, and return him fit and unimpaired. He also spoke of the pleasure it gave to the Council to see so many members of Parliament and so many presidents of bodies allied to the Association at the table. He coupled with the toast the names of Sir Kingsley Wood, Parliamentary Secretary to the Ministry of Health, and Sir Holburt Waring, President of the Medical Society of London.

Sir H KINGSLEY WOOD, M.P., said, on behalf of Mr Neville Chamberlain and himself, how much they had valued the assistance and co-operation of the British Medical Association during the past year. The relationship between the Government and the medical profession was never so close and cordial as it was to-day, and he put that happy result down largely to the work of the Association. It had undoubtedly played a useful part in voicing the views of the profession to the department of State which had most to do with medical affairs. He could give the assurance that no new scheme or additional obligations which involved the members of the medical profession would for a moment be contemplated without in the first place the freest and frankest consultation with the Association. Reference had been made by Sir Thomas Horder to the great progress in health affairs, which he attributed to the partnership between the Ministry of Health, the medical profession, the local authorities and the great body of voluntary associations up and down the country. Too many people were to-day looking to the State for things which they ought to be doing themselves. It was the policy of the Ministry as far as possible to foster voluntary organizations. The voluntary service rendered in this country was matter for pride to every citizen.

Sir HOLBURT WARING congratulated the Association upon its new house. He had heard many discussions as to the advisability of the Association taking up its residence in Tavistock Square, especially in view of the possibility that the University of London might become a very near neighbour. The Bloomsbury site for the University was still under discussion, but he thought the Association might look forward to a certain number of highly respectable institutions presently settling in its locality. The London School of Hygiene and Tropical Medicine plans for which were going forward was one of these—an institution which, when completed, would be second to none in the world.

The Medical Secretary

The CHAIRMAN at this point announced that the Council at its meeting that day had decided to accede to the request of the South African Committee that the Medical Secretary should be allowed to go to South Africa on an organizing tour. Although his absence would mean great privation at headquarters—for he would be away five or six months—the Council felt that it was right to make this response to the request of their South African colleagues. He called upon the company to express its good wishes to Dr Cox, the most devoted colleague, one of the best servants the Association ever had, and the most patriotic man who could be sent on an imperial mission. (Loud applause.)

Dr ALFRED COX who was warmly received said that he was going to South Africa on a mission for the Association which he would dearly like to bring off with flying colours. His purpose was, if possible, to effect the solidarity of the profession in that Dominion. His regret was at leaving the interesting concerns of headquarters for so long a time, but he went with the desire to do credit to the Association of which he had been an officer for eighteen years and which he loved more every year he worked for it. (Applause.)

The Chairman

The toast of "The Chairman" instead of being a casual compliment at the end of the gathering was the climax. Dr C E DOUGLAS proposed the toast in a capital speech, in the course of which he said that no association had ever had so hard-working and so devoted a chairman as Dr Bolam. The Chairman was a man who rose to every occasion. He had revealed himself, when the Association wanted new premises, as the champion house hunter of the kingdom. (Laughter and applause.) He had also shown with what dignity he could handle a royal occasion and sustain his position as the first officer of the Association in the presence of the King. (Applause.) And that night he appeared as host at his own table. But these more or less ornamental duties were things he took in his stride. The members of Council knew him best for his masterly conduct of business. What was his secret of successful chairmanship? After watching him for six years the speaker had discovered it. He knew the alpha and omega of chairmanship. The alpha of chairmanship was in any meeting to be able to restrain a member from monopolizing the conversation, and the omega was like unto it—to refrain from monopolizing the conversation himself. Dr Bolam was a typical Englishman of the North. Tennessee had a couplet which had sometimes puzzled the speaker:

bright and fierce and fickle is the South
And dark and true and tender is the North

Dark with the depth of intelligence, true as every Englishman was true to his word and tender with the cynic's humour and rugged loving-kindness of the men of those counties from Trent—those were the characteristics of the Chairman. (Applause.) There was "a south in the wind" that he was terminating his office as Chairman. That must not be. (Applause.) He would like to see him remain to take his place on that day in seven years' time when the centenary of the Association would be celebrated. And for a long—for a much longer chairmanship was there not ample precedent in the thirty-three years of office of Sir Charles Hastings.

Dr BOLAM who was affectionately greeted on rising said that this was one of the proudest moments in his term of office now rapidly nearing its conclusion. (Cries of "No.") Had he the energy and wit of Dr Douglas he might perhaps be persuaded to carry on the work with which he had been entrusted. At the same time he hoped that while mother would sit in the chair during the centenary year, he himself would be there on that occasion. No man could have received during these last five years more kindly help and encouragement than it had been his lot to receive, in particular from the permanent staff who did everything for him, and allowed him to take the credit for it.

British Medical Association

CURRENT NOTES

The Chairman of Council's Badge of Office

THE very beautiful Badge of Office for the Chairman of Council, shown in the accompanying illustration, has been designed and executed by Mr Allan G Wyon. It takes the form of a gold and enamel star measuring about 3½ inches across. The central device is a replica of the staff and serpent of Aesculapius in the form in which they appear above the Memorial Gates of the Association's new home. The inscription "Chairman of the Council" surrounds this central device appearing in letters of gold on a circle of blue enamel. Between this main "star" and the locket loop by which the badge is suspended from the blue ribbon collarette is a smaller star bearing, again in blue enamel, the initials "B.M.A." Mr Wyon was the designer also of the Badge of Office presented in July last at Bath to the Chairman of the Representative Body, and he prepares the gold medals of the Association.

The Badge of Office was presented to Dr Bolam at the Council meeting on Wednesday, October 21st after the following letter had been read to the Council:

It has appeared to some of us for some time to be desirable that the Chief Executive Officer of the Association should be marked by a Badge of Office in order that the ordinary member may easily identify the individual who should receive most of the praise or blame for the acts of the Association.

At the Bath Meeting one of our members was privileged to see the very beautiful jewel prepared by Mr Allan G Wyon for the Chairman of the Representative Body, and after consultation we decided to ask Mr Wyon if he would undertake the design and preparation of a Badge of Office for the Chairman of Council of the Association. We have left the arrangements in the hands of the Financial Secretary and Mr Wyon and have little doubt that you will be satisfied with the result.

We hope you will wear this jewel for a long time, and that when in the course of years you hand it on to your successor it will prove to him a constant reminder of the high position to which you have raised your office.

We have asked Mr Wyon to bring the Badge of Office with him shortly after the opening of the Council Meeting this morning to present it to you on our behalf.

We make it a condition that our anonymity is respected."

The report of the Proceedings of Council on October 21st will appear in next week's SUPPLEMENT.

Organizing Tour of the Medical Secretary in South Africa

The Council at its meeting on October 21st acceded to a pressing request from the South African Committee that the Medical Secretary should be allowed to visit South Africa on an organizing tour of all the Branches there. It was pointed out that the present was the best time for such a tour, and accordingly Dr Cox sails on October 30th, and does not expect to be back until early in April. The intention is that he shall confer with the South African Committee, which will lay out an itinerary for him, and that he shall see as many members of the profession in that country as possible and report both to the South African Committee and to the Council on his return. The main object of the tour is to organize the Branches and to bring them into closer contact with the Association.

reference to the resolution passed by the Council, which instructed him to convey to the South African Committee the Council's best wishes for the success of that Committee's efforts to promote the solidarity of the profession in South Africa. Members are requested to note that all communications addressed to the Medical Secretary personally will be dealt with during his absence by the Deputy Medical Secretary.

Association Prizes for Essays by Medical Students

The Council of the British Medical Association propose to award in March, 1926, prizes of £10 each for the best essays by final-year medical students on the disabilities that may be directly due to simple fracture (excluding separation of the epiphysis)—(a) of the femur, (b) of the tibia, (c) of the fibula, (d) of the tibia and fibula (simultaneously injured), and the means to be adopted in the treatment of such cases in order to prevent or minimize these disabilities—namely, one prize in each of the following groups of medical schools:

Group 1—University of Aberdeen, University of St Andrews (University College Dundee).

Group 2—Queen's University of Belfast, University of Dublin (Trinity College), National University of Ireland (University College Cork, University College, Dublin, University College, Galway), Royal College of Surgeons in Ireland (Schools of Surgery).

Group 3—University of Birmingham, University of Bristol, University of Wales.

Group 4—University of Durham, University of Leeds, University of Sheffield.

Group 5—University of Edinburgh, School of Medicine of the Royal Colleges.

Group 6—University of Glasgow, Anderson College of Medicine, Queen Margaret College School of Medicine for Women, St Mungo's College.

Group 7—University of Liverpool, Victoria University of Manchester.

Group 8—London, Charing Cross Hospital Medical School, King's College Hospital Medical School.

Group 9—London, Guy's Hospital Medical School, London Hospital Medical College.

Group 10—London, London (Royal Free Hospital) School of Medicine for Women, University College Hospital Medical School.

Group 11—London, Middlesex Hospital Medical School, St Mary's Hospital Medical School.

Group 12—London, St Bartholomew's Hospital Medical College, St George's Hospital Medical School.

Group 13—London, St Thomas's Hospital Medical School, Westminster Hospital Medical School.

Group 14—Medical Schools in the British Empire outside the United Kingdom.

The prizes will be awarded to the authors of the essays deemed by the examiners to be the best sent in from the respective groups, but if no essay received from a group is considered deserving of a prize, no prize will be awarded in respect of that group. The essay, which must not exceed 5,000 words, should be clinical in nature, and must include concise notes of three cases personally observed by the student. Essays should be plainly written or typed on foolscap paper (one side only), and must reach the Medical Secretary, British Medical Association House, Tavistock Square, London, W.C.1, not later than January 16th, 1926. Each essay must be signed by a pseudonym, and be accompanied by a sealed envelope marked on the outside with the pseudonym, and containing inside a signed and dated statement that the essay has been the bona fide work of the competitor, and that he or she has not yet passed the final professional examination together with full name, address, and medical school. The essays received will be adjudicated on by examiners appointed by the Council from among members of the Association not resident in the area of the particular group. The decision of the Council will be final.

Notices in regard to the essays have been sent to the deans of the medical schools with a request for exhibition on the notice boards, as well as to those hospitals concerned with the education of medical students, and to the honorary secretaries of the Divisions and Branches of the Association in whose areas the respective schools are situated. A new feature of the competition on this occasion is the tentative formation of a group for the medical schools in the British Empire outside the United Kingdom.

The Association's Annual Handbook.

The *Annual Handbook of the British Medical Association* for 1925-26 is now ready. Though primarily intended as a book of reference for honorary secretaries and other workers of the Association, the *Handbook* is also of interest and assistance to all members. The new edition has been completely revised. It contains the decisions of the Representative Body of the Association on questions of policy, particulars of the new London and Scottish Houses of the Association, information as to the *BRITISH MEDICAL JOURNAL*, the circulation of which is now over 33,500 copies weekly, and lists of the officers and officials of the Association and of its Council and Central Committees. Particulars are also given of the library and lending library, as to some new publications of the Association, the scholarships, grants, and prizes given by the Association, and a summary of some of its recent work. Copies of the *Handbook* can be had by members, *gratis* and post free, on application to the Medical Secretary, British Medical Association House, Tavistock Square, London, W.C.1. To non-members the book is on sale at 2s. 6d. (post free 2s. 9½d.).

Association Notices

PROPOSED CHANGE OF NAME OF BANFF, ELGIN, AND NAIRN DIVISION

NOTICE is hereby given to all concerned of a proposal made by a General Meeting of the Banff, Elgin, and Nairn Division held on October 2nd 1925, that the name of the Division be altered to "Banff, Morry and Nairn Division". The matter will be determined in due course by the Council. Any member affected by the proposed change, and objecting thereto, is requested to write, giving reasons therefor, to the Medical Secretary, British Medical Association House, Tavistock Square, W.C.1, not later than December 1st, 1925.

BATH AND DIVISION MEETINGS TO BE HELD

BATH AND BRISTOL BRANCH.—The following dates and places of meetings of the Bath and Bristol Branch have been fixed for the 1925-26 season: November 25th (Bath); January 27th 1926 Clinical meeting (Bristol); February 24th (Bath); March 31st (Bristol); April 28th (Bath); May 26th (Bristol). Extra meetings have been arranged at Wells in April and at Weston super Mare in May. The annual meeting will be held at Bristol on June 30th 1926.

BIRMINGHAM BRANCH, COVENTRY DIVISION.—The following programme of meetings of the Coventry Division has been arranged: the meetings will take place at the Coventry and Warwickshire Hospital at 8.30 p.m. Tuesday, November 3rd.—Paper by Dr. Mackey, Common sense. Representatives' report. Dr. E. H. Snell. Tuesday, December 1st.—Paper by Dr. Hart, Use of anaesthetics. Tuesday, February 2nd 1926.—Paper by Colonel Harrison, Modern methods in the diagnosis and treatment of gonorrhoea. Tuesday, March 2nd.—Paper by Mr. Musgrave Woodman. Tuesday, April 13th.—Paper by the Chairman (Dr. Fraser Annand). Some diseases and diets. Tuesday, May 11th.—Annual meeting. Members are invited to show specimens or cases at any meeting.

BIRMINGHAM BRANCH, NEWCASTON AND TARNWORTH DIVISION.—A meeting of the Newcastle and Tarnworth Division will be held at the Newcastle General Hospital on Wednesday, November 18th, when Mr. H. Beckwith Whitehouse M.S. F.R.C.S. will give an address entitled "Notes from an ante-natal clinic".

DUNDEE BRANCH.—A meeting of the Dundee Branch will be held at University College, Dundee on Friday, November 6th at 8.30 p.m. General Business. Report on Local Hospitals Committee. At a meeting of the Branch to be held at the same place on Friday, November 27th at 8.30 p.m. a British Medical Association Lecture will be delivered by Dr. F. A. E. Crew, lecturer in genetics, University of Edinburgh.

LANCASHIRE AND CHESHIRE BRANCH, HAILE DIVISION.—A supper dance will be held in Hyde Town Hall on Friday, November 13th at 8.30 p.m. Tickets price 15s. each may be had from the honorary secretaries. Members should apply early for their tickets as the number is limited.

METROPOLITAN COUNTIES BRANCH, CITY DIVISION.—A meeting of the City Division will be held in the Medical Lecture Theatre at St. Bartholomew's Hospital, Smithfield, E.C. on Tuesday, November 3rd at 4.30 p.m. Mr. John Fraser, Professor of Clinical Surgery, Edinburgh University, will deliver a British Medical

Association Lecture on sympathetic disturbances of the abdominal viscera in relation to surgery. Tea will be served in the Library at 4. It is hoped that as many members as possible will attend. Senior students at the hospital are invited to tea and the lecture. In conjunction with the Aesculapian Society there will be a clinical afternoon at the Metropolitan Hospital, Kingsland Road, on Friday, November 13th at 4.15 p.m. when Mr. R. A. Ramsey, F.R.C.S. surgeon to the hospital will show cases with notes. Members are invited to show cases at any meeting. Tea at 4.

METROPOLITAN COUNTIES BRANCH, HEYDON DIVISION.—A clinical evening will be held at Heydon (Friday, October 30th) at 8.30 p.m. at the Hendon College Hospital (near Hendon Central Station). Programme.—(1) Discussion on the diagnosis and treatment of gastric and duodenal ulcer. (a) The surgical point of view (illustrated by lantern slides) by Mr. Norman C. Lake, F.R.C.S. surgeon to Charing Cross Hospital. (b) The medical point of view by Dr. C. N. Wilson, F.R.C.P. physician to St. Mary's Hospital. General discussion will follow. (2) Treatment of puerperal infection by drainage of the uterus by Dr. Remington Hobbs, medical superintendent of St. Mary Abbott's Hospital, Kensington. (3) Demonstration of specimens by Mr. Leonard Phillips M.S. F.R.C.S. surgeon to patients, Queen Charlotte's Hospital. (a) Spontaneous separation of the cervix in labour. (b) A pyretic fibroid. Light refreshments will be provided. All practitioners are cordially invited. It would greatly facilitate the arrangements for the evening if practitioners intending to be present would notify the honorary secretary.

METROPOLITAN COUNTIES BRANCH, ST. PASCAS DIVISION.—The next meeting of the St. Pascas Division will be held at the British Medical Association House, Tavistock Square, W.C.1 at 9 p.m. on Tuesday, November 10th when Dr. Robert A. Young, C.B.F. F.R.C.P. physician to the Brompton Chest Hospital, will deliver a lecture on the early recognition of pulmonary tuberculosis.

METROPOLITAN COUNTIES BRANCH, SOUTH WEST ESSEX DIVISION.—A meeting of the South West Essex Division will be held at Livingstone College, Knott's Green, Leyton, on Tuesday, November 3rd at 5.30 p.m. when Dr. H. G. Adamson will read a paper on eczema and give a lantern demonstration.

METROPOLITAN COUNTIES BRANCH, WILLESDEN DIVISION.—The clinical meeting arranged for November 19th at the Isolation Hospital has been postponed owing to the death of Dr. Stewart. The second annual dinner of the Division will be held at the Criterion Restaurant, Piccadilly, on Sunday, November 15th, when Lieut. Colonel Kirkpatrick, I.M.S. (ret.) will preside. Reception at 7 p.m., dinner 7.30. Principal guests: Dr. H. B. Brackenbury and Mr. G. J. Triness, chairman, Willesden General Hospital. Any member of the Association will be welcomed and may bring a friend. Tickets 10s. each (exclusive of wine) may be had from Dr. W. Lock, 45 Church Road, N.W. 10.

MIDLAND BRANCH, CHESTERFIELD DIVISION.—A meeting of the Chesterfield Division will be held at the Maternity Hospital, Chesterfield, on Friday, November 13th at 8.15 p.m. when a discussion on small pox will be opened by Dr. Galloway. Tea and coffee will be served at 8.

NORTH OF ENGLAND BRANCH, STOCKTON DIVISION.—A meeting of the Stockton Division will be held in the Stockton and Thornaby Hospital on Friday, November 6th at 8.30 p.m. when an address will be given by Dr. W. E. Hume, F.R.C.P. on some observations on Bright's disease. A large attendance is hoped for.

NORTH OF ENGLAND BRANCH, SUNDERLAND DIVISION.—The annual address will be given by Dr. H. Crichton Miller on Thursday, November 12th. The annual dinner will be held the same evening at 7.30 at the Palace Hotel, Sunderland.

NORTHERN COUNTIES OF SCOTLAND BRANCH.—The autumn meeting of the Northern Counties of Scotland Branch will be held in the Columbia Hotel, Inverness, to-day (Friday, October 30th). A British Medical Association Lecture on infant feeding will be delivered by Dr. Leonard Findlay at 6 p.m. The members will dine together at 8 o'clock after which the presentation of the testimonial to Dr. Munro Vair will take place.

SOUTH WALES AND MONMOUTHSHIRE BRANCH, SWANSEA DIVISION.—A meeting of the Swansea Division will be held at the General Hospital, Swansea, on Thursday, November 5th at 8.15 p.m. Surgical clinic.

SOUTHERN BRANCH, PORTSMOUTH DIVISION.—In order to provide facilities for the discussion of subjects of professional interest and to promote social intercourse and good fellowship among the medical men of Portsmouth and district it has been decided to hold a meeting of the Portsmouth Division on the first Thursday evening of each month during the winter. The first meeting of the session will accordingly be held at the Queen's Hotel on Thursday, November 5th at 9.30 p.m. The meeting will be preceded by a supper (at 3 p.m. head) at 9 p.m. precisely. It is hoped that all members will make a special effort to be present and so secure the success of the inaugural meeting of the session. Members proposing to be present at the supper are requested to notify the honorary secretary by October 31st in order that arrangements can be made. Agenda.—Statement of accounts, recommendations of Executive Committee. (a) flag for Great Hall, British Medical Association House. (b) election of representative letter from Dr. Lockhart Stephens, honorary secretary, Southern Branch, kindly offering to present the Division with badges for the chairman and honorary secretary. Discussion. The early diagnosis of acute infectious diseases to be opened by Dr. James McGregor.

SOUTHERN BRANCH, PORTSMOUTH AND ISLE OF WIGHT DIVISIONS.—A joint meeting of the Portsmouth and Isle of Wight Divisions will be held at the Queen's Hotel, Southsea, on Wednesday, November 11th at 5 p.m. Dr. G. C. Anderson, Deputy Medical Secretary, will give an address on the British Medical Association's Hospital Policy. As the subject is of great importance to medical practitioners the Branch Council hopes that all members will endeavour to attend. Non-members will be heartily welcomed.

The autumn intermediate meeting of the Exeter Division will be held at the Athenaeum, November 4th at 4 p.m., when Dr. Oliver will deliver an address entitled 'The acute and chronic reference to small pox'. Tea will be provided at 4.40.

SOUTH WESTERN BRANCH EXETER DIVISION—The annual meeting of the Exeter Division will be held in the Library of the Royal Devon and Exeter Hospital on Friday, November 6th, at 3.30 p.m. Agenda: Report of Executive Committee, elect officers for session 1925-26. Tea at 4 o'clock. At 4.30 Dr. J. A. Roper will give the first of a series of lectures which is being arranged for the winter of 1925-26 on the modern treatment of diabetes.

SURREY BRANCH CROYDON DIVISION—The next meeting of the Croydon Division will be held at the Queen's Hotel, Upper Norwood on Thursday, November 19th at 4 p.m.

SURREY BRANCH GUILDFORD DIVISION—An ordinary meeting of the Guildford Division will be held at the Royal Surrey County Hospital, Guildford, on Thursday, November 5th, at 4 p.m. Tea will be served at 3.45. The surgical staff of the hospital will show cases in the wards.

SURREY BRANCH KINGSTON ON THAMES DIVISION—The first general meeting of the season will be held at Surbiton Hospital on Tuesday, November 3rd, at 8.45 p.m. An address will be delivered by Dr. Norman Haire on birth control and contraceptive methods. The other arrangements for the season are:—November 18th—Annual dinner at Nuthall's Restaurant, 7.30 p.m. December 1st—Dr. William Brown, Psychology and medicine, January 5th 1926—Dr. J. G. Turner, F.R.C.S., Dental sepsis, February 2nd—Dr. Robert Hutchison, Haematomesia, March 2nd—Dr. Kenneth Walker, F.R.C.S. (subject to be announced later).

SURREY BRANCH REIGATE DIVISION—A meeting of the Reigate Division will be held at the East Surrey Hospital, Reigate, on Tuesday, November 10th, at 8.45 p.m., when Mr. R. P. Rowlands will read a paper on the acute abdomen.

SUSSEX BRANCH CHICHESTER AND WORTHING DIVISION—The autumn meeting of the Chichester and Worthing Division will be held at Warner's Hotel, Worthing, on Wednesday, November 11th, at 7 p.m. On this occasion the Division will entertain guests representative of the public authorities in the area, and after the dinner a lantern lecture will be given by Dr. Habberton Lulham on human nature through a doctor's eyes. It is hoped that members will bring their wives and other guests, and members of the neighbouring Divisions (Horsham, Brighton, etc.) with their wives and other guests, are cordially invited. The price of dinner tickets is 7s., exclusive of wines.

YORKSHIRE BRANCH BARNLEY DIVISION—A meeting of the Barnsley Division will be held at the Central Café, Market Hill, Barnsley, to-day (Friday, October 30th). Supper will be served at 8.30 p.m. prompt. Mr. Graham Simpson (Sheffield) will give an address on a survey of renal surgery (with lantern demonstration).

YORKSHIRE BRANCH BRADFORD DIVISION—The following dates of meetings of the Bradford Division have been arranged:—November 4th—Opening meeting, inaugural address by the chairman, Dr. W. T. Rawson. December 8th—Combined clinical meeting with Bradford Medical-Chirurgical Society, January 26th 1926—Supper dance at Midland Hotel, February 17th or 24th—Lecture by Dr. R. A. Bolam, March—Annual dinner of the Division, April—British Medical Association Lecture, May or June—Motor picnic.

YORKSHIRE BRANCH DEWSBURY DIVISION—A meeting of the Dewsbury Division will be held at the Man and Saddle Restaurant, Dewsbury, on Tuesday, November 3rd, when a lecture will be delivered by Sir Berkeley Moynihan, Bt (Leeds). Supper will be provided at 8.15 p.m. Members from neighbouring Divisions will be welcomed.

YORKSHIRE BRANCH SHEFFIELD DIVISION—A general meeting of the Sheffield Division will be held at the Church House, St. James Street, Sheffield, to-day (Friday, October 30th), at 8.30 p.m. The representatives will present their report. It is hoped that all members will make a special effort to attend.

YORKSHIRE BRANCH WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION—At the meeting of the Wakefield, Pontefract, and Castleford Division to be held in the Bull Restaurant, Westgate, Wakefield, on Thursday, November 12th, at 8.30 p.m., Dr. J. S. Bolton (Wakefield Mental Hospital) will discuss the diagnosis and certification of mental diseases. Supper will be served at 7.45 p.m. (price 2s. 6d.). The meeting is open to all practitioners in the district.

Meetings of Branches and Divisions

METROPOLITAN COUNTIES BRANCH ST PANCRAS DIVISION

Discussion on Puerperal Sepsis

The St. Pancras Division held its first meeting of the winter session at the Association House, Tavistock Square, on October 13th. After Dr. KATHLEEN LANDER, vice-chairman, had expressed regret at the unavoidable absence of the chairman, Dr. Roche, a most interesting address on 'Puerperal sepsis in general practice, its causes and prevention' was delivered by Dr. JOHN S. FAIRBAIRN, obstetric physician to St. Thomas's Hospital.

Dr. FAIRBAIRN commenced by enumerating and discussing many causes of puerperal sepsis which were not under the direct control of the obstetrician and which accounted for so large a proportion of the total number of cases. In particular he deprecated wild statements as to the practitioner's responsibility pointing out that cases could be easily collected to fit in with a preconceived

idea. As an instance of this he mentioned a recent Government report which had given offence to many members of the medical profession. He, however, strongly recommended his audience to read the report of the Scottish Board of Health in which the difficulties of the busy practitioner received full acknowledgement. He himself appreciated the work of the general practitioner, carried out as it so often was under great difficulties, but he considered that the fully qualified medical man was too expensive a weapon to be used in normal confinements. He drew a comparison, very unfavourable to the medical man, between the medical mortality rates and those of the trained midwife. He strongly deprecated the unnecessary use of the forceps, although severely blaming the practitioner, harassed as he often was by the piteous appeals of the patient and her relatives. He thought that women nowadays were not prepared to put up with prolonged pain, knowing as they did that the 'whiff of an anaesthetic' topped their sufferings. In particular he stressed the importance of ante-natal care and simple supervision of the midwives' work. Finally, Dr. FAIRBAIRN appealed to his audience to look to the future and to form new ideals, instead of sticking to their viewpoints of the past. He begged for a very full discussion of his somewhat provocative address.

Dr. LANDER thanked Dr. FAIRBAIRN most cordially for his attendance and address. She was especially grateful to him for his comparison of the midwives' work with that of the doctor, a thing she had not previously dared to do in public. She herself strongly held the opinion that the midwife knew far more about how a confinement should be conducted than did the general practitioner, and was better fitted to conduct labour. She also thought that coitus hinc in pregnancy accounted for a considerable proportion of the cases of sepsis.

Dr. P. P. DALTON commented on the marked moderation displayed by Dr. FAIRBAIRN but joined issue with him and Dr. LANDER over the question of midwives. If Dr. FAIRBAIRN wanted better midwifery, why suggest that the midwives attend all the normal cases, thus robbing the doctor of his only means of gaining the experience of the normal on which he could build up and improve his treatment of the abnormal? Midwives had better mortality figures than the general practitioner (or the specialist) had because they were only allowed to attend on their sole responsibility those patients who were able to deliver themselves. Their mortality for these should be nil. As to doctors being an expensive instrument to use for normal confinements they were being forced to increase their fees because they only got the difficult cases nowadays. He noticed that it was mainly the women specialists who demanded that all the work should be given to the midwives. If he had a case in which the midwife thought she knew more than her doctor did he would dismiss her on the spot as a dangerous person.

Dr. O. I. THEOBALDS read notes of some striking cases of sepsis treated many years ago with marked success. The method used was to administer very large doses of phenazonum to wash out the uterus and to foment the abdomen. All the cases treated by this method recovered.

Dr. E. A. GREGG implored the younger members of the profession, who were not yet set in their ways, to include a midwife in their team of workers. He pointed out that full-time employment could easily be found for them. The plan was that the doctor should supervise the pregnancy and the midwife conduct the actual labour, calling in her chief if his help was required. His suggestions were received with marked approval.

Dr. A. J. CLARKE asked Dr. FAIRBAIRN's opinion as to the use of pituitrin instead of low forceps delivery. Dr. FAIRBAIRN, in reply, expressed his gratification at the keen interest shown by his large audience. He was particularly pleased at hearing Dr. GREGG's constructive suggestions. He approved of the use of pituitrin, but only if the forceps were by, ready for immediate use. If pituitrin did not complete labour in fifteen minutes the forceps should be used.

The meeting closed with a very cordial vote of thanks to Dr. FAIRBAIRN. Sixty-two members and guests were present.

BIRMINGHAM BRANCH NUNEATON AND TAMWORTH DIVISION

The new session of the Nuneaton and Tamworth Division was very successfully inaugurated on October 22nd at a meeting held at Tamworth General Hospital. Dr. LOWSON, the chairman, in his address dealt with the subject of medico-politics with special reference to the National Health Insurance Act. His address was much appreciated and gave rise to a discussion in which several members took part. Dr. McCOLL, the Divisional representative, gave a most comprehensive report upon the Representative Meeting at Bath.

The arrangements for the Treasurer's Cup golf competition as regards local entries were referred to a subcommittee, consisting of the two secretaries, and it was also decided to purchase badges for the officers of the Division. The secretaries were instructed to invite subscriptions (not exceeding half a crown) from the members towards the cost of the badges. All the members present subscribed.

The administration of treatment at the health resorts was a medical concern demanding special study. The health resort was a place for physical treatment by means of climate and for external methods—by baths and otherwise—a conforming to the climate so as to produce a harmonious effect. The simultaneous

treatment by means of physical remedies and medicaments advocated at some of the Continental health resorts, was not advisable because it was merely harmonious. Enlightened medical opinion was turning towards the health resort. Lord Dawson had "devoted health centres" and Sir George Newman proposed "treatment centres" especially for chronic rheumatic disorders. Both these authorities naturally and rightly insisted that investigation should be combined with treatment. This was particularly necessary in the case of the health resort and physical clinic for physical remedies had hitherto been left too much in the hands of non-medical persons.

Another new movement of opinion was towards the sea. Important congresses on thalassotherapy had been held at Venice and Arcachon and everywhere along the European coast there were not only a largely increased number of bathers but of marine hospitals and sanatoriums. Marine health resorts ought to be carefully differentiated especially in the British Islands for our seaside places are quite as different in their action as those upon the three seas of France. At every treatment centre, marine sanatorium or physical clinic at the seaside, certain methods of treatment might well be introduced to combat those particular forms of ill health for which the place has been earmarked. There was need for such specialized health resorts especially in the winter season adapted for example to the catarrhal affections of children, myocardial weakness, arterial hypertension, the soft forms of rheumatism and the nervous breakdowns of middle life. In all these matters the experience and co-operation of local practitioners were essential.

On the motion of the CHAIRMAN a hearty vote of thanks was recorded to Dr Porteus Fox for his very able address. In view of the importance to the borough of the subject discussed the Mayor and other councillors were present at the meeting by invitation. The meeting subsequently at the Mayor's request appointed Dr Bruce (M.O.H. Hastings), Dr W. E. Peck, and Dr Drybrough Smith to act with the local medico-surgical society in the formation of a medical subcommittee of five to co-operate with the council.

ULSTER BRANCH, PORTADOWN AND WEST DOWN DIVISION

A MEETING of the Portadown and West Down Division was held at Armagh on October 16th when the chair was occupied by the newly elected Chairman Dr R. FLOOD (Newry).

Dr ROBERT MARSHALL F.R.C.P. introduced a discussion on the prevention of heart disease in children. This was much appreciated by members and led to a free and interesting discussion in which many of those present took part. Drs DENNY and DARLING reported a case of uterine fibroid obstructing labour and the subsequent operation. Dr DARLING showed a most interesting case exhibiting the Parkinsonian syndrome; this was a girl who had encephalitis lethargica in 1924. He also showed some pathological specimens.

WILTSHIRE BRANCH, TROWBRIDGE DIVISION

A CLINICAL meeting of the Trowbridge Division was held on October 21st at Melksham Hospital. Cases were shown as follows: Dr C. F. RUMBOLD, multiple lymphomata; Dr A. D. HAMILTON and H. C. FAYLOR, amyotrophic lateral sclerosis; Dr C. EDE, popliteal cyst; Dr F. F. BOND, (1) bilateral cervical rib, (2) arthropathy; Dr D. LEIGH SPENCER, imperforate vagina in a child of 14 months. Each case was separately discussed by the members present after which tea was served.

Dr HAMILTON kindly consented to assist the honorary secretary in arranging for a dinner at Devizes on December 2nd; the price of tickets to be 10s. 6d., exclusive of wine.

YORKSHIRE BRANCH, HARROGATE DIVISION

A MEETING of the Harrogate Division was held at the Bath Hotel on October 14th when the chairman of the Division Dr L. G. E. CALTHROP presided. Non-members were invited, and they, together with members, were entertained at tea by the chairman prior to the meeting.

Dr ALFREDO COX, the Medical Secretary, in an address on the advantages of the British Medical Association to non-panel practitioners pointed out some of the activities of the Association that should appeal to all members of the profession: the grants for research of a type that could be carried out by a practitioner in his own laboratory, and the Journal as a vehicle for circulating the advances made by any research. He emphasized the growth of public medicine and dwelt on the futility of individual doctors attempting to bargain with large societies—work which could only be done on a national basis by those with long experience. As an example he instanced the recent negotiations between some approved societies and the British Spa Federation for the treatment of panel patients at certain spas. He said he had been looking into the matter recently at the request of members of that Division and had found that the scheme was in a very nebulous condition, and was unlikely to come into operation for some years except perhaps in a small way as an experiment. The medical organization required would be such as would entail considerable expense and very careful management as it would need the efficient co-operation of medical practitioners all over the kingdom. Yet it had been assumed by a few balneologists and Spa Federation experts that the medical side could easily be arranged by the medical societies of the spas concerned. Lastly Dr Cox made an appeal to non-members on the ground of *noblesse oblige*. The British Medical Association asked those who were not in material need of it to come in and help them. It wanted their views and it needed their outlook.

Dr Edgcombe thought that factors operating against the British Medical Association were the presence of a strong local medical

society and the fact that the Annual Meeting was held in July at a time when most of the members of the Division could not get away. He suggested that the Annual Meeting might be held in Harrogate at some future date.

Dr BAIN, sen., criticized the *BRITISH MEDICAL JOURNAL*. Dr PAVEN SMITH compared the British Medical Association to the Automobile Association. It was the knowledge of the good work it was doing for its members as a whole rather than a strict assessment of the amount of benefit likely to accrue to oneself that should make men join.

Dr COX, in his reply, said he believed the idea of an Annual Meeting in Harrogate would be welcomed by many, but it would have to be towards the end of July.

In the evening a dinner was held at the Hotel Majestic when Dr NIMMO WATSON proposed the toast of the British Medical Association to which Dr COX replied following which the chairman and others entertained the party with music.

YORKSHIRE BRANCH, WAKEFIELD, PONTEFRACT, AND CASTLEFORD DIVISION

THE opening meeting of the winter session of the Wakefield, Pontefract and Castleford Division was held at Wakefield on October 15th when Dr WILLIAM STEVEN, Chairman of the Division, presided. Mr J. A. COUPLAND F.R.C.S. (Leeds) gave an address on the mortality rate of operations for intestinal obstruction. Having pointed out that the mortality rate although greatly reduced, was still seriously high, he went on to discuss the reasons for the high mortality, and emphasized the great need for early diagnosis and prompt surgical treatment. He subsequently dealt with the principal points in diagnosis and criticized some diagnostic signs on which medical practitioners had been taught to rely—for instance abdominal rigidity and distension.

The address was one of singular interest to medical practitioners and after a discussion, in which several members joined, a very hearty vote of thanks was extended to Mr Coupland.

THE SIR CHARLES HASTINGS CLINICAL PRIZE FOR GENERAL PRACTITIONERS

THE Council of the British Medical Association has decided to establish experimentally an annual prize—"The Sir Charles Hastings Clinical Prize"—of fifty guineas for an essay or lecture for the purpose of stimulating systematic observation, research, and record in general practice. The Council believes that systematic observation by general practitioners, along selected lines of clinical study may result in the production of practical contributions of great value by those who are in a favourable position for following disease through its various stages.

The first prize will be awarded in 1926, and the conditions governing its award, as adopted by the Council on April 16th, 1924, are as follows:

Regulations

1 This prize is established by the Council of the British Medical Association for the promotion of systematic observation, research, and record in general practice; it includes a money reward of the value of fifty guineas.

2 Any member of the Association who is engaged in general practice is eligible to compete for the prize.

3 The work submitted must include personal observations and experience of the candidate collected in general practice, and a high order of excellence will be expected. If no essay entered is of sufficient merit no award will be made.

4 Essays, or whatever form the candidate desires his (or her) work to take, must be sent to the Medical Secretary, British Medical Association, B.M.A. House, Tavistock Square, W.C.1, not later than December 31st, 1925, and the prize will be awarded at the Annual General Meeting of the Association. The first award will be made in 1926.

5 If any question arises in reference to the eligibility of the candidate or the admissibility of his essay, the decision of the Council on any such point shall be final.

6 Each essay must be distinguished by a motto, and must be accompanied by an envelope marked with the same motto and enclosing the candidate's name and address.

7 The candidate who wins the award shall, if the Council so desires, publish his paper in the *BRITISH MEDICAL JOURNAL* or deliver a lecture on the subject thereof at a meeting of the Association.

8 Inquiries relative to the prize should be addressed to the Medical Secretary, B.M.A. House, Tavistock Square, London, W.C.1.

ANNUAL PANEL CONFERENCE

EMPHATIC VOICE OF CONFIDENCE IN INSURANCE ACTS COMMITTEE

THE Annual Conference of Local Medical and Panel Committees was held in the Great Hall of the British Medical Association House, Tavistock Square, on Thursday, October 22nd. It was very largely attended, and although the agenda appeared to be much lighter than usual, containing only about forty motions, many of them of a formal character, the proceedings nevertheless continued from 10 in the morning until 7 at night.

Dr E KALE LE FLEMING (Wimborne) presided, and was supported by Dr H G DAIN (Chairman, Insurance Acts Committee), Dr A Cox (Medical Secretary), Dr G C Anderson (Secretary to the Committee), Dr J R Dwyer (Scottish Secretary), and Mr W B Hempson (Solicitor).

The CHAIRMAN expressed the gratification of all the representatives on meeting for the first time in the dignified hall which was part of the home of the British Medical Association, and he thought they would all wish to congratulate the Association upon a house so well adapted to its purposes. (Applause.) He was proud of the fact that he should be the first to preside at a Conference in the Great Hall.

Among the preliminary business was a motion from Kent urging that the annual report of the Insurance Acts Committee ought to be available to representatives at an earlier date, before the provisional agenda of the Conference was drawn up. Dr DAIN explained that the report was held over until after the September meeting of the Insurance Acts Committee in order that it might be absolutely up to date. Had it been published earlier in the year a supplementary report to correct or amplify certain matters would have been necessary. He agreed, however, that next year the report, if possible, should be made available to committees a longer time ahead.

Dr HERBERT HALL (Hertfordshire) brought forward a motion to divide group N' (the group which includes his own county together with Middlesex, Buckinghamshire, Essex, East and West Ham and Southend) into two groups, each returning one member to the Insurance Acts Committee instead of the entire group returning two members as at present. Some objection to the proposed division was raised by representatives of other constituencies included in the group. It was pointed out that the division would bear unfairly on the Essex side, moreover, that to divide one constituency in this way would break up the symmetry of the whole scheme of grouping. The motion, however, was agreed to on the understanding that the division should only take place by the consent of all the committees composing the group—a consent evidently not yet forthcoming.

ANNUAL REPORT OF INSURANCE ACTS COMMITTEE

Dr DAIN, in bringing forward the annual report of the Insurance Acts Committee as to action taken since the last annual Conference (SUPPLEMENT, October 10th, p. 121), said that he could not recall a conference agenda which was so free from controversial matters. There were two reasons for this. One was that a special conference had been held in the earlier part of the year to consider the Memorandum of Evidence to be presented to the Royal Commission, and at that conference a good deal of the ordinary contentious business was disposed of. The second reason was that all improvements of the insurance system were at present held up pending the report of that Royal Commission. Any suggestions that might be made to the Ministry of Health were met by the statement that the Ministry was not prepared to consider alterations until the Commission had reported. One of the questions raised last year had been settled in a very admirable way. This was the over-representation of Sunderland in the group electing direct representatives to the Insurance Acts Committee, owing to the special constitution of the Local Medical Committee in that area. Sunderland had very generously altered its local arrangements in this respect so as to bring its representation into line with the other members of the group. There were only one or two matters in the report which called for general observations. One was the arrangement

which had been entered into with the Ministry of Health with regard to ophthalmic benefit. The methods suggested for the addition of this specialist service were experimental, and would probably be improved in the light of experience, but that experience would be of great value when other specialist services—this was the first of them—came to be added to the present service. This particular service had pitfalls which most of the other specialist services would not possess. The large majority of approved societies which up to now had given any ophthalmic benefit had done it largely through the opticians as a rule the benefit consisted in referring their members to opticians to be tested for and given glasses. The Committee, of course had taken the only possible line, that it must insist that in every case in which the practitioner considered that the eyesight required attention the diagnosis must be made by a properly qualified ophthalmic surgeon ('Hear, hear'). This had raised a situation of some difficulty such as, of course, would not arise in dentistry. A new standard had to be set up, and the approved societies had to be warned from a method which they had already adopted for optical benefit, and urged to adopt another method much more satisfactory, but also more expensive. A very small proportion of insured persons were at present entitled to this particular benefit, but by July, 1926 when the additional benefits accrued for very many large societies the question would take a much wider range, and it was hoped that those societies would then adopt the agreement made with regard to this additional benefit. The difficulty of getting together a list of ophthalmic specialists had been surmounted by a special committee of the British Medical Association, consisting of ophthalmic surgeons, with others, with Dr Wallace Henry as chairman. Very great care was exercised to ensure that all applicants for admission to the list of those ready to perform this service were properly qualified according to the standard set up. The other important matter on which he might say a few words was that of disciplinary action by the Ministry of Health. It was not necessary to repeat to the Conference the history of the cases which had caused considerable anxiety to the Committee as to the way in which the functions of the Ministry in this respect were carried out. The Minister himself in June last received a deputation from the Insurance Acts Committee on the subject. On that occasion the matter was laid before the Minister under four headings, and certain principles were put forward corresponding to those already set out in the Association's evidence to the Royal Commission. After some discussion as to the meaning of the principles, the Minister agreed that the principles were on the whole fair and sound, but he pointed out that the disagreement might arise on the bearings of a particular case with regard to those principles. Since that interview no case had arisen, to the Committee's knowledge, in which there was a difference of opinion as to the application of any of these principles. If and when such a difference arose the Committee would be prepared to deal with the matter. The proof of the pudding was in the eating, and he did not feel that anything further could be said on this point until experience showed whether the attitude of the profession had had a modifying effect upon the decisions by the Minister on receiving reports from Medical Service Subcommittees and Committees of Inquiry.

Dr Gordon Ward asked for further information with regard to the Committee's attitude to the Minister in relation to one of the four principles brought before him.

Dr DAIN, in reply, said that the Committee did not agree that in any circumstances it was competent for officers of the Ministry to set up a standard of professional treatment. The insured person was entitled to the best service which a qualified man could give but it was not competent for the Ministry to insist on a standard of treatment different in any way from the treatment which practitioners

gave to all their patients. The Committee would have behind it the full support of the Conference in maintaining the position that individual practitioners must be free to do what they believed to be best in the interests of the patient without the risk of some lay person—an official of the Ministry, who, moreover, had never seen the patient, and knew nothing at first hand about the case—saying he should do something different. (Applause)

CONFIDENCE IN THE EXECUTIVE

Dr D. R. FOTHERGILL (Brighton), as a matter of urgency brought forward the following motion:

That this Conference of Local Medical and Panel Committees reiterates its confidence in the Insurance Acts Committee of the British Medical Association as the one and only medical body authorized to defend the honour and interests of insurance practitioners and to voice their wishes and urges all its constituent committees loyally to support that committee only, dissociating themselves from action taken within the medical profession by others which can result only in disunion and in rendering collective bargaining ineffectual.

Dr Fothergill said that, coming up in the train that morning, he had thought that those attending the Conference would have little to do beyond looking out return trains, and then he saw in the newspaper a report of a meeting held on the previous day (in one journal the report was headed "Panel Doctors' Revolt") which "put his dander up," and he felt it was time the Conference passed some such resolution as he had brought forward. He wanted to put matters to the Conference quite bluntly. The position was back again at 1914. At the Aberdeen meeting in that year a strong attempt was made by certain medical practitioners to form an outside body to voice the wishes of the men serving under the Insurance Act. That was fought and "downed." He himself believed that the "downing" of that movement was the biggest step ever made towards unity in the profession ("Hear, hear"). Had that outside body been formed, the result would have been, instead of one authoritative and effective body, two bodies lacking authority or effectiveness, and the profession, instead of meeting there that day with practically nothing to do, would have had to fight for its very bread and cheese. (Applause.) Had the British Medical Association delivered the goods? or had it not? ("Yes.") The issue could be judged only by the facts. First he would point to the mobility of the executive body, the Insurance Acts Committee. Mobility was a condition of effectiveness on the part of any representative organization. When the Committee was first constituted only three or four seats were allocated to direct representatives of Local Medical and Panel Committees, but the constitution had been so moulded that now the direct representatives numbered about two dozen, and only four members were elected by the British Medical Association. The Committee had constantly called conferences, it had poured out voluminous documents—probably resented by many who read nothing except the newspaper—and it had given every constituent committee of the Conference the fullest opportunity of voicing its wishes. That was illustrated in the action taken on the Memorandum of Evidence submitted to the Royal Commission. In fact, so generous was the Association that its own Representative Body was asked to collaborate with the Conference in formulating recommendations, the two bodies sitting as one. When, in the matter of the expiration fee, the time came for united action by the profession, a most extraordinary thing happened. He himself had once stated that when one tried to grip the medical profession and weld it for one common purpose it would be like a handful of sand which trickled through the fingers. He was wrong, through the effective organization of the British Medical Association the whole of the insurance practitioners—99 per cent of them—sent in their resignations. Was not that a thing which for all time should make insurance practitioners and their committees stand by the one and only body which had "delivered the goods"? (Applause.) Many in the Conference perhaps did not know that it only required the chairman and a few other representatives of the Insurance Acts Committee to approach the Minister and say that a certain thing must not be done, and, speaking generally, it was

not done. The Government simply accepted the opinion of the Insurance Acts Committee as the opinion of the profession, and moulded its own action accordingly. (Applause.) The Committee had arrived at this happy result because it had been able to convince the Government that professional interests were also the interests of the public. Well, what would be the result if Panel Committees started equotting with other bodies? What would be the effect on the rank and file of insurance practitioners? They would say, "I am told that I must not have confidence any longer in the Insurance Acts Committee, and I don't quite know what this new 'stunt' is, I will leave it at that." Then, when trouble came, where would they be? Instead of ninety-nine out of a hundred in support of one united policy there would be, perhaps, forty or fifty. If the press could show that there was disunion among insurance practitioners, well, at any rate it made a headline, and a good many people took their opinions from the press. The impression was given that the Insurance Acts Committee was no good, that the profession was in revolt, and that some other body was coming along to look after it. What would be the effect on the Government when it learned that there was no longer any body competent to voice the opinions of insurance practitioners? The result would be to confuse the officials and to make them less inclined to heed representations made on behalf of the profession. The future was not in any case likely to be a calm sea. The Act was going to be extended. There might have to be a fight over many new proposals. It was necessary for the profession to be in a strong position and to speak with one voice, disunion would be fatal. He begged the Conference to stand together and adopt the resolution (Loud and general applause.)

Dr PETER McDONALD (York) said that it was a fairly open secret in the Conference that he was not always in entire agreement with Dr Fothergill, but on this occasion he was wholeheartedly with him, and seconded his resolution. He did so, however, with a certain amount of pain, because the resolution did cast reflection to some extent upon those with whom he had at one time been prominently identified. He ceased to be identified with the body in question, and his committee did the same, they came to the conclusion that that body was not promoting unity, but disunity ("Hear, hear"). He did not attend the proceedings of the previous day, his committee did not desire him to attend, it desired him not to attend. It seemed to him that the effect of those proceedings of which they read in the newspapers that morning was again to promote disunity, it looked as if that was the desire of the meeting in question. He was not quite certain that it might not have been better for the Conference to have treated the proceedings with silent contempt—a contempt they might well deserve. But there were two reasons why something should be said. The first was on account of the effect on the minds of the medical profession. The proceedings in question might lead people to suppose that the Insurance Acts Committee had been ineffective in the matter of disciplinary procedure on the part of the Ministry. But he need only point to one instance (the Lancashire case) in which the Committee secured its end by persistent pressure—almost badgering, indeed, although quite tactful badgering—and the result on the whole was satisfactory. That was just one instance of the work of the Committee. A second reason why the thing could not be passed over in silence was because of the effect upon the Minister of Health and the Ministry. The Committee had had interviews on this matter of discipline with the Ministry, and in one instance with the Minister himself, and had received from the Minister declarations which on the whole again were satisfactory. Now a body came forward and said, "No, things are not right." But the fact was that it could not be said whether things were right or wrong until it was known what the Minister was going to do. If the Minister implemented what he had said, then things were all right, if he did not, then it would be time to take action. But to give the Ministry the impression that the profession at this moment was not satisfied was unwise and not altogether "playing the game" ("Hear, hear"). It gave him great pleasure to second the resolution. (Applause.)

Dr GORDON WARD (Kent) said that in that Conference he represented the Kent Committee and no other body. But in view of the perfectly honest attacks which had been made on a particular body in the speeches just delivered he asked permission to speak for a moment as representing it. The body in question was in existence and was increasing in numbers. The question arose as to how it was to be treated. It claimed no more support than it actually got, and it was not fair to suggest that it stated, or had at any time stated, that it represented as wide an electorate as the Insurance Acts Committee. That body, on the previous day called a conference, which spent several hours discussing each step in the disciplinary proceedings. At the end of that conference it came to the conclusion that there should be an appeal to the courts. It had been suggested that this was idle opposition to the Insurance Acts Committee. Such was not the fact. The Insurance Acts Committee had an interview with the Minister of Health, the report of which (SUPPLEMENT, June 27th, p. 290) was before the Conference. The deputation took four principles and brought forward an illustrative case with regard to each of them. Two of those cases were cases of members of the other body, which had been entrusted with their interests. That body, previous to the Insurance Acts Committee interview, had intimated to the Minister that it wished to be heard on behalf of its members, but it was told that the Minister could only hear the Insurance Acts Committee. In the course of the interview with the Minister the question was raised of whether or not injustice was done in one of these instances, and the deputation said, "We are not pressing that claim." The speaker urged that in view of the information available there was no question but that definite injustice was done in this particular instance. These were the circumstances under which a conference largely of an educational character, was summoned. It was not possible for the present Panel Conference to give to one single subject the hours of consideration which were given by the conference on the previous day, but a good deal was learned from the discussion. Such a body could be treated if they pleased, with "contempt"—the word used by Dr Macdonald—but that it would hardly promote unity in the profession. Although he (the speaker) belonged to that other body, he stood there and declared that unity in the profession was the only thing that mattered. The members of that body had a right to express their own particular views. There was, as Dr Fothergill had said, a fight in the future. That body could very easily be forced into a position of almost compulsory antagonism to the Panel Conference and the Insurance Acts Committee. If that were done it would be done at the peril of the profession. At present it would be wise to let things alone, and to allow the process of evolution to proceed.

Dr L. A. GARGR (London) said that it was some years past since he definitely addressed himself to the task of contributing towards that professional unity which Dr Fothergill by the attitude and spirit of his speech, had succeeded in imperilling. He wanted to remind the conference that the last time he (Dr Gregg) stood on its platform was an occasion in which he went the whole length it was possible for one to go who, while wishing to remain loyal to the other body, ardently desired unity and a working agreement. He would, however, refuse to say another word in answer to the objectionable spirit of Dr Fothergill's speech. The seconder of the resolution had used the term "silent contempt." He wished he had not done so. He would remind the Conference that the other body which had been so much spoken about that morning took its share in the last great fight, it did its utmost, and he had never heard a word of appreciation of the services it rendered on that occasion. The suggestion was made that the Insurance Acts Committee and the profession were satisfied with the utterances of the Minister on disciplinary procedure. He contested that absolutely. The profession was not satisfied with those utterances, and a considerable pro-

portion of the members of the Insurance Acts Committee themselves were not satisfied. He wished to move that the Conference proceed to the next business. Having ventilated this matter, he hoped that any little ill feeling would pass away.

The motion to proceed to the next business was not accepted by the Chairman.

Dr BRACKENBURY (Middlesex), who was received with applause, said that he was not sorry that the motion had been brought forward, but he was more than a little sorry at the course of the discussion. The Conference was not now dealing with the satisfaction or otherwise of the Insurance Acts Committee with the utterances of the Minister on disciplinary cases but Dr Gregg, who was an important member of the Insurance Acts Committee, had never voiced in that committee the dissatisfaction of the large number of practitioners, which dissatisfaction, he now stated, existed. (Applause.) The Conference, again, was not concerned with the relations of the Medical Practitioners' Union to the Insurance Acts Committee. The resolution was concerned with the relation of the Panel Committees to the one and the other—a very different thing. If there were members of the profession who desired to belong to a trade union particularly of that type they were at perfect liberty to do so. He did not think they were wise, but that was for them to say. And if there were to be more bodies than one to organize the members of the profession, then the bodies ought to try to behave towards one another in a friendly and professional manner. It was necessary to judge, not by words, but by deeds, and they could make up their minds about the Medical Practitioners' Union, not by the words of its supporters on that platform, but by its actions. It would be fatal if there were a divided loyalty on the part of Panel Committees, which had again and again chosen the Insurance Acts Committee as their representative and executive body. If certain Panel Committees, as such, went to another conference and took their action through another executive body, then the influence of the present Conference and of its executive with the public, with the profession, and, above all, with Government departments, was well nigh gone. ("Hear, hear.") If the Medical Practitioners' Union chose to call a conference of its members in order to give them the education which they needed so badly—(laughter and applause)—neither he nor anyone else would stand in their way. But what was their decision on the previous day? Dr Gordon Ward had not told the present Conference, but the Conference probably knew, that the decision at the previous day's proceedings was to send a separate representation on behalf of insurance practitioners to the Ministry. If it had been an educational conference and had decided to make representations to the present Panel Conference or its executive, and had urged a further deputation to the Ministry, nothing would have been said. But if a position arose in which some Panel Committees sent representatives to the present Conference, some to another conference, and some to both, each conference instructing separate executive committees to go to the Ministry it would be disastrous. That was what was deprecated in the resolution, which he hoped would be carried almost unanimously by the Conference.

Dr Fothergill's resolution reiterating the confidence of representatives of Panel Committees in the Insurance Acts Committee was then put to the meeting, and was immediately seen to be carried by an overwhelming majority. The dissentients numbered eleven. The number of those who voted in favour of the resolution was not counted, but it must have been about 150.

DISCIPLINARY MATTERS

Dr G. G. GENG (Croydon), in moving "That all complaints against insurance practitioners should be dealt with in the first instance by Insurance Committees," described certain cases in which insurance practitioners had been penalized for not sending in reports to tuberculosis officers, and the complaint had not been made through the Insurance Committee in the ordinary way, although it was with Insurance Committees that insurance practitioners were under agreement.

Dr DAIN said that insurance practitioners had been always under obligation to furnish reports to tuberculosis officers

¹ No such words appear in the official report. The relevant passage appears to be the following:

The Minister. And what about injustice? Dr Brackenbury. That is not an opinion that we as a committee have expressed. We have brought to the notice of the Ministry a feeling widely current in the profession.

with regard to insured patients. When the treatment of tuberculosis was taken out of the hands of Insurance Committees it was arranged that such reports should be sent direct to regional medical officers, but eventually, in view of the cumbersome nature of that procedure, an agreement was arrived at that the regional medical officer should be cut out and reports go direct to the tuberculosis officer as before. As a matter of machinery the tuberculosis medical officer reported to the regional medical officer when a practitioner failed to send the reports for which he was asked, and the regional medical officer reported to the Ministry, on which report action might be taken, although the Insurance Committee had not been consulted in the matter. The officers of the Ministry, with whom this question had been raised, had urged that this was not a question in which facts were likely to be in dispute, or in which evidence was necessary—the practitioner had simply failed to present the report—and if it was desired to refer all such cases to the Medical Service Subcommittee, with the requirement that the doctor should appear before that body, it would cause a good deal of trouble to various people not least to the practitioner himself. The machinery had now been at work for two years, and the speaker did not think that any substantial advantage would be gained by doing what the resolution asked. The present arrangement did not seem likely to result in any particular injustice.

Dr. GEORGE urged that the Minister should not be allowed to fine practitioners without giving them the full trial to which they were entitled. (A Member: They were practitioners who did not do their job.)

The motion was lost by a large majority.

Dr. J. L. PICTON (Cheshire) moved

That there should be a right of appeal not only on grounds of procedure but on the merits of the case from the decisions of the Minister to the High Court or when removal from the panel is in question to the proposed medical tribunal if that be created.

He said that a similar resolution was brought forward at the last Conference and not carried. It was lost by a small majority, and some of those who voted against it did so under a misapprehension. What the last Conference had in mind was that, if such a resolution were carried, there might be a large increase in the amount of litigation before the courts to which practitioners would be compelled to submit, because the same right of appeal must be given to the complaining patient or other party as to the practitioner. But such rights, so far as insured persons were concerned, had always existed. Insured persons were not under the regulations and did not suffer from the disabilities attaching to insurance practice. They had always been free to go to the courts. It had also been said that this motion was unconstitutional because it interfered with the disciplinary control which a Minister responsible to Parliament for money expended on a particular service must have over those who worked that service. But the constitutional position depended upon the terms of the Act, and any modification of legislation could create a fresh constitutional position. Moreover, there was one case in which the Minister had actually withheld his decision pending the decision of the courts. Practitioners had no fear in invoking the common law. Why, indeed, should they want to be outside its sphere of action? Matters had quietened down since the interview with the Minister, but this disability remained, and it seemed to him that the safety-valve indicated in the resolution should be available.

Dr. D. F. TOWN (Durham) moved as an amendment that a practitioner should have the right of appeal against the decision of the Minister of Health to an independent authority if the same met with the approval of his Panel Committee. His own committee recognized that there should be a right of appeal, but at the same time there was another side to the matter, and the right might be very much abused if it were left in the promiscuous manner suggested in the resolution. The remedy would be for an insurance practitioner to have the right of appeal to a higher authority if he had the support and approval of his Panel Committee. This matter called for careful dealing. All that the profession wanted was equity.

Dr. DUNN hoped that the Durham amendment would be carried down. No Panel Committee would lightly face the

responsibility of having to decide whether a man who wanted to appeal should be allowed to or not. Dr. TOWN declared that no Panel Committee in the country would fail to do its duty faithfully and loyally on behalf of practitioners. He thought that the position of the profession would be strengthened by proceeding on these lines.

The Durham amendment was lost by a large majority.

Dr. G. C. GANNATT (West Sussex), in supporting Dr. PICTON's motion, said that the policy put forward in the Memorandum of Evidence seemed, from the point of view of the profession, to have broken down. It had been demonstrated to be incomplete, and to furnish no adequate protection for the practitioner. To urge that better things were hoped for in the future because there had been a deputation to the Minister was useless. Ministers came and Ministers went, and so long as that power remained in their hands it was a standing menace to the profession. Something had been made of the constitutional aspect of this question, but the fact was that these powers of the Minister did not depend upon constitutional precedent. The power to remove from the panel depended entirely on Section 15 (2) of the original Act of 1911. That Act was so far reaching that it merely skeleton management was all that could be achieved in the first instance, and details had to be filled in later, with the result that in order to get the Act to function it was necessary to create a special body of Commissioners and equip them with powers quite extraordinary. These Commissioners were to be the sole interpreters of their own legislation. He contended that it was inconceivable that Parliament ever contemplated the assumption by any men of such powers as these, and their inheritance by a new authority could only be attributed to a gross and lamentable oversight. The power to fine rested on a basis which was also questionable. Had the Chancellor of the time conferred with the profession as he conferred with trade unions and societies, and had the original Act contained provisions as satisfactory to the profession as to these other bodies, no Income-tax grant would ever have been required, and no power to fine would have existed. It was inconceivable that anybody would argue before Parliament that of two bodies of men working under the same authority, for the same people, and under the same Act, one should be subject to rigorous disciplinary control, and the other go scot-free. These powers of the Minister were based fundamentally on oversight and injustice, not on constitutional precedent. So far from being constitutional, they were more against the whole spirit of the constitution than any other piece of legislation since Stuart times. (Applause.)

Dr. J. CANNING (Salford) noted the reference in the Insurance Acts Committee's report to the Committee's consciousness "of a good deal of uneasiness in the minds of insurance practitioners generally," and this was to some extent satisfactory, but he would have welcomed a more definite expression of the Committee's own opinions. In spite of the fate of last year's resolution, his committee remained firmly convinced that the right of appeal to the High Court was absolutely essential to their liberty, not only as members of the profession, but as ordinary British citizens. Why should practitioners allow their liberties to be filched away? The position was bad enough as it stood, but what would happen when dependants came in, supposing a practitioner were unfortunate enough to come under the ban of the Ministry? Where was such a doctor to get a living, if ill? His economic fate should at least be made to depend upon the merits of his case as pleaded before the High Court, not upon the caprice of a Minister.

Dr. BRACKENBURY said that in view of the force and persuasiveness of the last two or three speeches it was only fair that he should place certain considerations before the Conference. His hope was that the Conference would decide to pass to the next business without taking a vote on this motion. The profession might yet be in a situation in which it would be driven, against its will, to adopt a resolution of this kind, and therefore he would be sorry to see it turned down to-day. On the other hand, it was necessary to recall what the profession had submitted to the Royal Commission. What it had submitted was something better than the simple proposition involved in the

present motion. It had suggested to the Royal Commission that all those personal disputes, as they might be called, regarding neglect or character of attendance should be taken away from the purview of the insurance system altogether, that these were matters which ought to be dealt with entirely along the lines of private practice, in which the patient, if dissatisfied, could go to some other doctor, or in which the doctor could ask the patient to go to somebody else. It was proposed that all these things, which constituted the bulk of the present complaints, should be removed altogether from this quasi legal procedure. Apart from giving a false or misleading certificate—which, of course, was a heinous professional offence by whomsoever committed, and with which the General Medical Council would deal—there should remain only two possibilities of complaint. The first was with regard to taking money deliberately from a patient when the practitioner had undertaken by his terms of service not to take money from him. That was not a purely professional matter, it was a question of fact into which other than purely medical and professional considerations entered. In these cases it had been suggested that the procedure should remain much as at present, plus certain reforms which would make it more acceptable to the profession. The other class of cases was that in which the habitual conduct was such as ought to lead to a man being removed from the panel. There it was suggested that the Minister must not act before he had received authority to act from a central authoritative professional tribunal. Thus the whole matter came down really to this, that a man might be fined for taking money from a patient when he had definitely undertaken not to take money. Was it worth while going to Parliament to ask for legislation in order that there might be an appeal to the High Court in such cases as those? He urged the Conference to wait until the report of the Royal Commission on these proposals was forthcoming.

Dr Gordon Ward said that apparently the Royal Commission had been asked by those who spoke for the British Medical Association and the Panel Conference to grant that virtually all complaints should be removed from insurance procedure. Such a request was plainly farcical. Discipline there must always be in any such service. The public view of insurance practitioners was that they were out for money and nothing else, but here they were only asking Parliament for the ordinary right of the citizen to appeal to the High Court. There was abundant evidence that that right ought occasionally to be exercised. He did not believe there was any likelihood of any extensive recommendation by the Commission on these subjects.

Dr Day emphasized what Dr Brackenbury had laid before the Conference. As the profession had so recently expressed an opinion to the Royal Commission, certainly the report of the Commission should be awaited before that opinion was modified. The representatives of the profession had put up certain suggestions, upon which Dr Ward wanted to go back in many respects. It was bad policy to alter, even in matters of detail, expressions of opinion which had been deliberately put forward, until it was known what effect might be given to them by those to whom they were submitted. The Ministry was aware of the nature of the evidence which had been tendered on this matter.

Dr Peto fully appreciated the force of what Dr Day had said, but he thought a vote ought to be taken on his resolution. The representatives of the profession had gone before the Royal Commission with a very hesitating voice on this matter. Since that evidence was given cases had occurred which had called forth the most vigorous comment, not only in the professional but in lay journals. If the matter was held up until the Commission reported it would be too late.

By 85 votes to 55 a resolution to proceed to the next business was carried.

OPHTHALMIC BENEFIT

Dr T. MILLER WILSON (Liverpool) had a motion urging that an official form should be provided for recommendations for ophthalmic benefit, and that the Insurance Acts Committee should be requested to draw up a suitable form of certificate. He said that at present some societies

supplied certificates and others did not. He agreed to an amendment by Southport that the motion should apply to recommendations for dental as well as for ophthalmic benefit.

Dr Day pointed out that this was asking the Ministry to furnish another official form, and he thought the profession had been trying to get rid of official forms. He suggested that the motion be in the form of a request to the Insurance Acts Committee to draw up a suitable form of certificate for recommendation for ophthalmic or dental benefit.

Dr MILLER WILSON accepted this suggestion, and in that form the resolution was agreed to.

Dr W. STEVEN (West Riding) moved

That this Conference is of opinion that when an insurance practitioner recommends an approved society to send one of its members to an ophthalmic surgeon whose name appears on the official list the insurance practitioner should have the right of nominating the ophthalmic surgeon due regard being paid to difficulties of distance and transport.

He said that the right ought to be secured to the practitioner of suggesting to the patient to whom to go for ophthalmic treatment. He agreed to an amendment substituting for "nominating" the word "suggesting."

Dr MANKELL (Barnford) suggested that the words "and to the desires of the patient" should be added at the end of the resolution.

Dr Day said that these various suggested amendments seemed to show that the resolution was without value. In any case, was not the choice of the specialist the patient's right? It was the practitioner's business to suggest to the patient to what specialist he should go.

The motion, with the two amendments, was agreed to.

Dr E. W. S. ROWLAND (Reading) moved

That this Conference is of opinion that the panel list of ophthalmic specialists is inadequate and that there should be two classes of specialists: (1) ophthalmic surgeons; (2) practitioners who are able to produce satisfactory evidence of special ability and training in refraction work.

He said that only two ophthalmic surgeons were on the list in Berkshire, and these were the only men to whom such patients could be sent. His committee was of opinion that there were at the present time two classes of people dealing with eye work—on the one hand, the pure specialist, who was in operating surgeon, and on the other a large number of men who by special training were perfectly qualified to prescribe glasses for patients. These two classes should be on separate lists.

Dr J. W. BONE asked whether the case of Reading was not already covered by the existing arrangements.

The Medical Secretary said that it was. The list now consisted of nearly 600 names, some of them people who were doing nothing but ophthalmic work, others general practitioners possessing certain qualifications laid down by the Conference. When a man made an application to go on this list he was required to satisfy certain criteria. In any case of difficulty as to a claim the Committee, which consisted of general practitioners and ophthalmic specialists, adjudicated.

Dr P. MACDONALD hoped the resolution would be turned down. The first steps were now being taken to establish a consultant service in the insurance system, and the best must be given. On no account must the second best be countenanced. If the consultants were divided into two classes, one best and the other second best, it would be bad policy. The question of the present inadequacy of numbers would settle itself in time.

The motion was lost.

CHAIRMANSHIP OF THE CONFERENCE

Dr ANDERSON announced at this stage, amid applause, that only one nomination for the chairmanship of the Conference had been received—namely, Dr E. K. Le Fleming—who was accordingly elected for another year. Dr LE FLEMING thanked the members for the compliment they had paid him.

NATIONAL INSURANCE DEFENCE TRUST

Dr DAY, as chairman and treasurer of the National Insurance Defence Trust, submitted the report as to

contributions by various areas. When the Trust was instituted by the Conference it was decided that the proper subscription for each committee was at the rate of 1d per insured person per annum, but it was realised that this could only be obtained in those areas in which a voluntary levy was established. It had been hoped that with the strong backing of the Conference, the trust funds would have increased until by now the yearly income would have been somewhere near 1d per insured person. So far this had not been borne out by experience. The sum of 1d per insured person should produce, roughly £29 000 a year. The following were the annual contributions during the last six years:

1920	£5 222	1923	£17 260
1921	£6 672	1924	£12 672
1922	£12 961	1925	£13,020 (to date)

In the report a column was added to show what percentage of the estimated subscription had been paid by the different committees. The results showed extraordinary variations, ranging from the few committees which had so far subscribed nothing at all to one committee (Huddington, East Lothian) which had subscribed 117 per cent of the total payments expected from it during the last six years on this basis.

Dr A FORBES (Sheffield) moved

That the time has now come for the Conference to fix a definite limit to the Trust Fund, that the limit be £100 000 and that the Insurance Acts Committee be empowered to determine a method equitable as between Panel Committees of providing the balance necessary to make up this sum.

He added, however, that he was quite ready to accept a friendly amendment calling for a higher limit than £100 000 but he thought the time had come when the Conference should indicate to the trustees how much money they were going to have to administer.

Dr L R FOTHERGILL hoped that the Conference would look, not so much to the present, as to the future. The Insurance Act would certainly be developed; it would affect the interests of every practitioner, and he doubted whether the present time was opportune for fixing any limit at all.

Dr H F OLDHAM said that it would be very undesirable at the present moment, when no one knew what the Royal Commission was going to recommend, that any sum should be fixed. The effect of constant propaganda had been to bring in a steady income and if that propaganda were continued a little longer he believed that a sum of money would be available sufficient to meet every requirement.

Dr T D LUND (Lancark) opposed the motion. The Conference had that day reaffirmed its confidence in the Insurance Acts Committee as the fighting arm of the profession, this was the fighting fund, and he was against any present limitation.

Dr DUN said that there was an advantage in having a definite sum in mind as the goal of effort in that it would resist the further adjustment of contributions as between committees. Certain committees from the beginning had strongly supported the fund, and their contributions were not far short of short at all of the expected level, but some of them were getting uneasy because they were contributing so large a proportion in comparison with others. There was some risk of jealousy between committees, some having contributed so much and others so little, and if the Trust was faced with the necessity of spending large capital sums out of the fund this disproportion in the contributions might tend to weaken unanimity on matters of policy. The sum he had suggested was £250 000, which represented nine or ten years' contributions at the rate of 1d per insured person per annum. No committee had as yet nearly reached the end of its quota if such a sum were taken but the fact that there was an eventual limit would tend to ease the burden on committees which had already contributed well, and would enable a more intelligent outlook on the whole position to be taken.

Dr GORDON WARD moved that this be referred to the Insurance Acts Committee in order that it might bring forward a definite recommendation on the matter at the next annual Conference.

Dr FORBES expressed his willingness to accept this amendment.

The amendment was carried.

Dr F D LUND brought forward, as matters for the consideration of the Insurance Acts Committee, that costs incurred by the Committee in central negotiations should be allocated among and collected from Panel Committees in ratio to the respective number of insured persons in each separate area, and also, in view of the apathy of many Panel Committees to the fund, that the Committee should review the position and issue recommendations.

These questions also were referred to the Committee.

Dr GORDON WARD moved to request the trustees to consider the form in which the accounts of the Trust are presented with a view to making them more easily understood. The accounts, he said, were not presented in the form of a balance sheet, and he wanted the statement of expenditures to be more particularized, especially as to the use which had been made of certain small loans.

Dr A I LARKINE (Hastings) asked whether Dr WARD would not endeavour to increase the contribution of his committee (Kent) above the level of 7 per cent of the total possible payments for the last six years. (Laughter.)

Dr DUN said that he was quite willing to accept the resolution. A balance sheet ought certainly to be provided. He went on to explain the circumstances in which loans were made to the Lancashire Panel Committee and to the Essex Public Medical Service.

This concluded the discussion on the Trust.

TRANSFER OF PRACTICES

Dr DUN moved, on behalf of the Insurance Acts Committee, a resolution declaring that a return should be made as early as possible to the 1912 Regulations governing the transfer of practices—that is that the notice issued to insured persons on the list of a deceased or retiring practitioner informing them of their right to a fresh choice should intimate that they would be deemed to have consented to their names being transferred to the successor's list unless within fourteen days of receiving such notice they notified their objection to such transference. He said that a return to the old system was desirable in several respects, and now that there was entire free choice of doctor the reasons which were operative when the Regulations were altered had lost their force. There was no reason, administratively or from the point of view of policy, why the old arrangement should not be reverted to. The Ministry met this, as it met every proposal at the present time by saying that the report of the Royal Commission must be waited, but the Insurance Acts Committee thought it desirable to have a vote of the Conference. The procedure proposed in the resolution had the support of Insurance Committee clerks, who had found the new procedure complicated and expensive.

The motion was adopted.

Dr G C GERRATT moved as an rider to add to the motion that no practice thus transferred could be retransferred in less than twelve months without reasons satisfactory to the Insurance Committee of the area. He said that this was a very important part of the new proposal, and it should be made clear that the profession set itself against any repetition of the old abuses.

Dr BRICKENBURY was sorry that Dr GERRATT did not appear to recognize that identical action was not necessarily desirable in different circumstances. If this particular provision—which would certainly be put forward, among others, as part of the general method—were selected for the emphasis of a special resolution it would suggest that the profession attached more importance to it than to other modifications of the general method. When the general method had been accepted by the Ministry this and any other modification desired might be pressed forward.

It was agreed to refer the proposed rider to the Insurance Acts Committee.

Dr GERRATT also pointed out that under the old Regulations it was the duty of the doctor who bought the practice to send out the notices at his own expense, and the only duty of the Insurance Committee was to see that they were in an approved form. Under the new Regulation it was the duty of the Insurance Committee to send out these notices at its expense. A reversion to the old arrangement might mean additional expense to the incoming practitioner.

Dr DAIN thought that even if practitioners had to meet this expense they would still prefer to go back to the 1912 system, but he was quite prepared to endeavour to secure a revision with regard to the old procedure of sending out notices, and return the present system in respect to allocation of expenditure.

RECORDS AND CERTIFICATES

Dr DAIN, again on behalf of the Insurance Acts Committee, asked the Conference to reiterate the opinion that while fully appreciating the value of careful clinical notes and essential dates on medical records, it was unnecessary to record all attendances, inasmuch as in many cases the continuation record cards overloaded the record envelopes and seriously diminished the utility of the clinical notes. He accepted an amendment by Githens to substitute for the last phrase the words 'and valuable clinical notes become obscured by a multiplicity of unnecessary repeat attendance marks.' Dr FORBES, in moving this amendment, said that unnecessary attendance marks at present "punctuated, elongated, and obliterated" the clinical history.

The motion as thus amended was agreed to.

Dr W J T BAKER (Lindsey) moved that Rule 11 of the Certification Rules ought to be amended so as to obviate the requirement that an insured person should be continuously treated and certified incapable of work for a period of twenty-eight days before the issue of an intermediate convalescent certificate. He also wanted the time of issue of such a certificate to be left to the doctor's discretion, and the maximum period covered by the certificate to be one month. His committee found it very unkind to a patient could not get away from his home to recuperate until after twenty-eight days. No doubt the difficulty was still greater in industrial areas.

Dr H D PORTLAND (Bedfordshire) wanted the maximum period to be two weeks instead of one month. A maximum of one month would have a tendency to become a minimum, and the patient would soon want and expect to be sent away for a month anyhow. It was advisable also that a patient should be seen by a doctor and again certified as fit or unfit after two weeks.

Dr DAIN said that the proposers both of the motion and the amendment had assumed that ability to issue an intermediate form carried with it the necessity that the patient must stay at home for twenty-eight days. What was forbidden was the use of the official form until the patient had been ill for twenty-eight days, but the society might agree, if it pleased, that the patient should go away for a convalescent holiday at the end of a week or the end of a day.

Dr BRENNAN (Stockport) related an instance in point, in which he had received a letter from Sir Thomas Neill stating that he (the doctor) ought not to have sent the patient away until after twenty-eight days. His reply was to the effect that that was an idiotic rule, when it was obviously in the interest of the patient's recovery that he should go away. He received a further letter from Sir Thomas Neill stating that this particular regulation was not the work of the approved societies, and implying that had the societies made these rules they would have contained all possible wisdom.

The amendment to limit the period to two weeks was lost, and the motion as proposed by Dr Baker was agreed to.

DISPENSING

Dr H R BROWN (Essex) moved that the Insurance Acts Committee be instructed to take steps to obtain an increase in the remuneration paid to small practitioners who undertook to do their own dispensing. He said that the difference between the average cost of drugs dispensed by a pharmacist in the area of the Essex Insurance Committee and the amount of the capitation payment to small practitioners for the purpose of dispensing drugs was 2 7d per insured person per quarter for the year 1924. Obviously, if the doctors were paid 6d a quarter and the pharmacists 8 7d, either the former were underpaid or the latter overpaid. He was able to bring forward evidence that dispensing was really being done at a loss. From some figures which he had carefully worked out in his own practice he

found that the cost to him for dispensing (including two-thirds of the dispenser's salary and the net cost of drugs, but not including rent for the dispensary) for his insured patients amounted to £84 in the year, and he was paid on the capitation basis £72.

Dr W I GORDON (Northumberland) supported the motion, and also furnished statistics obtained through the North of England Pricing Bureau. These showed distinct losses to the dispensing practitioner, and he pointed out that the position was an unfair one to the doctor, who was tempted to buy cheaper drugs or to stint a patient in dressings and so forth, to the patient's detriment.

Dr J P WILLIAMS-FIREMAN said that the Rural Practitioners' Subcommittee was as keen on this matter as anyone. It was waiting for conclusive figures covering the whole country, these it hoped to obtain from the official pricing bureau.

The motion was carried.

Dr D O TAYLOR (Devonshire) moved to instruct the Insurance Acts Committee to consider the question of the dispensing fee in relation to the supplying of special serums and expensive drugs and appliances. Dr BRACKENBURY said he was unaware that a special dispensing fee was paid to insurance practitioners in the case of serums, he did not think it applied in all insurance areas. Dr DAIN said that, of course, the dispensing practitioner received the same dispensing fee as the chemist. If the claim was made on behalf of practitioners that the fee be raised, this would include a raising of the fee to the chemist. He suggested, and it was agreed, that this matter be referred to the Insurance Acts Committee.

Dr TAYLOR further moved to instruct the Committee to take immediate steps to secure the provision of a standard methylated spirit suitable for general dispensing of prescriptions. In view of the great number of formulae uniformity in dispensing was at present impossible.

Dr J W BONE said that the particular question of methylated spirit had been dealt with by the Medico-Political Committee of the Association, and he thought that all that was possible up to the present had been done. Government departments had provided, or were about to provide, for grades of methylated spirit which would serve all medical purposes.

The motion was withdrawn.

MEDICAL BENEFIT FOR SEAMEN

Dr DAIN, for the Insurance Acts Committee, asked the Conference to express its opinion that the present method whereby members of the Seamen's National Insurance Society obtained their medical benefit through the society was more in the interests of the insured persons concerned and the medical profession than would be the administration of their medical benefit through Insurance Committees. The reasons for this were discussed in the report of the Insurance Acts Committee. In reply to a question, he said that the scale of fees paid by the society was still under discussion, they were all agreed that the present fee was unsatisfactory.

Dr A P LILDRED (Essex) had an amendment deprecating this society's practice of urging its members to accept as their medical attendants practitioners whom it recommended. This prevented insured persons from exercising their right of free choice of doctor. He described certain cases which had arisen in his constituency.

The MEDICAL SECRETARY said that this was a very old question which had been dealt with in part by the Insurance Acts Committee and in part by the Medico-Political Committee. At present the latter committee was in negotiation with the society with a view to getting back to the scale of fees in operation before a drop of 20 per cent took place. With regard to the preference of the society for certain doctors, he did not think either the Insurance Acts Committee or the Ministry itself could do much to alter matters, for the society was given the right to deal with its members to a certain extent outside the Act. The society had to do with a certain difficult class of insured men and preferred doctors who for years had had experience in treating seamen at the various ports, the seamen too liked when in a strange town and requiring treatment, to be told who were the 'seamen's doctors.'

Dr J W BOWI said that the Contract Practice Subcommittee of the Medico-Political Committee, which had been in negotiation with the Seamen's National Insurance Society, set up a scale which the society declared itself utterly unable to pay. The society offered a fee for a visit of 3s 6d and for a consultation at the surgery of 2s 6d, in each case to include medicine for two days. The negotiations at present were suspended, and there was no definite arrangement with these people. He had just seen some figures for Scotland. In Scotland where it was not the custom to dispense, the society was actually paying 1s 6d a visit.

The Medical Secretary added that in Southampton the profession by its united action, had compelled the society to give the fees without the 20 per cent reduction which accompanied in other areas.

The amendment was dropped, and Dr Dain's motion carried.

APPROVAL OF THE COMMITTEE'S REPORT

This concluded the matters on the agenda which bore upon the report of the Insurance Acts Committee, and the report was then formally approved. Dr DAIN accepted an amendment by Dr GORRISON WARD, upon the motion to approve the report, in the following terms: "But without prejudice to the right of any Panel Committee to make such payments in connexion with the administration of anaesthetics as the Regulations allow." Dr DAIN also stated that after examining the constitution of the central pool he could assure the representatives that everything was done in the actuarial calculations to safeguard the interests of insurance practitioners.

Dr J S MARSON (Warrington) brought forward what he described as a delicate and perhaps rather dangerous point in insurance practice when he asked the Committee to approach the Ministry with a view to drawing up definite rules for guidance respecting the treatment of insured persons by insurance practitioners as private patients. The position of an insurance practitioner when an insured person not on his list applied to him for treatment as a private patient was more than a little difficult, especially in view of the 1924 Regulations relating to free choice of doctor.

Dr DAIN gave an explanation of the circumstances in which an insurance practitioner may charge a fee to an insured person for general practitioner services. There was first the case in which the evidence of title to benefit was not forthcoming, when a fee could be charged, or an account rendered and a receipt given on Form G.P. 4. Then there was the case where the patient did not claim to be insured, but subsequently proved to be. This was dealt with under Clause 7 (3) of the terms of service: the fees were repaid to the patient, and the doctor got the appropriate credits. The next case was the really difficult one: the patient who went to a panel doctor in his own area and asked to be treated as a private patient. Here it should be explained to the patient that he had the right to change his doctor at any time and that the practitioner would take him on his list if he wished, that the practitioner could do in every way as well for him as a panel patient as he could if he were a private patient. If the patient still refused this offer and insisted on being treated as a private patient the practitioner should make him furnish a statement in writing to that effect. This safeguarded the practitioner's position if at any subsequent date the patient was told that he should not have paid and that if he sent the account to the Insurance Committee he would get his money back. On such advice he might claim the money back without any idea that he was letting down his doctor. Dr DAIN added that it was, of course not possible by Regulations to take away the insured person's right to go to any doctor of his choice, or to compel him to avail himself of the service if he did not wish to. On the other hand, not the least sympathy was due to the practitioner who would take fees from insured persons on the ground that he could treat them better as private patients. Then there was the patient who was on a practitioner's list and had subsequently moved outside the area in which the practitioner had contracted with the Insurance Committee to attend insured persons. In this case the

patient was entitled to the practitioner's services without fee when he came to see him, but if he desired to be visited outside the practitioner's area the latter was entitled to charge him a fee. The last case to be mentioned (and it would hardly seem necessary to refer to it if it were not that the question had been raised with the office) was the patient who was not on a practitioner's list and who lived outside that doctor's area of insurance practice. Obviously in this case the insured person had no claim on the practitioner's services as a panel doctor, but there was nothing to prevent the practitioner from attending him at the patient's or the doctor's house as a private patient, and charging him fees. After a few other questions had been asked and answered the motion was withdrawn.

THE COLLECTION OF STATISTICS

A long resolution was down in the name of Kent calling for a carefully organized campaign to obtain statistics from practitioners on such matters as fees, mileage costs of transport, and average income. Before calling upon the mover, the Chairman asked the Medical Secretary to state what was already being done upon these lines.

The Medical Secretary said that information was being collected under three headings. The first of these related to attendances on insured persons. Cards were being sent to 120 insurance practitioners who had volunteered to keep daily records of visits and attendances. The day-to-day record undoubtedly produced the best results so far as the ultimate average was concerned. With regard to mileage records, an appeal was made which was responded to by 85 rural practitioners who kept a record of the miles travelled in respect to both insured and private patients. In addition, during the latter half of last year about 150 model account books were forwarded to insurance practitioners who had promised to place their accounts at the Committee's disposal. These books entailed a great amount of detailed work, and he feared that in some cases they were not being kept but a number had been returned.

Dr GORRISON WARD then moved a series of resolutions urging the necessity that such statistics should be available as soon as possible, especially in view of the probable revision of the capitation fee at the end of 1926 and of the certainty that powerful interests will seek to lower it. The resolution continued:

That such statistics can only be obtained by a carefully organized campaign which may well involve the circulation of questionnaires or of model account books, the employment of actuaries, and the making of many thousands of visits to individual practitioners.

He mentioned some of the subjects on which statistics were necessary. One of these was mileage, another the difference between urban and rural dispensing. The Committee might map out eight or ten typical areas and send out a questionnaire. A few of those to whom it was addressed would return it voluntarily others would do so after repeated solicitation. Information regarding professional incomes were badly wanted, and it ought to be obtainable over a considerable area. Something definite ought to be known about maternity and other charges above the ordinary charge for attendance and medicine and so on. This was a statistic which could be got from selected areas, and Panel Committees could carry out a great deal of this work. One of the factors in assessing remuneration was the number of special services rendered. The figures for comparable professions also—and especially the figures for the fighting services and the civil service—had played a great part in the determination of the capitation fee in the past. Someone should draw up these figures in comparative form. Then there was the question of the number of anaesthetics given. Another was the scale of fees paid by such bodies as the National Deposit Friendly Society. The fees in club practices also ought to be taken into consideration. All this would require an organized campaign, and it would be necessary in very many instances to go down to the doctor and fetch the figures from him.

Dr W M RENTON, also of Kent supported the proposition, and in view of a later resolution from the same area suggesting that the funds of the National Defence Trust should be available for the purposes of this campaign,

said that he had no doubt that Dr Ward, his colleague, would support a more generous contribution to the fund than the present rather meagre one from his county.

The resolution as so far moved was agreed to, and Dr Ward then proceeded to move resolutions to the effect that the funds of the National Defence Trust should be employed for this campaign, and that "the executive committee of this Conference" be instructed to set up the necessary organization, appointing a special committee upon which experts might be co-opted, with a view to producing a really authoritative survey of the present economic position of the profession. He said that those areas which had not contributed to the fund, largely because of a subconscious idea that the "goods were not being delivered," would contribute if some such use as this were made of the money. He would certainly in that event advise his own area to make up its leeway. The sum of £5,000 would be the minimum cost of a campaign such as he had outlined. The special committee should include paid experts, such as an accountant and statistician. The position would not be imperilled if the money of the Trust Fund was used for this purpose. A sixpence gained on the capitation fee, which might well be the result of such a survey, would make an even larger expenditure well worth while.

Dr DAVY was glad to see from the terms of the Kent motion that the Insurance Acts Committee was recognized as "the executive committee of the Conference," at all events when there was money, especially trust money, to spend. He deprecated so definite a binding motion upon the Committee as to the methods by which it should secure its statistics. He was not prepared to accept an instruction as to detail on a matter on which there could be no proper discussion in that Conference.

Dr BRACKENBURY moved that in place of the last section of the resolution—the one instructing the Committee to set up the necessary organization—the Conference should adopt a clause referring all the previous clauses to the Insurance Acts Committee. The Conference would then be saying that it was concerned at the existing inability of the profession to produce statistics, that it was essential that such statistics should be made available as soon as possible, that such statistics could only be got by a carefully organized campaign, that funds in the National Defence Trust should be employed for this purpose, and that the whole of these matters be referred to the Committee.

Dr J W BONE seconded Dr Brackenbury's amendment. In its present form the scheme was entirely out of the question. No committee that had ever existed in the Association could take on a problem of that magnitude. It was the scheme of a megadominion. A body of supermen would be wanted for the purpose. The sum of £5,000 would not begin to finance such a scheme as had been foreshadowed by Dr Gordon Ward.

Dr WILLIAMS-FREEMAN supported Dr Ward in his desire for better statistics. He believed that a permanent committee to be set up by the British Medical Association to investigate statistics would be of the utmost value. In view of the possibility that dependants would be included, for instance, what statistics were in hand as to the relative attendances on men, women, and children? Again, an immense amount of statistical matter was issued from the Ministry itself from time to time, but it was not collated.

Dr BRACKENBURY agreed that better statistics were wanted, but the Conference would be unwise to commit itself to the details of Dr Ward's proposed method.

The MEDICAL SECRETARY said that even Dr Bone had underestimated some of the difficulties and also the expense. This work would require at least half a dozen clerks in the office, who would have to be trained. Some of the people who were wanted on this special committee would have to be paid. But the real solution of the difficulty was in the hands of insurance practitioners themselves, who could furnish statistics if they would. All the information necessary could be furnished by the members of that meeting with very little expense, but some of the people who had been most urgent with regard to the matter that afternoon had never furnished the office with a figure at all.

Dr BRACKENBURY said that with regard to the statement in the resolution that there was a probability of the revision of the capitation fee at the end of 1926, it should not be taken as certain that the question or revision would be raised at that time, unless the profession raised the question itself.

Dr GORDON WARD said that it was evident that the Committee did not intend to undertake this work in any extended form. Of course it would need six clerks, but the thing was worth doing. He was sorry to notice the sentiment of the permanent administration with regard to the matter.

Dr Brackenbury's amendment was carried, both as an amendment and as a substantive motion, by a very large majority.

OTHER MOTIONS

Dr W COOK (Warrickshire), in a resolution, wished it to be made clear that a Medical Service Subcommittee might, at the request of the Panel Committee, investigate any complaint made by a practitioner against an approved society or its agent. He related a local instance of approved society misdoing in regard to which the Ministry had taken a "milk and soda" attitude. Dr DAVY said that they would all share Dr Cook's indignation, but the resolution would affect nothing. It was not the business of Medical Service Subcommittees to investigate the delinquencies of agents of approved societies. He agreed to take to the committee a request from the Conference that some way should be explored for dealing with approved society agents.

Dr A E LARKING (Hastings) moved a resolution urging that when a patient had been referred to the regional medical officer by a society and the officer considered he was capable of work, the officer should, before sending in his report, communicate with the practitioner connected with the case if the latter was unable to be present at the examination. Dr BRACKENBURY said that in every case the practitioner was given the opportunity to attend the examination. He pointed out certain drawbacks to the procedure indicated in the resolution, and the resolution was put and lost.

Dr F J GOMEZ (Somerset) wished the Insurance Acts Committee to inquire into the unsatisfactory conditions existing with regard to domestic servants, so many of whom did not choose a practitioner until they required treatment. Dr DAVY said that this might be a rural problem, but it did not apply to the towns or suburbs. A motion on this subject was lost.

Dr J CANTLEY (Salford) had a resolution regretting that the Committee had failed to obtain the provision of a statutory fund whereby local Medical Committees could discharge the expenses involved in carrying out the duties imposed upon them. He also cited a local instance in which there had been or was likely to be financial loss to the practitioners of the area concerned for some necessary action which they had taken. Dr DAVY said that they were all agreed that such provision was desirable, but as a matter of practice the circumstances in which a local Medical Committee would be called upon to ask for the removal of a practitioner from the panel, and would have to bear certain expenses involved, would be very unlikely to occur. There were very special circumstances in the Salford case, and he did not think that the Committee could be said to have failed to obtain something required generally. The motion was lost.

Dr BATTISON (London) moved to express the strong opinion of the Conference that the notification of insured persons that they were no longer entitled to medical benefit should be made a statutory duty upon approved societies. He said that friction was caused when such persons applied for treatment and were informed that they were no longer entitled to benefit, and his Committee desired that the annoyance, both to the practitioner and to the insured patient, should cease. Dr DAVY said that the Insurance Acts Committee, after considering this matter, was of opinion that in view of the expense and trouble entailed in giving effect to the proposal no commensurate benefit would accrue to insurance practitioners.

generally and therefore it did not feel justified in supporting the proposal. The motion was carried.

Dr D G GREENFIELD (Northamptonshire) asked the Insurance Acts Committee to arrange for organized support for the Medical Charities Fund from every Panel Committee. The Medical Charities Committee, which was a channel through which the stream of medical benevolence might flow, should inform the profession fully as to the amount of money required properly to support medical charities and the Insurance Acts Committee should consider what proportion of that amount insurance practitioners might be expected to give. The motion was agreed to unanimously.

Dr A J LEWIS (Southport), in asking the Conference to express the view that the extraction of teeth was definitely outside the contract of insurance practitioners, cited the dental paper of the Lancashire Federation of Rural Friendly Societies, in which, among instructions to the applicant, was the following: 'For simple extractions where no anæsthetic is necessary you should consult your panel doctor who is required under his terms of service to provide such treatment free as part of your medical benefit. The Minister had been asked to have this withdrawn as inaccurate, but if he refused it would strengthen the hands of the profession to have such a resolution as he proposed. Dr DAVY said that there were circumstances in which this service must be performed—exactly the same circumstances as those in which the practitioner would perform it for a private patient—but cases must now rarely arise. Dr CRUTE said that in Scotland this matter had been taken up with the Board of Health and a satisfactory result arrived at. The Board appointed a court of referees to decide the specific cases and the court, after consideration, decided that dental treatment was for the purposes of the Act something further and additional to medical treatment and was not included in that expression and also that dental treatment was a treatment for which additional payment had to be made. Dr J HOLMES (Bury) said that now that dental work was so well organized it should be the recognized position that this service was no part of medical treatment. The motion was carried.

This concluded the business before the Conference which rose after passing votes of thanks to the Chairman (Dr Le Fleming) and to Dr DAVY.

PANEL CONFERENCE DINNER

On the evening of the Panel Conference the members of the Insurance Acts Committee were entertained at dinner by the members of the Conference. Dr H J CARDLE (Chairman of the London Panel Committee) presided and the arrangements which included an excellent entertainment were in the capable hands of Dr C L BATESON. Among the other guests were four medical members of Parliament—Dr Haden Guest, Sir Henry Jackson, Dr E Graham Little and Sir Richard Luce.

Dr J O SUMMERHALES, DSO, in a breezy speech proposed the health of the members and officers of the Committee. The flavour of his utterance fresh from the Oxfordshire country side is difficult to capture in a printed record. He distributed praises and criticisms impartially but ended by saying that the Committee had led insurance practitioners wisely and well and he considered that the medical men working the Insurance Acts had now as good a committee to look after their interests as they could ever expect to have. Dr H C DAVY, Chairman of the Committee alluding to the alleged revolt of panel practitioners as announced in certain newspapers and to the decisive vote of confidence by the Panel Conference that day told of a countryman who meeting another and desiring to inform him that his wife was in a certain condition said that she was 'stagnant'. You've got the wrong word, man, said the other. What you mean is she is 'pregnant'. It might have been imagined from the morning papers that the Insurance Acts Committee was 'stagnant' but subsequent events had proved that it was 'pregnant'. He went on to refer to the Medical Secretary's 1011 commission to South Africa and to wish him in the name of insurance practitioners a successful tour.

Dr Cox said that he was not accustomed to hear so many complimentary things said about the Insurance Acts Committee. He had heard a very different sort of comment expressed in the past and he knew of nothing which was so good for medical organization as trouble and plenty of it. He hoped therefore,

that when the report of the Royal Commission came out it would give the Insurance Acts Committee some long notice of it. With regard to his forthcoming mission, he commended his colleague Dr Anderson to a furtherance. Dr ANDERSON added a few words in which he indulged in some humour at the expense of his chief, who a holiday in South Africa he described in luxurious terms.

Dr R A BOLAM propounded the health of the medical members of Parliament. Members of the medical profession, he said did not take the part in public life which they ought to take for the good of the commonwealth and of the profession as well. A special debt of gratitude was due to those few who had the courage to brave the obloquy and turmoil of the political arena for the man who went in a municipal life or the larger life of Parliament incurred a good deal of odium entirely undeserved. The atmosphere moreover was one in which a man with a professional upbringing must find strange. When I read of Sir Richard Luce braving his uproarious constituents at Derby a week ago he could not help feeling that the services such a man rendered to the community were underrated.

Dr HADEN GUEST, MP said there were fourteen members of the profession in Parliament and so far as they could tactfully and pleasantly represented the medical point of view and brought the influence of the profession to bear upon other members. This was largely done in committee in private meeting, and even in social gathering. There was a medical committee on which there was an question of parity and the custom was being followed of getting men from outside to come and address them so that the medical members in their turn might be better able to inform the House on medical and scientific affairs. The training of the doctor was particularly valuable as a training for public life. Medical men a great deal knew more about the real conditions of the masses of the people than did the average citizen. They did not of course approach Parliament as members of a trade union, but as members of a profession—a very different thing. It was always difficult for a doctor to detach himself sufficiently from his profession to enter politics, but he hoped an increasing number would do so. What was needed at the present time was not a recitation of party difference but a more scientific view with regard to public affairs. Medical men did at least possess the scientific spirit but the more he saw both in this and other countries of politicians who were not doctors the more he was impressed by the sore need for the application of scientific knowledge and thinking to the solution of political difficulties. It was always interesting to stand back and bring a balanced scientific criticism to bear upon public affairs but it was much more difficult though also much more useful to enter public life and maintain that balance. The man who had been a successful fundraiser or grocer was not necessarily qualified to be a director in national concerns but the successful doctor had only to add some qualification for such a task. The taking of executive action in the State should not be left entirely to the commercial classes but more and more men of scientific attainments should be included to bring the scientific vision to bear upon national affairs.

Sir RICHARD LUCE and Dr GRAHAM LITTLE in their own appeals from the audience also made a few remarks.

THE ROYAL COMMISSION

THE forty-second meeting of the Royal Commission on National Health Insurance was held at the Home Office Whitehall on October 22nd and 23rd with Lord Lawrence of Kinnear in the chair on the 22nd and Sir Arthur Worsley on the 23rd.

Evidence was given by Mr J G F PRICE Principal Assistant Secretary Ministry of Labour on the question of utilizing the Employment Exchanges to create genuine employment for the purpose of dealing more generally with the problem of the arrears of penalties under the Health Insurance Scheme. Thereafter Sir Walter Kinnear Controller of Finance in a Department of the Ministry of Health Mr L C Brock Principal Assistant Secretary and Dr J S W Whitaker Senior Medical Officer of the Ministry were examined on a wide range of questions affecting health insurance on its administrative and medical sides.

LONDON PANEL COMMITTEE

WE have received from the secretary Dr C L BATESON a copy of the following resolution passed by the Panel Committee for the County of London at its meeting on October 22nd.

That the Panel Committee do inform the Panel Commission on the National Health Insurance Act that a medical member of the London Insurance Committee has never at any time consented to the proposal contained in the evidence submitted to them by Mr Le Fleming as Chairman of that Committee.

Correspondence.

The Cheshire Motion at the Panel Conference

Sir,—The Conference on October 22nd was very kind to me in allowing latitude beyond the merge time permitted to the recorder of a motion, nevertheless I feared to trespass on its indulgence, though I had much more to say. For this reason, and because I had no opportunity to reply to the criticism of Dr Brackenbury, I crave leave to supplement my remarks.

It is obvious that we may have a Minister of inferior quality to Mr Neville Chamberlain, and definitely prejudiced against us, also that, by taking on dependants of the insured, we may deliver ourselves completely into his hands. Such a man may more effectually ruin doctors by reflections upon their professional conduct than by fines. Dr Brackenbury claims that the difference between his policy and ours is trivial, I disagree with him. The one is incomplete in an essential particular, with him. The one is incomplete in an essential particular, with him. The one is comprehensive, logical, and lays no emphasis on any other pecuniary issue. As I stated, in 1912, so long as we fought for great principles, we won conspicuously, when we descended to a single monetary demand, we failed disastrously.

Again, when, lately, we were out for worthy causes—for our right to negotiate freely with the Minister, for protection from approved society interference, and for power to submit to arbitration any grave dispute—we won a notable victory, completely restored our reputation, and set an example to all of how such fights should be conducted by an educated profession. To quote the admirable words of Dr Brackenbury himself: 'What I say to you this morning is that the economic argument, while we do not minimize it the least, must now take a subordinate place.' And again: 'The public will realize that we care much less about sixpence here, or sixpence there, than we do about ensuring a good national service, and maintaining a free and honourable profession.'

Now, it is difficult to approach the Minister, but far more difficult to approach Parliament, which can alone assist us. Our one opportunity will, I take it, arise when the report of the Royal Commission is discussed. It is therefore absolutely necessary that the case then presented be logical, worthy, and convincing.

What, then, is the logical, worthy, and convincing policy at the present time? Surely to claim the natural right of every free Briton to defend, not merely his pocket, but his honour and reputation before an impartial court, to protest to the very uttermost against our present intolerable position of inferiority to the meanest society official in the matter of complaints, and not just to plead that the Minister cudgel us not too harshly on what would appear to be our only sensitive spot. Presumably, from some fear of offending the societies, the second argument was never even mentioned, either in the Memorandum or in the interview with the Minister. I would therefore narrate my own experience.

On May 11th, 1923, when the special mixed Committee was sitting, I moved a resolution before our Insurance Committee, to be sent to that mixed Committee, drawing its attention to the grave injustice of the present position of doctors, as compared with society officials, and calling upon it to take steps to put both upon an equal footing. Such was the patent justice of my appeal that at that meeting of 23, of whom no fewer than 16 represented approved societies, my motion was carried by a majority of 3, and of the minority not one opened his mouth. My speech was published verbatim, with report of the motion and voting, in the *National Insurance Gazette* of June 23rd, 1923, and in the columns of that organ of approved societies, which circulates to Insurance Committees, none entered a protest against either my motion or my arguments.

Now, are we going before Parliament on these great issues—winning issues as I maintain, and worthy of our traditions—or on a merely mercenary matter? In the former case, why delay for the report of the Royal Commission before declaring our intention? It seems to me that such declaration would produce a very desirable impression upon that body, and that it is a great pity that the panel Conference adopted a contrary view. In particular, I would protest strongly against a vote to proceed to the next business, as if our motion were merely frivolous or vexatious. Such conduct seems to me little conducive either to the proper ventilation of important business, or to good feeling among different Panel Committees. As I had no opportunity before, I must here challenge the suggestion by Dr Brackenbury that only charges of accepting fees would, under the policy of the Memorandum, come for final decision by the Minister. Section 38 includes for such decision also such general conduct as is held to be detrimental to the interests of the service. Will Dr Brackenbury seriously contend that negligence or incompetence leading to the death of the patient is outside this category?

Yet this has been precisely the charge brought in every notorious case of injustice, it is the charge made in a notable case published in the *SUPPLEMENT* for October 24th (p. 139). In three such cases already this charge, after being upheld by the Minister, has failed before another tribunal, and would therefore probably have failed before the High Court. In no case was the fine excessive for the offence alleged. Plainly such cases cannot be dealt with by merely changing the doctor, equally certainly no suggestions that we make, such as those in Section 41, will ever exclude them from decision of the Minister. Public opinion would be against such a barrier. They are the very cases which, under the policy of the Memorandum, would be finally decided by him with risk of grave injustice to us, but, under our policy, would, if necessary, go before the High Court, with good prospect of success.

I claim to have upset the former plea of constitutional precedent, I would add a word as to that of promoting undesirable litigation. Appeal to the High Court is a most formidable procedure, liable, even if successful, to costs amounting to hundreds of pounds. It seems to me to be to the last degree improbable that such a weapon would be taken up lightly, whether by doctors, insured persons, Insurance Committees, or approved societies. I am convinced that the total number of such appeals annually by all parties put together would be quite insignificant, and would differ but slightly under the two policies before us. I see no reason whatever why the Minister should object to a proceeding so universal, and one which relieves him to some extent from a disagreeable and one which relieves him to some extent from a disagreeable responsibility. Should he be so unwise as to do so, he must either claim infallibility above that of the High Court, or maintain that it is good for the service that an injustice committed be beyond repair. I credit him with too much sense to advance either thesis—I am, etc.,

G. C. GARRATT

Chichester, Oct. 24th

Naval and Military Appointments

ROYAL NAVAL MEDICAL SERVICE

SURGEON CAPTAIN H. S. BURTON, C.V.G. has been placed on the retired list with the rank of Surgeon Rear Admiral.
Surgeon Commander W. E. Orr by O.B.E. has been placed on the retired list with the rank of Surgeon Captain.
Surgeon Commander H. Drernan D.S.O. to the *Emerald*.
Surgeon Lieutenants H. L. Bernstein to the *Birmingham*. W. T. Dood, to the *Royal Oak*.

ROYAL NAVAL VOLUNTEER RESERVE

Probationary Surgeon Sublieutenant H. Willoughby to the *Champion* for even days training.

ROYAL ARMY MEDICAL CORPS

Major E. M. J. O'Farrell to be temporary Captain and temporarily relinquishes the rank of Major.

ROYAL AIR FORCE MEDICAL SERVICE

Flying Officer W. J. Hutchison is transferred to the Reserve Class D 2.
Flying Officer R. J. A. Chattey to R.A.F. Depot.
R. J. A. Chattey is granted a short service commission as a Flying Officer for three years on the active list with effect from and with seniority of September 28th 1925.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS.
Major E. N. Graham late Malay States Volunteer Reserve to be Major.
SUPPLEMENTARY RESERVE OF OFFICERS. ROYAL ARMY MEDICAL CORPS.
Lieutenant W. Boyd late R.F.A. Special Reserve to be Lieutenant.

VACANCIES

ABERDEEN ROYAL INFIRMARY—Assistant Surgeon to the Ear, Nose, and Throat Department.
BIRMINGHAM UNIV.—Resident Assistant Medical Officer (male) at Selly Oak Hospital. Salary £300 per annum rising to £400.
CHELSEA HOSPITAL FOR WOMEN—Anaesthetist. Honorarium £21 per annum.
COVENTRY AND WARWICKSHIRE HOSPITAL—(1) Resident Junior House Surgeon. (2) Resident House Physician. Male. Salary £125 per annum each.
DURHAM COUNTY COUNCIL—School Dental (part time) for Bishop Auckland School Clinic. Remuneration £11s 6d per school session.
HOSPITAL FOR SICK CHILDREN, Great Ormond Street W.C.1—Medical Registrar and Pathologist. Salary £200 per annum.
LIVERPOOL SMITHY HOSPITAL—(1) Male House Surgeon. (2) Female Gynaecological House Surgeon. Salary £100 per annum.
MANCHESTER ROYAL INFIRMARY—Resident Medical Officer at the Barn Connalescent Hospital. Remuneration at the rate of £250 per annum.
METROPOLITAN ASYLUMS BOARD—Junior Assistant Medical Officer in the Infectious Hospitals Service. Salary £504 per annum.
MIDDLESEX COUNTY COUNCIL—Assistant Medical Officer (female). Salary £600 per annum rising to £750.
NEWCASTLE-UPON-TYNE CITY MENTAL HOSPITAL—Junior Assistant Medical Officer (male). Salary £350 per annum rising to £400 on obtaining Diploma in Psychiatry.
NORTHAMPTON GENERAL HOSPITAL—Honorary Assistant Surgeon.
QUEEN MARY'S HOSPITAL FOR THE EAST END, Stratford E.15—Honorary Assistant Physician.

British Medical Association.

PROCEEDINGS OF COUNCIL

Wednesday, October 21st, 1925

A MEETING of the Council of the Association was held on October 21st. The meeting was the first to take place in the Council Chamber at the new House in Tavistock Square, also the first to be called to order by the handsome gavel recently presented by the Tasmanian Branch. Dr R A BOLAM was in the chair, and the following members were present:

Dr H B Birchenbury (Chairman of Representative Body), Mr A Bishop Harman (Treasurer), Mr J Basil Hall (Past President), Mr R G Hogarth (President-Elect), Dr C O Hawthorne (Deputy Chairman of Representative Body), Dr G A Allan, Dr J Barcroft Anderson, Dr T Ridley Bailey, Surgeon Rear Admiral Sir Percy Bassett-Smith, Dr H S Beadles, Dr J W Bone, Dr H C Bristowe, Dr G F Buchan, Dr H G Dun, Dr J S Darling, Dr C E Douglas, Mr T P Dunhill, Mr W McAdam, Dr D Ewart, Dr D E Fimar, Dr C E S Flemming, Dr T W H Garstang, Dr F J Gomez, Dr I W Goodbody, Dr J Gusani, Lieut Colonel C B Heald, Dr R Wallace Henry, Dr G B Hillman, Dr J Hudson, Dr I W Johnson, Dr R Langdon Down, Dr David Lawson, Dr R W Leslie, Dr E K Le Fleming, Sir Richard Luce, MP, Dr A Lyndon, Dr P A Lyster, Dr J G McCutcheon, Dr J A MacDonald, Dr S Morton Mackenzie, Major General Sir William McEpherson, Dr A Manknell, Dr J C Matthews, Dr G W Miller, Dr Hugh Miller, Dr Christine Murrell, Mr A W Nuthall, Lieut Colonel F O Kneely, Dr William Paterson, Dr R C Perceock, Dr T Padeliffe, Lieut Colonel J W F Rait, Dr Lockhart Stephens, Dr John Stevens, Dr W I Thomas, Dr G Clark Trotter, Mr E B Turner, Dr J F Walker.

Apologies for absence were read from the President (Dr Thomson), Dr John Mills, Dr D Walshe, and Sir Jenner Verrall.

Preliminary and Personal

The death of Dr G K Smiley, who was a member of Council in 1919-20 was reported and Sir Richard Luce paid a tribute to the memory of an old friend and colleague through whose influence he himself was persuaded to take up work in the British Medical Association. He recalled the

heroic way in which Dr Smiley had borne the afflictions which fell upon him.

It was agreed that Dr Oswald Marriott should be asked to fill the vacancy on the Council in respect of the Hong Kong and China and Malaya group of Branches.

The Chairman was authorized to send to all who had contributed to the success of the Bath meeting the cordial thanks of the Association. He said that the Bath meeting would be one of the most memorable in the series of Annual Meetings for the vast amount of local effort which the occasion evoked. He could not recall an Annual Meeting in which the local colleagues had in such a marked degree spent themselves in ensuring success. (Applause.)

The Council unanimously decided to recommend to the Representative Body that the retiring President Mr J Basil Hall should be elected a Vice President of the Association as a recognition of his services as President. The Chairman said that Mr Basil Hall had had a busier year than had fallen to the lot of most recent Presidents but he had fulfilled his duties in a most excellent manner and had rendered sterling service to the Association.

It was resolved to place on record and to transmit to His Grace the thanks of the Council to the Archbishop of Canterbury for his services in dedicating and opening the Gates of Honour on July 13th.

The Treasurer in submitting a financial statement which was largely concerned with the expenditure incident to the removal to the new premises and the ceremonial opening, said that the burden of the arrangements had fallen heavily upon the department of the Financial Secretary and Business Manager, and to Mr Lewis Scott himself as chief of the staff, and to his lieutenant Mr Griffiths, in particular some recognition was due for most ungrudging labours. (Applause.)

Badge of Office for the Chairman

The Medical Secretary read a letter addressed to the Chairman from certain members of the Association who desired to remain anonymous, saying that it had appeared to them for

some time to be desirable that the chief executive officer of the Association should be identifiable by a badge of office. At the Bath meeting one of the writers of the letter saw the beautiful jewel prepared by Mr Allan G Wyon for the Chairman of the Representative Body, and after consultation the members asked Mr Wyon to undertake the design and preparation of a badge of office for the Chairman of Council. The arrangements were left in the hands of the Financial Secretary and Mr Wyon, and the writers hoped that the Chairman would wear the jewel for a long time to come, and that when he handed it to his successor it would be to the one who would then wear it a constant reminder of the high example set by Dr Bolam during his tenure of office.

Mr Wyon, on behalf of the members, then invested the Chairman with the badge, a beautiful piece of gold work, of which a photograph was reproduced in last week's SUPPLEMENT at page 144.

The Chairman said that this was quite an irregular and undisciplined proceeding, but he would be very glad to wear the badge during the short time which remained of his term of office. It was only one more proof of the extraordinary kindness which had pursued him ever since he was elected to the chairmanship, and he hoped that succeeding Chairmen of Council would have as happy a time in wearing it as he had had during the last five years. The badge was, of course, a decoration for the Chairman in perpetuity, but that his own term of office should have been signalized by its bestowal filled him with gratitude. (Applause.)

The Committee Work of the Association

A resolution from the Brighton Division was considered, asking the Council to arrange, when considered advisable for the publication in the SUPPLEMENT of the fullest possible reports of meetings of the standing and other committees, on the ground that members of the Association had at present little or no opportunity of judging for themselves of the very great amount of detailed work done by those committees. Dr J A Macdonald pointed out that the substance of the proceedings of the committees was embodied in the reports of the meetings of Council and in the Annual and Supplementary Reports, while matters in the committee stage often formed the subject of a Current Note. There was great pressure on the space of the JOURNAL, and additional reports of this kind could only be published at the sacrifice of other and perhaps more important matter. Dr Langdon Down pointed out that the chief value of committee work lay in the fact that it was done without publicity, and therefore on that general ground he would deplore the proposal. The matters under discussion in the Central Ethical Committee were certainly not of a kind which could be freely published. Dr Bore moved that, in the opinion of the Council, the present method of reporting the work done by the various committees is satisfactory, and this was agreed to.

Advertisements of Conditional Appointments

Dr J A Macdonald, Chairman of the Journal Committee, brought forward the question of advertisements by public authorities for medical officers in which the statement appears that the successful candidate shall become a member of a trade union, or society, or association, certain public bodies having recently made requirements of this nature. After full debate the Council passed resolutions for the guidance of the Journal Committee.

On a later matter, on the report of the Medico-Political Committee, it was resolved to bring before the Representative Body the strong objection to the practice adopted by some public bodies of asking medical practitioners to tender for appointments with a recommendation that advertisements for such appointments be not published in the JOURNAL.

Question of a Membership Card

Dr Morton Mackenzie brought forward a proposal from the Organization Committee that members of the Association should be furnished with a membership card. This would tend to prevent unfair advantage being taken by non-members of the facilities at headquarters, and it would afford to members

attending meetings in Divisions other than their own or going overseas some document which they could produce as *prima facie* evidence of their membership. Dr Wallace Henry and Dr Beadles supported the proposition, but the Treasurer pointed out that the preparation and dispatch of such cards would require the employment of another clerk, and in view of the heavy financial commitments of the Association at the present time the Finance Committee could not agree to the expenditure involved. Other members pointed out that it would be more effective to get those who called at headquarters to sign an attendance book.

The proposal for a membership card was not adopted.

Dr Mackenzie reported that the membership of the Association was still increasing. It was 2,000 above the corresponding figure for last year, and was now well over 30,000.

Medical Secretary's Tour in South Africa

Dr Mackenzie then introduced the question of the organization of the profession in South Africa. A memorandum by the Medical Secretary was circulated giving an account of the conversations which had recently taken place. Dr Mackenzie said that the Association at headquarters was anxious to do all it could to help the profession in South Africa. Their view was that the secret of the solution of the South African medical question lay in the better organization of the South African Medical Committee and in the appointment of a Medical Secretary for South Africa. The South African Committee had suggested that Dr Cox should go out to South Africa on an organizing tour. Dr Orenstein, vice-president of the South African Committee, who was visiting this country, said from the first that Dr Cox ought to go out to South Africa. The Chairman of Council and the speaker, together with Dr Cox, while at Bath had an interview with Dr Orenstein, Dr Napier, who was a protagonist of the movement for the South African Medical Association, and Dr Meyer, who was a delegate to the Annual Meeting. Dr Napier asked whether the British Medical Association would grant immediate affiliation to the South African Medical Association irrespective of any question of amalgamation of the British Medical Association in South Africa with that body. He was informed that the answer must be in the negative. At that meeting Dr Orenstein again strongly pressed his desire that the Medical Secretary should go to South Africa, and the other two South African gentlemen agreed that such a visit would do good. A little later a cable was received from the President of the South African Committee (Dr Campbell Watt) saying that the Committee unanimously invited Dr Cox to pay the visit, and that it did not require this year the £1,000 which had been promised towards the salary of the South African Medical Secretary, it had not, in fact, been possible to find the right man. The Organization Committee thought that a good case could be made out for sending the Medical Secretary. It would mean that he would be in South Africa for four months or a little more, and would undertake a proper organizing tour right through the country. The Committee believed that the visit would not only result in a better organization of the South African Branches, but would probably bring to a fruitful and satisfactory issue the prolonged negotiations with regard to the organization of the profession, would enhance the position of the South African Committee, and strengthen the ties uniting the members of the Association in South Africa with those in the home country. He moved that the Council accede to the South African Committee's invitation that the Medical Secretary should visit South Africa on an organizing tour.

Dr Paterson, on behalf of the Domestics Committee, cordially supported the recommendation. The Treasurer said that the Finance Committee took no exception to this proposition. It would cost about £800 to send Dr Cox to South Africa, but part of Dr Cox's ordinary duties was to visit the Divisions at home, and this was only an extension of his tour. Dr Langdon Down remarked that if in absence of Dr Cox for six months from the work of the office could be arranged without detriment, there must be somebody at the office to whom they were very much indebted. Dr Macdonald, as one who had visited South Africa, supported the proposal wholeheartedly. Dr Mackenzie said that Dr Cox's absence

would involve a strain upon the head office, but the work could be managed by curtailing certain activities and making some adjustments. He hoped that South Africa would accept this as a gesture of entire friendliness.

The resolution was carried unanimously and Dr Biscoff Anderson, on behalf of South Africa, offered the Council the sincerest thanks for what it had done. A resolution was also carried instructing the Medical Secretary to convey to the South African Committee the Council's best wishes for the success of the Committee's efforts to promote the solidarity of the profession in South Africa.

The Chairman said that it was well appreciated that this meant a sacrifice on all sides, but he had the greatest hope for the success of the mission, and tendered the best wishes of the Council to Dr Cox.

The Medical Secretary thanked the Council, and said that he knew his colleagues in the office would rise to the occasion, but he asked for the forbearance of the Council if some things were not done quite so thoroughly as usual and some things even omitted. He would certainly convey the Council's good wishes to the South African Committee for the success of the mission in which they as well as himself would be involved during the next five or six months.

Other Oversea Matters

Dr Mackenzie said that the arrangement which had been made with the Canadian Medical Association seemed to be bearing excellent fruit. He moved that following on the adoption of the Articles of Association as regards affiliation, the Council give notice to dissolve the following Branches of the Association in Canada: Halifax (Nova Scotia), Montreal, St John (New Brunswick), Saskatchewan, and Toronto. This was agreed to.

A report from Mr H W Carson, F.R.C.S., who went as an official delegate to the meeting of the Canadian Medical Association in June, was laid before the members. Mr Carson reported that the Canadian Congress was attended by some 500 members, and many valuable papers were read and interesting discussions followed. He found everywhere a very friendly feeling towards the British Medical Association on the part of the members of the affiliated body in Canada, and he thought that this was in great part due to the impression left by Sir Jenner Ferrell and Dr Cox and by Mr Basil Hall during their recent visits.

A letter of thanks was directed to be sent to Mr Carson for acting in this capacity.

A formal invitation was received from the executive committee of the Australasian Medical Congress, to be held at Dunedin, New Zealand, in February, 1927, asking the Council to send an official representative of the Association. Dr Ewart representing New Zealand on the Council, supported the invitation. He said that a hearty welcome awaited any such visitor, and added that the profession in New Zealand was well informed and up to date, and an interesting scientific programme would be carried through. The President of the Congress, Mr I E Brunett, CMG, F.R.C.S., was a former teacher of his, and he knew that with him in the chair a successful Congress was assured.

It was resolved that a letter of thanks for the invitation be sent, and that the appointment of a representative be deferred until the next meeting of Council.

Practice of Psycho-analysis by Medical Men

Following upon the resolution of the Annual Representative Meeting referring to the Council a motion that it should consider certain practices alleged to be prevalent among some medical men practising psycho-analysis. Dr Langdon Down brought forward a report of the Central Ethical Committee on the subject. It had he said received the very careful consideration of the Committee, which had had the advantage of the presence of Dr L A Parry who introduced the subject at the Representative Meeting. Dr Parry had stated to the Committee that neither he nor the Sussex Branch wished the Council to undertake the investigation of complaints against individuals and, with regard to the other way in which the

Council might approach the matter—that of a general pronouncement—it was not desired that any general condemnation of psycho-analysis should be issued, it was only certain aspects of the matter which were challengeable. On being asked to define what it was that was objected to, Dr Parry replied that it was the practice of habitually and unnecessarily emphasizing the sexual aspects of psycho-analysis. The Committee felt that the word 'unnecessarily' constituted a great difficulty. It was always one of the debatable questions of medicine what was and what was not necessary. Dr Parry had furnished particulars of three or four cases, but in one of them only was the information first hand. An endless discussion on the whole question of psychology and human instincts might be opened up. It should be remembered that persons aggrieved had their proper legal remedy. On the statements submitted certain of the practices appeared to be criminal with regard to others it was a debatable question whether what was alleged to have happened constituted an offence and in one case the complaints made by the patient were in such a form that it was hardly credible that what was alleged to have occurred could really have taken place. It would be unnecessary for the Council to say that it regarded actions which were of a criminal nature as being objectionable. Like other professional organizations the Association would desire to encourage among its members an undeviating regard for the discretion and delicacy which ought always to mark professional conduct. Any departure from this position would undoubtedly merit and receive severe condemnation by the general verdict of the profession. But to proclaim this doctrine by a public announcement might well be held to imply that some general or urgent necessity for such an announcement had arisen, and would thus appear to support a conclusion which his Committee was not prepared to accept. He moved that the Council take no further action with respect to the resolution.

This was agreed to without discussion.

Puerperal Morbidity and Mortality

Dr J W Bone (the vice chairman) brought forward a report from the Committee on Causation of Puerperal Morbidity and Mortality. The report was of an entirely preliminary character. The Committee, of which Sir Eben MacLennan had been appointed chairman, hoped to present an interim report at the next meeting of Council. Dr Bone stated that the Committee was in touch with the Medical Research Council with a view to ascertaining what assistance that Council would be prepared to give in the conduct of certain researches cognate to its subject.

The Council appointed Mr E B Turner a member of the Committee, and gave the Committee power to co-opt an additional member, probably on the nomination of the Medical Research Council.

Factory Medical Service

Dr Bone, chairman of the Medico-Political Committee, reporting with regard to the resolutions of the Representative Meeting on the factory medical service, said that his Committee recommended that a joint meeting with the Public Health Committee be called to consider the question, that the Association of Certifying Factory Surgeons be asked to appoint representatives to attend, and that the question at issue be extended to embrace the advisability of the factory medical service being made an exception to the policy of the Association that all health services should be under the administration of the Ministry of Health. Sir Richard Luce said that in the present form of the Factories Bill there was no proposal to alter the medical arrangements at all, and it was important if any steps were to be taken before this bill went through that it should be definitely known what the Association wished. The recommendation was agreed to.

Consultations at Reduced Rates

Dr Bone also reported that the Association of Assistant Masters in Secondary Schools had applied for information and advice with regard to making arrangements for obtaining the services of consultants for members of that body at reduced rates. The Committee did not consider that such schemes were necessary, as persons deserving of special consideration

as regards fees could always get it on the recommendation of their family doctor. He moved that general arrangements with consultants for their acceptance of reduced fees for services rendered to organized groups of persons were unnecessary and undesirable.

Dr Wallace Henry pointed out that the resolution as it stood was opposed to the policy adopted by the Council in the matter of ophthalmic benefit for insured persons, and, after a short discussion it was decided that the resolution should be re-drafted by the Committee and brought forward at the next meeting.

Tests for Drunkenness

Arising out of the recent correspondence in the JOURNAL, Dr Bone proposed that the Association should set up a special Committee, composed of neurologists, psychotherapists, and persons with special knowledge of the subject, to consider and report on the present tests for drunkenness. A Home Office committee was now sitting, and, he was informed, would be glad to co-operate in any investigations. Dr Mckenzie supported the recommendation. In view of the difficult cases with which the medical man was constantly confronted he thought that every effort ought to be made to get a definite ruling on the point.

The appointment of the committee was agreed to, and it was also agreed that police surgeons should be asked to nominate representatives to serve.

Ophthalmic Benefit

On the report of the Insurance Acts Committee, moved by Dr Dain, Dr Brackenbury drew attention to a paragraph relating to ophthalmic benefit, which stated that some 572 practitioners had now expressed their willingness to serve under the scheme. He said that it was desirable that the Council and the whole Association should know one or two things about this ophthalmic benefit, its limitations, and the way in which certain of the approved societies were acting. Many members of the Council must have been under the impression that the arrangement entered into with regard to ophthalmic surgeons for insured persons would be operative over the whole field of national health insurance, but certain of the largest approved societies were not in the arrangement at all, they had not had time to be in it yet. The great majority of insured persons, therefore, did not come under this arrangement. The collective arrangement which had been made applied only to a relatively small minority. The point which deserved attention was what happened to a member of a society outside this arrangement. The societies had made arrangements with the opticians, and if the optician gave the member a certificate that in his opinion it was desirable that an ophthalmic surgeon should be consulted the society would honour that certificate from the optician, but if an insurance practitioner gave a similar certificate that in his opinion it was desirable that the patient should see an ophthalmic surgeon, the approved society—the Prudential—took no notice whatever of the certificate. That was a state of affairs which ought not to be tolerated. The Ministry of Health, however much it might disapprove, had no power to bring the societies into a better way except by persuasion. The fact remained that the certificate of a registered medical practitioner that the opinion of an ophthalmic surgeon was desirable was ignored and repudiated by the Prudential approved society, whereas a similar certificate given by an optician was honoured.

Dr Dain and other members agreed that the position was unsatisfactory. Dr Dain also spoke of certain anomalies in the list of specialists, which would be got over by consulting local committees. Up to now it had been purely an office matter. Dr Wallace Henry said that on the Ophthalmic Committee there were representatives from all parts of the country. The first list was crude but it had now been possible to make it more complete and inclusive.

Minimum Salaries in Scotland

Dr Hugh Miller, Chairman of the Scottish Committee, reported that at a conference with representatives of local authorities arranged by the Board of Health the following

modifications of the Association's scale of minimum salaries for public health medical officers in its application to Scotland were suggested: (1) a lower salary than £800 for medical officers in areas with a population of less than 25,000, (2) differentiation in the scale for officers of the school medical service, (3) a graded scale for officers employed in departments. The Committee had agreed to continue consideration of the first of these modifications, pending further information, did not agree to the second and, with regard to the third, recommended that it be authorized to continue negotiations for the adoption of an agreed scale of minimum salaries, providing for a graded salary for officers employed in departments, commencing at less than £600 and increasing by regular increments to a figure higher than £600. He said that the number of special areas in Scotland to which a concession might reasonably be given was not more than half a dozen. It was thought that a joint committee might be set up to deal with these special cases as they came forward. With regard to the graded scale, the whole standard of professional remuneration was not so high as it might be, but he thought the arrangement proposed might assist matters.

Dr Buchan said he quite realized that special areas required special consideration, but that ought not to be a matter of general resolution and if a graded salary were permitted it ought to be from £500 up to £700 to be equivalent to anything near the £600 minimum. Dr Brackenbury said he would rather stick to the £600 and be beaten in the majority of cases than waive it in the manner proposed. The poverty of Scotland did not appear to be a reason for departing from the minimum, but a reason which would appeal was that the local government units in Scotland were smaller, and it was not to be expected that these small units should pay the salaries which the relatively larger units of England and Wales paid. Dr Allan also pointed out as another factor to be considered that the proportion of medical graduates was very much greater in Scotland than in England, and there was a considerable surplus of unemployed practitioners.

It was agreed to ask the Committee to give further consideration to the whole matter.

Arrangements for Next Annual Meeting

The Chairman, on behalf of the Arrangements Committee, submitted the arrangements for Sections and a timetable for next Annual Meeting, to be held at Nottingham in July. With regard to the Section of Anaesthetics a suggestion had been received from the Society of Anaesthetists in the United States and Canada that it might be possible to combine its own annual meeting with the meeting of the Section at Nottingham, and thus give the meeting an international character.

The Council endorsed the Committee's view that this would be a welcome arrangement, and agreed that officers for the Section should be appointed with this in mind.

The Chairman reported that a valuable memorandum on the arrangements for Annual Meetings, based on the experience at Bath, had been received from Mr W. G. Mumford, Local Honorary Secretary and Acting President of the Bath Meeting.

The New Headquarters

On the report of the Office Committee, various internal arrangements in the new House were discussed, including garage facilities for members and others, the use of rooms for meetings of other bodies, and the contributions to be made by Branches and Divisions of the Association towards the expenses of meetings held in the House.

The Council agreed that in order to provide increased library accommodation the Hastings Hall should be fitted with bookshelves. This would also have the advantage of improving the acoustic properties of the hall, which at present are inferior to those of the Council Chamber, owing to the paneling and seats in the latter.

Dr Hawthorne said that the Library Subcommittee welcomed any proposal for the provision of increased library accommodation, but urged upon the Council the need for better accommodation for certain valuable folios and other works.

Other Committee Reports

Sir Richard Luce reported that the Naval and Military Committee was in communication with the War Office as to the pensions of majors of the R.A.M.C. & twenty years service, and was also moving in the matter of the pay of captains in the Territorial Army. Dr Ridley Bailey, for the Public Health Committee, reported on the action taken in connection with a number of public health appointments. Mr McAdam Eccles, for the Hospitals Committee, brought forward as recommendations to the Representative Body two paragraphs for adoption as the hospital policy of the Association which were approved by the last Representative Meeting but in connection with which the requisite two months' notice had not been given. He also stated that correspondence was proceeding with the Hospital Saving Association with regard to a suggestion, already endorsed by the Council, that every patient who was a member of that body and sought treatment should carry with him a recommendation from his medical practitioner. Dr Paterson, chairman of the Dominions Committee, said that the Committee had no recommendations to bring forward, but certain matters were in their early stages. Protests had been received from the Kenya and Zanzibar Branches against the new regulations for the East African Medical Service and the Colonial Office was being acquainted by the Committee with the prevailing dissatisfaction, and was being asked for further information. He hoped that the Committee would be prepared to make certain recommendations at the next meeting. There was great trouble also in the Malayan Medical Service, where the salaries were inadequate, and the administration in a state of chaos. The Committee was given to understand that the Windward Islands Medical Service had been somewhat improved of late, and inquiries were being pursued in the Branch there to find out whether there was sufficient justification for the withdrawal of the Important Notice.

The Council nominated Dr Ridley Bailey and Dr A. Manknell as representatives of the Association upon the council of the Society of Medical Officers of Health and concluded its business at 6.15 p.m., in time for the Autumn Dinner, of which a report appeared in last week's SUPPLEMENT.

Association Notices**AFFILIATION OF CANADIAN MEDICAL ASSOCIATION WITH BRITISH MEDICAL ASSOCIATION***Dissolution of Canadian Branches*

NOTICE is hereby given by the Council of the British Medical Association to all concerned of the following resolution passed by the Council on October 21st 1925:

That following on the adoption by the Annual Representative Meeting, 1925, and Extraordinary General Meetings of the Association, of Articles of Association as regards affiliation, and the terms of the affiliation of the Canadian Medical Association with the British Medical Association the Council, in pursuance of the power conferred upon it by Article 15 do forthwith give notice to dissolve the following Branches of the British Medical Association in Canada: Halifax, Nova Scotia, Montreal, St John, New Brunswick, Saskatchewan, Toronto.

Written notice of the intended dissolution of the Branches of the British Medical Association in Canada is also being given to those Branches which will be deemed by the Council to be dissolved as from June 1st 1926.

By order of the Council

ALFRED COY,
Medical Secretary

October 28th, 1925

BRANCH AND DIVISION MEETINGS TO BE HELD

BIRMINGHAM BRANCH. NUNEATON AND TAMWORTH DIVISION.—A meeting of the Nuneaton and Tamworth Division will be held at the Nuneaton General Hospital on Wednesday November 18th when Mr H. Beckwith Whitehouse, M.S. F.R.C.S., will give an address entitled "Notes from an antenatal clinic."

GLASGOW AND WEST OF SCOTLAND BRANCH.—A clinical meeting for members of the Glasgow and West of Scotland Branch will take place in the Royal Hospital for Sick Children, Yorkhill, Glasgow,

on November 18th at 3 p.m., when surgical and medical cases will be demonstrated by members of the hospital staff. The annual dinner of the Branch will be held on the same evening at 6.30 for 7 p.m., in Feigson and Forrester's Restaurant, 36 Buchanan Street, Glasgow.

GLOUCESTERSHIRE BRANCH.—The opening meeting of the new session of the Gloucestershire Branch will be held on Thursday, November 12th at the Royal Infirmary, Gloucester, at 6.15 p.m. Presidential address: Chronic pelvic pain in women. There will be supper at the Spread Eagle Hotel after the meeting (price 5s each exclusive of wine). Members intending to be present at the supper are asked to notify the honorary secretary.

LANCASHIRE AND CHESHIRE BRANCH.—A scientific meeting of the Lancashire and Cheshire Branch will be held at the Bolton Infirmary, Chorley, New Road, Bolton on Thursday, November 12th at 3.30 p.m. Agenda.—Dr F. P. Mallett (Bolton) Introductory remarks. Dr T. H. Oliver (Manchester) Insulin in private practice. Dr C. W. Paget Moffitt (Bolton) Antenatal treatment from the public health point of view. Dr R. D. Mothersole (Bolton) Septic ulcers. Exhibition of cases and specimens. Tea will be given by the Bolton Division, and in order that the necessary arrangements may be made members proposing to be present are asked to notify Dr R. Cranna, 584 Blackburn Road, Bolton as early as possible.

LANCASHIRE AND CHESHIRE BRANCH. HAIDE DIVISION.—A supper dance will be held in Hyde Town Hall on Friday, November 13th at 8.30 p.m. Tickets, price 15s each, may be had from the honorary secretaries. Members should apply early for their tickets as the number is limited.

LANCASHIRE AND CHESHIRE BRANCH. MID CHESHIRE DIVISION.—A meeting of the Mid Cheshire Division will be held in the Board Room of the Altrincham General Hospital on Thursday, November 12th at 8.30 p.m. prompt. After the business meeting a British Medical Association Lecture will be given by Professor Edward Mellorby of Sheffield University on diet and disease. The lecture will be illustrated by lantern slides. Members of other Divisions and non-members in the area will be heartily welcome.

LANCASHIRE AND CHESHIRE BRANCH. ROCHEDALE DIVISION.—The third meeting of the session of the Rochdale Division will be held in the Chippiness Hall, Dyke Street at 8.30 p.m. on Wednesday, November 11th. Dr G. J. Langley (Manchester) will deliver the third of a series of lectures on recent advances in cardiology.

METROPOLITAN COUNTIES BRANCH. CITY DIVISION.—In conjunction with the Aesculapian Society there will be a clinical afternoon at the Metropolitan Hospital, Kingsland Road on Friday, November 13th at 4.15 p.m. when Mr P. A. Ramsey, F.R.C.S. surgeon to the hospital will show cases with notes. Tea at 4. Members are invited to show cases at any meeting.

METROPOLITAN COUNTIES BRANCH. ST PANCRAS DIVISION.—The next meeting of the St Pancras Division will be held at the British Medical Association House, Tavistock Square, W.C.1 at 9 p.m. on Tuesday, November 10th when Dr Robert A. Young, C.B.E., F.R.C.P. physician to the Brompton Chest Hospital will deliver a lecture on the early recognition of pulmonary tuberculosis.

METROPOLITAN COUNTIES BRANCH. WILLEMS DIVISION.—The clinical meeting arranged for November 19th at the Folation Hospital has been postponed owing to the death of Dr Stewart. The second annual dinner of the Division will be held at the Criterion Restaurant, Piccadilly on Sunday, November 15th when Lieut. Colonel Kirkpatrick, I.M.S. (ret.) will preside. Reception at 7 p.m. dinner 7.30. Principal guests, Dr H. B. Brackenbury and Mr G. J. Furness, chairman, Wilsden General Hospital. Any member of the Association will be welcomed and may bring a friend. Tickets, 10s. each (exclusive of wine) may be had from Dr W. Lock, 45 Church Road, N.W.10.

MIDLAND BRANCH. CHESTERFIELD DIVISION.—A meeting of the Chesterfield Division will be held at the Maternity Hospital, Chesterfield on Friday, November 13th at 8.15 p.m. when a discussion on small pox will be opened by Dr Garrow. Tea and coffee will be served at 8.

NORTH OF ENGLAND BRANCH. SUNDERLAND DIVISION.—The annual address will be given by Dr H. Crichton Miller on Thursday, November 12th. The annual dinner will be held the same evening at 7.30 at the Palatine Hotel, Sunderland.

SOUTH WALES AND MONMOUTHSHIRE BRANCH. SWANSEA DIVISION.—A meeting of the Swansea Division will be held at the General Hospital, Swansea on Thursday, November 19th at 8.15 p.m. when Dr White will speak on some general aspects of "Mind therapy."

SOUTHERN BRANCH. PORTSMOUTH AND ISLE OF WIGHT DIVISIONS.—A joint meeting of the Portsmouth and Isle of Wight Divisions will be held at the Queens Hotel, Southampton on Wednesday, November 11th at 3 p.m. Dr G. C. Anderson, Deputy Medical Secretary, will give an address on the British Medical Association's Hospital Policy. As the subject is of great importance to medical practitioners the Branch Council hopes that all members will endeavour to attend. Non-members will be heartily welcomed.

STAFFORDSHIRE BRANCH. SOUTH STAFFORDSHIRE DIVISION.—Sir Robert Jones has kindly consented to show cases to the members of the South Staffordshire Division on Sunday, November 8th at 2.30 p.m. at the Shropshire Orthopaedic Hospital, Gobowen, near Oswestry. It is proposed that members of the party should lunch (3/-) at the Winery Arms at 1.15 p.m., and proceed two and a half miles to the hospital at Gobowen.

SURREY BRANCH. CROYDON DIVISION.—The next meeting of the Croydon Division will be held at the Queen's Hotel, Upper Norwood on Thursday, November 19th at 4 p.m. An address will be given by Dr J. Bright Banister entitled "Some obstetric emergencies."

SURREY BRANCH KINGSTON ON THAMES DIVISION—The following are the arrangements for the season—November 18th—Annual dinner at Nuthalls Restaurant 7.30 p.m. December 1st—Dr William Brown Psychology and medicine January 5th 1926—Mr J. G. Turner, I.R.C.S. Dental sepsis February 2nd—Dr Robert Hutchison Haematemesis March 2nd—Mr Kenneth Walker, I.R.C.S. (subject to be announced later)

SURREY BRANCH REIGATE DIVISION—A meeting of the Reigate Division will be held at the East Surrey Hospital, Reigate on Tuesday, November 10th, at 8.45 p.m., when Mr R. P. Rowlands will read a paper on the acute abdomen.

SUSSEX BRANCH CHICHESTER AND WORTHING DIVISION—The autumn meeting of the Chichester and Worthing Division will be held at Wines Hotel, Worthing on Wednesday, November 11th at 7 p.m. On this occasion the Division will entertain guests representative of the public authorities in the area, and after the dinner a lantern lecture will be given by Dr Habberton Lullum on human nature through a doctor's eyes. It is hoped that members will bring their wives and other guests and members of the neighbouring Divisions (Horsham Brighton etc.), with then wives and other guests are cordially invited. The price of dinner tickets is 7s, exclusive of wine.

WILTSHIRE BRANCH TROWBRIDGE DIVISION—The Trowbridge Division will hold a dinner at the Bear Hotel Devizes on Wednesday, December 2nd, at 7.15 for 7.30 p.m., after which Mr Cecil Terry will read a paper on some minor points in surgery. The price of the dinner exclusive of wine, is 10s. 6d., and members intending to be present are requested to notify Dr D. Leigh Spence (The Limes Melksham) by the first post on Saturday, November 28th. As this is the first dinner held by the Division for many years it is hoped that all members will make a special effort to attend. Non members in the Devizes area are cordially invited.

YORKSHIRE BRANCH DEWSBURY DIVISION—A meeting of the Dewsbury Division will be held at the Man and Saddle Restaurant Dewsbury on Tuesday, December 1st. Dr Burrows (Leeds) will read a paper on referred pain from a diagnostic standpoint. Supper will be provided at 8.15 p.m. Members from neighbouring Divisions will be welcomed.

YORKSHIRE BRANCH ROTHERHAM DIVISION—The annual dinner of the profession will this year be held under the auspices of the Rotherham Division at the Crown Hotel, Rotherham on Friday, November 20th at 7.15 for 7.30 p.m. Price of tickets 15s. exclusive of wine. Members are requested to notify the secretary regarding tickets not later than November 13th.

YORKSHIRE BRANCH SHEFFIELD DIVISION—A meeting of the Sheffield Division will be held in the General Lecture Room The University, Sheffield, on Friday, December 11th at 8.30 p.m. when a British Medical Association lecture will be given by Dr Crumpler on the new outlook on cancer. Non members will be welcomed.

YORKSHIRE BRANCH WAKEFIELD DIVISION—At the meeting of the Wakefield Pontefract and Castleford Division to be held in the Bull Restaurant Wakefield on Thursday, November 12th, at 8.30 p.m. Dr J. S. Bolton (Wakefield Mental Hospital) will discuss the diagnosis and certification of mental diseases. Supper will be served at 7.45 p.m. (price 2s. 6d.). The meeting is open to all practitioners in the district.

Meetings of Branches and Divisions

BERKSHIRE AND CHESHIRE BRANCH WARRINGTON DIVISION
A MEETING of the Warrington Division was held in the Infirmary on October 30th. Dr J. CRIGGON BRAMWELL (Manchester) read a concise and lucid paper on the treatment of cardiac failure with congestion. At the termination of his address the lecturer was accorded a most hearty vote of thanks for the enjoyable evening given to the Division.

NORTH OF ENGLAND BRANCH CLEVELAND DIVISION
A MEETING of the Cleveland Division to which members of the neighbouring Divisions had been invited was held in the Board Room of the North Ormesby Hospital, Middlesbrough on October 22nd. A most interesting address was given by Mr J. BASIL HALL, M.Ch. F.R.C.S. of Bradford Past President of the Association on his experiences and impressions of his recent tour in Canada and the United States. Mr Hall spoke in his usual humorous vein and at the close answered a number of questions. The address was greatly enjoyed by those who had the good fortune to be present.

SOUTH WALES AND MONMOUTHSHIRE BRANCH SWANSEA DIVISION
A MEETING of the Swansea Division was held on October 22nd when the Vice Chairman of the Division Dr H. R. FREDERICK presided in an able manner. Dr DANIEL L. EVANS delivered a lecture on the diseased heart in pregnancy which was followed by a splendid discussion in which the majority of those present including Dr I. ATTERSON, lady medical officer of the Public Health Department, took part.

SURREY BRANCH CROYDON DIVISION
A GENERAL meeting of the Croydon Division was held at the Croydon General Hospital on October 27th when Dr J. H. THOMPSON was in the chair. The honorary secretary was instructed to write to Dr Walter Gupper (Wallington) a former chairman of the Division expressing the regret of the members that he was leaving the neighbourhood and wishing him God speed. The Vice Chairman Dr J. G. SWAYNE invested the Chairman Dr J. H. Thompson with the chairman's badge and the Honorary Secretaries Dr C. G. C. Scudamore and Dr P. W. Hamond, received the secretaries' badges from the Chairman.

Dr H. BATTY SHAW F.R.C.P. gave an address on the early treatment by artificial pneumothorax of pulmonary suppuration which was listened to with very great attention and a number of members took part in the discussion which followed. At the close Dr Batty Shaw was heartily thanked for his address.

National Insurance

THE ROYAL COMMISSION

THE forty third meeting of the Royal Commission on National Health Insurance was held at the Home Office, Whitehall, on October 29th, with Sir Arthur Wiles, and later Lord Lawrence of Kingsgate, in the chair.

Evidence was given by Mr A. B. MacLachlan and Mr H. W. S. Francis, Assistant Secretaries, Ministry of Health, as to the public provision of health services outside the insurance scheme and the relations of these to the medical benefit arrangements. Thereafter further evidence on the general provisions of the insurance scheme was given by Sir Walter Kinnear, Mr L. G. Brook, and Dr Smith Whitaker of the Ministry of Health, and by Sir James Lushman and Mr G. Wight of the Scottish Board of Health.

Volume III of the Minutes of Evidence (twenty fourth to thirty fourth days) and Part III of the Statements of Evidence (Appendices XL to LXXXI) are now on sale in final form and may be purchased from H.M. Stationery Office, Admiralty House, Kingsway, W.C.2, or through any bookseller at the following prices: Vol. III of Minutes 10s. net per page extra. Part III of Statements, 10s. 6d. net postage extra.

CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL AND PANEL COMMITTEES

IN the report of the proceedings of the Conference of Representatives of Local Medical and Panel Committees a mistake appeared on page 155 in connexion with the discussion on the provision of medical benefit for seamen. It states at the bottom of page 155 and the top of page 156 that Dr Eldred of Essex proposed an amendment to the Insurance Acts Committee's motion which amendment was subsequently dropped. What actually happened was that the motion proposed by Dr Drum on behalf of the Insurance Acts Committee was carried, and that, subsequently, a separate motion was proposed by Dr Eldred, which was also carried.

LOCAL MEDICAL AND PANEL COMMITTEES BERKSHIRE

PRINTED copies of the annual report of the Berkshire Local Medical and Panel Committee for the year 1924-25 have recently been issued to the practitioners on the panel for that county. The report is signed by the chairman, Dr P. Napier Jones of Crowthorne. It contains a series of paragraphs headed "Panel doctors and public service—an opportunity, from which we quote the following passages:

The Panel Committee of Berkshire has been in existence for fourteen years and has reached a stage when its statutory duties have become familiar, and thanks to the standard of work done by you take up less time than formerly. We therefore feel that we ought to turn our attention to matters outside these duties and endeavour to use our established position to enhance the reputation and standing of the panel doctor.

The Panel Committee is the recognized channel through which the Minister of Health approaches doctors on questions affecting public health. Precisely the same avenue is open to the country urban and rural councils, boards of guardians, philanthropic bodies and the public generally. We desire to prove that instead of exploiting doctors as rival individuals they are able to obtain the force of the united medical opinion and assistance through this Committee provided their objects and methods are sound.

"There is a subject which is very much in the minds of leading social workers at the present time—namely the care of mentally deficient and feeble minded persons whether certifiable under the Act or not. As our business is confined to deciding whether a particular person is certifiable and whether a particular child is able to benefit by attendance at a primary school this subject does not affect us greatly. For that very reason it lends itself rather well as a means of showing how general practitioners can give a useful lead in social and scientific reform without any question of material gain."

The Committee has accordingly arranged a meeting for Tuesday, November 10th at 3 p.m., at 75, London Road, Reading when Dr Henry Devine, O.B.E., F.R.C.P., medical superintendent of the Portsmouth Corporation Mental Hospital, will deliver an address on the care of mental defectives. All medical practitioners on the Berkshire panel are invited to attend and invitations are being sent to influential people interested in the subject. Dr Devine was President of the Section of Neurology and Psychiatry at the Annual Meeting of the British Medical Association held at Portsmouth in 1923.

LONDON PANEL COMMITTEE

At the meeting of the London Panel Committee on October 20th with Dr H J CARDLE in the chair Drs Cardle and Harry Roberts were appointed representatives of the Committee on the Medical Service Subcommittee for the ensuing year and Drs J H Triquet, A T Swan and R G Chase were appointed deputies to serve in the absence of the representatives. At a subsequent meeting of the Local Medical Committee Dr T M Ness was reappointed to represent that body on the subcommittee.

Evidence before Royal Commission—The Committee resolved to inform the Royal Commission that the medical members of the London Insurance Committee had never at any time consented to the proposals contained in the evidence submitted to the Commission by Mr Lesser the vice chairman of the Insurance Committee (see SUPPLEMENT, August 29th, p 101, and October 31st p 158). Mr Lesser was reported to have informed the Royal Commission that the medical members of the Insurance Committee had agreed to the evidence which he submitted.

Transfer of Practices. Clearance of Lists—A communication was received from the Insurance Committee stating that it was desirable that the lists of all practitioners withdrawing from the medical list should be cleared and that their successors should be credited under Clause 1 (2) of the Distribution Scheme only in respect of those persons whose title to benefit was established. This was contrary to the view which the Panel Committee had always held that the successor to a practice should receive credits equivalent to the total number on the list of his predecessor. It was agreed to request the Ministry to receive a deputation on the question of the clearance of lists of practitioners succeeding to practices, and matters relevant thereto.

Duplicate Copies of Prescriptions—A letter was read from the London Pharmaceutical Committee calling attention to the fact that in certain cases insured persons had obtained medicine from chemists by means of duplicate copies of prescriptions. Such copies had been given to the insured persons for the purpose of presentation at the next consultation. A resolution was proposed expressing agreement with the opinion of the London Pharmaceutical Committee that the difficulty would have been obviated had the former duplicate or triplicate prescription books been still in use. So much diversity of opinion was expressed, however, with regard to the utility of duplicate or triplicate prescriptions that the whole matter was referred back to a subcommittee for further consideration.

Ethical Questions—Four cases were reported in which the recently appointed Ethical Subcommittee had been of service in warning practitioners with regard to relatively minor irregularities and approval was given to the action by the subcommittee in each instance.

Distribution Scheme and Emergency Treatment—The Committee resolved to ask the Ministry of Health to receive a deputation to discuss the subject of granting discretionary powers to the Committee in considering claims for payment for emergency treatment submitted by practitioners after the period allowed under the provisions of the Distribution Scheme. This period which was until recently forty eight hours has been extended to seven days but on again approaching the Insurance Committee for discretionary powers the Panel Committee was told that in cases of doubt where a practitioner had applied to the Insurance Committee for advice before sending in a claim, and such claim was not submitted within seven days the application to the Committee might be regarded as the date of the receipt of claim. The Panel Committee was not able to accept this interpretation of the Distribution Scheme.

Onychogryphosis—Among the claims for payment for the services of a second practitioner in administering an anaesthetic considered by the Committee was one in which the nature of the case was given as onychogryphosis. In reply to a member, the Secretary said that he understood this to be a case of in growing toe nail.

Correspondence.

The Cheshire Motion at the Panel Conference

SIR,—May I correct two small but important errors in the report of my speech (SUPPLEMENT October 31st, p 152)?

I did not contend that it was inconceivable that Parliament contemplated the assumption by any men of the extraordinary powers assigned to the Commissioners, but the assumption of such powers by any single man.

Again, I did not claim that It was inconceivable that any body would argue before Parliament, etc., but that, had there been no additional Exchequer grant it was inconceivable that anybody then would have argued etc. In fact, no power to fine was granted by the Act itself, and all possible excuse for the survival of the present iniquity has been long removed. The arbitration award of 1920 and departmental inquiry of 1921 fixed the salaries of doctors and society officers respectively, after adequate experience of their work and with no reference whatever to the Exchequer grant which has in fact, ceased to exist. As a matter of the most elementary justice the two parties should now be treated alike, and I do not foresee the societies submitting to the penalizing of their officers without right of appeal on the merits of the case, as well as on the amount of the penalty.—I am, etc.,

Chichester, Oct. 31st.

G C GARRATT

Naval and Military Appointments

ROYAL NAVAL MEDICAL SERVICE

SURGEON COMMANDER C R RICKARD is placed on the retired list with the rank of Surgeon Captain.

Surgeon Commanders J P Shorten D.S.C. to the Princess Margaret H R B Hull and A I Sheldon to the President additional for three months post graduate course.

CURRENT NOTES

Association Propaganda

MANY interesting points as to the progress of the British Medical Association were under consideration by the Propaganda Subcommittee at its meeting on October 28th, during its review of the propaganda work of the Association, local and central. The membership of the Association is now over 30,400. No fewer than 3,203 new members joined in the year from October 1st, 1924, to September 30th, 1925. Of this number, about 2,000 were newly qualified members of the profession, a remarkably high record, brought about mainly as a result of the meetings of welcome to the newly qualified given by those Divisions and Branches whose areas contain medical schools. The Subcommittee was especially gratified with the following figures shown by the Glasgow and West of Scotland Branch and the Newcastle-on-Tyne Division:

Qualification	No registered	No joined B M A
Glasgow M B	279	267
Durham M B	45	44

A wide field still remains for propaganda, especially among the newly qualified. The Council hopes that all the Divisions and Branches concerned will follow the example set by the Newcastle-on-Tyne Division and the Glasgow and West of Scotland Branch. Many interesting programmes of meetings arranged by Divisions in all parts of the country were reported to the Subcommittee, and it was thus not surprising to find that, in the analysis of methods of introduction of new members, the item "Recruited by Home Divisions and Branches" headed the list with a total of 655 new members. There is, however, still a small number—a steadily diminishing one—of Divisions which are unorganized or inactive, and these are being communicated with.

Garage Accommodation at Headquarters

Garage facilities are now available for members in the garage at the rear of the North Wing of the Association's new House in Tavistock Square. Members may garage their cars during the day free of charge, and during the night at a charge of 2s a night. There are also two lock-up garages available, the charges for which are 5s a night, 25s a week, or £40 a year; these may be let for a period of not longer than one year on a three months' notice, or for shorter periods. All applications for garage accommodation should be made to the Financial Secretary and Business Manager. The garage will be accessible only during office hours, except by arrangement with the caretaker. It must be clearly understood that the Association can take no responsibility for cars garaged on the premises.

New South Wales Medical Roll of Honour

The New South Wales Branch of the British Medical Association has published in pamphlet form a list of the members of the medical profession of New South Wales who served overseas during the war, together with a list of the orders and decorations awarded, and the roll of honour. A view of the memorial tablet in the hall of the British Medical Association Building, Sydney, is included. We reproduced a photograph of this tablet in the JOURNAL of October 27th, 1925 (p. 778).

Border Counties Branch Banner

At a well attended meeting of the Border Counties Branch of the British Medical Association held at Tullie House, Carlisle, on October 23rd, the presentation banner which the Branch is providing to be hung in the Great Hall of the Association's new headquarters building in London, to commemorate the Annual Meeting of the Association held in Carlisle (1896), was handed over to the care of the Mayor of Carlisle, for exhibition in Tullie House for a short period before its dispatch to London. Mr. Norman MacLaren, president of the Branch, who took the chair, said that the Border Counties Branch was one of the first to fall in with the suggestion that banners bearing the arms of the cities and towns wherein the Annual Meeting of the Association had taken place should be hung in the Great Hall. He then recalled his memories of the Association's meeting in Carlisle in 1896. Dr. Helm, honorary secretary of the local committee of the Carlisle meeting, and Dr. Graham, secretary of the Local Inter-Parliamentary Committee in 1896, also gave some reminiscences of that occasion. The Mayor gracefully accepted custody of the flag for exhibition at Tullie House for a fortnight.

Northamptonshire County Council Medical Officer of Health

In the autumn of 1924 the Northamptonshire County Council tendered to the BRITISH MEDICAL JOURNAL an advertisement for a medical officer of health and school medical officer for the administrative county of Northampton. The salary was to be at the rate of £1,050 per annum. According to the new salaries scale the commencing salary should have been somewhere within a range of £1,100 to £1,200. The advertisement was refused, and at the instance of the Ministry of Health a conference was held between representatives of the county council and the British Medical Association, together with representatives of the Society of Medical Officers of Health, with a view to arriving at a satisfactory salary. No definite conclusion was come to, and the appointment remained in abeyance. In May last a further conference was held, and an agreement was reached that the commencing salary should be £1,100, and that the advertisement should include the information that it is the practice of the county council to review salaries periodically and to award suitable increments of salary for proved ability and satisfactory service.

This arrangement has been approved by the Northamptonshire County Council, and an advertisement in conformity with it appears in this week's JOURNAL. It will be seen that in this case the principle of collective bargaining has been successful, agreement has been reached, and there is, consequently, no reason why members of the profession should not apply for the post.

CERTIFICATION IN MENTAL CASES

ADDRESS TO THE OXFORD DIVISION BY
DR T S GOOD

At a recent meeting of the Oxford Division of the British Medical Association a paper on the subject of certification was read by Dr T S Good, OBE, medical superintendent of the City and County Mental Hospital, Littlemore, Oxford. Dr Good, after pointing out that certification was a legal device to protect the liberty of the individual and the public interest and safety, spoke first of the Mental Deficiency Act, which, he said, represented a closer accord of law with medicine than did the Lunacy Acts.

Grades of Mental Defectives

Under the Mental Deficiency Act persons of feeble intellect were defined as those whose mental defectiveness can be shown to have existed from birth or from an early age, and they were divided into four classes: (1) idiots, incapable of guarding themselves from common physical dangers, (2) imbeciles, having a mental defect not amounting to idiocy, but so pronounced as to render them incapable of managing themselves or their affairs, (3) feeble-minded persons who, while not imbecile, required care, supervision, and control, (4) moral imbeciles, persons who from an early age displayed some permanent mental defect coupled with strong vicious or criminal propensities on which punishment had little or no deterrent effect.

The first point to which the attention of the medical man should be directed in these cases was whether the mental defect was present from birth or from an early age. Persons whose mental defect arose from or followed brain lesions, the result of toxins or senile changes, should not be classed as mentally deficient. These were degenerative anomalies, they had been normal but had regressed. In the mentally deficient there was a minus degree of certain mental faculties or qualities from the earliest age. Frequently cases of mental enfeeblement, with marked moral deterioration, which had appeared first after some acute illness, were brought to the medical man for his opinion. In all probability these cases represented the after-effects of encephalitis. The impairment of the intelligence in the case of these young persons was usually slight, except in memory and concentration, it was on the moral side that the weakness was manifest. The parents often could not understand that there was any grave mental deterioration, because the child though naughty and undisciplined, was sharp and precocious. The truth was that these were cases of arrested mental development at such an age that the further development of abstract ideas (involving adjustment to the social and ethical needs of civilized society) was impossible, probably owing to changes in the higher cells of the cortex.

The Problem of the Moral Imbecile

Such cases, as the law stood at present, were not often certifiable under either the Lunacy or the Mental Deficiency Acts, but Dr Good believed that they formed a large group in the fourth class of persons—namely, moral imbeciles—just mentioned. It was this fourth class which presented the principal difficulty to medical men. The idiot, the imbecile, and the feeble-minded person were usually discovered by the point-scale or the Binet-Simon test, but the morally intractable were a problem that had yet to be solved, and meanwhile they were a danger to the community because of their social and ethical delinquencies.

Dr Good thought that moral imbeciles might be divided into three groups: (1) those in whom, on examination with the point-scale test, the concrete thought processes appeared intact, but abstract ideation was very defective, (2) those who showed the moral deterioration he had just described as following from acute illness (and here he emphasized the need, as in all mental cases, for careful examination of the physical condition), (3) those whose moral imbecility might be mainly due to grave errors in early education, the term "education" including the behaviour of parents and others in respect to them, for moral irregularities in children were often traceable to

emotional repressions in early childhood caused by the actions and speech of older persons.

As an example of the first of these groups, he described the case of a woman, aged 37, who, by the point-scale or Binet and Simon test was 11 years of age. But it was only when her comprehension, her sense of absurdity, and her power of definition of abstract terms was tested that it was found that apparently she had no capacity for abstract thought. Her record was one of continual social lapse. Until the war she went through life as an apparently normal person simply because her environment was such that there was, nothing to make her immoral. During the war, when her husband was at the front, she had two illegitimate children and became addicted to alcohol. On a casual examination she did not appear feeble-minded, only when she was examined carefully was the paucity of abstract thought detected.

The Law as regards the Lunatic

The law as regards the mentally defective, Dr Good continued, was more in accord with medicine than the law as regards the lunatic. The legal definitions of the feeble-minded person were capable of scientific support. The various degrees of feeble-mindedness involving nerve cell paucity could be detected by psychological tests for measuring or examining the intellect. Only in the case of moral deficiency was there any difficulty, and even here the Mental Deficiency Act was an improvement on the Lunacy Acts. The medical man was at all events given a definition of mental defect, he had the means of verifying and diagnosing a mental defective by the point-scale or Binet-Simon examination, he was protected by being able to call in a medical opinion approved by the law, and he had the right to appeal to the local authority to act in a case where he considered it necessary. Moreover, the same law was applied to rich and poor—that is, to private and pauper patients—alike.

Under the Lunacy Act of 1890, on the contrary, no definition was afforded. There was no mathematical method of examination in the case of the lunatic one had to pay regard principally to emotional abnormalities. Feeble-mindedness was a failure of conscious mental processes, whereas the psychoses were mainly a failure of conscious control of unconscious or automatic mental processes. Again there was no provision in the Act for a recognized medical authority backed and upheld by the law, and even the magistrate who signed the order was not bound to see the case. The medical man could not appeal to the local authority, he could only notify the police or advise the friends. Finally, the procedure of certification was not the same in the case of the rich as in the case of the poor.

The Mental Deficiency Act, therefore, with its definitions and safeguards, was a more advanced act scientifically than the Lunacy Act of twenty-three years earlier. It was important to keep in mind that the two forms of mental disorder—feeble-mindedness and lunacy or psychoses—were separate entities. Feeble-mindedness was a congenital condition, a psychosis an acquired condition. The feeble-minded might develop a psychosis, but legally the lunatic could not be feeble-minded.

Certification in Lunacy

The Lunacy Acts threw upon the medical man the responsibility of deciding in the eyes of the law something which the law itself did not define. To judge from recent legal proceedings, not only did the law fail to define the condition, but it might punish members of the medical profession when they attempted to protect the patient and the public by treating the patient in the only way in which the law allowed a medical man to treat a lunatic—namely, by certifying him and placing him in a mental hospital or licensed house.

After describing the legal procedure and hearings of certification, Dr Good addressed himself to the matters to be carefully considered before signing a certificate. In the first place, the certificate must be made on facts observed by the medical man himself—facts that he would be prepared to swear to, and to undergo cross-examination upon, in a court of law. A certificate was not valid so long as it contained only particulars communicated by others. It was a good rule for the medical man to arrive at the facts from his own observation of the patient before he heard what others had to say. The supposed 'facts' communicated by others sometimes proved to be only figments of the imagination. The relatives often exaggerated a mere emotional outbreak due to some domestic trouble of which they themselves were the cause. In some cases also their anxiety to get the patient out of the way led them to put down as facts what they had only feared or had even invented.

In one case the statement by a relative was that the person under observation had tried to stab him and so forth. The person concerned refused to give any information to the medical man and that fact was set down by the medical man on the certificate accompanied by the relative's statement. The certificate was returned by the Board of Control asking for a fact which clearly indicated insanity. The medical certifier had evidently

been influenced unconsciously by the statement of the relative, who turned out to be a feeble minded person himself also a sufferer from shell shock. The person under observation was quite sane and her refusal to give information was simply due to resentment.

Objective Signs

The facts which could be safely used to certify a patient were such as indicated him to be a danger to himself or to others by his conduct, and they might be divided into objective and subjective signs. The objective signs included great alterations in the conduct of the patient as observed by the medical man. Sometimes a medical man was called to a case in which the patient had alarmed his friends by suddenly becoming restless and talking absolute rubbish. In such cases the medical man should suspect aphasic lesions or encephalitis and a physical examination, with an assurance to the patient that he was ill, and that his inability to talk successfully was due to his illness would often quieten him and allay the fears of his friends. A physical examination of the supposed lunatic was imperative. A sudden onset or rapid exacerbation of symptoms within a few days was almost invariably due to toxic causes and was of the nature of a delirium. When combined with emotional disturbance there was great motor restlessness, loss of power of orientation to time and place, a history of influenza typhoid pneumonia or other acute illness, or the puerperium, certification should be delayed for as long as possible, as these cases often recovered under treatment.

Suicide was the danger to the patient which probably in cases of depression had most influence in leading to the signing of the certificate. Personally the speaker believed that the statement that a patient was suicidal was made too often. Suicide was seldom prevented by certification. The suicidal individual committed the act without warning. The threatened or attempted suicide seldom materialized in the successful act. He believed that in the case of many so called suicidal patients the idea of suicide only occurred to them when they believed themselves to be becoming insane, and if the law refused to accept suicidal threats or attempts as signs of insanity suicide would be greatly lessened. Homicidal attacks without apparent reason should undoubtedly be dealt with by certification.

Subjective Symptom

Incoherence—meaning by that term, not rambling conversation, but a true loss of sentence formation—was a symptom of grave import. It was found in cases of toxic poisoning, in uterine sclerosis, in the end period of general paralysis of the insane, and in some cases of dementia praecox. Its presence generally indicated certification and the medical man should endeavour to discover the physical cause. In dementia praecox incoherence was generally accompanied by absurdities in movement and expression.

Rambling speech was often a sign of intense emotional strain but a little patience on the part of the practitioner might dispel the symptom. There were cases, especially senility and toxemia where rambling speech was indicative of grave cerebral degeneration, and here it was a point which could be used in signing a certificate. Refusal to speak might be due to motor inability or to deep mental depression or loss of memory. If used as a fact in signing a certificate, the medical man should be quite sure that it was not due to the patient's annoyance or resentment. Patients with a facial expression of acute misery who refused to speak were generally grave melancholics, and in the certificate the refusal to speak should be coupled with a description of the facial expression.

Delusions and Hallucinations

A delusion was an abstract idea which could not be reasoned away. A hallucination was a false belief connected with one of the special senses. Probably all false mental processes connected with sensation had a physical origin—that is, the organ connected with the sense perception was not functioning properly or its physical nervous mechanism was deranged. Peripheral neuritis might cause the common hallucination of 'feeling electrical currents', the hallucination of poisoning might derive from an alteration in the sense of taste. Frequently associated with carious teeth, and that of internal growths from some failure in the normal rhythm of peristalsis. Delusions or false ideas which could not be shaken were not only subjective facts to be used in a certificate but represented a condition which could seldom be dispelled except by treatment in a mental hospital. They must not be confounded with obsessions, or false ideas which the patient knew to be such, but could not force out of his mind. Obsessions were not indicative of a psychosis and should not be used alone as a statement in a certificate. The delusion of the paranoid, in which the patient generally supposed himself to be persecuted, was one of the gravest of mental disorders—dangerous to the public and difficult to treat. The delusion was of slow

formation, and while the patient imagined various secret plottings against himself he remained otherwise sensible. If this false idea was attached in the mind of the patient to any particular person, that person stood in great danger. Fortunately, these cases were comparatively rare, but it recognized they should be certified.

Dr Good concluded by saying that the study of mental disorders was a branch of medicine which had been and was ill taught. Every medical man derided these cases and with good reason if he had never as a student been made familiar with their commonest symptoms. The first case he had to deal with was a nightmare to the young practitioner, he was afraid of doing something against the patient's interest and against the law. Until medical men insisted on the law recognition, that the treatment of mental symptoms was the treatment of illness, and often curable they would be hampered by the bogey of certification. At the same time if they were to treat and understand the problem of mental illness they must educate first themselves and then the public, and only by such a course would they free themselves from the fear of legal penalty and public blame.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD

BIRMINGHAM BRANCH, NUNEATON AND TAMWORTH DIVISION—A meeting of the Nuneaton and Tamworth Division will be held at the Nuneaton General Hospital on Wednesday, November 18th at 5.30 p.m. when Mr H. Beckwith Whitehouse, M.S. (I.R.C.) will give an address entitled 'Notes from ante natal clinic.'

GLASGOW AND WEST OF SCOTLAND BRANCH—A clinical meeting for members of the Glasgow and West of Scotland Branch will take place in the Royal Hospital for Sick Children, 101 Hill, Glasgow, on November 18th, at 3 p.m. when surgical and medical cases will be demonstrated by members of the hospital staff. The annual dinner of the Branch will be held on the same evening at 6.30 for 7 p.m. in Ferguson and Forrester's Restaurant, 36 Buchanan Street, Glasgow.

LANCASHIRE AND CHESHIRE BRANCH, HYDE DIVISION—The following programme of meetings of the Hyde Division has been arranged for the session 1952-56: Friday, November 13th, 8.30 p.m.—Supper dansant in Hyde Town Hall. Thursday, November 26th, 8.30 p.m.—Scientific address in Hyde Town Hall by Dr C. J. Bond, C.M.G. Vitamins from the medical and public health point of view (illustrated by lantern slides). January 1956—Social function (to be arranged). Thursday, January (exact date to be arranged) at 8.30 p.m.—Medico-legal address by His Honour Judge E. O. Burgess in Dukinfield Town Hall. Friday, February 26th, 8.30 p.m.—Scientific address by Mr John Morley, M.Ch. (I.R.C.S.) in Stralybridge Town Hall. Thursday, March 18th, 8.30 p.m.—Medico-political address by Dr L. J. Pictou, O.B.E. in Hyde Town Hall. Thursday, May 20th, 11 a.m.—Picnic to Bakewell, Chatsworth, and Buxton, meet at Mottram Moor. Thursday, June (exact date to be arranged) at 4 p.m.—Annual meeting in Hyde Town Hall. A hearty invitation is extended for all meetings to the members of neighbouring Divisions.

METROPOLITAN COUNTIES BRANCH, CITY DIVISION—In conjunction with the Aesculapian Society there will be a clinical afternoon at the Metropolitan Hospital, Kingsland Road, to day (Friday, November 13th) at 4.15 p.m. when Mr R. A. Ramsey, F.R.C.S., surgeon to the hospital, will show cases with notes. Tea at 4. Members are invited to show cases at any meeting. A meeting of the Division will be held at the Metropolitan Hospital, Kingsland Road, E., on Tuesday, December 1st at 9.30 p.m. when Mr Comyns Berkeley will speak on the treatment of cataracts. The annual dinner of the Division will take place at the Holborn Restaurant on Thursday, December 3rd at 7.15 for 7.30 p.m.

METROPOLITAN COUNTIES BRANCH, LEWISHAM DIVISION—A meeting of the Lewisham Division will be held on Tuesday, November 17th at 8.45 p.m. at the Parish Room, St. Laurence Vicarage, Bromley Road, Catford, when Dr R. Godwin Chase will occupy the chair. Agenda: Questions arising from the Insurance Acts; address on the relationship between the voluntary hospitals and the general medical practitioner by Dr Herbert I. Eason, C.B., C.M.G., medical superintendent of Guy's Hospital.

METROPOLITAN COUNTIES BRANCH, SOUTH WEST ESSEX DIVISION—A meeting of the South West Essex Division will be held at the Wesleyan Schoolrooms, High Road, Leyton, on Tuesday, December 1st at 3.30 p.m., when Dr M. A. Culpin will read a paper on the handling of nervous patients.

METROPOLITAN COUNTIES BRANCH, WESTMINSTER AND HOLBORN DIVISION—A social evening will be held by the Westminster and Holborn Division on Thursday, November 26th at the British Medical Association House, Pavilions Square, W.C.1. Members and their friends will be received at 8.30 p.m. by the chairman, Dr Redmond Roche. Ladies will be welcomed. At 9 p.m. Prof. G. Elliot Smith, F.R.S., will read a short paper on 'The left handed lady of Lloyd's.' It is hoped that all members will take this opportunity of visiting the new headquarters, the success of the evening depends on a large attendance. Members and their friends from invited music light refreshments, dancing for a number and guest may be had free on morris secretary (Dr P. I. Stuart Webb, Mayfair, W.1) further tickets may be had for 2. 6d each and remittance must accompany application.

Meetings of Branches and Divisions.

METROPOLITAN COUNTIES BRANCH WILLESDEN DIVISION—The clinical meeting arranged for November 19th at the Isolation Hospital has been postponed owing to the death of Dr Stewart. The second annual dinner of the Division will be held at the Criterion Restaurant, Piccadilly, on Sunday, November 15th, when Lieut Colonel Kirkpatrick, I.M.S. (ret.), will preside. Reception at 7 p.m. dinner 7.30. Principal guests: Dr H.B. Brackenbury and Mr G.J. Furness, chairman Willesden General Hospital. Any member of the Association will be welcomed and may bring a friend. Tickets 10s. each (exclusive of wine), may be had from Dr W. Lock, 45 Church Road, N.W. 10.

MIDLAND BRANCH CHESTERFIELD DIVISION—A meeting of the Chesterfield Division will be held at the Maternity Hospital, Chesterfield, to-day (Friday, November 13th) at 8.15 p.m., when a discussion on small pox will be opened by Dr Garrow. Tea and coffee will be served at 8. A meeting will also be held at the Maternity Hospital on Friday, December 11th at 8.15 p.m., when Dr J.S.C. Douglas, Professor of Pathology, University of Sheffield, will give an address on passive immunity. Tea and coffee at 8.

NORTH OF ENGLAND BRANCH NORTH NORTHUMBERLAND DIVISION—The annual dinner of the North Northumberland Division will be held in the Plough Hotel, Alnwick, on Friday, November 20th at 6.30 for 7 p.m., tickets 10s. 6d. each (exclusive of wine). Members intending to be present are asked to notify the honorary secretary not later than November 16th, and to enclose a remittance for their own and their guests' tickets. Evening dress.

SOUTH WALES AND MONMOUTHSHIRE BRANCH CARDIFF DIVISION—The following Divisional programme for the winter 1925-26, has been arranged—December 2nd—Dinner and dance in Cox's Rooms, Cardiff. The guests will include the Lord Mayor (Alderman W.B. Francis), Sir William Diamond, Dr H.B. Brackenbury, and others. Dr Brackenbury (chairman of the Representative Body of the Association) will give an address at 3.30 p.m. on the same day, in the Engineers' Institute, Park Place, Cardiff, on theory and practice in British Medical Association policy. Further particulars will be circulated. December 16th—Lecture by Dr J. Stanley White (London) on recent advances in endocrine therapy, in the Engineers' Institute, Cardiff illustrated by lantern slides. January 20th 1926—Clinical meeting in the Medical Unit Lecture Room, Cardiff Royal Infirmary, short papers and clinical cases. February 17th—Continued meeting with the Cardiff Law Society at 8 p.m. in the Park Hotel. This subject—one of medico-legal interest to all practitioners—will be announced later.

SOUTH WALES AND MONMOUTHSHIRE BRANCH SWANSEA DIVISION—A meeting of the Swansea Division will be held at the General Hospital, Swansea, on Thursday, November 19th, at 8.15 p.m., when Dr White will speak on some general aspects of gland therapy.

SUFFOLK BRANCH SOUTH SUFFOLK DIVISION—A meeting of the South Suffolk Division will be held to-day (Friday, November 13th), at 3.30 p.m. at the Crown and Anchor Hotel, Ipswich. Dr Hugh Thimsheld, I.R.C.P. (Physician St. Bartholomew's Hospital), will give a lecture on the treatment of rickets considered in light of recent work.

SURREY BRANCH CROYDON DIVISION—The next meeting of the Croydon Division will be held at the Queen's Hotel, Upper Norwood, on Thursday, November 19th, at 4 p.m. An address will be given by Dr J. Bright Banister, entitled "Some obstetric emergencies."

SURREY BRANCH KINGSTON ON THAMES DIVISION—The annual dinner of the Kingston on Thames Division will be held at Nuthall's Restaurant, Kingston, on Wednesday, November 18th at 7.30 for 8 p.m. Charge 7s. 6d. (exclusive of wine), to be paid at the restaurant. The guests will be Mr F.G. Penny, M.P. and Mr G.D. Densham, Mayor of Kingston. Medical guests of members will be welcome. There will be a short musical programme.

WILTSHIRE BRANCH TROWBRIDGE DIVISION—The Trowbridge Division will hold a dinner at the Bear Hotel, Devizes, on Wednesday, December 2nd, at 7.15 for 7.30 p.m., after which Mr Cecil Terry will read a paper on some minor points in surgery. The price of the dinner, exclusive of wine, is 10s. 6d., and members intending to be present are requested to notify Dr D. Leigh Spence (The Limes, Melksham) by the first post on Saturday, November 28th. As this is the first dinner held by the Division for many years it is hoped that all members will make a special effort to attend. Non-members in the Devizes area are cordially invited.

YORKSHIRE BRANCH DENSBUARY DIVISION—A meeting of the Densbury Division will be held at the Man and Saddle Restaurant, Densbury, on Tuesday, December 1st. Dr Burrows (Leeds) will read a paper on referred pain from a diagnostic standpoint. Supper will be provided at 8.15 p.m. Members from neighbouring Divisions will be welcomed.

YORKSHIRE BRANCH HALIFAX DIVISION—A general meeting of the Halifax Division will be held in the Board Room of the Royal Infirmary, on Wednesday, November 18th at 8.30 p.m. Professor M.J. Stewart will give a lantern talk on gastric ulcer and cancer.

YORKSHIRE BRANCH Huddersfield DIVISION—The medical dance will be held on Wednesday, December 16th, in the Royal Infirmary, from 9 p.m. to 1 a.m. Reception commencing at 9.15 will be wish to dance. A bridge drive admission by programme. As the arranged Tickets 8s. 6d. each (sufficient number of tickets are sold, dance will only be held if a sufficient number of members will inform the committee if members wish to assist the number of tickets required.

YORKSHIRE BRANCH ROTHERHAM DIVISION—The annual dinner of the Rotherham Division will be held under the auspices of the Rotherham Division at the Crown Hotel, Rotherham, on Friday

November 20th, at 7.15 for 7.30 p.m. Price of tickets 15s. exclusive of wine. Members are requested to notify the honorary secretary regarding tickets not later than November 13th.

YORKSHIRE BRANCH SHEFFIELD DIVISION—A meeting of the Sheffield Division will be held in the General Lecture Room, The University, Sheffield, on Friday, December 11th, at 8.30 p.m. when a British Medical Association Lecture will be given by Dr Cramer on the new outlook on cancer. Non-members will be welcomed.

Meetings of Branches and Divisions.

METROPOLITAN COUNTIES BRANCH CITY DIVISION
A MEETING of the City Division was held at St. Bartholomew's Hospital on November 3rd, when Professor JOHN FRASER of Edinburgh gave a very interesting lecture on sympathetic disturbance of the abdominal viscera in relation to surgery. Several members of the hospital staff and more than a hundred medical students attended, and this occasion, which was notable as being one of the first Divisional meetings in London to be attended by a large number of students proved to be a very great success. Dr CLARK TROTTER, medical officer of health for Islington and chairman of the Division, contributed an excellent introductory speech and the dean of the Medical College, Dr T.W. STORE, extended a cordial welcome to Professor Fraser. In the course of the meeting the great advantages associated with membership of the British Medical Association were emphasized, the claims of the benevolent funds were urged, and the importance of every practitioner obtaining medical protection was insisted upon. A vote of thanks to the lecturer was proposed by Prof. or G.E. GASK.

NORTHERN COUNTIES OF SCOTLAND BRANCH
A MEETING of the Northern Counties of Scotland Branch was held in the Columbia Hotel, Inverness, on October 30th, when Dr CAMPBELL, President, was in the chair. Dr LEONARD FRIDLEY of Glasgow delivered a British Medical Association Lecture on infant feeding. The lecture was listened to with much appreciation by about fifty members, and at the close the lecture was accorded a very hearty vote of thanks. After the lecture the members, along with the following as guests (Dr William Mackay, Dr Dreyer and the B.M.A. Lecture), Smith Mr Kyle Mackintosh, Dr Dreyer and the B.M.A. Lecture), dined together. Dr J. Munro Moir was also a guest of the Branch on this occasion.

Presentation to Dr Munro Moir
The 101st of The King, Patron of the British Medical Association, having been duly honoured, the CHAIRMAN, in making a presentation to Dr Munro Moir said he had a pleasant duty to perform in being the spokesman of so many of the practitioners of the North who desired that night to express their gratitude to Dr Moir for all the work he had done for them for so many years. The ready response to the appeal in connection with the testimonial showed how widespread that gratitude was. It was to Dr Moir that the Association owed its strong position in the North of Scotland. In presenting Dr Moir with his portrait illuminated address, and a cheque he hoped Dr Moir would realize how much they appreciated his sacrifice of so many hours in a busy life to the professional welfare of the chairman then called upon the company to pledge the health and happiness of Dr Munro Moir which was duly honoured. Dr Moir in reply thanked the members for their kindness, and expressed the pleasure afforded to him by the work he had been able to do for the Branch. Dr WILLIAM MACKAY, the Rev. DONALD MACLEOD, Dr DREYER, and Dr FRIDLEY also spoke regarding Dr Moir's sterling qualities and the great work he had done on behalf of the profession in the North. The portrait illuminated address was much admired by the assembly. The illuminated address incorporating the badge of the British Medical Association and a view of Inverness, was worded as follows:

We the undersigned, on behalf of the Members of the Northern Counties of Scotland Branch of the British Medical Association in presenting you with this Address Portrait and Cheque desire to acknowledge your devoted service to the medical profession in the North during the last thirty three years.

For over twenty five years you have acted as Honorary Secretary of this Branch and we beg to assure you that your faithful and untiring work on our behalf has been deeply appreciated. It is largely owing to your tact, sagacity and enthusiasm that the British Medical Association occupies the influential position that it does in the Northern Counties of Scotland.

A Member of the British Medical Association for over forty even years you have been a Member of Council, a Representative of this Branch on the Representative Body, a Member of the Scottish Committee, a Member of the Organization Journal and Medico-Political Committee, Vice President of the Section of Medical Sociology, Chairman of the Inverness Division and on two occasions President of this Branch. In all the above capacities you displayed the great qualities of vigorous common sense and a high sense of duty which rendered your service so valuable.

Next June (1926) you will complete fifty years practice of your profession and we beg to offer you our warmest congratulations on the near approach of the completion of this long period of professional

life during which you have honourably upheld the dignity and interests of our profession

We wish you all happiness and contentment in looking backward on a busy and useful professional life beloved by your patients and esteemed by your colleagues

(Signed) D C CAMPBELL President
E H MACKENZIE President Elect
J B SIMPSON Representative for
Caithness and Sutherland
D MACFADYEN, Secretary

Inverness, October 30th 1925

ABERDEEN BRANCH

A GENERAL meeting of the Aberdeen Branch was held in the Palace Hotel, Aberdeen on October 30th. In the absence of the President and President Elect, Dr RORIE (Cults) was elected to the chair.

The Branch Council's report was read and approved and a financial statement was submitted showing a credit balance of £28 13s 8d. Dr HOWIE and Mr COLE were appointed to audit the accounts. Forty four new members were admitted during the year. The following officers were elected for 1925-26:

President Dr D WAT on Geddie (Aberdeen) President Elect Dr J F SKINNER (Shene) Honorary Treasurer Dr JOHN LEVACK (Aberdeen) Honorary Secretaries Dr T FRASER (Aberdeen) Mr F K SMITH (Aberdeen)

A lively discussion took place with regard to the present condition of both the Branch and Division. The hope was expressed that a wider and deeper interest in the affairs of the Association might be taken at other times than those during which the financial interests of members were at stake and various proposals were put forward for the Branch Council's consideration. Dr CHARLES LORDES brought forward the question of post graduate teaching during the summer vacation as proposed by the Association and the SECRETARY stated that this matter was under consideration by the Branch Council, and also by another body.

A vote of thanks to the chairman closed an animated gathering and thereafter the members present dined together in the hotel and spent an interesting and enjoyable social evening.

BIRMINGHAM BRANCH BROMSGROVE DIVISION

The first clinical meeting of the winter session of the Bromsgrove Division was held at the Smallwood Hospital, Redditch, on November 5th when Dr R DOUGLAS WILKINSON (Birmingham) read a paper on the use of insulin in private practice. The paper was thoroughly enjoyed by all. Non members of the Association were invited to the meeting.

BIRMINGHAM BRANCH DUDLEY DIVISION

The annual meeting and dinner of the Dudley Division took place at the Saracen's Head Hotel, Dudley, on October 29th.

All the retiring officers were re-elected.

Chairman Dr F M TIBBETTS Vice Chairman Dr G J DUDLEY OBE Honorary Secretary Dr L D ROBERTS

Dr G K GIFFORD in a very humorous speech, proposed the toast of prosperity to the British Medical Association.

Dr G C ANDERSON (Deputy Medical Secretary), responding, apologized for the absence of Dr COX, Medical Secretary who was due to start the following morning on a six months tour of South Africa. He announced that the membership of the British Medical Association had reached the record figure of 30,400. They were all proud, he was sure of the magnificent new Association buildings in Tavistock Square which had been recently opened by His Majesty the King. The Association was recognized by Government departments as representing the medical profession and they now consulted the Association before imposing any new regulation on the profession. The Council of the Association was actively engaged in considering the very important question of post graduate education in the kingdom with London as a centre. Locum tenens bureaux were in course of organization for the benefit of its members in fact bureaux were already in being in some areas. The Association was mainly responsible for the present satisfactory state of national health insurance. Every insurance practitioner in the country owed a debt of gratitude to Dr H B BLACKBURN, whose untiring exertions brought the recent negotiations to such a successful issue. The Royal Commission would probably issue its report towards the end of the year but he (Dr Anderson) did not think that any very drastic changes would be imposed, at any rate as far as medical benefit was concerned.

Mr A W NUTTALL, F.R.C.S. (President of the Birmingham Branch), spoke of the enormous amount of voluntary work which was being done often at the expense of their own practices by the members of the Council. In addition to the Council meetings there were committee meetings almost every day, entailing journeys to London from most distant towns. He also reviewed the work done by the permanent officers, the Medical Secretary, his deputy whom they welcomed among them that evening, and the Assistant Medical Secretaries.

Dr MICHAEL BREZICH, and all too briefly proposed the health of the visitors. This toast was responded to by Dr RIDLEY BAILEY who in eloquent phrases pointed out that the power of the Association was derived from its high moral force and pleaded that whatever advances were made the importance of maintaining this character should be paramount.

CAMBRIDGE AND HUNTINGDON BRANCH ISLE OF ELY DIVISION

The first annual dinner of the Isle of Ely Division together with the Isle of Ely Panel and Local Medical Committees was held at the Griffin Hotel, March, on October 27th. Dr C E STEPPENS, chairman of the local Division of the British Medical Association presided and a very enjoyable evening was spent. After the toast of The King had been duly honoured Sir WILLIAM CLARKE

chairman of the county council proposed that of "The British Medical Association" which was acknowledged by Dr ALFRED COX OBE, the Medical Secretary. Dr P A HENNLEY proposed that of "The Isle of Ely Insurance Committee" to which the Rev S S WALTON replied. The toast of "Our Guests" proposed by Dr ARTHUR PAIV, was acknowledged by Major H H LITTLE for Sir H LUCAS TOOTH, Bt, M.P. The final toast of the evening "The Chairman," was proposed by the Rev R B HILL to which Dr STEPHENS replied. During the evening songs were rendered by Drs A G S WATERS and G H LUCAS and Dr PLYTON WALKER gave a humorous medical recitation.

MIDLAND BRANCH LEICESTER AND RUTLAND DIVISION

A MEETING of the Leicester and Rutland Division attended by 84 members, was held at the Medical Club, Leicester, on November 4th when a lantern demonstration was given by Mr H D GILLIES C.B.E. F.R.C.S., on developments of plastic surgery. The results shown on the screen were received with frequent applause and the lecturer was warmly thanked for one of the most interesting addresses delivered to the Division for a long time past.

NORTH OF ENGLAND BRANCH NORTH NORTHUMBERLAND DIVISION

A MEETING of the North Northumberland Division was held on October 29th in Berwick Infirmary presided over by Dr Iulton of Wooler. After the business had been transacted an exceedingly interesting address was given by Sir DAVID DRUMMOND D.C.L. M.D., Past President of the Association, on our mistakes in diagnosis and how and why we make them. At the conclusion of the address a hearty vote of thanks was on the motion of Dr SCOTT PURVES, accorded to Sir David Drummond. Tea was kindly provided by the matron of the Infirmary at the close of the proceedings.

SHROPSHIRE AND MID WALES BRANCH

The fiftieth annual general meeting of the Shropshire and Mid Wales Branch was held at the Royal Salop Infirmary on October 27th. Dr J WHEATLEY, medical officer of health for the county of Salop having been installed in the presidential chair read a most arresting paper on the future of public health work and of the general practitioner. He stressed the importance of public education in hygiene and the improvement of housing, sanitation and the supply of fresh air in the prevention and removal of disease, pointing out that the methods used in the extermination of any particular disease were of more importance than the mere fact of extermination. It would be said have been a national calamity for instance if the prophylactic inoculation for typhoid had preceded the discovery that improved sanitation was the primo need. In the matter of tuberculosis too general hygienic measures would tend to stamp out not only this disease but many others whereas tuberculin and other cures merely aimed at the disease itself and left the community no better off in other respects. The prevention and treatment of disease, both from the public health and general practitioner viewpoints must be based on physiology and the physiologist would have to be far more exploited in the future than he had been in the past.

The annual dinner was subsequently held at the Raven Hotel, Shrewsbury when members and guests to the number of eighty sat down. It proved one of the most successful and enjoyable in the history of the Branch. The principal guests were the Archdeacon of Salop (the Hon H E S Lambart) the Headmaster of Shrewsbury School (Canon H A P Sawyer) and Admiral Sir Cecil Thursby, K.C.M.G.

SOUTH MIDLAND BRANCH

The autumn meeting of the South Midland Branch was held at the Northampton General Hospital on October 29th. Dr I S Lloyd nominated by the Branch Council as President Elect was elected unanimously.

Mr GIFFORD NASH F.R.C.S. read a paper on modern treatment of appendicitis with special reference to when to operate. He made it clear that this paper arose out of that read by Sir James Berry at the Annual Meeting. He gave a great mass of statistics showing that immediate operation had a lower mortality than a policy of wait and see. He then gave some striking private statistics of his own, showing that appendicitis was far more common in the last ten years than in the twenty years previously. His own private statistics now showed 304 consecutive cases of appendicitis without a death.

Eight members took part in the subsequent discussion all were unanimous in concurring that a policy of immediate operation was the correct one except in a few very special cases. Several members pointed out that a policy of wait and see threw a greatly increased responsibility on the surgeon. Mr Gifford Nash replied. During a twenty minutes interval tea was provided by the Honorary Secretary.

Mr HOLMES subsequently read a paper introducing a discussion on carcinoma of the colon bringing forward several points on which he wished for the opinion of the meeting. Among these were "Is it ever worth while to do a local incision in carcinoma of the rectum?" "Is colotomy worth while when the patient is not really obstructed?" "To make it worth while an operation must not only prolong life but increase comfort." He gave a summary of the symptoms of carcinoma of the colon and pointed out that there was some danger in the use of the sigmoidoscope. He discussed the treatment, and gave details of 26 cases of his own.

Dr ROBSON described the methods of examination by x rays. The method he advocated was screen examination of an opaque enema. He emphasized the need for preparation by emptying the large bowel and requested members to send their patients up prepared if they wished for an immediate examination.

Drs. GREENFIELD and ROUGHTON then spoke giving several additional suggestions for after treatment. Five other members also spoke, and Mr. NORMAN replied.

SOUTHERN BRANCH, PORTSMOUTH DIVISION

The opening meeting of the Portsmouth Division winter session was held at the Queen's Hotel, Southsea, on November 5th. A feature of the meeting was the presentation of British Medical Association badges to the chairman and honorary secretary of the Division by Dr. LOCHART STEWART, honorary secretary of the Southern Branch. It was decided to present a flag from Portsmouth to hang in the Great Hall at headquarters. After the business there followed an interesting discussion opened by Dr. JAMES McCURION on the early diagnosis of neuro-infectious diseases. This was one of the most successful Divisional meetings held at Portsmouth. It was attended by about seventy members, of whom fifty sat down at the supper which preceded it.

YORKSHIRE BRANCH, SHEFFIELD DIVISION

A MEETING of the Sheffield Division called to receive the representative report of the Annual Meeting at Bath, was held on October 30th, the chairman of the Division, Dr. A. C. TURNER, presided.

Dr. A. LOEBES said that the Council had recommended that it would be a good thing if the chairman and secretaries of Divisions had badges of office and as senior amongst the ex-chairmen of the Sheffield Division it gave him great pleasure to present badges to the chairman and secretary. He then invested the chairman and secretary with badges of the pattern described in the Supplement of September 26th. Proceeding to give his report as representative at the 1925 Annual Representative Meeting Dr. LOEBES said it was not necessary to enter into much detail as nothing very controversial had been dealt with. Of medico-political matters coroners' law and death certification was perhaps the most important, and on this there had been a good deal of difference of opinion at the meeting, but ultimately the recommendations of the Council were carried. Some points connected with the Dangerous Drugs Acts and drug addiction were brought up at the meeting, and the results of an interesting questionnaire on this subject were reported. It was felt that it would be well if it became a generally accepted practice with medical men having the care of cases of drug addiction to share the responsibility by calling in a colleague in consultation. The question of a special tribunal to consider cases of men accused of offences under the Dangerous Drugs Acts had also been discussed. On the subject of public health appointments it was evident at the meeting that in some parts of the country there was a good deal of feeling that £500 was rather more than they could afford to pay a newly qualified person. A recommendation was carried that it should be in order to appoint junior officers to commence at the lower salary of £500 per annum who had not had the three years' experience contemplated in fixing the higher scale. On the question of hospital policy—a hardy annual—the important clause relating to "services rendered or to be rendered" was this year carried by a large majority, so that on this point the policy of the Association was now definitely settled. This did not mean that there was any intention of enforcing this policy in places where the hospital staff themselves did not desire it, but that when the local hospital staff should endeavour to enforce it they could rely on any support the Association could give them. In conclusion, Dr. LOEBES said he had been specially impressed at this meeting by the discussion in regard to the setting up of a medical benefit fund within the British Medical Association. It was pointed out that the present state of affairs was the reverse of creditable, a very small percentage of the profession subscribed to the two existing medical benefit funds. A committee had been appointed to take steps for improving the position.

Mr. C. W. SMITH (Dr. LOEBES's co-representative) said that individual medical defence was the subject which excited most interest at the meeting. The Sheffield representatives had been instructed to vote against the Association undertaking individual defence. Numerous arguments were brought forward on both sides. After a long discussion a Cardiff amendment which opposed the Association undertaking individual defence was carried by 97 votes against 72 the voting being much the same as last year. One point of special interest to Sheffield in regard to the recruiting of new members was that four towns were mentioned, with the names of their secretaries, where specially good work had been done—namely Newcastle, Glasgow, Liverpool, and Sheffield. Perhaps the most important point with regard to National Health Insurance was that the ophthalmic benefit scheme had been established, which commenced in July last. 600 ophthalmic surgeons had intimated their willingness to co-operate in the scheme. It was proposed at the meeting that a separate medical journal should be published dealing with ophthalmic diseases; this was carried and the new periodical would appear in due course. In conclusion Mr. SMITH spoke very warmly of the hospitality shown by the members of the Association at Bath, everything possible had been done to give the representatives a good time. The trip to Stonehenge was one of the best in which he had ever joined.

Mr. CARRER said it was by no means the first time that the Division had had to thank Dr. LOEBES for serving as its representative. Attendance at the Representative Meeting involved more strenuous work than was commonly supposed. He had very much pleasure in proposing a hearty vote of thanks to Drs. LOEBES and SMITH. This was seconded by Dr. LOEBES and carried most cordially. Dr. LOEBES in reply endorsed Dr. SMITH's words of appreciation of the hospitality shown them at Bath. Lastly on the proposal of the CHAIRMAN a vote of thanks to Dr. LOEBES for his generous invitation to the badges of office to the Division was very heartily carried.

National Insurance

THE ROYAL COMMISSION

THE forty-fourth meeting of the Royal Commission on National Health Insurance was held at the Home Office, Whitehall, on November 5th and 6th, Lord LAWRENCE of Kingsgate, and later Sir ARTHUR WOLLEY, in the chair. Evidence was given by Sir WILLIAM Glyn Jones as to the powers and duties of Insurance Committees and the limited field of work open to them under the conditions of the insurance scheme as it has now developed. Thereafter the Commission sat in private to review the evidence which has been received since it began its work and to consider the questions arising therefrom.

INSURANCE ACTS COMMITTEE AND SCOTTISH SUBCOMMITTEE

LECTION OF DIRECT REPRESENTATIVES

THE following have been elected as direct representatives of Local Medical and Panel Committees on the Insurance Acts Committee and its Scottish Subcommittee for the session 1925-26.

Insurance Acts Committee

Group "A"—Dr. C. L. Douglas (Cupar, Fife) and Dr. J. G. McCutcheon (Glasgow).

Group "B"—Dr. R. H. Dix (Sunderland).

Group "C"—Dr. G. B. Hillman, M.B. (Wakefield), and Dr. G. H. Sedgwick (Thrybergh, nr. Rotherham).

Group "D"—Dr. R. G. McCowan (Manchester), Dr. H. I. Oldham, M.B. (Morecambe), and Dr. T. Miller Wilson (Liverpool).

Group "E"—Dr. I. G. Davies (Wrexham) and Dr. W. L. Thomas (Cardiff Rhondda).

Group "F"—Dr. C. I. Palmer (Mansfield Woodhouse Notts).

Group "G"—Dr. T. Ruddy Bailey (Bilston, Staffs).

Group "H"—Mr. L. Lewis Lacey, I.R.C.S. (Leicester).

Group "I"—Dr. John Steed (Hereford).

Group "J"—Dr. D. G. Greenfield (Rushden, Northants).

Group "K"—Dr. J. P. Williams Freeman (Amidover, Hants).

Group "L"—Dr. H. C. Jones (Barnstable).

Group "M"—Dr. J. J. Day (Canterbury) and Dr. E. R. Iothergill (Hove).

Group "N"—Dr. C. H. Panting (Leyton) and Dr. H. Rose (Wendover, Bucks).

Group "O"—Dr. H. J. Cardale (London) and Dr. E. A. Gregg (London).

Insurance Acts Subcommittee (Scotland)

By County Local Committees—Dr. R. Bruce DSO (Gulls, Aberdeen-shire), Dr. D. E. Dickson (Guelphilly, Liffelshire), Dr. J. W. Little (Newmans, Lanarkshire), and Dr. W. R. Martine (Weston, Haddington).

By Single Panel Committees—Dr. W. Lawson (Glasgow), Dr. G. W. Miller, DSO (Dundee), Dr. John Orr (Edinburgh), and Dr. James Todd (Glasgow).

Correspondence

The Cheshire Motion at the Panel Conference

SIR,—When I wrote my letter (SUPPLEMENT, October 31st, p. 159) I had not before me the report of Dr. Brudenbury's speech, much of which, owing to the fact that I was near the back of the hall when he commenced, I appear to have missed. I should like to comment upon that portion.

Dr. Brudenbury is in error in stating that the Memorandum produces something "better than the simple proposition involved in the Cheshire motion." On the contrary, the Cheshire motion was and is an addition to that Memorandum, it accepts the whole of the suggestions contained therein but adds also something which experience has shown to be absolutely necessary. It is clear that the Memorandum was prepared under the influence of the Lancashire fine case, and that the practice since exhibited by the Minister of supporting accusations of negligence calculated to ruin doctors completely, yet imposing fines so moderate as to defy appeal on the score of excessive penalty, was not foreseen except by Cheshire.

The sole difference between the Cheshire policy and that of the Memorandum is that the former allows defence against such action and the latter does not. The one allows the doctor to defend his honour and reputation as well as his pocket, the other his pocket alone. I contend that the Cheshire policy will appeal to Parliament and the public, while the other will not only fail so to do, but be ruinous to our reputation—I am, etc.,

Manchester, Nov. 8th

G. C. GUNNITT

Naval and Military Appointments

ROYAL NAVAL MEDICAL SERVICE

SURGEON LIEUTENANT I. P. SPERO (R.N.A.R.) has entered as Surgeon Lieutenant R.N., and appointed to R.N. Hospital, Haslar for course

ADMINISTRATION OF MEDICAL BENEFIT

A MEETING of the London Centre of the Faculty of Insurance was held on October 26th, when Mr H LESSER, LL.B., occupied the chair, and Mr C W FOLLOWS, clerk of the Brighton Insurance Committee, gave an address on the administration of medical benefit.

Mr FOLLOWS said it would be impossible for him to deal fully with such a vast subject in the brief time at his disposal and he would therefore touch on one or two of the most important points principally those concerned with practical administration. The early difficulties of compiling medical lists were immense but to-day they had an adequate medical list in every area in spite of almost daily changes. They had withdrawals and they had a large number of admissions. Any doctor registered by the General Medical Council had a statutory right to apply to be placed on the medical list if he accepted the terms of service providing that he had not been removed from the medical list of any other area by the Ministry of Health upon a representation that his continuance on the list would be prejudicial to the interests of insured persons. They had no option but to place every doctor so qualified on the medical list on application and after that if they had any reason to believe that his continuance would be prejudicial steps for his removal had to be taken in accordance with the Regulations. With regard to surgery hours and surgery accommodation the question of accommodation could only be dealt with by somebody on the spot as the type of accommodation varied according to the neighbourhood. Surgery hours also had to be determined by local conditions but he considered, in the interests of the insured persons, the shorter the surgery hours the better so as to leave the doctor the maximum amount of time for visiting. Among other items to be dealt with were the questions of registers and the method of dealing with entry slips exit forms transfer of society and change of name upon marriage. The Index Register was not intended to be an index of the actual insured population in a given area but was really a register of the insured persons who entered insurance in that area or who chose a doctor on removal to that area and had not subsequently chosen a doctor in another area. Originally it was intended to be a register of the actual insured population but it was found impossible to keep a note of all the removals and societies ceased to send the removal slips notifying change of address so that it was not now attempted to get the actual insured population at any time resident in a given area. The register was also a combination of a register and ledger account upon which all the 'credits' to Insurance Committees for the purposes of medical benefit were based.

Mr FOLLOWS then explained how medical cards were issued to insured persons and the subsequent procedure. He also dealt with the medical practitioners' responsibility towards insured persons not on his list to temporary residents and to travellers. With regard to payments each quarter the Insurance Committee advised the doctor of the numbers on his list at the beginning of the previous quarter plus his acceptances less his removals, and it was on the basis of the number at the commencement of the quarter that the doctor received payment so that the Insurance Committee had ample time in which to prepare the doctor's payment. The doctor had ten days to raise any question in regard to the number credited to him and if he did not dispute it in that time he could not raise the matter afterwards. With regard to the general financial settlements there were two during the year—a provisional and a final one. The Ministry made a provisional credit at the beginning of the year, and at the end

a final one, but the principle of the distribution was the same throughout. The money was first of all credited to the Central Practitioners' Fund by the Ministry and that fund was constituted on a basis of 9s a head. The distribution of the money between Insurance Committees was made by the Minister after receiving a report from the Distribution Committee which was set up to satisfy certain interests. The basis of the issue of the funds was the register figure of the Insurance Committee, taken every quarter. That figure, however, had to be adjusted—it had to be either loaded or reduced in respect of temporary residents attended in the area as compared with those attended in other areas, or any other relevant circumstances—and when the final adjustment was made the amount payable to any Insurance Committee was the same proportion of the fund as the ratio of that Committee's units to the total units of all Committees. The Insurance Committee had to divide its local pool amongst the medical practitioners and this was done quarterly. Various adjustments however had to be made—such as the amount allowed for Prel Committee expenses, payment for services rendered by any anaesthetist and any expenses incurred for emergency treatment—and after those deductions had been made the pool was divisible among the doctors for the quarter *pro rata*, so that it was not intended to be 9s on any given amount per head. Doctors with 'limited lists' also had to have a deduction, which was from 2 per cent because they did not share in the responsibility of the treatment of those persons not on a doctor's list as the other doctors did. The 'limited lists' were generally those of resident medical officers in institutions. Deductions had also to be made from the ascertained figure in respect of fees paid by insured persons by way of deposit. After explaining how medical practitioners were remunerated under the Manchester and Salford Schemes (which were the great exceptions to the capitation basis of payment) Mr FOLLOWS concluded his address by saying that he had sufficiently indicated the tremendous amount of work involved in the administration of medical benefit, though he had been able only to touch the fringe of the subject, there was not time to deal with mileage institutions, special arrangements, medicines medical records, service subcommittees representations or title to benefit.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD

BIRMINGHAM BRANCH COVENTRY DIVISION—A meeting of the Coventry Division will be held at the Coventry and Warwickshire Hospital on Tuesday, December 1st, at 8.30 p.m. Dr. Heaf will read a paper on the use of sanocrysin.

BIRMINGHAM BRANCH NUNEATON AND TAMWORTH DIVISION—A meeting of the Nuneaton and Tamworth Division will be held at the Tamworth General Hospital on Thursday, December 17th, when Dr. A. P. Thomson will read a paper on the rheumatic state in childhood.

KENT BRANCH ISLE OF THANET DIVISION—The next meeting of the Isle of Thanet Division will be held on Thursday, November 26th, at 4 p.m. at the Princess Mary's Hospital, Margate, when Dr. Hugh Raven will take the chair. Dr. H. O. West (the medical superintendent) will speak on some present methods of treatment of surgical tuberculosis. Tea will be provided.

KENT BRANCH TUNBRIDGE WELLS DIVISION—The annual dinner of the Tunbridge Wells Division will be held at the Wellington Hotel on Thursday, December 10th, at 7.45 p.m. Tickets 10/- 6d each. Double tickets (lady and gentleman) 20s. Private (medical) guests may be invited. Applications for tickets accompanied by remittance should be made as soon as possible (but not later than December 8th) to the honorary secretary (Dr. D. Davies, 8 Lion d'Or Gardens, Tunbridge Wells). At the conclusion of the dinner an address will be given by Mr. W. E. Kempson (Solicitor to the Association) on some pitfalls in medical practice.

British Medical Association.

CURRENT NOTES

Queen Alexandra

THE following letter of condolence with the King and the Royal Family on the death of Queen Alexandra has been sent on behalf of the British Medical Association by the Chairman of Council for submission to His Majesty

24th November, 1925

My Lord,

On behalf of the members of the British Medical Association throughout the Empire I respectfully beg leave to express to His Most Gracious Majesty the King, our Patron, Her Majesty the Queen, and the members of the Royal Family, the Association's heartfelt sympathy and profound sorrow at the death of Queen Alexandra, whose gracious thoughtfulness and unflinching devotion to the relief of suffering have endeared her to the profession.

The Association joins with the whole Empire in mourning one so greatly beloved, and in expressing to His Majesty its loyalty and devotion.

I am,

Your Lordship's most obedient Servant,

R. A. BOLAN,

Chairman of Council

The Rt. Hon. Lord Stamfordham, G.C.B.,
Buckingham Palace,
S.W.1

Pay and Conditions in the R.N.M.S., R.A.M.C. and R.A.F.M.S.

THE British Medical Association ever since the war has continued to urge upon the various directorates the reasons which, in its opinion, have led to a shortage of candidates for the Royal Naval Medical Service, the Royal Army Medical Corps, and the Royal Air Force Medical Service. Endless delays have occurred in reaching anything like a satisfactory settlement, but it is gratifying to learn definitely, as evidenced by the answer of the Secretary of State for War to a question in the House of Commons, recorded in the Parliamentary Notes in last week's JOURNAL (p. 981), that an interdepartmental committee appointed by the Government is seriously considering the whole question of pay and conditions of service in the medical branches of the Services, and that the British Medical Association is to be asked to send representatives to place its views before the committee.

A Mistaken Fmager

IN the course of the sitting of the Coal Commission on November 7th, Mr. Herbert Smith, president of the Miners' Federation, during his cross examination of Mr. W. A. Leo, who submitted evidence on behalf of the Mining Association, said, "Doctors have to be members of the British Medical Association before they can practise," and asked

whether there was any more harm in the miner being a member of his union. The witness replied that it was one thing to persuade a man to be a member and another to use the sort of persuasion employed by the Miners' Federation. Mr. Smith's statement about the British Medical Association, as members of the medical profession are well aware, is erroneous. We are inclined to think that he might have been expected to know that the British Medical Association is a voluntary body, devoted to the interests—scientific, social, and political—of members of the profession, and that the right to practise is conferred only by the entry of the practitioner's name on the *Medical Register*, a statutory document kept by the General Medical Council (Medical Act of 1858, Sections 25, 26 and 27). It will be seen that the President of that Council in his address (p. 185) at the opening meeting of its session this week, made a passing reference to the confusion which occasionally arises between voluntary societies of medical men and the General Medical Council.

Annual Meeting of Canadian Medical Association 1926

THE annual meeting of the Canadian Medical Association in 1926 will be held at Victoria, British Columbia, on June 21st to 26th, and at the request of the secretary of the Canadian Medical Association the Industrial and Publicity Commissioner for Victoria has forwarded to the British Medical Association copies of the official illustrated descriptive guide to that city. The guide sets forth the many attractions of Victoria, which the Commissioner informs us is often described as "a bit of Old England on the shores of the Pacific," and the Medical Secretary of the British Medical Association will be glad to forward a copy to any member who is thinking of visiting Canada next summer. Under the scheme of affiliation between the British Medical Association and the Canadian Medical Association, any members of the former attending the annual meeting of the Canadian Medical Association will receive as a matter of course all the privileges of membership of the Canadian Medical Association for the period of the meeting. Any members of the Association who are able to attend the meeting of the Canadian Medical Association will find it a most interesting occasion.

Constituencies for Election of Representative Body

THERE will be found on page 182 of the SUPPLEMENT this week the provisional Home Constituencies for election of the Representative Body, 1926-27. It will be seen that the Council proposes to repeat the existing grouping, except that the new St. Pancras Division of the Metropolitan Counties Branch is being made an independent constituency. Any Division objecting to the proposed arrangements should send to the Medical Secretary, British Medical Association House, Tavistock Square, W.C.1, not later than March 1st, 1926, a statement of its objection and of the reason therefor, and of what change the Division would

Association Notices

suggest the Council should make Under By-laws 41 and 43 the Representatives and Deputy-Representatives must be elected not more than nine nor less than two months before the Annual Representative Meeting at Nottingham, commencing on July 16th next. Each constituency in the United Kingdom of not less than 150 members is entitled to elect an additional Representative for each complete number of 100 members in excess of 50.

General Meeting or Postal Vote?

It is a matter for the Executive Committee of the Division—or, where the constituency comprises more than one Division, for a joint meeting of the Executive Committees of the Divisions forming the constituency—to decide whether the Representative(s) and Deputy-Representative(s) shall be elected by a general meeting of the constituency or by postal vote. The meeting must be called (or where the election is by voting papers, the voting papers be issued) by the secretary of the Division forming the constituency, or (in the case of constituencies comprising more Divisions than one) by the secretary of the Division containing the largest number of members. Whichever method of election is adopted, a meeting of the constituency must be held within the period June 18th to July 15th inclusive, to instruct the Representative(s). The names of Representatives and Deputy-Representatives must be notified to the Medical Secretary not later than June 3rd, 1926.

Retired Pay Appointments of Naval Medical Officers

In June last the British Medical Association made representations to the Admiralty in regard to the salaries offered to retired medical officers, R.N., for such services as the examination of recruits on a whole-time basis. The amount offered was £200 per annum. The Association pointed out that even for pensioned officers this salary was considered entirely inadequate and suggested that there should be an addition of at least 50 per cent. No official information has yet reached the Association, but it is understood on good authority that the rate of remuneration has been raised to £300 per annum.

Ophthalmic Benefit Proof of Title

At its meeting on November 12th last the Ophthalmic Committee of the British Medical Association expressed the following opinions, and is asking the Ministry of Health to bring them to the notice of all approved societies which have adopted the ophthalmic benefit scheme, in order that any misunderstanding may be avoided.

- (a) That unless proper credentials are produced by insured persons at the beginning of any consultation there can be no recognition by the specialists on the official list of any obligation to see them at the fee of one guinea.
- (b) That no exception can be made to the foregoing rule even in cases where insured persons forget to produce the proper credentials at the time of examination, but produce them subsequently.

PROPOSED CHANGE OF AREAS OF WINCHESTER, GUILDFORD, AND SOUTHAMPTON DIVISIONS

NOTICE is hereby given to all concerned of the following proposal made by the Winchester Division of the Southern Branch

(1) That the Urban Districts of Aldershot, Wimbomborough, and Fleet, together with that part of the Hartley Wintney Rural District lying east of and including the civil parishes of Crondall, Crookham, Emsay, and Lisle, be transferred to the Guildford Division of the Southern Branch

(2) That the Municipal Borough of Lynton, the Urban Districts of Eastleigh and Bishopstoke, the Rural Districts of South Stoneham, New Forest, Bordingbridge, Ringwood, and Lynton, and the civil parishes of Salisbury and Hook with Walsall in Fareham Rural District be transferred to the Southampton Division of the Southern Branch

Written notice of the proposal has been given to the Guildford and Southampton Divisions, and to the Southern and Surrey Branches, and the matter will be determined in due course by the Council. Any member affected by the proposed change and objecting thereto is requested to send a statement of his or her objection, and of the reason therefor to the Medical Secretary, British Medical Association House, Tavistock Square, London, W C 1, to reach him not later than December 28th, 1925

BRANCH AND DIVISION MEETINGS TO BE HELD

BIRMINGHAM BRANCH COVENTRY DIVISION—A meeting of the Coventry Division will be held at the Coventry and Warwickshire Hospital on Tuesday, December 1st, at 8.30 p.m. Dr. Half will read a paper on the use of sanocrysin.

BIRMINGHAM BRANCH NUNEATON AND TAMWORTH DIVISION—A meeting of the Nuneaton and Tamworth Division will be held at the Tamworth General Hospital on Thursday, December 17th, when Dr. A. P. Thomson will read a paper on the rheumatic state in childhood.

CAMBRIDGE AND HUNTINGDON BRANCH—A British Medical Association Lecture on some points in clinical endocrinology will be given by Dr. Leonard Williams on Wednesday, December 16th, at 3 p.m., in the Pathological Lecture Theatre, Medical Schools, Cambridge. All medical practitioners are cordially invited and it is hoped that as many members as possible will attend.

KENT BRANCH TUNBRIDGE WELLS DIVISION—The annual dinner of the Tunbridge Wells Division will be held at the Wellington Hotel, on Thursday, December 10th, at 7.45 p.m. Tickets 10s. 6d. each. Double tickets (lady and gentleman) 20s. Private (medical) guests may be invited. Applications for tickets accompanied by remittance should be made as soon as possible (but not later than December 8th) to the honorary secretary (Dr. D. Davies, 8 Lonsdale Gardens, Tunbridge Wells). At the conclusion of the dinner an address will be given by Mr. W. E. Hempsen (Solicitor to the Association) on some pitfalls in medical practice. At a meeting of the Division to be held on Friday, December 18th, at 3.30 p.m. at the General Hospital, Tunbridge Wells, a British Medical Association Lecture will be given by Professor A. J. Hall (Sheffield) on some after-effects of encephalitis lethargica.

LANCASHIRE AND CHESHIRE BRANCH—The first annual dinner of the Lancashire and Cheshire Branch will be held at the Midland Hotel, Manchester, on Thursday, December 17th, at 7.30 p.m. The price of tickets has been fixed at 15s. each and members may invite guests (male or medical women only). The Branch Council hopes that each member of the Branch will make every effort to attend. Those intending to be present are asked to notify the honorary secretary (Dr. A. Corsar Sturrock, 14, St. John Street, Manchester) immediately.

METROPOLITAN COUNTIES BRANCH CHELSEA DIVISION—At a meeting of the Chelsea Division to be held on Wednesday, December 2nd, at 4.30 p.m., at the Cancer Hospital, Fulham Road, S.W., Dr. Robert Knox, radiologist to King's College and the Cancer Hospitals, will give an address on x-rays in the diagnosis of the right upper quadrant of the abdomen. Tea will be served before the address. It is hoped that all members will make a special effort to be present on this occasion.

METROPOLITAN COUNTIES BRANCH CITY DIVISION—The next meeting of the City Division will be held at the Metropolitan Hospital, Kingsland Road, E., on Tuesday, December 1st, at 9.30 p.m., when Mr. Comyns Berkeley, chairman of the Metropolitan Counties Branch, will read a paper on the treatment of eclampsia. The annual dinner of the Division will take place at the Holborn Restaurant on Thursday, December 3rd, at 7.15 for 7.30 p.m. Tickets (12s. 6d.) to be obtained from the secretary, Dr. E. Wooley, 43, De Beauvoir Road, N. The next clinical meeting of the Division will be held at the Metropolitan Hospital on Friday, December 11th, at 4 for 4.15 p.m. Dr. Noiman Hill will show cases.

METROPOLITAN COUNTIES BRANCH HENDON DIVISION—The first annual dinner of the Hendon Division arranged to be held at the Brent Bridge Hotel, Hendon, on November 27th, has been postponed till Thursday, December 3rd, at 7 for 7.30 p.m. All medical practitioners and their friends are cordially invited. It is hoped that members will make a special effort to be present and bring their friends. The Hendon Centre of the British Music Society (president, Sir Richard Terry, Mus. Doc.) will join in this function and has kindly arranged to be responsible for the musical part of the programme. Dinner ticket 7s. 6d. each.

METROPOLITAN COUNTIES BRANCH KENSINGTON DIVISION—A general meeting of the Kensington Division will be held in St. Mary Abbott Parish Hall, Vicarage Gate, Kensington, W.8, on Tuesday, December 8th, at 8 for 8.30 p.m. An address will be given by Dr. Percy John Cammidge entitled "The use and abuse of insulin."

METROPOLITAN COUNTIES BRANCH LEWISHAM DIVISION—The Lewisham Division will hold a clinical evening at the South Eastern Children's Hospital, Sydenham, S.E.26, on Tuesday, December 15th. The annual dinner of the Division will take place at the Royal Bell Hotel, Bromley, on Thursday, December 17th, at 7.30 p.m., with Dr. R. Godwin Chase in the chair. Members are invited to bring medical guests. As the Chairman and Committee feel that it is highly desirable to foster the social side of medical practice in the borough it is hoped that all members will endeavour to be present. Dinner ticket 10s. 6d. (exclusive of wine).

METROPOLITAN COUNTIES BRANCH MARYLEBONE DIVISION—A meeting of the Marylebone Division will be held at the British Medical Association House, Tavistock Square, W.C.1, at 8.15 p.m. on Wednesday, December 9th, when a discussion on the relationship of the medical profession to unqualified practice will be opened by Sir Holburt Waring. Among those who have promised to take part in the discussion are Sir William Wilcock, Dr. C. O. Hawthorne and Mr. McAdam Eccles. Non-members will be welcomed and are invited to take part in the discussion. Every member attending is asked to bring a medical friend.

METROPOLITAN COUNTIES BRANCH SOUTH MIDDLESEX DIVISION—The following programme of meetings of the South Middlesex Division has been arranged: Wednesday, December 9th—8.15 p.m. General business, 8.30 p.m. Dr. R. Langdon Down will read a paper on the work of the British Medical Association. Wednesday, December 10th—1926—3.15 p.m. General business, 3.30 p.m. Dr. G. H. Dupont will read a paper on some observations on modern methods of control of scarlet fever and diphtheria. Tea will be provided. Wednesday, March 10th—8.15 p.m., General business, 8.30 p.m. Sir Kenneth Goadby will read a paper on chemistry of the blood as an aid to prognosis and treatment. Wednesday, April 14th—3.15 p.m. through the courtesy of Dr. J. B. Cool, a tour of the West Middlesex Hospital has been arranged. Tea will be provided. Wednesday, May 5th—Annual Meeting, 8.15 p.m., General business, 8.30 p.m. Election of officers, report of the representative and of the honorary secretary. The meetings with the exception of that on April 14th, 1926, will be held at St. John's Hospital, Tickenham. In the event of any special meetings being required or any alteration of the programme being necessary, due notice will be given.

METROPOLITAN COUNTIES BRANCH SOUTH WEST ESSEX DIVISION—A meeting of the South West Essex Division will be held at the Wesleyan Schoolrooms, High Road, Leyton, on Tuesday, December 1st, at 3.30 p.m., when Dr. Millais Culpin will read a paper on the handling of nervous patients.

METROPOLITAN COUNTIES BRANCH WESTMINSTER AND HOLBORN DIVISION—The social evening arranged by the Westminster and Holborn Division for November 26th has been postponed, owing to the death of Queen Alexandra until Wednesday, December 2nd. It will take place at the British Medical Association House, Tavistock Square, W.C.1. Members and their friends will be received at 8.30 p.m. by the chairman, Dr. Redmond Roche. Ladies will be welcomed. At 9 o'clock Professor G. Elliot Smith, I.R.S., will read a short paper on "The left-handed lady of Lloyd's." It is hoped that all members will take this opportunity of visiting the new headquarters. Members and their friends from other Divisions are cordially invited. Music, light refreshments, dancing till midnight. Tickets for a member of the Division and guest may be had free on application to the honorary secretary (Dr. R. E. Stuart Webb, 8 West Chapel Street, Mayfair, W.1). Further tickets may be had for 2s. 6d. each and remittance must accompany application.

MIDLAND BRANCH CHESTERFIELD DIVISION—A meeting of the Chesterfield Division will be held at the Maternity Hospital, Chesterfield, on Friday, December 11th, at 8.15 p.m., when Dr. J. S. C. Douglas, Professor of Pathology, University of Sheffield, will give an address on passive immunity. Tea and coffee at 8.

NORTH OF ENGLAND BRANCH SUNDERLAND DIVISION—A scientific meeting of the Sunderland Division will be held at Monkwearmouth Hospital, Sunderland, on Tuesday, December 15th, at 7.30 p.m. All members of the Division are invited to be present.

NORTH LANCASHIRE AND SOUTH WESTMORLAND BRANCH—A meeting of the North Lancashire and South Westmorland Branch will be held by kind permission of Dr. Hough and the governors of the hospital at the Ethel Hedley Hospital, Ca. Saturday, December 5th, at 3.15 p.m. C.M.G. M.D. (Bristol) will give a British Lecture on insulin treatment of diabetes with particular reference to the complications of diabetes and surgery in diabetes.

SOUTH WALES AND MONMOUTHSHIRE BRANCH CARDIFF DIVISION—A dinner and dance will be held in Cox's Rooms, Cardiff, on Wednesday, December 2nd. Dr. H. B. Brackenbury (Chairman of the Representative Body of the Association) will give an address at 3.30 p.m. the same day in the Engineers' Institute, Park Place, Cardiff, on theory and practice in British Medical Association policy.

SOUTH WALES AND MONMOUTHSHIRE BRANCH SWANSEA DIVISION—A meeting of the Swansea Division will be held at the General Hospital, Swansea, on Thursday, December 3rd, at 8.15 p.m. Medical clinic.

SOUTHERN BRANCH JERSEY DIVISION—A meeting of the Jersey Division will be held on Thursday, December 17th, when Lieut. Colonel P. J. Marcet, chairman of the Division, will read a paper on common bacillary diseases of the island.

STAFFORDSHIRE BRANCH AND NORTH STAFFORDSHIRE DIVISION—A combined meeting of the North Staffordshire Division will be held at the Central School of Science, Stoke on Trent on Thursday, December 3rd, at 4.45 p.m., when a lecture will be delivered by Dr. Hugh Thursfield on the heart in the child and its prognosis. The meeting will be followed by a dinner at the North Stafford Hotel at 6.30 p.m. (charge for dinner 12s 6d.)

SURREY BRANCH CROYDON DIVISION—A meeting of the Croydon Division will be held at the Croydon General Hospital on Tuesday, December 15th, at 8.30 p.m., when Mr. A. H. Todd, F.R.C.S. will speak on cases collected from the orthopaedic department of the Croydon General Hospital.

SURREY BRANCH GUILDFORD DIVISION—A meeting of the Guildford Division will be held at the Royal Surrey County Hospital, Guildford on Thursday, December 3rd, at 4 p.m., when Dr. H. G. Adamson will give a lecture, illustrated by lantern slides, on the factors which determine the pattern and distribution of skin eruptions. Tea will be served at 3.45.

SURREY BRANCH KINGSTON-ON-THAMES DIVISION—A general meeting of the Kingston-on-Thames Division will be held at Surbiton Hospital on Tuesday, December 1st, at 8.45 p.m. A lecture will be given by Dr. William Brown on psychology and medicine. The committee hopes that the increased interest manifested in these lectures will be more than maintained on this occasion.

SURREY BRANCH REIGATE DIVISION—A meeting of the Reigate Division will be held at the East Surrey Hospital, Reigate, on Tuesday, December 8th, at 8.45 p.m. Dr. H. C. Cameron will read a paper on some complaints of children.

WILTSHIRE BRANCH TROWBRIDGE DIVISION—The Trowbridge Division will hold a dinner at the Bear Hotel, Derizes on Wednesday, December 2nd, at 7.15 for 7.30 p.m. after which Mr. Cecil Terry will read a paper on some minor points in surgery. The price of the dinner exclusive of wine, is 10s. 6d., and members intending to be present are requested to notify Dr. D. Leigh Spence (The Limes, Melksham) by the first post on Saturday, November 28th. As this is the first dinner held by the Division for many years it is hoped that all members will make a special effort to attend. Non-members in the Derizes area are cordially invited.

YORKSHIRE BRANCH BRADFORD DIVISION—A combined meeting will be held with the Bradford Medico-Chirurgical Society on Tuesday, December 8th.

YORKSHIRE BRANCH DEWSBURY DIVISION—A meeting of the Dewsbury Division will be held at the Man and Saddle Restaurant, Dewsbury on Tuesday, December 1st. Dr. Burrows (Leeds) will read a paper on referred pain from a diagnostic standpoint. Supper will be provided at 8.15 p.m. Members from neighbouring Divisions will be welcomed.

YORKSHIRE BRANCH HUDDERSFIELD DIVISION—The medical dance will be held on Wednesday, December 16th, in the Royal Infirmary, from 9 p.m. to 1 a.m. Reception 8.45. For those who do not wish to dance, a bridge drive, commencing at 9.15 will be arranged. Tickets 8s. 6d. each admission by programme. As the dance will only be held if a sufficient number of tickets are sold, it will greatly assist the committee if members will inform the honorary secretary before December 5th of the number of tickets required.

YORKSHIRE BRANCH SHEFFIELD DIVISION—A meeting of the Sheffield Division will be held in the General Lecture Room, The University, Sheffield, on Friday, December 11th, at 8.30 p.m., when a British Medical Association Lecture will be given by Dr. Cramer on the new outlook on cancer. Non-members will be welcomed.

YORKSHIRE BRANCH WAKEFIELD, PONTEFRAC AND CASTLEFORD DIVISION—A meeting of the Wakefield, Pontefract and Castleford Division will be held at the Playhouse, Westgate, Wakefield on Sunday, December 13th, at 3.30 p.m., when Colonel L. W. Harrison (Special Medical Officer for Venereal Diseases to the Ministry of Health) will deliver a British Medical Association Lecture on the management of syphilis, illustrated by a cinematograph film.

Meetings of Branches and Divisions.

METROPOLITAN COUNTIES BRANCH NORTH MIDDLESEX DIVISION
The first meeting of the North Middlesex Division for the season was held on October 28th in the Southgate Council Offices.

A letter was read from Dr. Fairweather, expressing regret at being unable to accept office as vice-chairman, and Dr. Payne was elected in his place. The Divisional gold badges of office for the chairman and secretary, presented by the Executive Committee, were handed round for the inspection of members.

The chairman, Dr. Fuller, took for the subject of his inaugural address Endocrinology, some facts and fancies. He said that the year 1889 was the beginning of modern endocrinology, though the real meaning of Brown Sequard's paper was not appreciated at the time. He then described the better known glands and their functions and illustrated this account with numerous cases of successful treatment by means of them. After discussing some of the recent work on diabetes and insulin and on the parathyroids and gonads, and mentioning especially the treatment of epilepsy and petit mal by parathyroid hormones, Dr. Fuller referred to the attitude of sceptics, gave some hints for treatment taken at random from his notebooks, and concluded with a forecast of what the future of treatment by the ductless glands might become.

Afternoon tea was provided by the kindness of the chairman, and a hearty vote of thanks to him brought the meeting to a close.

The annual dinner took place the following evening in the Criterion Restaurant. There were present fifty-five members and guests, including Dr. C. Courtenay Lord, Assistant Medical Secretary representing the Central Office of the Association. The musical programme after dinner was provided by members of the Division, and a very enjoyable evening was spent.

NORTH OF ENGLAND BRANCH SUNDERLAND DIVISION Annual Dinner

The annual dinner of the Sunderland Division was held on November 12th when Dr. STANLEY RAW, chairman of the Division, presided. The guests included the Mayor, Dr. H. Crichton Miller (London), Dr. James Hudson (president of the North of England Branch), Mr. Luke Thompson M.P., Dr. Elstace Hill (M.O.H. for Durham County), Mr. W. G. Easthope, and the Rev. R. S. McLauchlan.

After the toasts of the King and the Houses of Parliament had been honoured, that of the Corporation and Mayor of Sunderland was proposed by Dr. D. F. Tomp. The Mayor, in reply, said that the municipality was very much in the hands of the medical profession. The valuable assistance rendered by the profession was a priceless asset. Though the health of the borough was not all it might be, the corporation was deeply interested in new devices for the treatment of disease. When they read of members of the medical profession who died through their devotion to science and in their efforts for the deliverance of mankind from suffering, they felt thankful that there were such heroes.

Dr. MONAGH proposed the health of the Association, and referred to his great work in connection with it. Dr. CRICHTON MILLER, in reply, said that it was that he had tried, with some success, to apply his mind to seeing the whole thing and seeing psychoneurosis whole, neither remaining in an objective groove nor becoming a crank.

The toast of the British Medical Association was proposed by His Honour Judge PARRY, who said it was a representative organization of one of the greatest of professions and commanded the esteem and gratitude of the whole community. It was said that the British Medical Association was a trade union the same thing had been said about the law. In a sense it was true for the medical and other great professions included among their objects the economic protection of their members. In one respect, however, the professional organizations differed from the industrial organizations. The former all recognized that the aim of the professions was the performance of a public function, and they made rules not merely for the economic protection of their members, but also rules intended for the better service of the public. Their ideal was that of service and not merely self-protection. No profession had shown that public spirit which dominated professional men more consistently than the medical profession.

Dr. HUNTER, in acknowledging the toast, said that the British Medical Association had been for some years trying to elaborate the distinction between profession and trade union, and he considered it was a very proper distinction to draw. The North of England Branch had over one thousand members which represented 80 per cent of the practitioners in the area. The Association had reached a height of prosperity and usefulness never before achieved, and its membership was now more than 30,000.

Mr. W. G. EASTHOPE, in proposing the toast of 'Prosperity to the Sunderland Division' said that there was no doubt of the respect and admiration in which the outside public held the medical profession. Owing to the Division's policy of reticence, the public knew little of its corporate activities, but they knew the members individually and held them in high esteem.

The CHAIRMAN, in responding, said that the Division, from every point of view, compared favourably with any other Division of the Association and paid tribute to the successful work of its honorary secretary, Dr. DIX.

SOUTH WALES AND MONMOUTHSHIRE BRANCH SWANSEA DIVISION
On November 5th a clinical meeting of the Swansea Division was held at the Swansea General Hospital, when Dr. URBAN MARKS, chairman of the Division, presided. Several cases of interest were shown by Dr. A. CLARKE BLEG, O.B.E., and Dr. KINGSTON KNIGHT (house physician at the hospital).

SUFFOLK BRANCH SOUTH SUFFOLK DIVISION
A MEETING of the South Suffolk Division was held at the Crown and Anchor Hotel, Ipswich, on October 2nd, when Dr. W. F. ADLEY was in the chair.

The following motion, proposed by the Executive Committee, was adopted unanimously:

That a levy of 2s. 6d. per annum be made for the purpose of paying the expenses of the Representative in Representative Body. Any remaining balance to be carried forward and be credited to a fund for the next year to be used for the same purpose. That the representative be allowed one guinea per day, not to exceed eight days.

It was also resolved that this resolution should apply for the current year only, and be brought up for re-adoption at the annual meeting.

Dr. HARE, in a well-prepared statement intermingled with dry humour, briefly outlined the important discussions at the Annual Representative Meeting which he attended at Bath, and a hearty vote of thanks was unanimously accorded him.

The CHAIRMAN briefly explained the present position adopted by the staff of the Ipswich and East Suffolk Hospital with regard to the new contributory scheme and its relationship to the hospital policy of the Association. The contributory scheme had been submitted to the head office, which asked for the views of the staff.

with regard to the following points: (1) Income limit for the contributors—The staff were unable to express an opinion as to what the income limit should be. (2) The necessity for the patient bringing a note from the doctor—The staff thoroughly agreed to this point. (3) The consultative nature only of the out-patient department—Agreed. (4) The provision for a percentage of contributions passing into a staff fund—The staff do not yet consider it suitable to alter their honorary status.

The general feeling of the meeting was in sympathy with the attitude adopted by the staff.

Dr Addey was warmly thanked for his kindness in providing tea.

SUSSEX BRANCH CHICHESTER AND WORTHING DIVISION Autumn Dinner

The dinner of the Chichester and Worthing Division took place at the Warren Hotel, Worthing, on November 11th, when Dr H. J. M. Milbank Smith presided over a large company, including the Mayor of Worthing, members of local governing bodies, and members of the medical profession. In proposing the health of the guests,

Dr L. A. PARR, honorary secretary of the Brighton Division, referred to the many distinguished persons present and acknowledged with gratefulness the assistance he had received from Dr Helen Boyle, late chairman of the Brighton Division. He congratulated the Division on the latest of its many activities in bringing together such a large number of members of the various governing bodies in the neighbourhood. The work of such bodies and that of the medical profession was, he said, mutually interdependent. Without the assistance of the doctors it was quite impossible for the governing bodies who had so much to do with medicine and the public health to carry on their work. No public body was complete unless it numbered among its members at least one member of the medical profession. The profession on the South Coast was particularly fortunate in its association with the members of public bodies. The Brighton Division had recently been asked by the board of guardians to select six consultants. This he considered was a great compliment to the Association.

The Mayor of Worthing, in acknowledging the toast, expressed his appreciation at being invited to meet such a distinguished body as the Association, and of the great advances achieved through it. In referring to the importance of the health of the child—one of the greatest questions of the day—the Mayor said that in Worthing they had a small body doing excellent work in that direction under Dr Walslow. He urged that medical men should send their patients to the South Coast instead of abroad. Everything possible was being done to encourage visitors to Worthing.

Dr HENRY BOYLE, late chairman of the Brighton Division who also responded, spoke wittily of after-dinner speakers, and quoted Herodotus for a curious and interesting custom. The views of the Greeks on a particular question were obtained after dinner and again the following morning, and on the two statements were founded the decisions made. That was, she held, an appeal to the subconscious mind and the conscious mind.

Alderman FROST, in proposing the toast of "Prosperity to the British Medical Association," said that the Association had rendered very great services both to the medical profession and the community at large. He referred to the high status attained in the profession, and acknowledged the services given to rich and poor alike by its members. The public health service of the country had benefited by its activities as was illustrated by the recent speech of Sir Kingsley Wood when he said that the Government would never think of issuing new health legislation or of modifying the old without seeking the help and experience of the whole medical profession centred in the Association.

Dr G. C. ANDERSON (Deputy Medical Secretary), in reply said he thought the Association deserved a great many of the compliments that had been paid it that evening. Regarding the fundamental differences between trade unionism and professional unionism, he said that the former existed for the interest of a particular class while the latter existed for the interest of the community. Dr Anderson referred to the growth of the Association in the Division and welcomed the presence of members of the local governing bodies as showing that the Association stood for something good.

Sir ST. CLAIR THOMSON, President of the Royal Society of Medicine in proposing the health of the honorary secretary of the Chichester and Worthing Division spoke with pride of his forty-two years' membership of the British Medical Association. He urged that every young man should join it as soon as he was qualified. In responding Dr DUNCAN D. MACKINTOSH called attention to the insignia of office worn by the chairman and himself for the first time that evening. He spoke of the pleasure he found in performing his duties.

The toast of 'The Chairman' was proposed by Dr HINDS who expressed the belief that nothing but good would come out of that meeting. He paid a tribute to Dr Milbank Smith's services on behalf of the Association both in his present position and as secretary. The CHAIRMAN, in reply, expressed the hope that the occasion would be an annual gathering.

Dr HABBERTON LULHAM subsequently gave an interesting lantern lecture on human nature through a doctor's eyes, which was thoroughly enjoyed by the assembly.

NATIONAL INSURANCE

Dr R. GODWIN CHASE, chairman of the Lewisham Division of the British Medical Association, and a member of the London Panel Committee, has been appointed the medical representative of the London County Council on the London Insurance Committee in succession to the late Dr Pring.

GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION.

WINTER SESSION, 1925

THE one hundred and twenty-second session of the General Medical Council was opened at 44, Hallam Street, W., on November 24th. The President, Sir DONALD McALISTER, Bt., K.C.B., was in the chair.

Official notification was received of the appointment of Professor Edward Fawcett, M.D., as representative of the University of Bristol for five years from July 1st, 1925. Professor Fawcett was introduced by Sir Gilbert Baring and took his seat.

Communications were received from Dr Caton, Professor Harvey Littlejohn, and Dr Russell, stating that they were unable to attend the session of the Council owing to illness. The sympathy of the Council was extended to these members. The President said that he thought the Council would wish to send a message of congratulation to Sir Dyce Duckworth, a former treasurer, whose 85th birthday it was. This was agreed to with applause.

THE PRESIDENT'S ADDRESS

The President then proceeded to deliver his address from the chair. The members of the Council and the strangers in the galleries all stood during his opening reference to the death of Queen Alexandra.

Sir DONALD McALISTER said: Gentlemen,—We meet under the shadow of a national bereavement. The death of the Queen Mother Alexandra, revered and beloved by the whole nation, has made us all fellow-mourners with the Royal Family. The Council will join with me in expressing to the Lord President of the Council, as the Minister concerned with our statutory functions, our desire that on a suitable occasion he may convey to Their Majesties a loyal and dutiful assurance of our respectful sympathy and deep regret.

We lose from our counsels a member of exceptionally wide experience and administrative ability by the retirement, after fifteen years' service, of Sir Isambard Owen, the representative of the University of Bristol. Having held high office in that University, and also in the Universities of Cambridge, London, Durham, and Wales, he was able both to frame ideals of academic organization and to embody them in statutes and ordinances. Few men of our profession in this generation have done so much constructive work of an abiding kind in setting the framework and directing the policy of modern universities. We offer him our good wishes in his retirement from his manifold and fruitful labours. His place is taken by the distinguished Dean of the Bristol Faculty of Medicine, Professor Edward Fawcett, F.R.S. His eminence in anatomical science, and his experience as an examiner for many of the licensing bodies, give him a claim to our welcome which the Council willingly records.

The Disciplinary Functions of the Council

In accordance with our practice, the November session will be mainly devoted to the hearing of charges against registered practitioners. These charges are brought before us as "the tribunal, to whom the Legislature has left the decision, as being the best judges in the matter." I quote the words of Chief Justice Cockburn. If I may use in supplement the words of Lord Justice Fry, "the Council are fully aware that [in these inquiries] they are performing judicial duties," and, he added the comment, they "endeavour evidently to perform them in a very admirable manner." The composition of the Council changes slowly, but these authoritative estimates of its jurisdiction, its attitude, and its procedure as a court, are still applicable, as they have been throughout the thirty-six years during which I have had the opportunity to observe the Council from within. Apart from cases of conviction in the criminal courts, the charges to be investigated allege conduct which, in the words of the Act constituting the Council, is "infamous conduct in a

professional respect." These words are sometimes misinterpreted and misapplied by persons ignorant of their history, sometimes even by advocates practising before this tribunal. It is therefore desirable in the common interest that, from time to time, their legal definition should be recalled. The legal definition was not framed by the Council, it was laid down for the direction of the Council by the Supremo Court, and it was picked up by Lord Justice Lopes, Lord Justice Dwyer, and Lord Escher, Master of the Rolls, in consultation. It is thus

"If a medical man in the pursuit of his profession has done something with regard to it which will be reasonably regarded as disgraceful or dishonourable by his professional brethren of good repute and competency, then it is open to the General Medical Council if that is shown, to say that he has been guilty of infamous conduct in a professional respect. The Master of the Rolls added further "The question is not merely whether what the medical man has done would be an infamous thing for anyone else but a medical man to do. He might do an infamous thing which would be infamous in anyone else, but if it is not done in a professional respect, it does not come within Section 29 [of the Act]. Yet, in relation to his profession—that is either with regard to his patients or to his brethren—he does that which may fairly be considered 'infamous conduct in a professional respect,' then I think it is within the Section."

Within the jurisdiction defined by the statute, according to the procedure laid down by the Lords Justices when giving judgement in certain leading cases, and in accordance with the definition of the technical term "infamous conduct" furnished by the same authority, the Council performs its statutory duty as a "domestic forum." If, swayed by fear, favour, or clamour, the Council fails to perform any duty vested in it by law for the protection of the public, the Medical Acts themselves provide that the public shall not go unprotected. The Privy Council may issue its directions to the General Council to make good the default, and, failing compliance, "may exercise any power or do any act or thing vested in or authorized to be done by the General Council." In other words, the Medical Council is a public department, with judicial functions defined by statute and by the courts, working under the supervision of the Privy Council, and subject to supersession by the Privy Council if it defaults. It is not vested with any powers or duties for the "protection" of the medical profession, other than those implied in the preamble to the Medical Act, 1858—namely, "That persons requiring medical aid should be enabled to distinguish qualified from unqualified practitioners." For that purpose, which is obviously a purpose of public utility, the Register was set up. The Council's duty to the public is simply to ensure that no one who is not legally qualified by adequate professional training and testing shall get on to the Register, and that no one who by his conduct has forfeited his claim to be entrusted with the status of a legally qualified practitioner shall remain on it.

The legal privileges of the qualified practitioner of medicine and surgery, as compared with the unqualified, are few. He has no monopoly of practice in either branch, such as the law confers on dentists and midwives in their specialties. The "privileges" are rather trusts than advantages. Thus only the qualified can legally grant a valid medical certificate of illness or injury, or of death, or legally prescribe a dangerous drug for a patient. In many cases the attestation of a qualified practitioner is legally equivalent to that of a magistrate or a clergyman. These "privileges" are clearly based on the assumption that members of a learned and honourable profession may be trusted to deal honourably. Whoever, therefore, abuses that trust by misusing the privileges his status confers, or by covertly enabling others for private gain to evade their legal disabilities, is chargeable with misconduct "in a professional respect," and makes himself liable to its penalty of removal from the Register. As the law stands, he is then as free to practise as if he had not been registered, and the public are as free to employ him, if they think fit. But the Council, as the guardians of the Register, have neither the power nor the responsibility of controlling his conduct thereafter. His status is that of an unqualified practitioner, and he is outside the Council's jurisdiction.

The members of the Council will perhaps pardon me for

reporting from this chair what is entirely familiar to them, but there are indications that, both within and without the profession, misunderstandings and confusions exist regarding the Council's functions and limitations. We are, for example, frequently confounded with voluntary organizations and societies of medical men, constituted for scientific and professional purposes, and subserving these purposes with eminent efficiency. These bodies are not, however, charged by statute with our duties and powers, nor we with theirs. We have no professional interest to serve other than the efficient performance of the specific duties laid upon us by the law in furtherance of the public welfare. It appeared to me expedient that, speaking publicly to my colleagues, not for them, I should endeavour to state as briefly and clearly as I can the true facts concerning our position. I need not say that nothing in my remarks has particular reference to any of the cases set down for inquiry this session. In each of these the full evidence on both sides has still to be set forth in open court, in each of them after patient hearing the Council's judicial decision will, as always, be given strictly on the ascertained merits of the case.

I turn to certain matters of interest which have called for attention during the recess.

Southern Ireland

As regards Ireland, I have only to say that the Act of the Free State passed in February, 1925, which made the Medical Acts operative in Southern Ireland for one year, has been working smoothly so far as this office is concerned. We have had no official intimation from the Free State Government, or from the Privy Council, that the Act will be renewed next February. Unofficial communications from members of the Irish Branch Council, and others, indicate that indefinite renewal is improbable, and that conferences on the question are in progress between the Government of the Free State and a committee representative of the Irish medical profession. Until the legislative proposals of the Government in Dublin for the future regulation of medical practice in Southern Ireland are known, it would be inexpedient for this Council to discuss the potential reactions of such legislation on medical education and registration in Great Britain and Northern Ireland. The Free State is autonomous within its own territory, and we must await the decision of its own Government and Parliament.

Italy

The agreement for medical reciprocity with Italy was signed by Signor Mussolini and the British Ambassador, as plenipotentiaries, on May 21st, 1925. Certain difficulties of an administrative—perhaps I might say of a bureaucratic—kind were raised by Italian officials during the summer. These related chiefly to the documents to be furnished by British practitioners desirous of practising in Italy, and to their attestation. With the efficient assistance of the Foreign Office, and of the respective Embassies in Rome and in London, these difficulties were satisfactorily overcome. We now learn from Rome that in the *Italian Official Gazette* of August 28th was published a Royal Decree of June 18th, by which full and entire execution was given, as from May 21st, 1925, to the reciprocity agreement. We may therefore say that the cordial understanding regarding medical reciprocity, which subsisted between Italy and this country from 1910 until the promulgation of the recent Italian law on the subject, has been completely restored.

Canada Saskatchewan

The position taken up by the Province of Saskatchewan, by which it, in effect, denies to British practitioners registered here the privileges granted in this country to provincial licentiates, has been the subject of communications between the Dominions Office and the Deputy Governor-General of Canada on behalf of the Dominion Government. The Dominion authorities propose a conference with the provincial authorities on the subject, and request that action by the Privy Council in regard to the discontinuance of the unreciprocated privilege of Saskatchewan should remain in abeyance, pending such conference. The Executive Committee have assented, being desirous that every opportunity should be afforded for reconsideration of the

anomalous position created by Saskatchewan legislation. The recent parliamentary elections in the Dominion may be accountable for the delay in reaching a settlement. The analogous case of New Brunswick will, no doubt, have to be dealt with in a similar manner.

Indian Universities

The Executive Committee have received communications from the University of Calcutta indicating that the syndicate are now prepared to receive a visitor or inspector of their M.B. examinations, whose report may enable the Committee to form an opinion concerning the "sufficiency" of that degree in terms of the Medical Acts. Colonel Needham, the official inspector approved by the Council, has accordingly been instructed to visit the examinations in question. His report, however, cannot reach the Committee until, at earliest, its meeting in February, 1926, and no decision as to the renewal of recognition can be reported to the Council before the May session. Certain interim reports by Colonel Needham on other Indian universities and colleges have been received, and such action as the Committee deemed suitable has been taken thereupon. In particular, his report on the progress made by the University of the Punjab has justified the Committee in continuing for another year the recognition accorded to its degrees, under the same conditions as before.

Revision of the "British Pharmacopoeia"

The Pharmacopoeia Committee is now in a position to proceed with its preparations for the revision of the *British Pharmacopoeia* 1914, which it has for some time been contemplating. Two recent events have cleared the way. The first is the passing of the Therapeutic Substances Act, 1925, by which Government machinery is provided, in association with the International Commission of the League of Nations, for fixing standards, etc., in relation to preparations requiring biological methods of testing. The second is the issue of the report of the International Conference on Potent Drugs, held at Brussels in September. At this conference the Council was represented by Sir Astor Tirard, who will report to the Pharmacopoeia Committee its proceedings and conclusions. If the latter are accepted, with or without reservations, by the British Government, this acceptance will necessarily involve modifications, some of them important and far-reaching, in the text of the *Pharmacopoeia*.

The Lord President of the Council has been pleased, at the request of the Committee, to enlist the services of the India Office, and of the Dominions and Colonial Office, in transmitting, through the several Governments of the Empire, an invitation to their respective medical and pharmaceutical authorities to communicate to the Council suggestions for the improvement of the *Pharmacopoeia*, with a view to its better adaptation to local requirements. Similar invitations have been addressed directly to the universities and medical corporations in this country. The Pharmaceutical Society of Great Britain has been asked to co-operate in the work of revision by nominating members of a Pharmaceutical Advisory Committee and a Committee of Reference in Pharmacy. Steps will also be taken to procure the nomination of committees of reference in other subjects, such as chemistry, botany, biological methods, pharmacology, and therapeutics.

As the *Pharmacopoeia* has by the nature of the case to serve the purposes of all the parts of the Empire in which it is current, it has to include within its scope a much larger number of drugs and preparations than would be deemed necessary for any one part. A given preparation may be thought obsolete or useless here, and yet be in much demand elsewhere. Any drug, in fact, which is (1) in current use over any considerable area, and (2) requires for the safety of the public that it should be exactly defined in respect of source, preparation, standard of purity, etc., has a claim to admission. The modern freedom of international communication further makes it expedient that, in different countries, the same or equivalent names, especially in the case of potent drugs, shall mean preparations of equivalent strength and composition. In so far as this end can be attained by international agreement, the assimilation makes for public health and

safety. All these considerations have to be kept in mind by the Pharmacopoeia Committee, and it hopes, with the assistance which it has invited from the authorities at home and overseas, and with the co-operation of its expert committees of reference, in the next issue to "afford to the members of the medical profession and to those engaged in the preparation of medicines throughout the British Empire one uniform standard and guide, whereby the nature and composition of substances to be used in medicine may be ascertained and determined."

A vote of thanks to the President for his address was accorded, on the motion of Dr. J. A. Macdonald, seconded by Sir Norman Walker.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE

SURGEON COMMANDER E. D. RUTHERFORD (retired) has been promoted to the rank of Surgeon Captain (retired).
Surgeon Commander H. E. White M.V.O. O.B.E. to the President, additional for three months, not a graduate course.
Surgeon Lieutenant J. V. Williams to the *Edgemon* on joining.

ROYAL ARMY MEDICAL CORPS

Major E. M. Pennefather to be Lieutenant Colonel to complete a tab. *Edgemon*.
Captain G. O. F. Alley M.C. is granted the temporary rank of Major whilst employed as Deputy Assistant Director of Hygiene and Pathology. The following Captains to be Majors: J. C. Sproule O.B.E. with precedence next below N. T. Whitehead M.C. G. F. All on M.C. with precedence next below A. F. C. Martyn (substituted for notification in the *London Gazette* August 8th 1924).
Captain W. P. Croker to be Major January 24th 1925 with precedence next below J. Rowe M.C. (Substituted for notification in the *London Gazette* of February 10th 1925).

ROYAL AIR FORCE MEDICAL SERVICE

Wing Commanders B. A. Payne D.S.O. and W. W. Shorten to R.A.F. Depot pending disposal on transfer to Home Establishment.
Squadron Leaders T. J. Kelly M.C. and J. T. Forbes to R.A.F. Depot on transfer to Home Establishment.
Flight Lieutenants H. McW. Daniel to Aircraft Depot Iraq, V. R. Smith to Helioportia Detachment Egypt, A. F. Barr Sim G. Kinneir T. J. D. Atteridge and J. C. O'burne to R.A.F. Depot on transfer to Home Establishment.
Flying Officer R. W. White is promoted to the rank of Flight Lieutenant.
Flying Officers G. M. Anderson to R.A.F. Depot, B. L. Edwards to R.A.F. Hospital, Halton, L. C. Palmer Jones to Central Flying School, Upavon, R. C. L. Fisher, J. Parry Evans and F. L. White to R.A.F. British Hospital Iraq, H. C. Patten on and B. Pollard to Station Commandant Hinaidi.
Dr. W. D. McKeown has been granted a short service commission as Flying Officer for three years on the Active List.

SUPPLEMENTARY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Major H. B. Walker late temporary Major R.A.M.C., to be Captain.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Captain G. W. B. Shaw R.A.M.C. to be Divisional Adjutant 44th (Home Counties) Division T.A. vice Captain S. R. Reid R.A.M.C. who vacates the appointment.
Captain H. A. Sandiford M.C. R.A.M.C. to be Divisional Adjutant 49th (West Riding) Division T.A. vice Captain C. Lopham R.A.M.C. who vacates the appointment.
Lieutenant H. S. Ward (late M.G. Corps) to be Lieutenant.
Sanitary Companies—Lieutenant G. W. Wright to be Captain.

TERRITORIAL ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Captain J. C. Robb (superannuated for service with the Belfast University Contingent O.T.C.) from the Active List to be Captain.

VACANCIES

ALL SAINTS HOSPITAL FOR GENITO-URINARY DISEASES.—Resident House Surgeon. Salary at the rate of £200 per annum.
BIRMINGHAM CORPORATION.—Senior Assistant Medical Officer (male) at the Infectious Diseases Hospitals. Salary £500 per annum rising to £600.
BIRMINGHAM MATERNITY HOSPITAL.—House Surgeon. Salary at the rate of £75 per annum.
BIRMINGHAM AND MIDLAND HOSPITAL FOR SKIN AND URINARY DISEASES.—Honorary Assistant Physician.
BIRMINGHAM QUEEN'S HOSPITAL.—(1) Anaesthetist (2) Obstetric and Ophthalmic House Surgeon (3) Casualty House Surgeon. Salary for (1) £70 to £100 per annum (2) and (3) £70 per annum.
BRADFORD ROYAL EYE AND EAR HOSPITAL.—Male House Surgeon. Salary £120 per annum.
BRIGHTON HOVE AND PRESTON DISPENSARY AND HOVE HOSPITAL.—Honorary Medical Officer.
CAIRO MEMORIAL OPHTHALMIC LABORATORY.—Ophthalmic Surgeon and Director of Ophthalmic Laboratory. Salary £1,500 per annum.
CAMBRIDGE ADDENBROOKS HOSPITAL.—House Surgeon (male). Salary at the rate of £130 per annum.
CARDIFF CITY MENTAL HOSPITAL, Whitechurch.—Locumtenent (male) for six months. Salary 74 guineas a week.
CHARING CROSS HOSPITAL W.G.2.—Honorary Assistant Radiologist.
CHELSEA HOSPITAL FOR WOMEN, Arthur Street S.W.3.—Junior House Surgeon (male). Salary £100 per annum.
COUNTY MENTAL HOSPITAL, Rainhill.—Temporary Assistant Medical Officer. Salary £7 7s per week.

Printed and published by the British Medical Association at their Office, Tavistock Square, in the Parish of St. Pancras, in the County of London.

CURRENT NOTES

ANNUAL MEETING NOTTINGHAM 1926

THE ninety-fourth Annual Meeting of the British Medical Association will be held in the latter part of July, 1926, at Nottingham, under the presidency of Mr. R. G. Hogarth, C.B.E., F.R.C.S., senior surgeon to the Nottingham General Hospital. The Annual Representative Meeting will open on Friday, July 16th, the President will give his Address to the Association at the adjourned Annual General Meeting on Tuesday, July 20th, and the Sections will meet on the three following days. The Council, on the advice of the Arrangements Committee, has decided that the scientific and clinical work of the Nottingham meeting shall be divided among thirteen Sections. We print below the names of the Sections and their Presidents, that of Anaesthetics will, it is hoped, be of the nature of an international section. The full list of officers of Sections will appear in a later issue.

Presidents of Sections

Medicine—F. H. JACOB, M.D., F.R.C.P.—(Nottingham)
Surgery—Sir D. ARCY POWER, K.B.E., F.R.C.S.—(London)
Obstetrics and Gynaecology—COMPTON BLKELFY, M.D., M.Chir., F.R.C.I.—(London)
Pathology and Bacteriology—Lieut. General Sir WILLIAM B. FISHMAN, K.C.B., K.C.M.G., F.R.S., F.R.C.I., Director General A.M.S.
Medical Sociology—C. J. DODD, M.C.M.G., F.I.C.S.—(Leicester)
Neurology and Psychology—E. FARQUHAR BUZZARD, M.D., F.R.C.P.—(London)
Ophthalmology—W. G. LANE, M.B., Ch.B., F.R.C.S.—(Nottingham)
Public Health—W. J. HOWARTH, C.B.E., M.D., D.P.H.—(London)
Diseases of Children—HUGH THURSFIELD, M.D., F.R.C.P.—(London)
Laryngology and Otology—A. BROWN, M.B., Ch.B., M.D., D.Sc.—(Glasgow)
Dermatology—H. G. ADAMSON, M.D., F.R.C.P.—(London)
Orthopaedic—E. MURHEAD, LITTLE, F.R.C.S.—(London)
Anaesthetics—SAMUEL JOHNSTON, M.D., C.M.—(Toronto)

THE ROYAL OPENING ON JULY 13th 1925

THE JOURNAL of July 18th, 1925, contained a complete account of the formal opening of the British Medical Association's House in Tavistock Square, London, on Monday, July 13th, by His Majesty the King, accompanied by the Queen. It included also descriptions of the new headquarters and of the several buildings previously occupied by the Association, and historical notes on the site of the new house and on the growth of the Association overseas. These

THE BRITISH MEDICAL ASSOCIATION'S HOUSE, TAVISTOCK SQUARE, LONDON

articles, as well as the report of the opening ceremonies, were very fully illustrated by reproductions of photographs, drawings, and plans, and the SUPPLEMENT was devoted to a facsimile in black and white of pages from the Association's *Roll of Honour*, together with pictures of the new building and of the Memorial Gates opened and dedicated on July 13th by the Archbishop of Canterbury. That issue of the *BRITISH MEDICAL JOURNAL* has, we believe, been preserved by many readers as a souvenir of a day which will ever be memorable in the annals of the Association. For the benefit of new members of the

profession and others who have not yet joined the Association, the following note recalls, very briefly, the main features of the new building.

THE ASSOCIATION'S NEW HOUSE

THE well known building in the Strand, vacated this year, was built in 1908, when the British Medical Association was 76 years old. It is very substantially built, and being the freehold property of the Association, is a most valuable asset, but owing to the immense growth of the work of the Association in recent years it had become far too small to fulfil its functions adequately, so that accommodation originally intended for the use of members generally had to be absorbed for business purposes. Meanwhile the membership had grown from 21,000 in 1908 to 29,000 at the time of the move, and is now over 39,500. The beautiful new building, of red brick with white stone facings, formally opened as the headquarters of the Association on July 13th.

stands back from the north east corner of Tavistock Square on the direct route from Kingsway to King's Cross. Part of the site was formerly occupied by Tavistock House, the home for some years of Charles Dickens. The building, as completed to the design of Sir Edwin Lutyens, R.A., has a total floor area of 58,000 square feet. The main block is supported by two wings, which with it comprise three sides of a quadrangle. Entering from the private roadway, the first objects that strike the eye are the beautiful wrought-iron Memorial Gates, opening into the Court of Honour with its circular grass plot, and behind the Gates the main block with lofty windows and handsome pediment surmounting four pairs of Corinthian columns. Right and left of the central archway on the ground floor of this block are the mahogany-panelled Library of the Association, and the Members' Common Room, most comfortably furnished for conversation, writing, and refreshments. Beneath them are large basement offices with staff dining rooms and storage accommodation. Above is the Great Hall, 130 feet long, and carried to the height of the roof. This splendid hall, with its gallery and dais, can seat more than 500 people, the simplicity of its structure is scarcely less remarkable than the boldness of its scheme of colour decoration. On the first floor of the North Wing, above the Hastings Hall, are the general offices concerned with publishing, subscriptions, and advertisements, on the second floor is further accommodation for the Finance Department, with rooms for the staff of the Medical Insurance Agency, on the third floor is the Editorial Department, and on the fourth is the printing office. The first floor of the South Wing, over the Council Chamber, contains handsome committee rooms, and rooms for the Intelligence Officer and her staff, the second and third floors are allocated to the Medical Department. The Council Chamber on the one side of the Courtyard and the Hastings Hall on the other are alike in shape and size (60 feet long, 30 feet wide, and 30 feet high), but are furnished differently. The former is panelled in oak and its floor rises in tiers placed lengthwise facing the rostrum, the latter, intended for conferences, can seat 150 persons, and its walls will shortly be fitted with oak bookcases. On the north the buildings are flanked by a modern utilitarian garage, on the south by the pleasant Council garden adjoining the grounds of the Mary Ward Settlement, with Dickens's mulberry tree

Garage Accommodation at Headquarters

Garage facilities are now available for members in the garage at the rear of the North Wing of the Association's new House in Tavistock Square. Members may garage their cars during the day free of charge, and during the night at a charge of 2s a night. There are also two lock-up garages available, the charges for which are 5s a night, 25s a week, or £40 a year, these may be let for a period of not longer than one year on a three months' notice, or for shorter periods. All applications for garage accommodation should be made to the Financial Secretary and Business Manager. The garage will be accessible only during office hours, except by arrangement with the caretaker. It must be clearly understood that the Association can take no responsibility for cars garaged on the premises.

The Great Hall British Medical Association House

and backed up by a hint that important persons in the neighbourhood have participated, not infrequently leads to acceptance of the offer, the enjoyment of a pleasurable period of anticipation, followed by disillusionment. For instance, a genial and persuasive gentleman calls who is giving away volumes of Shal espeare's works. There is, of course,

no charge, but as an afterthought he suggests that it would be a pity not to have a nice cover to protect them. Such a cover can be had for a matter of a few shillings, which, of course, must be paid in advance. The statement is made that Dr X, who lives hard by, has been supplied with one and is delighted. If the unwary doctor parts with his money he is told that the goods will reach him in a few days. Weeks pass by and inquiry brings the reply that all is well, but that owing to strike, delays in transit, and so forth there has been an unavoidable delay in delivery. Weeks pass into months but the goods do

The Council Chamber

not arrive. A further inquiry through the post comes back marked "Gone—no address." It is the old story—the bird has flown, and the doctor is so much the poorer and possibly wiser. This is no allegory. These things are happening to-day. Should a benefactor of this sort pay any of our readers a visit we advise them to show him the door.

Superannuation of Public Health Medical Officers

The British Medical Association, which for many years past has been pressing for superannuation for all medical officers employed by local health authorities, has accepted an invitation to give evidence before the Select Committee appointed to consider the Local Government and other Officers' Superannuation Act. The Association's evidence will be mainly directed to securing that the Act shall be made compulsory, and that, in consideration of the late age at which medical officers enter the service of public health authorities, legislative provision shall be made for the addition of years of service for medical practitioners employed by local authorities. Without a provision for added years, no doctor engaged whole time in public health work can retire at the age of 60, and very few at the age of 65, with the forty years' service necessary for earning a full pension.

The Central Ethical Committee and Sir Arbuthnot Lane

In some of the newspapers of June 6th last there appeared reports of a speech attributed to Sir Arbuthnot Lane and delivered at a luncheon given by the English Speaking Union to the American and Canadian doctors then visiting this country. The speech, as reported, included an attack on the status, the policy, and the proceedings of the Central Ethical Committee of the British Medical Association. Sir Arbuthnot Lane's attention was called to the newspaper reports, and this led to some correspondence between himself and the Committee. The Committee desired that this correspondence should be published, but regrets that Sir Arbuthnot Lane has not given his assent to this proposal.

Association Notices**BRANCH AND DIVISION MEETINGS TO BE HELD**

ABERDEEN BRANCH ABERDEEN DIVISION—A special meeting of members of the Aberdeen Division will be held at 29 King Street Aberdeen on Tuesday December 8th at 3.30 p.m. The business includes consideration of friendly societies contract practice.

BIRMINGHAM BRANCH COVENTRY DIVISION—A meeting of the Coventry Division will be held at the Coventry and Warwickshire Hospital on Tuesday December 8th at 8.30 p.m. and not December 1st as previously arranged. Dr Wilson will show some cases of Parkinsonian syndrome following epidemic encephalitis, and Dr Hefz will read a paper on the use of sanocrysin.

DORSET AND WEST HANTS BRANCH Bournemouth DIVISION—A meeting of the Bournemouth Division will be held on Monday, December 14th at 4.15 p.m., at St. Peter's Small Hall Bournemouth when Dr J. H. Sequiera will give a British Medical Association Lecture on some common affections of the skin. Tea at 4 p.m.

KENT BRANCH TUNBRIDGE WELLS DIVISION—The annual dinner of the Tunbridge Wells Division will be held at the Wellington Hotel on Thursday December 10th at 7.45 p.m. Tickets 10s. 6d. each. Double tickets (lady and gentleman) 20s. Private (medical) guests may be invited. Applications for tickets accompanied by remittance should be made as soon as possible (but not later than December 8th) to the honorary secretary (Dr D. Davies 8 Lonsdale Gardens Tunbridge Wells). At the conclusion of the dinner an address will be given by Mr W. E. Hempsen (Solicitor to the Association) on some pitfalls in medical practice. At a meeting of the Division to be held on Friday December 18th at 3.30 p.m. at the General Hospital Tunbridge Wells a British Medical Association Lecture will be given by Professor A. J. Hall (Sheffield) on some after effects of encephalitis lethargica.

LANCASHIRE AND CHESTER BRANCH WARRINGTON DIVISION—A meeting of the Warrington Division will be held in the Infirmary on December 11th at 8.30 p.m. Dr Core (Manchester) will read a paper on hysteria as met with in general practice.

METROPOLITAN COUNTIES BRANCH CITY DIVISION—The next clinical meeting of the City Division will be held at the Metropolitan Hospital Kingsland Road E. on Friday December 11th at 4 for 4.15 p.m. when Dr Norman Hill will show cases.

METROPOLITAN COUNTIES BRANCH HAMPSHIRE DIVISION—A Divisional meeting will be held at the Hampshire General Hospital on Thursday December 10th at 8.30 p.m. when an address will be given by Mr Alec W. Bourne, F.R.C.S. assistant gynaecological surgeon to St. Mary's Hospital on recent work on puerperal sepsis.

METROPOLITAN COUNTIES BRANCH KENSINGTON DIVISION—A general meeting of the Kensington Division will be held in St. Mary Abbott's Parish Hall Vicarage Gate Kensington W.8 on Tuesday December 8th at 8 for 8.30 p.m. An address will be given by Dr Percy John Cammidge entitled 'The use and abuse of insulin.'

METROPOLITAN COUNTIES BRANCH MARLBORNE DIVISION—A meeting of the Marlborough Division will be held at the British Medical Association House Tavistock Square W.C.1 at 8.15 p.m. on Wednesday December 9th when a discussion on the relationship of the medical profession to unqualified practice will be opened by Sir Hilbert Waring. Among those who have promised to take part in the discussion are Sir William Wilcock Dr C. O. Hawthorne and Mr Meldrum Eccles. Non-members will be welcomed, and all invited to take part in the discussion. Every member attending is asked to bring a medical friend.

METROPOLITAN COUNTIES BRANCH ST. PANCRAS DIVISION—The next meeting of the St. Pancras Division will be held at the British Medical Association House Tavistock Square W.C.1 on Tuesday, December 8th at 4.30 p.m., when Dr Robert Bronté pathologist to the Home Office, will deliver an address entitled 'A few notes on toxic pathology.' Members of other Divisions who are in the House when this address is being delivered are very cordially invited to attend. Tea will be provided.

METROPOLITAN COUNTIES BRANCH SOUTH MIDDLESEX DIVISION—A meeting of the South Middlesex Division will be held at St. John's Hospital Twickenham, on Wednesday, December 9th at 8.15 p.m. At 8.30 Dr R. Langdon Down will read a paper on the work of the British Medical Association.

MIDLAND BRANCH CHESTERFIELD DIVISION—A meeting of the Chesterfield Division will be held at the Maternity Hospital, Chesterfield, on Friday December 11th, at 8.15 p.m. when Dr J. S. C. Douglas Professor of Pathology University of Sheffield will give an address on passive immunity. Tea and coffee at 8.

NORTH LANCASHIRE AND SOUTH WESTLONDON BRANCH—A meeting of the North Lancashire and South Westlondond Branch will be held by kind permission of Dr Hough and the governors of the hospital at the Ethel Hedley Hospital Calgarth Windermere, to day (Saturday December 5th) at 3.15 p.m. Professor J. A. Nixon C.M.G., M.D. (Bristol) will give a British Medical Association Lecture on insulin treatment of diabetes with particular reference to the complications of diabetes and surgery in diabetes.

SOUTH WALES AND MONMOUTHSHIRE BRANCH CARDIFF DIVISION—A meeting of the Cardiff Division will be held at the Engineers Institute Cardiff on Wednesday December 16th. Dr J. Stanley White (London) will give a lecture illustrated by lantern slides on recent advances in endocrine therapy.

SOUTH WALES AND MONMOUTHSHIRE BRANCH MONMOUTHSHIRE DIVISION—A meeting of the Monmouthshire Division will be held at the County Hall Newport on Tuesday, December 15th at 2.30 p.m. Agenda: Correspondence to receive and adopt the report of the Executive Committee of the Monmouthshire Division as to the Ebbw Vale Workmen's Medical Society to discuss and vote upon a resolution in connexion therewith address on cancer and its treatment by Mr Duncan C. L. Fitzwilliams C.M.G., F.R.C.S. surgeon to St. Mary's Hospital London.

SOUTH WALES AND MONMOUTHSHIRE BRANCH SWANSEA DIVISION—An ophthalmic meeting will be held by the Swansea Division at the General Hospital, Swansea, on Thursday, December 17th at 8.15 p.m.

SOUTH WESTERN BRANCH EXETER DIVISION—The next meeting of the Exeter Division will be held in the Library of the Royal Devon and Exeter Hospital on Friday December 11th at 4.30 p.m. A lecture and demonstration on the use of plaster of Paris in the treatment of fractures and other surgical conditions will be given by Mr Norman Lock. Tea at 4 p.m.

STIRLING BRANCH—A clinical meeting of the Stirling Branch will be held on Wednesday December 9th at 3.15 p.m. within the Falkirk Infirmary when surgical cases will be shown by Dr A. L. Hunter and Mr Tennant (Glasgow). Dr Pendleton White will demonstrate a few eye cases and thereafter Dr David Shannon (Glasgow) will open a discussion on some common mistakes of obstetric practice. Tea will be served after the meeting.

SURREY BRANCH REIGATE DIVISION—A meeting of the Reigate Division will be held at the East Surrey Hospital Reigate on Tuesday December 8th at 8.45 p.m. Dr H. C. Cameron will read a paper on some complaints of children.

WORCESTERSHIRE AND HEREFORDSHIRE BRANCH HEREFORD DIVISION—A meeting of the Hereford Division will be held at 20, East Street Hereford on Monday, December 7th at 3.30 p.m. It is hoped that every member will endeavour to attend as the agenda is of importance including mileage fees in emergency midwifery cases and the position of school medical officers. A lecture under the auspices of the Division will be given at the Herefordshire General Hospital on Monday December 14th at 3 p.m. by Dr J. Stanley White on some recent aspects of gland therapy. The lecture will be illustrated by lantern slides. A large attendance is hoped for. Tea will be provided.

YORKSHIRE BRANCH BRADFORD DIVISION—A combined meeting will be held with the Bradford Medical-Chirurgical Society on Tuesday December 8th.

YORKSHIRE BRANCH HUBBERTSFIELD DIVISION—The medical dance will be held on Wednesday December 16th in the Royal Infirmary from 9 p.m. to 1 a.m. Reception 8.45. For those who do not wish to dance a bridge drive commencing at 9.15 will be arranged. Tickets 8s. 6d. each admission by programme. As the dance will only be held if a sufficient number of tickets are sold, it will greatly assist the committee if members will inform the honorary secretary before December 5th of the number of tickets required.

YORKSHIRE BRANCH SHEFFIELD DIVISION—A meeting of the Sheffield Division will be held in the General Lecture Room The University Sheffield on Friday December 11th at 8.45 p.m. when a British Medical Association Lecture will be delivered by Dr William Cramer D.Sc. F.R.C. of the Imperial Cancer Research Fund on the present outlook on cancer. A cordial invitation to be present is extended to all members of the medical profession.

YORKSHIRE BRANCH WATFORD POTTERFAC AND CASTLEFORD DIVISION—A meeting of the Watford Potterfack and Castleford Division will be held at the Playhouse Westgate Wakefield on Sunday, December 13th at 3.30 p.m. when Colonel L. W. Harris (Special Medical Officer for Venereal Diseases to the Ministry of Health) will deliver a British Medical Association Lecture on the management of syphilis, illustrated by a cinematograph film.

Meetings of Branches and Divisions

METROPOLITAN COUNTIES BRANCH SOUTH MIDDLESEX DIVISION

An ordinary meeting of the South Middlesex Division was held at St John's Hospital, Twickenham, on November 11th, when Dr GUTHRIE was in the chair.

Address by Dr C P Symonds

After the transaction of Divisional business, Dr C P Symonds, assistant physician for nervous diseases Guy's Hospital, read a paper entitled "Functional or organic? Some points of view." Discussing first the organic point of view, Dr Symonds referred to the belief that the functional nervous disorders would eventually prove to depend upon as yet undiscovered lesions of the brain or cerebellum. He quoted certain cases of encephalitis lethargica as evidence that symptoms of the neurotic type might be due to organic disease but believed that these cases were distinguishable from the main body of neurotics if their symptoms were carefully studied. This led him to the psychogenic point of view which supposed that neurotic symptoms were due to faulty habits of mind, and that if any physical change existed in the brain this was the result rather than the cause of the mental habit. The proof of this lay in the results of treatment, as, for instance, in the case of an hysterical paralysis in which the patient's ability to move the limb depended upon his attitude of mind towards it. He quoted cases of anxiety neurosis in which equally striking relief from symptoms had been obtained by psychotherapy.

Infective and toxic conditions might also be responsible for neurotic symptoms and an example of early tuberculous infection was quoted. But the importance of septic foci in the causation of the neuroses had been much exaggerated. One met with plenty of neurotics who had had tonsils or teeth extracted, but few who obtained from such treatment more than the temporary benefit that might be expected from its suggestive effect.

The striking improvement in the mental state obtained by giving thyroid to cases of myxoedema had led to the notion that the neuroses might depend upon disorders of endocrine balance, but here again the results of treatment had been disappointing. On the whole it must be confessed that the drug houses had profited more than the patients from this line of treatment.

Nervous exhaustion was held by some authorities to be an important factor. The term, unfortunately, was loosely worded. Actually in a number of cases of which he quoted an example, after rest had failed to effect a cure common sense psychotherapy and return to work had succeeded.

It was advisable, therefore to bear in mind that minor mental disorders might result from a variety of causes—organic cerebral disease, toxæmia, endocrine disorder, and exhaustion—but that the most important factor in most cases was failure on the part of the patient to deal with his emotional problems. Dr Symonds believed that a proportion of those who developed later in life the habit of chronic nervous invalidism might have been saved from this fate by psychotherapy in the earlier stages. Unfortunately this entailed some responsibility on the part of the patient who often preferred to be told that the illness depended upon obscure toxicæmic factors outside his own control. Such opinions given often without adequate proof, led in some cases to the opportunity for really effective treatment being missed.

In the discussion that followed the paper Dr GUTHRIE said that he had not found much benefit from vaccines and mentioned one of his cases which had not improved by psychotherapy. Dr CAMPS referred to a case treated by vaccines greatly to the satisfaction of the patient. Dr REID recalled the parallel case of those who cured rheumatism and were not cured themselves. He was of the opinion that the true causes and cure of neurotic symptoms had not yet been discovered, and asked regarding cases where no lesion was found, whether they might not nevertheless be organic. Dr HUME was interested in the case of the student and asked Dr Symonds if this fitted in with the Freudian theory. Dr DAFKE described several cases which had recently come under his observation two of which he thought were due to encephalitis or some form of toxæmia. He asked what degree of nystagmus should be regarded as pathological.

In reply, Dr Symonds stated that with regard to inequality of pupils it was fairly common in normal people, the main significance was its reaction to light and accommodation. Concerning the ice bag, he considered it a useful line of treatment. He was of opinion that there might be disturbance of synaptic junctions in cases with no organic lesions—these cases could be cured by reversing the reaction of mind. The student mentioned by him who was disinclined for work was not of a sexual type. His complaint was due to the fact that his success had been obtained by plodding.

METROPOLITAN COUNTIES BRANCH WILLESDEN DIVISION

Divisional Dinner

The Willesden Division held a most successful dinner on November 15th at the Criterion Restaurant, Piccadilly Circus. There was a good attendance of members, their wives and friends, and the principal guests were Dr H B Brackenbury and Mr George J. Laine, J.P. The chair was occupied by Lieut Colonel H. HINKPATRICK, the chairman of the Division. After an excellent

dinner, the toast of 'The Willesden Division of the British Medical Association' was proposed in cordial terms by Mr G B MOWER WHITE, I.R.C.S., who praised the spirit and work of the Division. The CHAIRMAN responded in the happiest manner and described some of his Indian experiences. The toast of 'The Willesden Hospitals' was proposed by Dr BRACKENBURY in a most instructive speech, in which he described the working of the Hornsey Hospital. In that hospital as he explained there was free right of entrance to all the practitioners in the district, and they were at liberty to bring in their patients and give them the necessary surgical or medical treatment. He showed that the system worked in a completely satisfactory fashion and that thorough efficiency and competence were maintained. A triple reply was made by Mr G J. LURNESS, J.P., Dr A G TROUP, and Dr W L TURNER, all of whom described in an effective way the work of the hospitals. Dr Turner's humour being especially appreciated. The toast of 'The Guests' was proposed by Dr LOCK in a neat speech full of Scotch humour. To this toast two replies were made. On behalf of the ladies Miss A L LAWRENCE, Intelligence Officer of the British Medical Association, spoke with precise brevity and grace. Mr JAMES JOHNSTON, secretary, Middlesex Panel Committee, replying on behalf of the gentlemen, referred to the opportunity which such gatherings gave to a statesman of the profession like Dr Brackenbury to learn the gifts and characteristics of the local units of the profession, and then gave interesting thumbnail sketches of three family physicians with whom he had professional contact. The toast of 'The Chairman' was proposed by Dr STOCKER in a felicitous speech. Suitable acknowledgement was made of the work of Dr LOCK in organizing the dinner and of Drs Scott, Stocker, and Sturridge, who were associated with him.

METROPOLITAN COUNTIES BRANCH CITY DIVISION

In conjunction with the Aesculapian Society, a clinical meeting was held on November 13th at the Metropolitan Hospital. There was a good attendance.

Mr R A RAMSAY F.R.C.S., surgeon to the hospital showed the following cases, with notes and x-ray plates. Excision of knee for old tuberculous disease in a man aged 18. Abdominal swelling, two cases of osteitis deformans, spontaneous fracture of first metatarsal, hairy growth on tongue, talipes calcaneus, Pott's disease of spine, osteo arthritis of hip and elbow, coxa vara (adolescent) haematoma sternomastoid swelling on hip.

The meeting closed with a very hearty vote of thanks to Mr Ramsay, and his house surgeon for the very interesting and instructive afternoon.

BIRMINGHAM BRANCH NUNEATON AND TOMWORTH DIVISION

The second meeting of the session of the Nuneaton and Tomworth Division was held on November 18th at the Nuneaton General Hospital. Mr H BECKWITH WHITEHOUSE M.S. F.R.C.S. (Birmingham) read an exceedingly interesting paper entitled 'Notes from an osteo-clinic.' The meeting was largely attended, and Mr Whitehouse's paper was followed by an animated discussion in which a number of members took part. A vote of thanks to Mr Whitehouse for his very valuable paper was carried by acclamation.

CAPE OF GOOD HOPE (MIDLAND) BRANCH

A GENERAL meeting of the Cape of Good Hope (Midland) Branch was held at the Provincial Hospital, Port Elizabeth on September 20th, when Dr R D LAURIE was in the chair. He exhibited plaster casts and x-ray photographs of a case of hallux valgus before and after osteotomy showing excellent results.

The report of the committee of inquiry on public hospitals and kindred institutions was laid before the meeting. After discussion of the various clauses the report was adopted with the exception of minor clauses, where alternative suggestions were made.

ZANZIBAR BRANCH

A MEETING of the Zanzibar Branch was held on August 20th at the Health Office. Dr Copland was elected president and Dr Semple honorary secretary and treasurer.

The accounts of the preceding year were submitted and agreed to. A communication from the Deputy Medical Secretary of the Association requesting the comments of the Branch on the Medical Practitioners Decree of 1925 (Dent Certificates) was considered. It was pointed out by Mr SPEARMAN, acting director of medical and sanitary services that this death report form had been drawn up in this particular way because in addition to registered medical practitioners, there were also certain other persons licensed to practise and to sign death reports and it was considered that this form would tend to bring to light any irregularities and hence was a necessary measure of protection to the public. The meeting, therefore, came to the unanimous conclusion that members of the Association practising in Zanzibar should agree to make use of this form without requiring a fee.

The new regulations for the East African Medical Service as contained in Colonial Office publication No 1103 were considered. It was pointed out that both medical officers and sanitary officers were thereby deprived of certain financial privileges—namely the right of private practice or an allowance in lieu thereof which were expressly held out as inducements when they joined the service.

On the motion of Dr RANA seconded by Dr COPLAND it was agreed that a memorandum on the subject be prepared for submission to the Council of the Association and requesting the Association to make representations to the Colonial Office to consider and rectify this anomaly by restoring the allowance to medical officers of health and granting a similar allowance to medical officers in those stations where private practice is prohibited.

GENERAL COUNCIL

OR

MEDICAL EDUCATION AND REGISTRATION

WINTER SESSION, 1925

(Continued from page 187)

DISCIPLINARY CASES

Indirect Advertising

THE Council devoted the whole of its sitting on November 28th to the consideration of a charge of indirect advertising, in which the British Medical Association was the complainant, against William Lloyd, F.R.C.S. Ltd., of Brook Street, Grosvenor Square, London. After a hearing which lasted for two and a half hours and a private deliberation of half an hour, the Council decided to instruct the Registrar to erase Mr Lloyd's name from the Register. The charge was as follows:

That being a registered medical practitioner you—
Sought to obtain patients and to promote your own professional advantage by means of an article published in the *Daily Mail* of June 5th, 1925 entitled

HAY FEVER—NEW TREATMENT—SPECIALIST'S REPORT—PATIENTS CURED,
which was based upon materials supplied by you
Sought to obtain as patients certain persons who after reading the article had written to the *Daily Mail* for your name and whose letters were forwarded to you by the *Daily Mail* and to whom you wrote inviting appointments to be made for treatment although they had not themselves communicated with you
And that in relation to the facts so alleged you have been guilty of infamous conduct in a professional respect

Mr Lloyd appeared in person and was defended by his counsel, Mr J. B. Melville. Mr W. E. Hempton, solicitor, appeared on behalf of the British Medical Association. The President, Sir Donald MacAlister, directed all members of the British Medical Association who were members of the Council to withdraw. About twelve members thereupon retired and took no part in the proceedings.

The Complainant's Case

Mr Hempton in opening said that this case was one of the most important that had ever come before the Council. It was important alike to the profession and the public and for that reason the British Medical Association felt it a duty to bring the facts to the knowledge of the Council. It was specially important in the interests of the public in view of the comments upon the matter of advertising by doctors which appeared from time to time in the press. The latest of these in a London journal published the previous evening referring to a case which had been before the Council declared that doctors like other people, must take the public into their confidence. The article which was the concern of the present inquiry was published in the most conspicuous position in the *Daily Mail* was headed in heavy type and was said to be by a special correspondent. Mr Hempton then proceeded to read the article.

The article began by stating that sufferers from hay fever could take hope for the future for a prominent West End specialist had at last found an absolute cure for this distressing malady. This good news came at a most opportune time when many people were victims. The treatment was carried out by such a simple device as sprays attached to an electrically driven pump which sprayed a healing solution over the inflamed membrane. The relief was almost instantaneous. The writer stated that in his own case the treatment was continued for perhaps twenty minutes, and at the end he walked out quite a different person. There were persons afflicted with this malady that they had been unable to take part in any social occasions but after this treatment with in some cases only one or two applications and in the majority not more than six they were able to lead a normal life. The article went on to state that the specialist had put some of his cases to three severe tests. One of the tests was for a group of former hay fever patients to spend nights in a tent in a hayfield and they had no relapse. It was stated that the composition of the remedy was a secret but there were no ingredients of a harmful nature.

It appeared that in another edition of the *Daily Mail* for the same date some further paragraphs were added, in which the specialist was reported as stating that he condemned any form of injection as useless that it was necessary to go direct to the nasal mucous membrane and the pharynx for the seat of the trouble and that some of his patients had come to him disappointed after the use of much advertised remedies while others had been confident that serums had helped them but on inquiry he had always found that relief was due to other causes such as a change of temperature.

Mr Hempton after reading the article said that without wishing to be unduly severe he could not help thinking that it read like an advertisement by an unqualified person of a secret remedy which he desired to foist upon the public under the aegis of that journal. Information reached the British Medical Association that three persons admittedly suffering from hay fever and seeking some remedy for a very trying complaint communicated with the editor of the *Daily Mail* with a view to ascertaining from him if possible who was the specialist with this complete and assured remedy. The evidence of these persons was set out in three statutory declarations and as he understood from the counsel on the other side that they would not be challenged he had not thought it necessary to retain these persons as witnesses,

though they had in fact been in attendance at the time of hearing originally fixed. The first was a gentleman in Bradford who wrote to the editor stating that he was much impressed by the article and received in reply an undated letter as follows:

Dear Sir—We now have permission from the doctor referred to in our article on hay fever in the *Daily Mail* of Friday June 5th to give his name and address to inquirers. It is as follows: Dr William Lloyd, 58 Brook Street, London W. We regret that this is all we can do to assist.—Yours faithfully The News Editor

On June 26th, about a week after writing his original letter this gentleman in Bradford received a card giving an address and telephone number, and stating

Mr William Lloyd will be pleased to see Mr G— by appointment. Fees 4 guineas and 2 guinea.—(Signed) E. LOVETT, Secretary.

The second declaration was by a lady living in Earl's Court who after her inquiry received an undated letter from the editorial department of the *Daily Mail* stating that her letter had been forwarded to the doctor referred to in their article on hay fever. She sent this letter to the British Medical Association. She also received by post on June 26th a card in the same terms as the one received by the first witness. The third declaration was made by a gentleman in Bury St. Edmunds, who in reply to his inquiry received a letter in the same terms as that received by the lady and later a communication stating that Mr Lloyd would be pleased to see him by appointment. None of the persons decided to put themselves under Mr Lloyd's treatment.

The article was clearly written with Mr Lloyd's knowledge and further, after publication on inquiries being made as to the name of the specialist referred to, he allowed his name to be disclosed. Two persons who had made declarations in this article came from very different parts of the country and it was impossible to conjecture how widely this advertisement had gone and how many others had similarly sought information. He had discovered that the circulation of the *Daily Mail* in June was 1,744,000 copies a day. The announcement in such an organ of a specific cure for a widespread complaint would attract great attention and when the identity of the specialist referred to was disclosed it would probably become the most gigantic advertisement that a member of the medical profession had ever received.

Two letters had been put in on behalf of the respondent both dated October 1925. In one of them Mr Lloyd wrote to the Registrar stating that this matter had caused him considerable annoyance, but that he understood the *Daily Mail* would explain how his name came to be disclosed. Mr Lloyd went on

As several months have passed it is difficult to remember the exact sequence of events but I do remember that a potent of mine a distinguished journalist did ask my permission to incorporate in an article some information I had imparted to him with regard to hay fever. I had no objection to this provided my name was not disclosed. It appeared that subsequently my name was disclosed to a few persons who made inquiries of the *Daily Mail* and some letters were forwarded to me. Apparently owing to a misunderstanding of instructions I gave my secretary appointments were made for me to see two or three of the persons. On an average I saw between twenty and thirty patients a day, the great majority of which are made by my secretary. I do not think I have any personal acquaintance with any of the patients who sent them to me.

The other letter from the manager of the Legal Department of Associated Newspapers Limited (the proprietors of the *Daily Mail*) ran as follows:

Mr W. Lloyd has pointed to us in reference to a communication he has received from you relating to an article which appeared in the *Daily Mail* in June last. A well known member of the staff of the *Daily Mail* was a patient of Mr Lloyd and in course of treatment for hay fever Mr Lloyd mentioned to him some of the points of his treatment which he was incorporating in a book. The member of our staff thought that the matter would make an interesting article and told Mr Lloyd of his intention to write one. Mr Lloyd said he had no objection to an article being written embodying some of the information he had imparted but under no circumstances was his name to be mentioned or any other indication given that the material for the article came from him. The article was written and in due course published but no proof was submitted to Mr Lloyd and in due course published but no proof was submitted to Mr Lloyd. The article attracted considerable attention and we received a large correspondence and many telephone calls from our readers. Unfortunately it appears that some subordinate member of our staff who was aware of the fact that Mr Lloyd had imparted the material for the article communicated over the telephone Mr Lloyd's name to a limited number of those readers. In addition to which it appears that the writer of the article did ask Mr Lloyd to give appointments to a few selected cases which had been brought to his attention. For the oversight on the part of the member of our staff who communicated Mr Lloyd's name in response to some inquiries we can only express our regret for any annoyance caused him.

Mr Hempton said that if the 'subordinate member of the staff' knew that Mr Lloyd had given the information it seemed reasonable to suppose that the information was common property to the staff and that they understood that any sufferer from hay fever should be referred to Mr Lloyd as the person to whom it should go. The extraordinary phrase, 'a few selected cases' was used in this letter. By whom and in what circumstances were these cases selected?

Mr Melville made an objection at this point. He was ready to meet the charge set out against the respondent but it was grossly unfair to import into the case prejudice against Mr Lloyd by reason of a phrase used in a letter on his behalf written by somebody else. The statements in that letter ought not to be made the basis of an additional charge.

The Legal Assessor said that Mr Hempton was entitled to read the comments he had made and later the Council would judge to the weight of those comments.

Mr Hempton regretted that Mr Melville should have used the phrase 'grossly unfair.' He had only wished to point out that there must have been some conference between Mr Lloyd

and the writer of the article as to how inquirers should be selected for treatment. In conclusion he reminded the Council of its Warning Notice in respect to advertising and canvassing.

The Defence

Mr William Lloyd, in evidence, stated in reply to his counsel that he had been in practice for several years as a nose and throat specialist. He stated his qualifications, appointments, contributions to medical journals, and his authorship of a book entitled *Hay Fever, Hay Asthma, Its Causes, Diagnosis, and Treatment*. He was also the inventor of the otoscope. On June 4th last he received a visit from Sir Percival Phillips, who came to be treated for hay fever. In the course of the treatment his patient said, "This would make an interesting article, and added something to the effect, 'If I wrote it would you mind?'" Mr Lloyd replied, "I hope that on no condition will you disclose my name in any shape or form." No proof was sent to him. He saw the distinguished journalist the following day—the day on which the article was published—when he came again for treatment. He gave the *Daily Mail* no permission to write letters to inquirers giving his name and address. He had no communication at all with the *Daily Mail*. Sir Percival Phillips asked him if he would take certain cases from among those which had inquired, and he agreed. Asked how it came about that his professional cards were sent to people who had written to the *Daily Mail*, he denied that he arranged with the *Daily Mail* to send on letters or that he instructed his secretary to send out cards in answer to any letters that might come from the *Daily Mail*. He only wanted her to send the cards to a few selected cases which the writer of the article had sent on. In reply to the President, who asked who was to select the cases, the witness said, "Sir Percival Phillips." He affirmed that it was never his desire to seek any professional advantage by means of this article. "It is too ridiculous to think that I need such a thing as that 'I am too busy.' Does your practice run into some thousands a year?" Many thousands," Mr Lloyd added, that if he had overstepped the limits of professional etiquette he desired to tender his apologies to the Council.

Cross Examination

Mr Hempsen asked how the information given to Sir Percival Phillips was conveyed— orally or in writing—Mr Lloyd said that he imparted the information during treatment—there was no writing at all.

The article gives particulars of groups of cases treated by you. Are the facts stated in the article as to the composition of these groups correct?—Absolutely incorrect—every word.

In the course of the article it is stated the composition of this remedy is of course a secret. Was that told by you to the writer?—I never used the word secret.

There are some paragraphs in the article in which the specialist himself is supposed to be speaking. Was the material contained in those paragraphs supplied by you?—Not one word of it.

Did you give the writer a description of the three tests you had employed?—It is all untrue. I never mentioned it. Sir.

There is scarcely a word of truth in the article is there?—Not one word of it is my wording.

The President: Sir Percival Phillips wrote this article, no doubt in his own words, but the words express something in which he must have got from somewhere. Did he get that something from you?—Yes.

Was the material in connexion with these three tests supplied by you to him?—I do not remember.

Did you say anything about a group of hay fever sufferers spending the night in a tent in a hayfield and having no relapse?—I never said that.

Or anything like it?—Nothing like it.

Mr Hempsen: Then there are many points in the article which are not based on anything he said?—Yes.

Have you seen the writer since the article appeared?—I treated him on three or four occasions after the article appeared.

Did you protest against what had been published as being untrue?—Strongly.

Are you calling Sir Percival Phillips as a witness?—No.

What form did your protest take—by word of mouth or by letter?—By word of mouth.

When was it made?—The day the article appeared and the two subsequent days when the writer came again for treatment.

What was his explanation?—He did not say very much. He seemed to smile.

It was subsequent to your protest being made that you and he selected the patients?—I did not select any.

The President: You protested that he had published an untrue article about you? Was that what you said?—Yes.

But afterwards you agreed with him to receive patients who had applied to him in consequence of that false article?—Yes.

Mr Hempsen: Did he give you a list of the names of those patients?—He said, "I will send a few selected cases to me." When they arrived I told my secretary to receive them and arrange appointments.

The President: What are your uniform consultation fees?—Four guineas for the first visit and two guineas subsequent visits.

Mr Hempsen: When my friend asked you why you did not want your name disclosed you gave the reason, owing to his enormous practice. Was that really the reason?—I did not want my name in any way associated with the affair.

Did you consider the ethical side of the question at all?—Oh, yes.

And did you come to the conclusion that you were justified in doing what you did?—Certainly not. I did not think that anything would come of this. I had no idea that the article would appear.

You did attend a few selected cases?—Yes, on professional terms.

How was your secretary to know which were these selected cases?—They would hand in letters. I told her the previous day that I might have the patients and she was to give them appointments.

On what principle did the selection of patients take place?—It was left to Sir Percival Phillips to send on any cases.

You left it entirely to his judgment to pick out from the mass of those inquiring the few who were to come to you?—Yes.

Questions were then put to Mr Lloyd by members of the Council through the chair.

The President: After all, did you write to the *Daily Mail* protesting against it?—Certainly not.

Why did you say it is a lie?—I said it is a lie.

Why did you not say so to the writer when he came next day?—I did not see him.

What did you say to him?—That I was very much surprised at the wording of the article. It was all so foreign to me. I told him that I thought he might have communicated with me before the article was published. To that he made no reply whatever simply diverted the talk.

You were satisfied with that?—Well, I made a strong protest, and he said he was sorry.

You have said that this article was false from beginning to end and practically that he invented the whole thing?—I can almost say that.

And yet there was no question in your mind that he was referring to you in the article?—The wording is the invention of Sir.

Ah, yes the wording but not the substance?—I gave him the substance during the treatment.

Did he take any notes of the substance?—None at all.

Have you written a book about hay fever?—Yes.

Did you give him a copy?—No.

Did you tell him about the book?—Yes, he saw the book. I handed him a copy to look at.

Could he have got any part of this article out of the book?—He could get out the information about the serum treatment.

Did you talk to him about that?—I told him it had been disappointing and unsatisfactory. I rang up the *Daily Mail* and told them on no account to give my name.

The President: The same day?—It might have been two or three days afterwards.

Then when it is stated by their news editor that you gave permission for your name to be mentioned that is a lie?—A deliberate lie.

A strange statement to make. Remember what the news editor says. We now have permission from the doctor referred to. You say that is a deliberate lie?—It is a deliberate lie.

On another occasion the news editor writes, "I have to acknowledge receipt of your letter and to state that it has been forwarded to the specialist referred to." When the matter arose I told them not to send any letters or give my name in any shape or form.

Sir Percival Phillips had your permission to send you cases which came to the *Daily Mail* or himself which he might select?—His words were, "I would like you to see a few cases."

You gave your permission?—Yes.

In the letter sent on your behalf from the Legal Department of the Associated Newspapers it is stated that Mr Lloyd said he had no objection to an article being written embodying some of the information he had imparted. Is that true?—Yes, he said, "I might write this, and I said, 'Yes as long as you do not mention my name or identify me.'"

The Legal Association: Did you read the article as the morning it was published?—Yes.

Did you protest then?—I told the writer the same day.

And he took no notice?—He only smiled.

Do you wish the Council to understand that you made any protest?—What was the strongest thing you said?—I said that the whole thing was very wrong, that he had come at 4 o'clock in the afternoon in the height of the season when I was very busy, and the article appeared next morning and I was very upset. I repeated the same thing on subsequent days when he came.

And he never made any answer or said that it was untrue that his article was a mixture of fact and falsehood?—He said that he was sorry that I had written what he had written.

What did he say when you told him the article contained a lot of things which were not true?—He expressed his regret and said it would never occur again.

Did he not make any answer to your charge?—He said it made a fine newspaper headline.

Concluding Speeches

Mr Melville at once admitted that his client had been very judicious to give any material at all to journalists, but the case did not amount to infamous conduct. Having regard to Mr Lloyd's busy and lucrative practice there was not sufficient evidence of any desire to enlarge it by such means as these. It was easy when talking to journalists to have things carried up afterwards in a form which, if not entirely untrue at all events conveyed a wrong impression. The protests of people who complained of being misinterpreted formed part of the everyday life of journalism. Not long ago there was a sensation because the Prime Minister as a result of some charity remarks to a journalist found himself the subject of an interview in a Sunday paper in which all manner of things were purported to have been said by him. Mr Lloyd was engaged in the treatment of this distinguished journalist and it occurred to the journalist that there was in Mr Lloyd's method useful material for an article. It would have been wiser if Mr Lloyd had said that nothing must appear but, of course, the article was written in the popular style to be expected in a paper with such an immense sale. It was done to catch the attention of the man in the street who in most cases forgot all about it immediately afterwards. The last thing Mr Lloyd could do in the circumstances was to make any effective protest to the *Daily Mail*. With regard to the rest of the complaint there had been a good deal of surmise and conjecture, but it was incredible that Mr Lloyd was desirous of building up a practice upon this necessarily isolated advertisement. When a certain number of people wrote making inquiries the newspaper was bound to furnish some foundation for what it had published otherwise it would have been open to the reproach of its readers and might well have been challenged by its contemporaries. Therefore a few patients were selected by Sir Percival Phillips out of a large number of inquirers and passed on to Mr Lloyd for treatment. Mr Lloyd wished to express to the Council his regret. In a long professional career not without distinction he had hitherto conducted himself in an honourable manner, and had never before been in a position in which any professional censure could have been directed against him.

Mr Hempsen said that his friend had asked what Mr Lloyd could do about it when he discovered that the article had been published. Well the last thing he should have done was to agree to treat the patients who came through the medium of this advertisement.

Judgement

The Council then deliberated in camera after which the President announced the decision as follows.

Mr Lloyd I have to announce to you that the Council have found the facts alleged against you in the Notice of Inquiry proved to their satisfaction. They have judged you to have been guilty of infamous conduct in a professional respect and have directed the Registrar to erase your name from the Medical Register.

"The Newell Treatment for Tuberculosis"

The Council on November 30th considered the case of Joseph Benson Hooker, LRCS Ed LRCP Ed MD Durh, registered as of 4 Spanish Place, Manchester Square, London, who was summoned on the charge that he had sought to attract to himself patients and to promote his own professional advantage by associating himself with the advertising and canvassing carried on through the medium of articles published in *John Bull* in March, April and May last relating to an alleged 'consumption cure' known as the Newell treatment. It was also charged against Dr Hooker that he had sent circular letters regarding the 'cure' to persons not under his charge, but whom he thereby hoped to secure as patients and that he had endeavoured in his own advantage to induce practitioners to use in the treatment of their patients and to make themselves responsible for a medicament of whose properties and action such practitioners were ignorant, while refusing to disclose to them the compositions or formulae.

The complainant was the Medical Defence Union, represented by Mr Oswald Hempson. Dr Hooker was represented by Mr Freedman.

Mr Hempson, in opening, said that this was a very serious case of consistent advertising. He understood Dr Hooker's defence to be that he was an honourable and reputable member of the profession and that all he did was returned by motives of philanthropy and a desire to combat a national scourge. Mr Hempson thought it might appear from the facts that the motives were not so disinterested. He then read to the Council the articles in *John Bull*. The articles had startling headlines and subheadings and were accompanied by portraits of the Minister of Health, the President of the General Medical Council, Sir George Newman, and others. The claim advanced in these articles was for nothing less than a certain cure of consumption. It was stated that a research chemist, Mr Newell, had prepared a serum which he believed to be an effective antidote to the tubercle bacillus. The article stated that Mr Newell was not a member of the medical profession and believed that his discovery would not receive professional recognition but be consulted at a West End specialist on tuberculosis. The article went on to give details which Mr Hempson submitted could only have been furnished by a medical man. The writer stated that this treatment was either mere quackery or the most stupendous medical discovery of modern times and that in either case it demanded investigation by the General Medical Council, to which a certain offer was made in *John Bull* evidently under a misapprehension as to the Council's functions. In a second article published a week later, it was stated that about fifteen London doctors were already treating their patients with this preparation, and that about a hundred cases had so far been dealt with yielding 95 per cent of cures. It was also stated that the Ministry of Health was prepared to make an investigation, and that those concerned in introducing the remedy were ready to place the formula in the hands of the General Medical Council under the usual pledge of secrecy. *John Bull* was determined to act in the interests of the sufferers, and criticism was directed against the inaction of various medical bodies including the British Medical Association which was 'setting itself against the treatment.' It was also stated that the Ministry of Health had been offered 15,000 treatments for the benefit of the poor but this had been ignored. We deny to officialdom the right to delay the matter any further.

Mr Hempson then went on to read certain correspondence. One letter signed per pro J S Hooker, chairman of the said committee, was to a gentleman stating that his name and address had been received from *John Bull* with an intimation that he was desirous of undergoing the Newell treatment for tuberculosis. Such treatment (the letter proceeded) was only carried out through qualified medical men and on receipt of the name of the correspondent's doctor it could be arranged for him (the doctor) to have supplies of the medicament. If, for any reason the doctor was unable to take up the case the correspondent could be put in touch with another medical man or it might be arranged for a member of the staff to give the treatment. The letter added that a committee of duly qualified medical men are in constant attendance here (at 4, Spanish Place). Another letter, sent to a patient, stated: 'I shall be pleased to send your doctor sufficient treatment to last you for a month on receiving two guineas, which is the charge for the same. This was signed per pro J S Hooker. In reply to a letter from the Registrar, Dr Hooker had written admitting that he had drafted a circular letter putting forward to the medical profession the claims of the treatment but he argued that this letter made it clear that the treatment was only to be used through qualified medical men, and he quite failed to see how this could be called 'outing for patients.' Dr Hooker had added that a few copies of this circular letter were despatched to prospective patients who could not get treatment through ordinary medical channels. He did not know what course he ought to have pursued in regard to these persons in view of the fact that they were suffering from this fell disease for which he believed he had a certain cure. When asked by the Registrar to give the names of the 'duly qualified medical men' who were constantly in attendance at this address to deal with cases by the Newell treatment—for *John Bull* had stated that it was prepared to furnish to the General Medical Council the names of the committee—Dr Hooker replied that he had promised not to divulge the names without the consent of the persons concerned and as they had declined at present to give their permission it was unanimously agreed that it would serve no useful purpose to anyone to acquaint you with such names, at all events until the long

series of test treatments are published to the profession. "If any explanation is needed," added Mr Hempson, "as to why that gentleman stands alone before you it is contained in that letter." When asked in some further correspondence with another party why he did not bring this discovery before the medical societies Dr Hooker wrote: "I have no time to attend such meetings as you mention. Another statement was that although the members of the committee were not at present allowed to divulge the formula, they gave their assurance and guarantee that it had no dangerous reaction whatever. Letters were read from two doctors stating that their names might be removed from the list of those receiving the medicament because they hesitated to use a remedy of the composition of which they were unaware or because there were circumstances in connexion with this matter which they did not like. Mr Hempson also drew attention to a small pamphlet 'The Newell treatment for tuberculosis.' This also bore out that the discovery was kept secret and not offered freely and unconditionally to the profession. It stated however that the remedies employed were quite orthodox and a number of testimonials from patients as well as doctors were appended. Mr Hempson concluded by describing this as the most undoubted case of advertising which had ever come before the Council. The medical societies and journals were amenable to this gentleman but he chose to have recourse to a lay paper of the type of *John Bull*.

Mr Freedman in defence put in a certificate stating that Dr Hooker was suffering from angina pectoris and that he was unfit to stand examination. The Council would be better able to judge than himself whether Dr Hooker would suffer harm by submitting himself to cross examination but he was prepared to go into the box if the Council desired.

The President said that Dr Hooker's counsel must take the responsibility as to whether or not he called his client.

Dr Hooker was not called and his counsel proceeded to read first certain letters and then his statutory declaration. When the case was mooted Dr Hooker wrote to the Registrar stating that 600 medical men were employing the method and these included many tuberculosis officers. We are acting in a humane spirit, and not waiting to obtain the official recognition. I am proud of the privilege of having first introduced this method amongst medical men. In another letter he stated that if he had contravened medical ethics he had done so unwittingly. In his statutory declaration Dr Hooker stated that he was 72 years of age and had been in practice since 1877 and for the last twenty-one years in London. He was not guilty of the charges made against him. He had never sought to attract patients to himself nor had he been associated with advertising or canvassing through the medium of *John Bull*. He admitted the authorship of the circular but he had never sent it to any person in the hope of securing a patient for himself. The letter urged the patient to seek the advice of his own doctor. In 1924 he was introduced to a distinguished medical and chemical researcher Mr Newell who was a man of the utmost integrity, and who had been the means of discovering what he believed to be a possible cure for tuberculosis. He was much interested in Mr Newell's investigations and Mr Newell placed at his disposal the entire formula in order that he might investigate it on his own behalf but this was given to him in strict confidence. The results on patients appeared so remarkable that he sought the aid of another doctor, and eventually of a second doctor, to each of whom by permission of the discoverer the formula was communicated. The results were most gratifying. Success was obtained in from 90 to 95 per cent of cases. A third doctor, who had been on the staff of one of the largest tuberculosis hospitals in this country after a long trial of the treatment pronounced himself enthusiastically in its favour. *John Bull* then heard of the matter and sought an interview with Dr Hooker. Whatever information he gave was on the strict understanding that the names and addresses of the medical men concerned should not be divulged. He was not interested in the publication of any article in *John Bull*, except in so far as it directed attention to a matter of vital importance to the nation. In order that the medical profession might have the benefit of the discovery he drafted the circular letter, which did not bear the construction placed upon it in the charge, because it was clear from that letter that the treatment was only to be issued through qualified medical practitioners. The words 'We may be able to arrange for one of our own staff to give this treatment' were only intended as a last resort in order that patients who had not a medical man prepared to give the treatment should not suffer. When his attention was drawn to the fact that these words were ethically questionable the remaining circular letters were destroyed. A representative of *John Bull* called on him to discuss the possibility of giving the formula to the medical profession and in consequence of that discussion he persuaded the discoverer to consent to give the formula with all records and data, to the General Medical Council, the formula to be furnished from the offices of *John Bull* but the General Medical Council refused the offer. His counsel urged on Dr Hooker's behalf that he had never sought to attract patients to himself. He had been in the profession for nearly fifty years and now he certainly did not wish for an overflow of patients for he had more than he could deal with. He had merely endeavoured to secure for the public the benefit of a great scientific discovery.

After a private deliberation by the Council, the President announced the decision.

I have to announce that the facts alleged in the Notice of Inquiry against Joseph Benson Hooker have been proved to the satisfaction of the Council. The Council have judged Joseph Benson Hooker to have been guilty of infamous conduct in a professional respect and have directed the Registrar to erase from the Medical Register the name of Joseph Benson Hooker.

CURRENT NOTES

Royal Commission on National Health Insurance
At page 198 of this SUPPLEMENT will be found a Supplementary Memorandum which has been submitted to the Royal Commission on National Health Insurance on behalf of the witnesses of the British Medical Association who appeared before the Commission on April 30th and May 7th, 1925. The Supplementary Memorandum contains some observations on the evidence which has recently been given before the Commission by representatives of the Ministry of Health.

The Medical Secretary's Visit to South Africa
In the SUPPLEMENT of October 31st it was announced that Dr Alfred Cox sailed on October 30th for an organizing tour of all the Branches of the Association in South Africa. He now reports his safe arrival in Capetown and the commencement of the work which he went to South Africa to do. His tour promises to be a strenuous one. Included in the itinerary drawn up for him by the South African Committee (which is, of course, subject to alteration) are visits to the following places: Capetown, Johannesburg, Pretoria, Bulawayo, Victoria Falls, Salisbury, Mafeking, Ladysmith, Pietermaritzburg, Durban, East London, Grahamstown, Port Elizabeth, Kimberley, and Bloemfontein.

A Divisional Social Evening at Headquarters
A "social evening," which it is hoped may be the precursor of others to be arranged by various metropolitan Divisions, was held at the new House of the British Medical Association on Wednesday of last week, when the Westminster and Holborn Division arranged a very successful gathering. The event had been fixed for a week earlier, but was postponed on account of the death of Queen Alexandra. Any of the shades of those genial and accomplished companies who attended the sessions at old Tavistock House in the time of James Peiry, or, later, in that of Charles Dickens, if they still linger about the old haunts, must have been attracted by the stately revelry and entertainment, reminiscent of the good fellowship of years gone by, and have been interested to observe that their own programme for evening parties is still followed, whereby the intellectual and the social are blended—first the feast of reason, and then the flow of soul. After the

members and their friends had been received in the Members' Common Room by Dr Redmond Roche, chairman of the Division, and Mrs Roche, an adjournment was made to the Hastings Hall, where Professor G Elliot Smith, F.R.S., delivered a short address (printed at page 1107 this week) on "The left-handed lady of Lloyd's." The fossilized portions of the skull discovered during recent excavations on the site of the new Lloyd's building were on view, as well as casts of two of the famous prehistoric crania which have been the subject of debate in the anthropological world of recent years. Professor Elliot Smith told his audience how he deduced from these fragments certain information with regard to this distant forerunner of the London woman of to-day. After the lecture, and a very warm vote of thanks to Professor Elliot Smith, the company made their way to the Great Hall, which, with its colour and space, made an ideal setting for the kind of entertainment that was to follow. From the dais an orchestra played excellent dance music. Almost everybody, sooner or later, yielded to the rhythm, and if it was not quite the case that, as Goldsmith put it, "the good grandsire, skilled in gesture lore, was frisking 'neath the burden of fourscore," certainly some very senior members of the profession showed what they could do by way of setting an example to the younger, and kept it up until well past midnight. The centre of the hall was cleared for this purpose, and around this space small tables were arranged in cabaret fashion, at which the company could sort themselves out and enjoy refreshments and conversation, so that the effect was that of a big family party. An item not on the programme was furnished after 11 o'clock by two accomplished dancers, Miss Barbara Helen and M Leon Fiori, from the Shaftesbury School of Dancing, who gave an exhibition of the Spanish or Spanish-American tango, this was greatly enjoyed, as, indeed, was the entire evening, the success of which was due to the officers of the Division, represented by Dr Stuart Webb, the honorary secretary, and the permanent headquarters staff responsible for the arrangements in the House, with Mr Ferris Scott at their head. The number of invitations sent out was 220, and the acceptances could not have fallen far short of this number.

Ophthalmic Benefit.

In conjunction with the Ophthalmic Committee the Insurance Acts Committee has had under consideration the extension of the form which should be used by an insurance practitioner when recommending one of his insured patients to consult an ophthalmic specialist. This, of course, is one of the practitioner's obligations under the terms of service for insurance practitioners. The Insurance Acts Committee

¹ BRITISH MEDICAL JOURNAL SUPPLEMENT May 23rd 1925 p 209
Ibid May 30th 1925 p 233.

has considered the suggestion put forward at the recent Conference of Local Medical and Panel Committees that an official form should be provided for this recommendation, but does not approve the institution of an official form for this purpose. All that is required is a simple expression of opinion that the patient should consult an ophthalmic specialist, and the Committee suggests the following form of words is being suitable for adoption by insurance practitioners in this respect:

To

This is to certify that I have examined you and am of opinion that you should consult an ophthalmic surgeon

Dental Treatment by Insurance Practitioners

Attention was recently drawn to a "dental letter" issued by an approved society, which stated that it was part of an insurance practitioner's contract to give treatment for simple tooth extractions where no anæsthetic was necessary. The Insurance Acts Committee has always maintained that, with the possible exception of emergencies, it is no part of the duty of an insurance practitioner to extract teeth, and the Ministry of Health was asked to take the matter up with the society concerned. The Ministry now states that an assurance has been given that the statement in the society's "dental letter" referred to above will not appear in any future copies.

ROYAL COMMISSION ON NATIONAL HEALTH INSURANCE

SUPPLEMENTARY MEMORANDUM BY THE BRITISH MEDICAL ASSOCIATION.

OBSERVATIONS ON THE EVIDENCE GIVEN BY WITNESSES ON BEHALF OF THE MINISTRY OF HEALTH

1 The witnesses on behalf of the British Medical Association desire to submit for the consideration of the Royal Commission some observations with regard to evidence given by witnesses from the Ministry of Health on certain suggestions made by the Association. They submit these observations, not primarily with the view of criticizing the opinions expressed by the Ministry's witnesses, but rather in the hope that they may make more clear certain points which seem to have been imperfectly understood, and that in this and in other ways they may be helpful in indicating to the Commission the views of the medical profession. Apart from the points touched upon in this Memorandum, it may be taken that the Association's witnesses are in general agreement (and for the most part in actual verbal agreement) with the evidence of the Ministry's witnesses.

2 Suggestions as to the exclusion of certain classes from compulsory health insurance

(i) *The clerical staffs of certain banks, insurance companies and similar employers.* We observe that the Ministry's witnesses admit that this class of insured person is in several respects exceptional, and that societies entering for this special class are very favourably situated. Sir Walter Kinnear agrees that such insured persons "are forced to pay for something that in practice they never get either in respect of statutory benefits or additional benefits." The suggestion put forward by the Ministry to meet these exceptional circumstances is that additional treatment benefits should continue to be available for such insured persons after they have ceased to be insured. While not opposed to this suggestion on principle, we submit (a) that this would merely emphasize the peculiar position of this class among insured persons, (b) that the difficulties implicit in any such arrangement (especially with regard to similar insured persons who do not happen to be members of the select societies) will scarcely be less than those involved by the exclusion of such persons from insurance by certificate of the Ministry as suggested by the Association, (c) that it is exactly in these cases that the temptation would be greatest to grant as an additional benefit the return of the insured person's contributions, so that those who least need help may seem medical attention wholly at the expense of the employer and the State. We urge, therefore, that the preferable method of dealing with this exceptional class is to exclude them altogether by suitable methods as suggested by the Association.

(ii) *Exempt persons.* We desire to emphasize for the information of the Commission the facts (which cannot really be recaptured by any other means than through their medical attendants) (a) that though a large number of this class may avail themselves of certain advantages to which they are entitled it is a common experience that they express themselves as quite willing, or even as preferring to be without them, (b) that by reason of the formalities and conditions of "making their own arrangements" as they have to do, then attendance is more troublesome to practitioners than that on other insured persons

(c) that they have to make, even under their present conditions, considerable payments in many cases towards the cost of their medical attendance. We suggest that if it be not possible to exclude such persons from insurance altogether as a class, they should at least be allowed voluntarily to exclude themselves as individuals. It follows that the Association is strongly opposed to any raising of the income limit for such persons as has been suggested. On the other hand, the Association believes that if employers are still compelled to make a contribution in respect of such persons it would be more advantageous that, in return for such contributions, certain additional treatment benefits or extensions of medical treatment should be available for them, rather than that they should be eligible for ordinary medical benefit.

(iii) *The higher-paid manual worker.* The Association views the national health insurance system primarily as a health service, and it is evident that any unnecessary inclusion of certain persons within its scope must, on financial grounds, diminish the advantages of the service to those who need them most. The only reason advanced against the exclusion of the highly paid manual worker seems to be the formidable administrative difficulties involved. The Association's witnesses, in their evidence, admitted that such difficulties would arise and would be great, but, adopting Sir Walter Kinnear's words with regard to administrative difficulties of a not very dissimilar kind, "we would far from hope that, if the Commission would be good enough to recommend something on the basis we suggest, we should be able to overcome some of the difficulties." It should be noted that, under this heading, we do not propose to exclude any manual worker who has, prior to any new arrangement, paid contributions for an appreciable period.

(iv) *The general income limit for non-manual workers and voluntary contributors.* We note that the Commission has received the suggestion (though not from the Ministry's witnesses) that the income limit should be raised from £250 to £300 or even £350. The Association is very strongly opposed to any such suggestion. Indeed, it suggests that the existing income limit is even now unnecessarily high, and that at least it should be materially lowered for insured persons without dependants.

3 Suggestions as to the inclusion of certain classes of persons not at present included

(i) *Poor persons not under a contract of service.* The Association's witnesses recognize that the situation has been materially modified by the passing of the recent Widows', Orphans', and Old Age Contributory Pensions Act. Under this Act there are considerably increased inducements for poor persons voluntarily to enter or to remain in insurance, and this opportunity is given to other such persons for the first time. We recognize, too, that the adoption of the Ministry's suggestion for the compulsory insurance of certain persons who are described as under a "contract for service" rather than a "contract of service" would further modify the position. Under present circumstances

therefore, we do not desire to press for the compulsory inclusion at an early date of other workers who, though not under a contract of service, are in a like economic position to existing insured persons, though we continue to believe that such inclusion is desirable.

(1) *The dependants of the lower-paid workers.* The need for some general provision of a domiciliary medical service for these dependants does not appear to be contested. Indeed, the Ministry's witnesses have pointed out that, in the absence of such a service, the usefulness of certain other health provisions is lessened and the difficulties of making suitable maternity provision for non-insured wives of insured persons are insuperable. Also that such a service would bridge the gap which in the majority of cases exists between the ages of 14 and 16 years. We would point out that it appears from question and answer 23,851 that the exact nature of our suggestion has not been clearly understood. At the same time we realize that the matter is one of great difficulty, and that in the present economic and financial condition of the country any early extension of the kind indicated may perhaps be considered impossible. We would, however, urge the Commission to consider whether, even if unable to make any proposals for immediate action, they could not recommend that so soon as conditions allow the provision of medical advice and treatment for the dependants of lower-paid workers should be made, and that this provision should be made either under the insurance scheme or by arrangements similar to those in accordance with which medical benefit is given thereunder.

4. *Suggestions as to extensions in the scope of the medical service.*

(1) *Consultant and specialist service.* While very anxious that such a service should be established at the earliest possible moment, it should be made clear that the Association is not in agreement with the proposals put forward by the Ministry's witnesses as to the method of providing it. We note that the Ministry have submitted to the Commission a copy of the "Memorandum of Discussions on Certain Questions of Provision of Medical Services" which was published in 1919 and is now printed as Appendix CLII. It is stated in the Memorandum itself that "the members of the medical profession present participated in the discussions as individuals and not as committing the bodies to which they belonged," and though the Association has not repudiated the provisional conclusions set forth in the Memorandum, and would almost certainly endorse its main arguments and suggestions to-day, experience since 1919 has in one or two important respects modified the attitude of the profession towards certain of these, notably that upon which the evidence of the Ministry's witnesses with regard to the method of providing a specialist service is founded. The difference of attitude will be seen in paragraph 25 of the "Statement of Evidence" submitted on behalf of the Association as compared with paragraphs 31 and 35 of the "Memorandum of Discussions." Opinion within the profession is now very definitely opposed to the provision of a consultant and specialist service founded primarily and mainly upon a series of "clinics" staffed by a limited number of part-time officers. Experience has led us to believe that the conditions of ordinary private practice should be adhered to as far as possible, and, as in the case of arrangements now being made for what is called "ophthalmic benefit," a free choice of specialist, and consultations at the consultant's rooms or at the practitioner's house or surgery or at the patient's home, should not only be an essential part of the scheme, but should be the ordinary and normal procedure to be followed. While agreeing that in some circumstances or places a clinic system, with certain provisos, may be found convenient we would urge the Commission not merely not to separate a domiciliary specialist service from any extension in this direction, but rather to recommend the building up of the whole extended service on the lines of domiciliary arrangements in the widest acceptance of the term.

(2) *Additional treatment benefits.* We have noted with some anxiety that some of the witnesses of the Ministry have spoken loosely of the "provision of special treatment services" by approved societies. It is quite clear—and

this is, of course, endorsed by the Ministry—that any such direct provision would be contrary to Section 14 of the Act of 1911, and that the only form of additional benefit permitted is the defraying of part or the whole of the cost of treatment obtained by members themselves, and not the organization of a service for them. We are emphatically of opinion, in agreement apparently with that of the Ministry, that all treatment benefits should be included as statutory benefits for the whole of the insured population, and it is fundamental with the profession that no such benefit should be organized or administered by approved societies either directly or indirectly, but by some appropriate public statutory body on which there is suitable medical representation. Without this safeguard it is impossible for any extension of the scope of the medical service to be carried to a successful issue.

5. *Modifications of disciplinary powers and procedure.*

The Association's witnesses are unable to accept answer 24,000 as a complete statement on the matter or as one which is entirely accurate in every detail. The evidence of the Ministry's witnesses in this matter does not touch the points on which the profession is profoundly exercised, and we would urge upon the Commission the importance of giving very careful consideration to this subject with a view, we hope, to making recommendations on the lines of paragraphs 41 and 42 of the Association's "Statement of Evidence" as modified in some degree by the evidence of the Association's witnesses.

6. We shall be glad to give any further evidence on the above points that the Commission may desire or to submit any further observations that may be deemed necessary.

Association Notices.

TRANSFER OF CIVIL PARISH OF WARLINGHAM FROM REIGATE TO CROYDON DIVISION OF SURREY BRANCH

NOTICE is hereby given of the following proposal made by the Croydon and Reigate Divisions and the Surrey Branch.

That the Civil Parish of Warlingham be transferred from the Reigate to the Croydon Division of the Surrey Branch.

The matter will be determined in due course by the Council. Any member affected by the proposed change, and objecting thereto, is requested to write, giving reasons therefor, to the Medical Secretary, British Medical Association House, Tavistock Square, W.C.1, not later than January 12th, 1926.

BRANCH AND DIVISION MEETINGS TO BE HELD

BIRMINGHAM BRANCH, NUNEATON AND TAMWORTH DIVISION.—A meeting of the Nuneaton and Tamworth Division will be held at the Tamworth General Hospital on Thursday, December 17th at 3 p.m. when Dr A. P. Thomson will read a paper on the rheumatic state in childhood.

CAMBRIDGE AND HUNTINGDON BRANCH.—A British Medical Association Lecture on some points in clinical endocrinology will be given by Dr Leonard Williams on Wednesday, December 16th at 3 p.m., in the Pathological Lecture Theatre, Medical Schools, Cambridge. All medical practitioners are cordially invited, and it is hoped that as many members as possible will attend.

DORSET AND WEST HANTS BRANCH, BOURNEMOUTH DIVISION.—A meeting of the Bournemouth Division will be held on Monday, December 14th at 4.15 p.m. at St. Peter's Small Hall, Bournemouth when Dr J. H. Sequeira will give a British Medical Association Lecture on some common affections of the skin. Text at 4 p.m.

EDINBURGH BRANCH, SOUTH EASTERN COUNTIES DIVISION.—An ordinary meeting of the South Eastern Counties Division will be held in the Railway Hotel, Newtown St. Boswells on Wednesday, December 23rd at 3 p.m. Business. Arrangements for an annual presentation of badges of office for chairman and secretary of Division by Dr James Morris Menzies (Selkirk) present chairman of the South Eastern Counties Division. Address on ultra violet radiation and its application on medicine by Dr Charles Cameron, medical superintendent of E. T. Fortune Sanatorium.

KENT BRANCH.—The quarterly meeting of the Kent Branch will be held on Wednesday, December 16th at 3 p.m. at the West Kent General Hospital, Maidstone. Dr Alfred Greenwood, county medical officer, will read the paper with which he opened the discussion at a conference called by the county council to consider the treatment of crippled children. Dr Greenwood will also read his scheme for the object presented to and accepted by the Kent County Council in November. As the subject specially affects the medical staffs of hospitals, their attendance is invited as well as that of members of the Branch. Lunch can be obtained at the Royal Star Hotel at 1.45 p.m. at 3.6d each.

KENT BRANCH TUNBRIDGE WELLS DIVISION—A meeting of the Tunbridge Wells Division will be held at the General Hospital, Tunbridge Wells on Friday December 18th at 3.30 p.m. Dr A. J. Hall Professor of Medicine University of Sheffield will give a British Medical Association Lecture on later effects of epidemic encephalitis (illustrated by lantern slides). Tea will be provided. Further lectures will be given on January 20th 1926 by Dr T. A. Fox on some varieties of psychotherapy, and in March by Dr A. White Robertson.

LANCASHIRE AND CHESHIRE BRANCH—The first annual dinner of the Lancashire and Cheshire Branch will be held at the Midland Hotel Manchester on Thursday December 17th at 7.30 p.m. The price of tickets has been fixed at 15s each and members may invite guests (male or medical women only). The Branch Council hopes that each member of the Branch will make every effort to attend. Those intending to be present are asked to notify the honorary secretary (Dr A. Corser Sturrock, 14, St John Street, Manchester) immediately.

LANCASHIRE AND CHESHIRE BRANCH WAERINGTON DIVISION—A meeting of the Warrington Division will be held in the Infirmary to-day (Friday December 11th) at 8.30 p.m. Dr Core (Manchester) will read a paper on hydatid met with in general practice.

METROPOLITAN COUNTIES BRANCH CITY DIVISION—The next clinical meeting of the City Division will be held at the Metropolitan Hospital, Kingsland Road E. to-day (Friday December 11th) at 4 for 4.15 p.m. when Dr Norman Hill will show cases.

METROPOLITAN COUNTIES BRANCH LEWISHAM DIVISION—A meeting of the Lewisham Division will be held on Tuesday December 15th, at 8.45 p.m. at the South Eastern Hospital for Children Sydenham, S.E.26 when Dr R. Godwin Chase will occupy the chair. After transaction of business clinical cases will be shown by the staff of the hospital. Members are invited to show cases. The annual dinner of the Division will take place at the Royal Bell Hotel Bromley on Thursday December 17th, at 7.30 p.m., with Dr R. Godwin Chase in the chair. Members are invited to bring medical gifts. As the Chairman and Committee feel that it is highly desirable to foster the social side of medical practice in the borough it is hoped that all members will endeavour to be present. Dinner ticket 10s. 6d. (exclusive of wine).

METROPOLITAN COUNTIES BRANCH WILLESDEN DIVISION—A meeting of the Willesden Division will be held at the Willesden General Hospital Harlequin Road on Wednesday December 16th at 9 p.m. Agenda: Report of Executive Committee, discussion Willesden hospital policy and the staffing of the Willesden General Hospital.

MIDLAND BRANCH CHESTERFIELD DIVISION—A meeting of the Chesterfield Division will be held at the Maternity Hospital Chesterfield on Friday January 8th 1926 at 8.15 p.m. Mr A. M. Webber F.R.C.S. honorary surgeon Nottingham General Hospital, will give an address on pelvic pain in women. Tea and coffee at 8.

NORTH OF ENGLAND BRANCH SUNDERLAND DIVISION—A scientific meeting of the Sunderland Division will be held at Monkwearmouth Hospital Sunderland on Tuesday, December 15th at 7.30 p.m., all members of the Division are invited to be present.

SOUTH WALES AND MONMOUTHSHIRE BRANCH CARDIFF DIVISION—A meeting of the Cardiff Division will be held at the Engineers' Institute Cardiff on Wednesday December 16th. Dr J. Stanley White (London) will give a lecture, illustrated by lantern slides, on recent advances in endocrine therapy.

SOUTH WALES AND MONMOUTHSHIRE BRANCH MONMOUTHSHIRE DIVISION—A meeting of the Monmouthshire Division will be held at the County Hall Newport on Tuesday December 15th, at 2.30 p.m. Agenda: Correspondence to receive and adopt the report of the Executive Committee of the Monmouthshire Division as to the Ebbw Vale Workmen's Medical Society to discuss and vote upon a resolution in connexion therewith, address on cancer and its treatment by Mr Duncan G. L. Fitzwilliams, C.M.G., F.R.C.S., surgeon to St Mary's Hospital London.

SOUTH WALES AND MONMOUTHSHIRE BRANCH SOUTH WEST WALES DIVISION—A meeting of the South West Wales Division will be held at the Carmarthenshire Infirmary on Wednesday, January 13th, 1926 at 3 p.m. when Professor A. J. Clark will give a British Medical Association Lecture on recent advances in endocrinology.

SOUTH WALES AND MONMOUTHSHIRE BRANCH SWANSEA DIVISION—A meeting will be held by the Swansea Division at the General Hospital Swansea on Thursday December 17th, at 8.15 p.m., when Dr Emily C. N. Paterson will open a discussion on eclampsia.

SOUTHERN BRANCH JERSEY DIVISION—A meeting of the Jersey Division will be held on Thursday, December 17th when Lieut. Colonel P. J. Marett chairman of the Division, will read a paper on common bacillary diseases of the island.

SOUTH WESTERN BRANCH EXETER DIVISION—The next meeting of the Exeter Division will be held in the Library of the Royal Devon and Exeter Hospital to-day (Friday, December 11th) at 4.30 p.m. A lecture and demonstration on the use of plaster of Paris in the treatment of fractures and other surgical conditions will be given by Mr Norman Lock. Tea at 4 p.m.

SURREY BRANCH CROYDON DIVISION—A meeting of the Croydon Division will be held at the Croydon General Hospital on Tuesday, December 15th at 8.30 p.m. when Mr A. H. Todd F.R.C.S. will talk on cases collected from the orthopaedic department of the Croydon General Hospital.

SURREY BRANCH KINGSTON-ON-THAMES DIVISION—At the meeting of the Kingston-on-Thames Division to be held on Tuesday, January 5th 1926 Mr J. G. Turner F.R.C.S., will read a paper on distal p.p.

SURREY BRANCH REIGATE DIVISION—At the meeting of the Reigate Division to be held at the East Surrey Hospital, Reigate,

on Tuesday, January 12th, 1926, at 8.45 p.m. Sir Henry Gauvain will read a paper on conservative treatment in non-pulmonary tuberculosis.

WORCESTERSHIRE AND HEREFORDSHIRE BRANCH HEREFORD DIVISION—A lecture under the auspices of the Hereford Division will be given at the Herefordshire General Hospital on Monday, December 14th at 3 p.m., by Dr J. Stanley White on some recent aspects of gland therapy. The lecture will be illustrated by lantern slides. A large attendance is hoped for. Tea will be provided.

WORCESTERSHIRE BRANCH DEWSBURY DIVISION—A meeting of the Dewsbury Division will be held in the Man and Saddle Restaurant, Dewsbury on Tuesday, January 12th, 1926 at 8.15 p.m. Dr W. Fletcher Shaw (Manchester) will read a paper on chronic pelvic pain.

YORKSHIRE BRANCH HALIFAX DIVISION—The next meeting of the Halifax Division will be held in the new X-ray Department (Whitaker Ward) of the Royal Halifax Infirmary on Wednesday, December 16th at 8.30 p.m. Dr Franklin will discuss X-rays and the interpretation of X-ray photographs in general, and will demonstrate the gastric technique.

YORKSHIRE BRANCH HULDERFELD DIVISION—The medical dance will be held on Wednesday, December 16th in the Royal Infirmary from 9 p.m. to 1 a.m. Perception 8.45. For those who do not wish to dance a bridge drive, commencing at 9.15 will be arranged. Tickets 8s. 6d. each, admission by programme.

YORKSHIRE BRANCH SHEFFIELD DIVISION—A meeting of the Sheffield Division will be held in the General Lecture Room The University, Sheffield to-day (Friday, December 11th), at 8.45 p.m., when a British Medical Association Lecture will be delivered by Dr William Cramer D.Sc. F.R.S. of the Imperial Cancer Research Fund on the present outlook on cancer. A cordial invitation to be present is extended to all members of the medical profession.

YORKSHIRE BRANCH WAKEFIELD, POTTERFAC, AND CASTLEFORD DIVISION—The lecture by Colonel L. W. Harrison on the management of syphilis, which was to have been given at the Playhouse Westgate, Wakefield, on Sunday, December 13th, has been postponed.

Meetings of Branches and Divisions

BIRMINGHAM BRANCH BROMSGROVE DIVISION

A clinical meeting of the Bromsgrove Division was held at the Smallwood Hospital Redditch on Thursday November 26th when a most interesting paper was read by Dr P. T. Hughes (Barnsley Hall) on neurasthenia. Numerous questions were subsequently put to Dr Hughes and answered by him. The meeting closed with a vote of thanks to Dr Hughes.

CAPE OF GOOD HOPE—WESTERN PROVINCE BRANCH

A meeting of the Cape of Good Hope—Western Province Branch was held at Capetown on October 30th, when the President, Dr C. H. Kruger, was in the chair.

The Chairman referred to the forthcoming arrival in South Africa of Dr Alfred Cox, the Medical Secretary of the Association and suggested a change in the date of the annual meeting of the Branch in order that Dr Cox might be able to attend. The motion was adopted.

The business of the evening was a symposium on neurosyphilis arranged by Dr F. H. Knox. Dr Knox read the opening paper in which he described the clinical features of neurosyphilis chiefly from a diagnostic point of view. In a lengthy but well-reasoned paper he covered the whole range of a very wide subject.

Dr W. P. Mulligan contributed a paper on the bacteriology and serology of neurosyphilis in which he discussed the various tests at present in use, elaborating Nonne's famous four cardinal tests. Dr E. W. D. Swift discussed neurosyphilis from the psychological point of view and gave an interesting account of modern experiences in the treatment of general paralysis of the insane while Dr J. S. du Toit and Mr J. L. Lunnoff dealt with the ophthalmological and otological aspects respectively.

In a brief contribution Dr Reith Fraser discussed the question of modern treatment of neurosyphilis from the primary stage of the disease onwards. On account of the lateness of the hour discussion was curtailed. Dr H. A. M. Bosman, however, thanked the collaborators for their instructive contributions and made some interesting observations on syphilis in its relation to malaria in the South West African natives.

Dr F. Kruger made some observations on the lucin tests and Dr T. J. W. A. Johnston recounted his experiences of syphilis and neurosyphilis during his long period of practice amongst the natives in the Northern Transvaal. Although he had seen many thousands of cases of syphilis in the native he had seen only two cases of neurosyphilis, both of which were meningeo-vascular in type. He was very grateful to the collaborators for their valuable symposium.

CEYLON BRANCH

The sixth meeting of the Ceylon Branch was held in the Colonial Medical Library on July 8th. Among the business transacted was the appointment of a committee consisting of the President, the Honorary Secretary and Drs E. G. Macleod and F. Cusackera to make arrangements for the annual dinner on September 5th.

The Council was empowered to take effective measures with a view to securing early incorporation of the Branch under the local laws.

Drs H. O. GUNAWARDENA, E. C. ALLES, and LUCIAN DE ZILWA read notes on interesting cases for which they were accorded the thanks of the meeting.

An extraordinary general meeting of the Branch was held in the Colonial Medical Library on September 29th. On the motion of Dr P. J. CUSSELL it was unanimously resolved.

That the action taken by the Legislative Council in passing the motion that apothecaries who joined the Medical Department prior to the promulgation of the Medical Registration Ordinance No. 2 of 1905 should be admitted to the Medical Register is a retrograde step is detrimental to the interests of the public and is derogatory to the medical profession and proposes that if Government decides to permit the apothecaries to practice they should be enrolled in another register and designated licensed practitioners, apothecaries, and that rules should be drawn up for their control by the Ceylon Medical Council.

Dr S. MUTTIAH moved the following resolution, which was carried unanimously.

That the licensing of apothecaries to practice medicine should be abolished after the closing of the Register (suggested in the first resolution) which should be kept open for a period of six months.

The following motion by Dr G. COORE seconded by Dr R. DE ARREW, was unanimously adopted.

That the rules and regulations at present in force at the Ceylon Medical College for the training of apothecaries be abolished and that in their place rules and regulations be framed to permit of the training being such as to fit them to be dispensers or compounders and druggists only.

Copies of the above resolutions were directed to be forwarded to the Hon. the Colonial Secretary, the President of the Ceylon Medical Council, members of the Legislative Council to all the members of the Branch, and to the press.

DUNDEE BRANCH

In University College Dundee on November 27th before an audience restricted by weather and other circumstances to about fifty, Dr F. A. E. CREW, director of the Animal Breeding Research Laboratory, University of Edinburgh, gave a British Medical Association Lecture on the mechanism of inheritance. In clear and cogent fashion he demonstrated on a series of slides taken mainly from experiments with the barnyard fowl (*Gallus gallus*) the possibility of identifying individual chromosomes and proving their association with heritable characters—the particular representation of the genes of individual characters in the chromosome and the local association in the chromosome of characters linked in linkage. He traced the relations of cross and back breeding and the essential mathematical sequence of the numbers exhibiting dominant or recessive characters in the filial generations. The keen appreciation of the audience was expressed in the vote of thanks.

GLASGOW AND WEST OF SCOTLAND BRANCH

A clinical meeting of the Glasgow and West of Scotland Branch was held in the Royal Hospital for Sick Children, Yorkhill, Glasgow, on November 18th. A series of cases illustrating medical and surgical diseases of childhood were demonstrated by Professor LEONARD FINDLAY, Mr. ALEXANDER MACLENNAN, and Mr. WILLIAM PARKIN, the physician and surgeons to the hospital, and the medical superintendent, Dr J. CAMPBELL SUTTIE, gave an exhibit of x-ray films and photographs with special reference to diseases of the lungs. Tea was provided and the governors and staff were recorded a very hearty vote of thanks for the excellent arrangements. The attendance estimated at 125 was not up to standard as owing to the city and surrounding districts being fog-bound travelling was neither pleasant nor safe.

The annual dinner of the Branch was held in the evening at Feiguson and Forsters Restaurant, when Dr GEORGE A. ALLAN, President of the Branch, occupied the chair. On this occasion members were invited to bring their lady friends but owing to climatic conditions only fifty attended. The guests of the evening were Dr JOHN STEVENS (secretary of the Edinburgh Branch), Dr JAMES R. DREVER (Scottish Medical Secretary), and Professor LEONARD FINDLAY, Mr. ALEXANDER MACLENNAN, Mr. WILLIAM PARKIN, and Dr J. CAMPBELL SUTTIE of the Royal Hospital for Sick Children. The toast of the Branch was proposed by Dr STEVENS and replied to by Dr J. G. McCUTCHEON, Branch secretary. The toast of The Guests proposed by the CHAIRMAN was acknowledged by Professor FINDLAY who spoke of the need for more facilities for clinical experience before registration. An excellent musical programme was rendered by Dr. and Mrs. J. Wallace Anderson.

LANCASHIRE AND CHESHIRE BRANCH HYDE DIVISION

The Hyde Division held a 'souper dance' in Hyde Town Hall on November 13th. More than a hundred members and their friends were present and a thoroughly enjoyable evening was spent.

On November 26th Mr C. J. BOND, C.M.G., F.R.C.S. (Leicester) gave an address to the Division in the Town Hall. Mr Bond was received by the Mayor of Hyde and after refreshments had been served in the Mayor's parlour he lectured in the Council Chamber to a large gathering of members and friends from neighbouring Divisions. The subject of his most interesting address was 'Vitamins from the medical and public health points of view.' The lecture was illustrated by lantern slides, which showed the original work carried on by the lecturer on this subject. A vote of thanks to Mr Bond was ably proposed by Mr F. G. PALFREY on behalf of the Division; this was seconded by Mr G. E. WRIGHT and supported by Mr. MANOULIAN on behalf of the visitors.

METROPOLITAN COUNTIES BRANCH ST. PAULS DIVISION

The St. Pauls Division held a very successful meeting at the British Medical Association House on November 10th when Dr KATHLEEN LAMBER, vice-chairman, presided. The Division received

with great regret the resignation of Dr A. F. ROCHE, M.C., chairman of the Division who is leaving the district.

On the recommendation of the Executive Committee Dr Geoffrey EVANS, F.R.C.P., was unanimously elected chairman of the Division. Dr GEOFFREY EVANS then took the chair. The following recommendation of the Executive Committee was carried with acclamation.

That Dr A. R. ROCHE be elected an associate member of the St. Pauls Division with all the privileges of an ordinary member, as that of voting in recognition of his great service in connection with the formation of the Division.

Dr ROBERT A. YOUNG, C.B.E. physician to the Brompton Hospital, delivered a most interesting address on the early recognition of pulmonary tuberculosis which was followed by a discussion in which many members took part. A very cordial vote of thanks to Dr Young was proposed from the chair and carried enthusiastically.

NORTH OF ENGLAND BRANCH CONSETT DIVISION

A combined business and social meeting of the Consett Division was held at the Imperial Hotel, Stanley, on November 20th when Dr JOHN MURRAY (Shotley Bridge) presided. There was a large attendance of members.

Before the business agenda was dealt with the CHAIRMAN referred in feeling terms to the death of the late Dr. Alexander Cook of Catehgate who had acted as president of the Division over a long period of years. He dwelt on the excellent work Dr Cook had done on behalf of the Association during that time and said that the Division had profited on many occasions by his wise and skilful leadership. A vote of condolence and a message of sympathy was directed to be sent to the widow on behalf of the members of the Division.

After the business meeting the members entertained Mr J. Hamilton Barclay, assistant surgeon, Newcastle Royal Infirmary, to a complimentary supper. Thereafter Mr BARCLAY gave an excellent address on the subject of acute abdominal emergencies dealing in an interesting and practical way with the differential diagnosis of gastric and duodenal ulcers, appendicitis, cholecystitis, gall stones, and acute pancreatitis. The address was illustrated by references to one hundred consecutive cases operated upon by Mr Barclay in the Newcastle Royal Infirmary. He emphasized the importance of early diagnosis and prompt operation giving convincing mortality figures in support of his thesis.

The address was well received and led to some discussion. A vote of thanks carried with enthusiasm, brought to an end a most successful and profitable meeting.

METROPOLITAN COUNTIES BRANCH LEWISHAM DIVISION

A meeting of the Lewisham Division was held on November 17th at the Parish Room, St. Laurence, Margate, Catford, when Dr R. GODWIN CHASE was in the chair. The provision of badges for the chairman and secretary was approved. In the course of a discussion on medical attendance at street accidents it was recommended that all medical men should keep a book for recording the time and date of calls received as recently trouble had arisen in connexion with injured persons.

Mr W. L. EASON, C.B., C.M.G., M.D., medical superintendent of Guy's Hospital, then delivered an address entitled 'The relationship between voluntary hospitals and general medical practitioners.' Mr EASON gave his experiences at Guy's and showed charts of attendances at that hospital for the past twenty years. The Insurance Act, he said, caused a large drop in the medical out-patients, but cases of skin and eye disease and of diseases of women had remained about the same, while increases were noted in cases of diseases of the throat and nose, diseases of children, and orthopaedic cases. All patients went before the inquiry officer and it was found that 45 per cent. of out-patients were insured persons and 25 per cent. of in-patients. 46 per cent. of the patients were uninsurable being children or over age. One patient out of five was sent by recommendation of his family medical attendant. In regard to the Hospital Saving Association the income limit was £4 a week for a single man, £5 for a married man without children, and £6 with children. The contribution rate was 3s a week. The only benefit conferred was that no inquiries as to income were made but patients were only admitted on medical grounds. Only 3 per cent. of out-patients were contributors and just 2 per cent. of in-patients. All patients sent to Guy's were treated though a considerable proportion of those sent by medical men would have been ineligible owing to the income limit. Guy's Hospital maintained (1) that it was established to treat the sick poor (2) the out-patient department gave an independent second opinion to the sick poor, which the rich were able to get on payment. In the accessory departments of x-rays and minor surgery moderate fees were charged patients required to be recommended by their own medical man.

Dr CHAS. BEATTIE, WHITE HALLMAN, Trowton, and BETHA joined in the subsequent discussion and Dr CHASEL spoke particularly on the Hospital Saving Association. A vote of thanks was accorded to the lecturer.

A meeting of the Lewisham Division was held on November 24th at the Parish Room, St. Laurence, Margate, Catford, when Dr R. GODWIN CHASE was in the chair and there was a record attendance of members. The CHAIRMAN outlined the scheme of the London Panel Committee for a public medical service for London. It explained that the scheme was for people who could not pay ordinary fees at the time or accounts when rendered. The fee would be 3d a week for each person, all of which went to the doctor, and 9d a quarter extra would be charged for administrative

services. Dr BATTESON, secretary of the London Panel Committee gave full details and reasons why the scheme had been brought forward. Drs BAIN, BEATTIE and JACKSON spoke against the scheme. The Lewisham Panel representatives Drs CHASE HALLINAN, and THOMSON, urged its adoption. Dr WHITE spoke in favour of existing provident dispensaries. Drs BUCHAN CHARLES and GILCHRIST joined in the discussion. A vote of thanks was unanimously passed to Dr Batteson for his address.

NORTH OF ENGLAND BRANCH NORTH NORTHUMBERLAND DIVISION

The annual dinner of the North Northumberland Division was held on November 20th at the Plough Hotel, Alnwick, when a company numbering thirty two members and their guests were present. The toast of the British Medical Association was proposed by Dr R. A. WELSH (Felton) and responded to by Dr JAMES HUNSON, who was the guest of the Division on this occasion. Our Guests was proposed by Dr R. E. MOYES (Broomhall), to which Professor STUART McDONALD (Newcastle) replied.

The number present was the largest on record for the annual dinner of the Division and it was unanimously agreed that a most enjoyable and successful evening had been spent.

A meeting of the North Northumberland Division was held in the Infirmary, Alnwick, on November 24th, when an address was given by Mr G. GREY TURNER, M.S., F.R.C.S. (Newcastle on Tyne), on some points about common rectal diseases and their treatment, illustrated with lantern slides.

At the close of the address Mr. Turner was very heartily thanked on the motion of Dr DEX of Wooler, for his most interesting and instructive lecture, which all those present had greatly enjoyed. Dr. Mason was also thanked for manipulating the lantern slides, which added considerably to the success of the address.

SOUTH WESTERN BRANCH TORQUAY DIVISION

A MEETING of the Torquay Division was held in the Torbay Hospital on November 11th, when Dr SCRASE (Newton Abbot) was in the chair.

Dr H. J. CAMPBELL (Dartmouth) presented his report of the Annual Representative Meeting and replied to several questions that arose in connexion therewith. The revision of the rules of the Division was completed in accordance with the recommendations of the Executive Committee and the honorary secretary was asked to have them printed and circulated to members as soon as possible.

Arrangements have been made to hold a dinner and dance in the Torbay Hotel Torquay on January 7th 1926. Invitations to this function are being sent to all the members and non members in the area of the Division. Any members of the profession who may be in the neighbourhood on that date will be made welcome. Full particulars may be had from the honorary secretary, Dr Cameron Davidson, Avonleigh Aedra Road Torquay (phone Torquay 2728).

SURREY BRANCH CROYDON DIVISION

A MEETING of the Croydon Division was held at the Queen's Hotel, Upper Norwood on November 19th. After the ordinary business the members adjourned for tea.

On resumption Dr BRIGHT BANISTER gave an address on some obstetric emergencies. He emphasized the value of ante natal examination in preventing emergencies, and discussed two clinical types—(1) the patient suffering from acute pain at or about full time (2) the patient suffering from haemorrhages at or about full time. Many members took part in the discussion which followed. A hearty vote of thanks was recorded to Dr Bright Banister.

YORKSHIRE BRANCH HALIFAX DIVISION

At the meeting of the Halifax Division on November 18th Professor STEWART gave a lantern talk on gastric ulcer and cancer. Twenty six members of the Division availed themselves of the opportunity of gaining insight into recent work on the pathology of these two conditions.

YORKSHIRE BRANCH WAKEFIELD, PONTEFRACT, AND CASTLEFORD DIVISION

A MEETING of the Wakefield, Pontefract, and Castleford Division was held at Wakefield on November 12th, when Dr J. SHAW BOLTON, medical director of the West Riding Mental Hospital, Wakefield delivered an address on the diagnosis and certification of mental diseases. It was essentially a practical address and included many useful hints on certification and diagnosis. After a discussion the Chairman (Dr William Steven) tendered to Dr Bolton the hearty thanks of the meeting for his interesting and useful address. Dr Steven also thanked Dr and Mrs Hillman for a beautiful table going which they had presented to the Division.

SUNDERLAND DIVISION DINNER

A Correction

In the report of the annual dinner of the Sunderland Division published in the Supplement of November 28th (p. 184) the remarks of His Honour Judge Moore in proposing the toast of the British Medical Association were incorrectly attributed to His Honour Judge Y. M. who was not present at the dinner. We much regret the error.

GENERAL COUNCIL

OR

MEDICAL EDUCATION AND REGISTRATION

WINTER SESSION, 1925

(Continued from page 195)

COMMITTEE REPORTS

The business of the session was almost entirely occupied with disciplinary cases, and the other business was more or less of a routine character. Sir NORMAN WALKER, for the Examination Committee, made an interim report on the answers received from the licensing bodies with regard to the reports of the Council's visitors on the examinations in anatomy and physiology, and said that a formal report would be made at the next session.

Dr J. Y. MACKAY, for the Education Committee, reported that the leaving certificate of the Department of Education of the Irish Free State, which the Council had recognized subject to its acceptance by one of the universities in place of matriculation, had been so accepted by the National University of Ireland, and the examination had accordingly been added to the list of those recognized by the Council. It was also agreed, on the recommendation of the committee, to circulate the licensing bodies in order to ascertain in what way the new regulations for the curriculum which came into operation at the commencement of 1925 carried out the revised resolutions of the Council with regard to professional education necessary for registrable qualification.

Sir JOHN MOORE presented the report of the Public Health Committee. He summarized certain correspondence which had taken place with a number of licensing bodies with regard to their interpretation of the Council's new regulations for the Diploma in Public Health. The University of Cambridge had been asked to make it quite clear in its regulations that its Diploma in Hygiene (Dip Hyg) was not a diploma registrable by the General Medical Council. In reply to an inquiry from the Welsh National School of Medicine as to the interpretation of Rule 2, which provides that the curriculum for a diploma shall extend over a period of not less than twelve calendar months subsequent to the attainment of a registrable qualification, the committee stated that the period of twelve calendar months might suitably include three months' practical work outside the university session.

A communication was considered from the Registrar of the Triple Board in Scotland, transmitting an application from six practitioners proceeding to America to study public health and sanitation, and proposing to spend one academical year at Harvard University for the degree of Master or Doctor in Public Health. The Triple Board had been asked whether the university was recognized by them to instruct in public health and sanitation. After some discussion the Council approved the view of the committee that the study taken at the University of Harvard could not be so recognized.

Sir GEORGE NEWMAN brought forward a communication, transmitted through the Ministry of Health, from the Society of Medical Officers of Health, giving a considered opinion with regard to the practical training required in the Council's new rules, and it was resolved that the suggestions of the Society should be kept in mind by the committee, and that regard should be paid to them in relation to the interpretation of the rules.

The President introduced the report of the Pharmacopoeia Committee, which embodied the report by Sir Nestor Luard on the second international conference on the unification of the formulae of powerful medicaments, held at Brussels in September last, also the protocol of the conference in the original text. For the better information of the committee on certain general questions arising out of the proposed revision of the *British Pharmacopoeia*, 1914, and on the changes it may be deemed advisable to make, the committee proposed at an early date to invite to a conference delegates from a number of medical, pharmaceutical, and scientific societies likely to be interested.

The Council approved this course, and authorized the payment of the travelling expenses of the delegates

DISCIPLINARY CASES *Cases Adjourned from Former Session*

The Council on November 24th considered two cases in which the pronouncement of its decision had been postponed from the session of November, 1924

The first was that of Alexander Dawson Reid, M.B. Ch.B. Aberdeen registered as of High Street South, East Ham, whom the Council had found to have been convicted by court martial in 1917 on a charge of being drunk in the field and to have since been convicted three times by a civil court—twice for being drunk, and once for driving a motor car in a dangerous manner (SUPPLEMENT, December 13th 1924, p. 220). Mr Oswald Hempson appeared on Dr Reid's behalf, and said that Dr Reid since the hearing of the case, had adhered strictly to the assurance he gave to the Council that he would refrain from drink and intended always to do so. He put in excellent testimonials from two medical men, for each of whom he had acted as locum tenens twice during the past year, and from the manager of a public house or whose ships he had served as a surgeon, all of whom had given a chief further declaration that he did not do so.

The other case was that of John Evans, M.R.C.S. L.R.C.P. London registered as of Newbury, Middlesex, with regard to whom it had been found at the previous hearing that he had signed certain certificates in a lax and careless manner (SUPPLEMENT, December 6th 1924, p. 209). Dr Evans produced testimonials from three professional colleagues as to the high standard of his professional conduct in the interval. The President announced the decision of the Council as follows:

Mr Evans as I warned you a year ago the Council takes a very grave view of any laxity on the part of a registered medical practitioner in giving certificates a privilege which is entrusted to him by the State in the belief that he will exercise it honourably, but having had good reports of your conduct since November last, the Council is now satisfied that you will be more careful in the future, and does not see fit to direct the Registrar to erase your name from the Medical Register.

Misdemeanours

A case in which a technical point was strongly contested on behalf of the defendant was that of Alexander Duguid, M.B., Ch.B. Aberdeen, registered as of Meadow Road, Leeds, who appeared on the charge that as a lieutenant in the Royal Army Medical Corps he had been tried by a field general court martial in 1917 for drunkenness when on active service and found guilty and dismissed the service, and further that at the Leeds city police court in 1922 he had been convicted of disorderly behaviour while drunk, and in 1925 at the same court of being found drunk and incapable, and fined 10s. or seven days' imprisonment in each case.

Mr Oswald Hempson instructed by the Medical Defence Union on behalf of Dr Duguid took up the point that drunkenness should not be classed as a misdemeanour under Section 29 of the Medical Act, 1858. That section confined the Council's powers in the case of a conviction when 'infamous conduct in a professional respect' was not charged to felonies or misdemeanours. Drunkenness was merely an offence not technically a misdemeanour. The Council, by taking up these convictions was exceeding its powers. Drunkenness was constituted an offence under the Licensing Act, 1872, Section 12, and he maintained that unless a statute laid it down that a particular offence should be taken to be a misdemeanour, the word misdemeanour in its general use connoted only those offences less than felonies which were tried upon indictment and were not the subject as in this instance of summary jurisdiction by magistrates. Unless the Council stated in the charge that such offences were infamous conduct in a professional respect it had no power to deal with them, and he intimated that in the event of his objection being overruled the question as to the Council's powers might be brought up in another court.

The Council's Solicitor (Mr Harper) argued that there was no such limitation under Section 29 of the Medical Act. Misdemeanours were clearly of two kinds, indictable and non-indictable, and the Council was as much within its rights in dealing with the second as with the first. He recalled a decision given by Alverstone, J.C., sitting with two other judges in 1907 in which he declared that the word misdemeanour was properly applied to those crimes and offences for which the law had not provided a particular name.

The Legal Assessor (Mr E. W. Hansell) said that for legal authority for his contention Mr Hempson had to go back to a very early date before the passing of the Summary Jurisdiction Acts. Mr Hansell contended that anything that was punishable by fine or imprisonment was a misdemeanour unless it was a felony, and that indictable offences were only one section of misdemeanours. The wide terms of the Medical Act made it allowable to consider misdemeanours in the more general sense.

The President ruled that the words 'any misdemeanour' in the Medical Act meant misdemeanours indictable or non-indictable, and included such charges as were alleged against the present defendant.

The case was then proceeded with. Dr Duguid in evidence said that the court martial took place in East Africa. The circumstances in which the alleged offence arose occurred just after his unit was handed over to the South African forces and he was not on duty on the occasion but was fraternizing with a South African officer who was charged with a similar offence. Dr Duguid strongly denied the charge of drunkenness. The evidence against him was given by East African natives, he did not remember that a white person gave evidence. With regard to the first of the civil convictions he was seeing a wedding party off at the railway station when he was arrested by the station policeman. He had had some

alcohol though he was certainly not intoxicated, but he did not appeal against the magistrate's decision because, he wished the occurrence to escape publicity. But from that day three years ago, he became a total abstemious and had so remained. On the occasion of the second conviction in April last he had taken a drug, dial for sleeplessness, and finding the ordinary dose ineffective, he repeated it twice the same night. The next day while in the street he felt unwell and hailed a cab, but the driver instead of taking him home took him to the police station, where after resting for an hour he recovered and was then told to his astonishment that a charge of being found drunk and incapable must be preferred.

A member of the Council asked what dial was and the President said that it was a synthetic sedative. The defendant remarked that he thought the action of these drugs rather uncertain.

Mr Hempson pointed out that Dr Duguid was not on duty on the occasion of these alleged offences. On both occasions at Leeds he had a locum tenens, and was not a member of the profession at that time so far as his obligations to his patients were concerned. The sentence of the court martial was not passed upon him as a member of the R.A.M.C., but as a commissioned officer, and it was not infamous conduct in a professional respect. He produced testimonials to Dr Duguid's character from the Lord Mayor of Leeds, a Leeds vicar, and a professional colleague.

The Council deliberated in private, after which the President announced the decision as follows:

Mr Duguid I have to announce to you that the Council has considered the charge of infamous conduct made against you (the charge arising out of the finding of the court martial) and the convictions recorded against you for drunkenness. They find that the charge and convictions referred to in the Notice of Inquiry have been proved but in view of the evidence before the Council they have not seen fit to direct the Registrar to remove your name from the Medical Register.

The next case was that of Andrew George Tottenham Hanks, L.R.C.P. and S.I., registered as of Edith Grove, Chelsea, who was summoned on the charge of having been convicted in 1920 of being drunk and riotous, in 1923 of being drunk and incapable, in June 1925 of being drunk whilst in charge of a horse, and in July 1925, of being drunk in charge of a donkey and cart and causing unnecessary suffering to the donkey by beating it with a whip. Dr Hanks was defended by Mr Oswald Hempson in trusted by the Medical Defence Union. Mr Hempson at the outset repeated the objection he had already made in a similar case, that these offences should not be classed as misdemeanours, and thereby be subject to the Council's judgement under Section 29 of the Medical Act, but he did not press the point in view of the previous ruling. On none of the occasions mentioned in these charges was Dr Hanks on professional duty. There were extenuating circumstances. Dr Hanks although a man advanced in years served abroad in the war. His first conviction followed a reunion dinner of his regiment but he strongly denied that he was intoxicated. In 1922 he had a fall from his horse and sustained a head injury which had rendered him deaf and also extremely susceptible to the effect of small amounts of alcohol. An unusually large number of testimonials were put in on Dr Hanks's behalf. The Council found the convictions proved but in order to give Dr Hanks an opportunity of reconsidering his character and conduct in this regard postponed judgement until May 1926, by which date he will be required to furnish the names of some of his professional brethren who may be willing upon application to testify to his habits and conduct in the interval.

Adultery

The next case considered was that of Charles Bertrand Wagstaff, M.R.C.S., L.R.C.P. London, registered as of the National Provincial Bank, Conhill, who was summoned to appear on the charge that being a registered medical practitioner he had abused his position by committing adultery with Lilian Savage, a married woman with whom and with whose family he stood in professional relationship of which adultery he had been found guilty in the Divorce Court on June 11th last in the case of Savage v. Savage and Wagstaff, in which he was the co-respondent.

Dr Wagstaff did not appear, nor was he represented. A letter from him was read, denying that adultery ever took place between Mrs Savage and himself, but adding that the circumstances were such that it was impossible for him to establish this to the jury and he would therefore submit to any action the Council might take.

Mr E. A. Savage, the petitioner in the divorce proceedings, gave evidence that he was requiring a medical practitioner for his wife and was recommending to Dr Wagstaff, who in due course attended Dr Wagstaff remained medical practitioner to his family until 1923 when owing to certain information received by the witness he asked him to discontinue his services, and, on further information, instructed his solicitor to warn him to have no further communication with Mrs Savage. He (the witness) had to go abroad and on his return he learned as the result of inquiries that Dr Wagstaff and Mrs Savage had stayed together. Proceedings for divorce were instituted and a decree nisi was granted with £2,000 damages against the co-respondent.

The Council judged Charles Bertrand Wagstaff to have been guilty of infamous conduct in a professional respect, and directed the Registrar to erase his name from the Register.

Prescribing without seeing the Patient

The Council on November 27th considered a charge against Edward William Dacre Hardy, M.C. M.R.C.S. L.R.C.P. registered as of Durlay Road, Bournemouth, that between June 30th 1924 and April 16th, 1925, he sent thirty-one prescriptions for morphine tablets (each to be supplied on three occasions) and morphine suppositories to a lady who had been a patient of his during the months of May and June 1924 but whom he had never seen after June 24th 1924, the giving of such prescriptions being an abuse of the privileges conferred upon practitioners by the Dangerous Drugs Act and Regulations under it.

204 DEC 12, 1925]

The complainant was the Home Office, represented by Sir Travers Humphreys instructed by the Director of Public Prosecutions. Dr Hardy was defended by Mr Oswald Hampson, instructed by the Medical Defence Union.

Sir Travers Humphreys said that the facts of the case were not in dispute. The Regulations made under the Dangerous Drugs Act were conceived in a spirit of absolute trust in the medical profession. But the Home Office took the view that of drugs they prescribed for any particular patient, that was entirely to their discretion. But the Home Office took the view that of drugs they prescribed for any particular patient, that was entirely to their discretion. But the Home Office took the view that of drugs they prescribed for any particular patient, that was entirely to their discretion.

Dr Hardy had practised in Bournemouth for some 25 years and in a manner highly creditable to himself, and he (Sir Travers) was glad to be the first to say so, but Dr Hardy had taken up a justifying attitude which made it necessary for the Council to be brought before the Council. The patient, now dead, was a lady in Bournemouth who first came under Dr Hardy's care in May 1924. Dr Hardy was asked by another doctor to take her over. She had been taking morphine for some time, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower.

Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower.

Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower.

Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower.

Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower.

Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower. For the end of June 1925, Dr Hardy continued to prescribe this minimum amount, but he could not get it lower.

what to charge for prescriptions given in such circumstances. In reply to Sir Travers Humphreys, he said that he would not dream of doing the same thing again, and he desired that it was not a proper thing to have done. A very fair and well-considered counsel. Dr Hardy also agreed with the President that although such prescriptions, they furnished no control against a minimum amount of morphine.

Dr I. Hyla Gieves, practising as a consultant at Bournemouth, he getting a maximum amount. Dr Hardy intimately for many years, and said that he had known Dr Hardy since he had been a boy. Dr Hardy was held in the high esteem by his colleagues in that town. Whatever the error into which he had been betrayed, they were convinced that he had acted in good faith. Mr Hampson also put in a testimonial signed by thirty-five members of the honorary staff of the Royal Victoria and West-End Hospital, stating that Dr Hardy's personal character and professional conduct had always been exemplary. The British Medical Association placed it on record that the conduct of Dr Hardy had been above reproach, and that he had maintained the highest ideals in all matters connected with the profession. Dr Leeming, a member of the Council of the British Medical Association, and Dr Johnson Smyth, a former member, gave similar testimony, and the Bournemouth Medical Society sent a testimonial to which many signatures were appended.

After the Council had deliberated in camera, the President announced its decision as follows:

Mr Hardy has been very carefully considered the facts alleged against him. The evidence brought forward in your report, and the communications which have been made on your behalf. The Council take a very grave view of any abuse of the Privileges of the Council, which have been made on your behalf. The Council take a very grave view of any abuse of the Privileges of the Council, which have been made on your behalf. The Council take a very grave view of any abuse of the Privileges of the Council, which have been made on your behalf.

On November 30th the Council considered the case of Sesé Kápo, N. B., Ch. B. I. d. n., registered as of Lagos, Nigeria, who was summoned on the charge that he had conspired with one Alhaji Taiwo by supplying to him a fictitious account of £25 for professional services alleged to have been rendered to Taiwo's wife and child, the purpose of the account being to enable Taiwo to withdraw money from the provident fund of the Nigerian Railway, which he could not withdraw without a detached account sent in by a medical practitioner. For this alleged offence Dr Kápo was tried with Taiwo in the district court of Lagos in March last, convicted of conspiracy and of forging the account, and fined £50 or six months' imprisonment. The conviction was upheld on his appeal to the Supreme Court of Nigeria, and as a result of the conviction the other administering the Government in Council directed the registrar of the Nigerian Register to delete Dr Kápo's name from the Council in the Colonial Office on out Dr Kápo was reported to the Council by the Government information received from the officer administering the Government of Nigeria. Dr Kápo appeared in person and was defended by Mr A. Neilson, K. C.

Mr Neilson at the outset contended the right of the Council to hold an inquiry, which was tantamount to a trial in the absence of any witness for the prosecution and of any of the relevant documents on which the trial at Lagos had proceeded. The Legal Assessor, however, thought that the objection should be overruled. What it was proposed to prove to the Council was that the respondent had been convicted in Nigeria, in over which he was struck off the Nigerian Register. The President, in overruling the objection, said that the fact of the conviction of the respondent was sufficient to entitle it to take further action. Mr Neilson made a strong protest and said that such a course would not be tolerated in any other court.

Mr Hurper (the Council's solicitor) then read the lengthy report of the proceedings in Nigeria. From a somewhat involved account of the proceedings in Nigeria, it was found that no record was found of the proceedings in Nigeria, it was found that no record was found of the proceedings in Nigeria, it was found that no record was found of the proceedings in Nigeria.

Dr Kápo in evidence said that he had studied at Guy's and the London hospitals and at Edinburgh. He had been in practice at Lagos, where his professional income was £500 or £600 a year. One night he was called by Taiwo to attend a woman in childbirth whom he assumed to be Taiwo's wife and who, in the absence of other accommodation, was brought to his surgery, where her confinement took place. He attended the woman subsequently, and also the child until some months later, he lost all trace of them. He described his bookkeeping and accounting arrangements which were somewhat singular, but he affirmed that he had never conspired with Taiwo or anyone else and without waiting for any communication from the General Medical Council he wrote asking the case in Nigeria was decided and immediately came to the conclusion that the charge might be investigated and immediately came to the conclusion that the charge might be investigated and immediately came to the conclusion that the charge might be investigated.

Not a single question was asked by the prosecution, nor a single remark made, to suggest any motive on the part of Dr. Kapo and yet in criminal trials it was upon motive that the whole matter hinged.

The President interrupted to point out that the implied motive on Dr. Kapo's part was to secure payment of his account.

Mr. Neil said that they were evidently at cross purposes. In a criminal charge 'motive' meant corrupt or criminal motive. Here no such motive was alleged, and indeed it was difficult to see how it could exist. Even if Dr. Kapo went halves with Taiwo over this fee it would seem inadequate to explain a single fraudulent act in the career of a well-to-do practitioner. The whole trial, in fact, was hopelessly muddled. Its most extraordinary feature was that one of the principal witnesses for the Crown, the real wife of Taiwo, stated in her examination in chief—it was not dragged out of her in cross examination—that at about the time of the alleged events her husband had picked up a second or temporary wife, bigamy being rather common in Nigeria, and also that this woman had disappeared at about the time when, according to Dr. Kapo, he lost sight of his patient. Yet in spite of this extraordinary corroboration from the Crown of the defendant's story hardly a reference was made to it by the presiding judge. The case was marked by a total absence of that strictness in criminal procedure which was characteristic of our own courts, and now it came before the Council resting on sketchy scribbled information without any document other than the record of the proceedings and without even the account supposedly forged on which the whole case turned.

The Council found that the facts alleged against Dr. Kapo that he had conspired to supply a fictitious account, had not been proved, and dismissed the charge.

Charges of 'Covering'

The Council considered a charge against Henry Thompson Keating, M.D., C.M. McGill, registered as of the School of Hygiene, Liverpool, who was summoned on the charge that he had knowingly enabled an unqualified and unregistered person, a Mr. Looker, to attend treat or perform an operation upon a patient or otherwise to engage in professional practice and also that for the promotion of his own professional advantage he had been associated with or employed by an unqualified and unregistered person who solicited advertisements drawing attention to his professional skill or knowledge.

The complainant was the Medical Defence Union represented by Mr. Oswald Hempson who stated that a woman in rather poor circumstances saw an advertisement by "Dr." Looker, who was described as an osteopath offering free consultations in any cases which had not responded to ordinary treatment. This woman had had treatment for some gynaecological trouble, and not being satisfied with her progress decided to avail herself of Mr. Looker's services, believing him to be a registered medical practitioner. On calling at his address in Kensington she described her symptoms, whereupon he said according to her story, that this was a case in which he would ask Dr. Keating, who was associated with him, to see her. Dr. Keating thereupon appeared, and, after examining her, stated that she had not been properly treated when her child was born and that an operation was desirable if the danger of cancer was to be averted. The full operation would cost £25. The woman could not afford this sum but said she would talk it over with her husband and ultimately it was decided that she should undergo the operation suggested. She then received a letter from Dr. Keating from Mr. Looker's address, stating that if she could come in on a particular day 'we will be prepared to do the operation.' Eventually, however, the woman underwent an operation at a hospital at the hands of another surgeon. It was added that on the occasion of the examination she tendered payment to Mr. Looker who, however, said that his work was entirely osteopathy, and that she must pay Dr. Keating, to whom accordingly she handed £15.

Dr. Keating, in evidence said that he was at present living at King's Cross. Before the war he was in practice at Montreal, where he did a good deal of gynaecology. Later he served with the British Canadian Recruiting Mission and was stationed at New York and Philadelphia where he met Dr. Looker who was medical officer with that mission so far as he knew then Looker was a fully qualified man. Quite recently he met him again in London and made three or four purely social visits to his house. On one of these occasions he was asked to see the woman who had called on Mr. Looker and he examined her. He did not wish to take any fee for the examination but the woman pressed the £15 upon him. The projected cost of £25 was made up chiefly of nursing home charges at the rate of even guineas a week. He was not anxious to take the case at all, in view of the age of the woman (54) the complicated nature of the case and the fact that it would probably involve a hysterectomy. He had never given Looker any fee or shared any fee with him. He was aware that Looker's qualifications did not entitle him to enrol on the Medical Register here and that they extended only to certain American States. In some hospitals in Canada and America osteopaths worked side by side with ordinary medical practitioners. He explained that the 'we' in his letter referred not to Mr. Looker and himself, but to himself alone, he always preferred this less egotistical pronoun.

Some corroborative evidence of Dr. Keating's statement was given.

The Council found that the facts had not been proved to its satisfaction and the case was accordingly dismissed.

The Council considered on November 24th, 25th and 26th the case of George Joseph Mary Fraser, I.R.C.P., L.R.C.S. (Irel), registered as of Blenheim Crescent, London who was summoned to appear on the charge that by his presence, countenance, advice or assistance or co-operation he had knowingly enabled an

unqualified and unregistered person, one Ulric Knyvett Hoff to attend treat, or perform operations or otherwise engage in professional practice, and to issue certificates, notifications reports or other documents in his (Dr. Fraser's) name or on his behalf. It was further charged against Dr. Fraser that he had signed the certificates of death stating that he had seen the persons during their last illness, and last saw them alive on particular dates, whereas he had not attended or seen them during their last illness at all. A further charge—which was not proceeded with—related to two convictions for failing to notify in the one instance a case of tuberculosis and in the other the birth of a child.

Dr. Fraser was defended by Mr. Charles Davis.

A number of witnesses were examined in support of the complaint. Dr. James Fenton (M.O.H. Kensington) testified that in a case in which scarlet fever was reported he discovered that

Dr. Hoff had been attending the family though Dr. Fraser had signed the certificates. On referring to the Medical Directory—the Medical Register not being handy—he was unable to find Hoff's name and made inquiries of the practitioner as a result of which both Dr. Fraser and Mr. Hoff came to see him the former appearing rather agitated and the latter explaining the omission of his name by his absence from the country for some years. A daughter of one of the women, a Mrs. Lembo whose death certificate Dr. Fraser had signed testified that Dr. Fraser had never visited her mother during her illness, the one occasion on which he had called at the house was an hour after she had died, the patient was attended throughout by the practitioner whom they knew as Dr. Hoff. Other witnesses who had been in attendance on one or other of the women also declared that they were seen by Dr. Hoff but never by Dr. Fraser and one witness stated that she saw Hoff write what appeared to be the death certificate. An insured patient gave evidence that she was on Dr. Fraser's list but was attended by Hoff who examined her throat, felt her pulse and asked questions about her symptoms. A sergeant of the Criminal Investigation Department, Scotland Yard gave evidence that Dr. Fraser called on him desiring to make a statement to be taken down in writing. This statement which was afterwards read over to Dr. Fraser and signed by him related the circumstances shortly to be given by Dr. Fraser in evidence under which he came into touch with and employed Hoff but an important point in this statement was that when Dr. Fraser met Hoff in 1918 he was aware that he was not a registered man. Later, however, he was led to believe after seeing a number of testimonials that Hoff was a licentiate of Apothecaries Hall, Dublin. It was further stated in support of the complaint that for the thirteen months ending March 1925 there were 5,166 insurance prescriptions issued from this practice of these, 2,668 were given by Dr. Fraser, 612 were given by Hoff and signed 'G. Fraser per pro,' and the remaining 1,886 were in Hoff's writing but were signed 'G. Fraser' alone.

Dr. Fraser, in evidence said that while he was a student in Dublin he was introduced by one of the visiting surgeons at the hospital to Mr. Hoff, and he regarded Hoff at that time as a fully qualified man. The suggestion was even made that he (Dr. Fraser) should go out to India as assistant to Hoff, who had a medical appointment there. After the war he met Hoff, who stated that he had been working with a certain doctor as his assistant. The statement which he had made at Scotland Yard that in 1918 he knew Hoff was not registered was an error. He never thought other than that he was registered, and when in 1924 Hoff called upon him and institutions he had been serving, he engaged him without hesitation as locum tenens. He did not take him on as a cheap assistant, he paid him eight guineas a week, though the sum was afterwards lowered to six, and then to four guineas, because Hoff would not take night work. From March 1924, Hoff acted for him during considerable periods while he (Dr. Fraser) was ill in a nursing home. One of the death certificates complained of related to the beginning of this period. It was complained that he (Dr. Fraser) had given the death certificate stating that he had seen the woman, a Mrs. Jenner in her last illness when in fact he had not seen her at all, but the truth was that at Hoff's request he got up from his sick bed to pay a visit to this woman who was then so near death that nothing could be done for her. In another case that of Mrs. Lembo the woman died just before he got to the house in the third case that of Mrs. Whiting he had not in fact seen the woman. He added that Hoff had come to him apparently straight from a hospital appointment and he certainly knew his work well. It was not until Hoff had been with him for nearly a year in connection with Mrs. Lembo's case that any misgiving arose in his mind. He then learned from Hoff that although he was qualified he was not registered and he then regularized the matter.

The President said that the matter regularized arose that of Mrs. Fraser were before the Council. One was that before engaging Mr. Hoff he had ascertained that he had neglected to register but that he would do so forthwith, the other that until the trouble arose in connection with one of the death certificates he had not thought or troubled about the matter. Which of these versions did Dr. Fraser wish to be accepted? Dr. Fraser said that he wished the second one to be accepted, he had confused together registration and qualification. Asked to explain about the case of the woman whom he declared he had attended on one occasion Dr. Fraser said that Hoff had led him to attend on one occasion suggested that it was thought to be expedient that he should attend and Dr. Fraser agreed.

Mrs. Fraser gave evidence corroborating her husband's story. She stated that Mr. Hoff often referred to the examination of Dr. Fraser and the doctors he had worked for. Mr. Davis, Dr. Fraser's solicitor mentioned the names of about twelve doctors

and institutions in whose service, it was understood Mr Hoff had been, and asked the Council's permission to read their letters. The President said that the letters were simply excuses for declining to give evidence. Mr Davis contended that they were documentary evidence in support of Dr Fraser's statement. It was the fact that Hoff had been employed in various parts of the country in medical capacities. The President said that this was not denied.

Mr Davis urged on behalf of his client that his idea having been fixed in his mind from his experience in his student days that Mr Hoff was a duly qualified practitioner no suspicion was likely to be entertained by him. It was not surprising, in view of his illness and of the anxieties of this case, that his evidence was to some extent confused and contradictory, but it became clearer when it was remembered that Dr Fraser had regarded registration and qualification as synonymous terms.

Mr Harper dwelt upon the death certificate in the case of Mrs Jenner, a case which arose directly Hoff entered the practice. It was denied by the woman in attendance on Mrs Jenner that Dr Fraser had visited the patient. Dr Fraser said that he had got up from his sick bed to visit her on one occasion. It seemed reasonable to suppose that Dr Fraser signed that death certificate because he knew that Hoff was not qualified to do so and matters went on like this for nine months before Hoff left Dr Fraser's service.

The Council found that Dr Fraser had enabled Mr Hoff to attend, treat, or perform operations upon patients in respect of matters requiring professional discretion or skill or otherwise to engage in professional practice as if he were duly qualified and registered, and to issue certificates, notifications, reports, or other documents of a kindred character in his name or on his behalf. They also found that Dr Fraser had signed certificates of death falsely in the case of the three women mentioned.

The Council have judged you to have been guilty in respect of these of infamous conduct in a professional respect and have directed the Registrar to erase your name from the Medical Register.

Alleged Touting for Patients

The case was next considered of Algernon Randolph Upton, M.R.C.S., L.R.C.P. Lond., registered as of Medina Villas, Hove, who was summoned on the charge that whilst acting as locum tenent for Dr Theodore C Pocock of Hove, and subsequently thereto, he had invited Dr Pocock's insurance patients to become his own insurance patients, and had filled in his name on the medical cards of some such patients, without being authorized to do so, in order to have them transferred to his list.

Dr Pocock, the complainant, was represented by Mr Ray Neve, and Dr Upton by Mr F W Gentle.

Mr Neve stated that in 1924 Dr Pocock had to go away from home for some months as the result of a serious breakdown in health, and he engaged Dr Upton as his locum tenent. There was nothing in the agreement to prevent Dr Upton from starting a practice later on in the same locality, and therefore when after Dr Pocock's return, Dr Upton opened a practice in an adjoining street no complaint was put forward on Dr Pocock's behalf. But it was contended that Dr Upton, both while he was in Dr Pocock's service and later, did things which were clearly a breach of professional etiquette, and he proposed to call witnesses to prove that Dr Upton had tried to get Dr Pocock's patients by asking them to come to him, these were patients to whom he was introduced as a result of taking on work as locum tenent.

Dr Pocock, in evidence, said that he had been in practice since 1907. He was away through ill health from May, 1924, onwards until 1925, and Dr Upton did his work. Until the autumn of 1924 Dr Upton was not on the panel, but as a result of representations by the East Sussex Insurance Committee he arranged to go on the panel, and at some time during the period from that date until the end of June, 1925, 73 of his (Dr Pocock's) patients transferred themselves to Dr Upton. The total number of his own insured patients decreased by seven during the year or so that Dr Upton had charge of his practice. In cross examination, Dr Pocock was asked whether any of his patients had complained to him because he had thrust party politics upon them and whether at a time when he was candidato for the Hove Town Council he had not dispensed bottles of medicine bearing the legend "Vote for Pocock." Dr Pocock denied this latter allegation, but admitted that he had given election literature to patients who came to his surgery. It was possible that one of the patients who had transferred to Dr Upton's list had complained that he had come to Dr Pocock's surgery for medicine and not for politics.

In further cross examination, Dr Pocock said that he had no knowledge that Dr Upton had been practising in Hove, at his father's surgery, for nearly two years before he came to him, nor that he carried on any private practice of his own at the time he was his locum tenent.

A number of Dr Pocock's insured patients were then called in support of the complaint. A Miss Boon said that in May, 1925, at the time when Dr Pocock returned to the practice, Dr Upton called at her house and in the presence of other members of her family said that he had already "a good few" of Dr Pocock's patients, and would be pleased to have any members of that family if they cared to change. All they had to do was to bring their cards to him. Another member of the same family corroborated, but a third who was also present at the conversation gave a somewhat different and less definite version of what Dr Upton had said. Other witnesses spoke to having met Dr Upton who told them he was starting practice in Hove or according to one, had opened an office, meaning a surgery, and had said, "If you send me on your panel cards I will get them exchanged and send them back to you." Another stated that she was handed by a boy the street a leaflet announcing that. At the request of several residents of the district it is proposed to form a sick club. Dr

Upton has consented to become the doctor." Another witness also an insured patient on Dr Pocock's list said that she left her medical card by accident at Dr Pocock's house, and some time afterwards she received it back with the name of Dr Upton written upon it.

Dr Upton, in evidence, said that he started practice in Hove in 1922, and went as locum tenent to Dr Pocock eighteen months later. His private practice at that time brought him in not more than £100 a year. He took over Dr Pocock's insurance and private practice, except that certain private patients were left in the hands of two other doctors to complete their treatment. He went on the panel in 1924, but during the time he was with Dr Pocock he had only one insurance patient of his own. He never invited any patients of Dr Pocock's to become patients of his, and he gave a different version to the stories of the conversations which the other witnesses had related. Until the time Dr Pocock came back to his practice every card which the witness signed was on Dr Pocock's behalf and was credited to Dr Pocock. He was under the impression that the number of Dr Pocock's patients had increased during his locum tenency, and it was a surprise to him to learn that day that Dr Pocock's insurance list had fallen from 1,069 in May 1924, to 1,062 in May, 1925. If a circular with regard to the sick club was handed to anyone in the street it was not on his instructions. He had nothing to do with the framing of the circular nor with its distribution. Asked, in cross examination, if the family of witnesses who had given evidence against him were a family of his, he replied that they were a family of partisans. He agreed that he had been in the United States, but he was unaware that in America a doctor's surgery was called "an office," which, counsel suggested, was the term he used in speaking to one of the persons concerned. Those who had come on to his list had come voluntarily and some of them had said that they would go elsewhere if he did not take them on. One person transferred him self and his family because he could not get attendance at Dr Pocock's. Another had told him that he went to see Dr Pocock for some ailment but instead of attending to him Dr Pocock had asked him to vote for him at the forthcoming election, and had said that he would feel better in the morning.

The secretary of the sick club, who was also the landlord of the premises where Dr Upton had his surgery, gave evidence that he himself had formed the club, as a result of representations by patients who called at the surgery, and that Dr Upton had nothing to do with the matter beyond agreeing to act as doctor.

Mr Gentle urged, on behalf of Dr Upton, that the recollection of conversations was apt to be distorted by time. The witnesses had stated that Dr Upton had told them he was starting a practice in Hove, words which he was unlikely to have used seeing that he had had a practice in Hove for some years. Not one patient had been produced who had actually transferred to Dr Upton's list as a result of his solicitations.

Mr Neve, on behalf of the complainant, referred to the great difficulty of proving a charge of this description, but his witnesses had made categorical statements, unshaken in cross examination, that they had been asked by Dr Upton to change their doctor. To all this Dr Upton offered only a bare denial. The sick club circular was very unsatisfactory; it did not appear reasonable that Dr Upton could have remained in ignorance of that circular and its terms.

After the Council had deliberated *in camera*, the President announced its decision as follows:

Mr Upton I have to announce that the facts alleged against you in the Notice of Inquiry have not been proved to the satisfaction of the Council.

Restorations to the Register

The Council, after private deliberation, directed the Registrar to restore to the Medical Register the following names:

Haydn Brown Patrick Joseph Honan, Trevor Owen Williams, and William Mortimer Sheen.

DENTAL EXAMINATIONS

Sir JAMES HODSDON introduced the report of the Dental Education and Examination Committee on the replies received from the licensing bodies to the Council's inquiry on dental examinations. A former resolution of the Council was to the effect that candidates, where possible, should be tested in the mode of administration of general anaesthetics in common use in dental practice, and should be required to perform extractions. The Royal College of Surgeons of England reported that it had always called upon a certain number of candidates in the final examination to perform extractions under anaesthetics. The inspector for the Council, however, had commented upon this test being assigned to very few, only two or three on each day of the practical examination, whereas fifty candidates and sometimes more were examined on the one day. The Council of the College expressed its "strong disapproval" of the suggestion that candidates under examination should be called upon to administer anaesthetics to patients. Sir James Hodson stated that his committee was of opinion that the test of performing extractions in the final examination for a dental qualification was as important as the other practical tests required by the licensing bodies, and that if circumstances permitted it would add greatly to the efficiency of the examination to test candidates in the administration of anaesthetics in common use in dental practice, such as adminis-

tration to be carried out under the personal supervision of the examiners. If the anaesthetics were administered by a skilled anaesthetist the candidate should be questioned on the mode of administration and the possible dangers that might arise therefrom. Another proposed resolution of the Council was that a candidate remitted in any subject of a professional examination should, before he was readmitted to examination thereon, be required to produce satisfactory evidence that he had, during the interval of remission, pursued at a recognized medical school or dental hospital the study of the subject in which he was rejected. The committee now suggested that the application of this resolution should not entail a period of remission of more than six months.

This last recommendation was agreed to by the Council, and it was also resolved to call the attention of the licensing bodies again to the various resolutions of the Council on dental examinations, together with the comments of the committee upon the replies they had already given.

Dentist's Name Erased

On a report from the Dental Board the case was considered of Thomas McGowan, of Blackburn "Dentist, 1921," who at the Liverpool Assizes in October was convicted on a criminal charge and sentenced to twelve months' imprisonment. In accordance with the finding of the Dental Board, the Council decided that the name of Thomas McGowan should be erased from the *Dentists Register*.

Restorations

The names of Stuart Christopher Nicoll and James Edward Smyth were restored to the *Dentists Register*.

National Insurance.

THE ROYAL COMMISSION

THE forty sixth meeting of the Royal Commission on National Health Insurance was held at the Home Office, Whitehall, on November 26th, Sir Arthur Worley, and later Lord Lawrence of Kingsgate, in the chair.

Evidence was heard from the National Confederation of Employers' Organizations (represented by Mr J B Forbes Watson and Mr John A Gregorson) on the financial aspects of the health insurance scheme. The confederation submitted that the present need for relief to industry so as to stimulate employment was so urgent as to warrant a reduction in the weekly contributions of the employers and workers that the present scheme is overfinanced, and that the progressive expenditure on additional benefits is more than this country can afford and more than can be justified on any international comparison.

Hereafter the Commission sat in private to continue its review of the evidence which has been received since it began its work and to consider the questions arising therefrom.

Proof copies of the oral evidence and the relative statements submitted at the meetings of October 22nd 23rd and 29th and November 5th (the forty first forty second forty third and forty fourth days) may be obtained from H M Stationery Office, Adelphi House, Kingsway, London W C2 on remittance of cost (1s 6d, 2s 3d, 2s 3d and 1s 6d respectively) and postage.

CAMBRIDGESHIRE LOCAL MEDICAL AND PANEL COMMITTEES

ON December 2nd, at the University Arms Hotel, Cambridge, a complimentary dinner was given by the panel practitioners of the area to Mr Arthur Wright on the occasion of his retirement from the post of clerk to the Insurance Committee for the County of Cambridge. Mr Wright has held office since the inception of the National Health Insurance Act.

Naval and Military Appointments

ROYAL NAVAL MEDICAL SERVICE

SURGEON COMMANDER E McEWAN to the *Falant* on relief.
SURGEON LIEUTENANT COMMANDERS E S Mellor to the *Lucia* M J Aitken to the *Victory* for Portsmouth Dockyard.
SURGEON LIEUTENANT T F Green to the *Indefatigable* A H Hawkins to the *Hospital* South Queensferry J Wolstencroft to the *Pembroke* for Chatham Dockyard A P Anderson Stuart to the *Pembroke* for R N Inshore Boat.
SURGEON LIEUTENANT (hort service) J G Holmes has transferred to the *Immanent* H.

ROYAL NAVAL VOLUNTEER RESERVE

Late temporary Surgeon Lieutenant H Parry Price RN granted a commission as Surgeon Lieutenant and attached to the London Division (merits of August 11th 1921).
Mr T A Brand has entered as probationary Surgeon Sublieutenant and attached to the Bristol Division.

ROYAL ARMY MEDICAL CORPS

Captain G O F Allen MC relinquishes the temporary rank of Major on being ordered to be employed as a Deputy Assistant Director of Hygiene and Pathology.

Captain T C Tibbs is granted the temporary rank of Major whilst employed as a Deputy Assistant Director of Hygiene and Pathology.

Captain H Jacquet MC to be temporary Captain and temporarily relinquishes the rank of Captain.

Captains J A Nicholson MC and W O Tobias retire receiving a gratuity.

ROYAL AIR FORCE MEDICAL SERVICE

Squadron Leaders R W Ryan to Aircraft Depot Egypt F E John on to No 4 Flying Training School, Egypt A J O Wigmore to Headquarters Iraq.

Flight Lieutenant W F Wilson, MC, is promoted to the rank of Squadron Leader.

Flight Lieutenants G H H Maxwell to No 216 Squadron, Egypt J Piendergast to No 24 Squadron Kenley E D D Dick on to R A F British Hospital Iraq, (Honorary Squadron Leader) E Brown to R A F Depot E G Howell to Engine Repair Depot Egypt in stead of to Aircraft Depot as previously notified.

Flying Officers R J K Chatterley to Aeroplane and Armament Experimental Establishment Martineham Heath T Glynn to R A F Depot on transfer to Home Establishment G J Hanly B W Cro J MacC Kilmartin G G J Nicholls and R F G Dick on to Headquarters India W A Beck to Headquarters, Palestine W D McKean to R A F Depot E A Alett and H W Levy to Research Laboratory and Medical Officers School of Instruction Hampstead, on appointment to hort service commissions for short course.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMS MEDICAL CORPS

Captain W W Phillip, late Captain R A MC Special Reserve to be Captain.

INDIAN MEDICAL SERVICE

Captain J Rodger has assumed the duties of Executive Officer Medical Cantonment temporarily in addition to his ordinary duties.
Captain (now Major) J Scott D S O G B to be acting Major from July 19th 1918 to March 26th 1920 while employed with the Egyptian Expeditionary Force.

Captain J W Van Reenan to be Major.
The services of Captain G R McRobert are placed temporarily at the disposal of the Government of Burma.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Captains F W Goodbody and J B Foubister having attained the age limit are retired and retain their rank.

Captain J W Macfarlane MC resigns his commission and retains his rank.

Captain T McCulloch (late R A MC) to be Captain with precedence as from August 23rd 1918.

Captain J A Stenhouse to be Major (prov.)
MC to be Captain (prov.)
Lieut Hugh Miller (late R A T A) to be Major from December 15th 1923.

COLONIAL MEDICAL SERVICE

Dr I Sander on appointed Medical Officer Tanganyika Dr E H Smith S D Stewart A H Brewster C J Milne and W St Clair Thwaites appointed District Medical Officers for Central Province Morua Gran Conda Diego Martin and Bonaire and Mayaro Trinidad respectively.
West African Medical Staff Dr W J Frazer Medical Officer Gold Coast to be a Senior Medical Officer in Nigeria vice Dr J A Bevan deceased Dr S Goodbrand Medical Officer, Gold Coast to be a Senior Medical Officer in Nigeria vice Dr J W Pollard promoted to be an Assistant Director of the Medical Service in that Colony Dr J F Moffatt Medical Officer Gold Coast to be a Senior Medical Officer in that Colony vice Dr R O White retired.

VACANCIES

BRADFORD CITY—Assistant Dentist Salary £450 per annum plus bonus at present £32 16s per annum.
BRISTOL AND HOVE PROVIDENT DENTAL HOSPITAL Queens Road Brighton—Honorary Anaesthetist.
BRISTOL NEW SUSSEX HOSPITAL FOR WOMEN AND CHILDREN—Radiologist (female) Honorarium £100 per annum.
BRISTOL ROYAL ST. JOHN'S HOSPITAL—Third Honorary Anaesthetist.
CANTERBURY HOSPITAL (FRS), Fulkham Road S W 3—Hou Surgeon Salary £100 per annum.
CHURCH ROYAL INFIRMARY—(1) Hou Surgeon (2) Assistant Hou Surgeon Salary £115 and £125 per annum respectively.
CITY OF LONDON HOSPITAL FOR DISEASES OF THE HEART AND LUNGS Victoria Park E 2—Physician to Outpatients. Honorarium is attached to the post.
COVENTRY COVENTRY AND WOLVERHAMPTON HOSPITAL—Hou Surgeon (male) Salary £135 per annum.
DULHAM COUNTY COUNCIL—Medical Superintendent at Holwood Hall Sanatorium Salary £850 per annum.
EAST LONDON HOSPITAL FOR CHILDREN Shadwell E 1—(1) Hou Surgeon (2) Morning Casualty Officer (Males) Salary at the rate of £150 and £120 per annum respectively.
HOSPITAL FOR SICK CHILDREN Great Ormond Street W C 1—(1) President Medical Superintendent Salary £300 per annum (2) Hou Surgeon (male) Salary £150 per annum.
LIVERPOOL UNIVERSITY—Lecturer in Anatomy Salary £200 per annum.
LONDON HOMOEOPATHIC HOSPITAL Great Ormond Street W C 1—The President Medical Officer—Salary at the rate of £100 per annum.
LONDON HOSPITAL E 1—(1) Assistant Obstetric and Gynaecological Surgeon to the Lying in Hospital Stephen Green F 1—(1) Medical Registrar and Outpatient Assistant (2) Surgical Registrar Honorarium at the rate of £50 per annum each.
MIDDELSEX HOSPITAL W C 1 S O L V 1—Two Surgical and one Medical Registrar Salary £100 per annum.

An Address

ON THE

HOSPITAL POLICY OF THE BRITISH MEDICAL ASSOCIATION

Delivered before the Divisions of the Southern Branch

BY

G C ANDERSON, M.D.,
DEPUTY MEDICAL SECRETARY

THE hospital policy of the Association is the result of a slow and steady growth of opinion within the medical profession. An enormous amount of labour has been spent upon the problem, and the policy is based upon the direct experience of members of the profession engaged in the practice of medicine in its widest sense, and in particular of those engaged in hospital work. The policy aims at being a practical and not an academic scheme. It is the result of the work of the members of the Association acting through its deliberating bodies, and it has been discussed and voted upon by members through the Divisions and the Representative Body. It has, moreover, been submitted to the vote of conferences of medical staffs of hospitals throughout the country called together for that particular purpose. The policy, to which practically the final imprimatur was given at the Representative Meeting at Bath, has been distributed in pamphlet form to all the voluntary hospitals of the country, and has been widely commented upon by the newspapers. The press notices were most encouraging, and on the whole it may be taken that the policy as it at present stands has been very well received by the lay public.

We must remember that hospitals were originally established as charities for the indigent, and as a consequence inability to pay for adequate attention was sufficient ground for admission. Many new conditions, however, have arisen during late years, and are still arising, which have very materially changed the standards of admission to voluntary hospitals, and the time has now come when the medical profession should consider seriously the new position. It is not merely the staffs of voluntary hospitals who are concerned, but the medical profession as a whole, and therefore my remarks will be made in the hope that all who are interested in this very important question will give the matter their close attention.

The medical profession, in common with the rest of the community, has in the past viewed the hospital as a charity

¹ Policy Affecting Hospitals Published by the British Medical Association 3d net.

maintained by the benevolent, and all those who could rightly claim to be the objects of such a charity were admitted and treated gratuitously, by the medical staff. Modern progress in medical science, the introduction of costly appliances for diagnosis and treatment, the need for more prolonged clinical observation due to the increased complexity of medical, surgical, and special department work, and many other factors, have driven people, who formerly obtained medical and surgical advice from the private practitioner in their own homes or in a nursing home, to seek admission to a voluntary hospital through sheer inability to meet the demands made upon their purses. It must, therefore, be fully recognized that the clientele of a hospital is now much more widely distributed, and that persons who heretofore would never have contemplated entering a hospital are now only too anxious to obtain treatment there. The indigent or necessitous class is not now, relatively to the population as a whole, nearly so numerous as it used to be in the nineteenth or even in the early part of the twentieth century, and medical attention is now available for every section of the community. The Poor Law medical service, the National Health Insurance service, the school medical service, etc., provide a means whereby medical care is available to the poorer sections of the population, and consequently the truly necessitous who are fit objects for charity do not exist in sufficient numbers to fill the hospital beds. Therefore a large number of beds are available for that part of the community which can and ought to contribute directly or indirectly for treatment and maintenance while in hospital.

In view of this altered state of affairs the position of the medical staff, at any rate so far as gratuitous service is concerned, must be reviewed in a new light. We must, of course, recognize that the purely charitable side of the hospital should be continued, wherein the whole cost of the maintenance of indigent patients is met by voluntary contributions and endowments, and to which the honorary medical staffs give gratuitous services. On the other hand, other patients who cannot be called indigent are being received and treated at our voluntary hospitals because they cannot obtain adequate treatment elsewhere, and for this section of the community payment is being made, or at any rate should be received by the hospital, either from the patient himself or from some third party on his behalf.

Although the whole voluntary system has undergone a gradual change during the past generation or more, the essence of the system still remains in the independent and voluntary management. The British Medical Association believes in the voluntary system, considering it to be to the advantage of the public, of medical science, and of the medical profession, and con-

quently it would view with grave concern any interference with what it believes to be the essence of the system.

In the old days the board of management, the subscribers, and the honorary medical staff gave their services and funds gratuitously to those who were unable to contribute in any way towards their maintenance, medical attendance, and treatment, but as soon as the demand for payment is made, and justly made, for those who are in a position to pay, in part or in whole, by direct or contributory methods then the original understanding becomes fundamentally changed and the voluntary principle as it was once known ceases to operate.

Facts must be faced, and changed conditions must lead to changed views. The voluntary system as it was once known must adapt itself to the new order of things, so that it may continue to be of benefit to those most concerned.

The independent and voluntary management will, as it has done in the past, administer the charitable side of the hospital only in so far as the indigent patients are concerned, but besides this it will now provide hospital benefit for those for whom payment in some form is rightly demanded for services rendered or to be rendered.

At a conference organized by the Labour party, to which were invited all those interested in the hospital problem, and at which was discussed the policy of the Labour party in regard to hospitals, an attempt was made to establish the principle that all hospitals should be State institutions maintained by public funds. The conference was beneficial in many respects, but chiefly because of the views expressed upon this point, and at its termination only a small minority even of the representatives of the Labour party itself was prepared to advocate such a state of affairs. The following resolution was unanimously adopted by the conference:

Some form of public assistance is essential if a complete and adequate hospital system is to be maintained and the development and maintenance of an adequate hospital system should be provided in such fashion as will preserve the best features of the present voluntary system.

Altogether, the voluntary principle is deep rooted in the minds of the people of this country, and the Association, representing the medical profession at large, has expressed the conviction that the system ought still to be maintained.

We must recognize, however, that the source from which hospital funds are to day being received differs somewhat from that of a generation or more ago. Some gratuitous and charitable contributions are given on the distinct understanding that they are to be expended at the discretion of those to whom they are entrusted. But there are also the newer forms of contributions made for services rendered or to be rendered, and these may be paid either by the patients themselves or by someone else on their behalf, it is here that we are face to face with a new order of things. Contributions to hospitals by employers of labour, and massed or periodical contributions by employees, must be looked upon as contributions for services given or to be given. These contributions are made on the understanding that when occasion for hospital benefit arises the need will be met. Again, very few of our hospitals do not now insist upon individual payments from all those patients not otherwise contributing who are in any way regarded as in a position to contribute something towards the cost of maintenance and treatment while in hospital.

Both in the contributory and in the individual method of payment we see a departure from the old established custom. Our hospitals no longer exist for the indigent alone, and the persons availing themselves of the facilities offered at the hospitals are drawn now from classes quite other than the hospital class of former generations. Many of them are obviously not proper recipients of, and indeed do not themselves desire, charity either in the form of hospital accommodation and maintenance or of medical treatment.

A source from which hospitals in increasing numbers are deriving their funds is the contributory method of payment, and contributory schemes for the provision of hospital benefit are springing up all over the country. The Association welcomes this method, but holds that certain safeguards and requirements are essential. A contributory scheme is one under which payments are made for which there is a stated or implied return. A person who is asked to contribute a certain sum weekly naturally does so on the understanding that should occasion arise the necessary accommodation and treatment at the hospital will be forthcoming.

The Association believes that in any scheme for the provision of hospital benefit it is undesirable that the hospital itself should undertake any insurance risk, and therefore it holds that schemes of this nature should be organized by some independent body. The reason for this is that in the voluntary hospital accepts an insurance risk of this nature the primary consideration in the admission of a patient—namely, the suitability of the case on medical grounds—would be prejudiced, and, further, the purely charitable funds of the hospital would run the risk of being used for a purpose for which they were not intended. The provisions of a contributory scheme should be such as to make the scheme self-supporting in order to meet all the demands made upon it by reason of the aid given to the beneficiaries.

The provisions of every contributory scheme should clearly indicate the absence, the limitation, or the presence of any contractual obligation to provide hospital benefit. It should be stated in plain language that the primary consideration in the admission of a patient is the suitability of the case on medical grounds, and that the ordinary hospital routine of admission, transference, and discharge of patients will be adhered to, no preference being given to any member of a contributory scheme.

The Association considers that when a hospital enters into any arrangement under a contributory scheme for the reception of patients such arrangement should be taken to cover the cost of maintenance and medical treatment, and that therefore the payments made to the hospital thereunder should be upon a tariff basis, full allowance being made for provision of accommodation, maintenance, and medical treatment. The consideration for the admission of all patients received on a tariff basis under such an arrangement should be inability to pay for adequate treatment as a private patient either inside or outside hospital, and no patient should be admitted without the recommendation of the attending practitioner, except of course, in emergency. It will therefore be obvious that some income limit should be fixed to determine the eligibility for hospital benefit on tariff rates under a contributory scheme, and the Association has suggested the following scale, which, of course, must be subject to economic and local variation and to periodical revision.

Class 1—Limit of income £200

- (a) Single persons over 16 years of age
- (b) Widow or widower without children under 16 years of age

Class 2—Limit of income £250

- (a) Married couples without children under 16 years of age
- (b) Persons with one dependant under 16 years of age

Class 3—Limit of income £300

- (a) Married couples with a child or children under 16 years of age
- (b) Persons with more than one dependant under 16 years of age

An examination of the various contributory schemes springing up all over the country shows that many of the fundamental conditions enunciated by the Association are being omitted. In some instances the hospital management itself is responsible for and is managing the scheme, while in others, such as the Hospital Saving Association in London, the management of the scheme is in independent hands. Many of these schemes contain no provision for an income limit, nor is there any rule to the effect that a contributor will only be admitted to the hospital upon the recommendation of the attending practitioner. Schemes that omit these two very important provisions are being started in various parts of the country, and the boards of management of the hospitals concerned are under taking to admit and treat contributors (irrespective of their incomes), and thus without consultation with the medical staffs concerned, assuming that they will continue to give their services gratuitously. It is time that the staffs of our voluntary hospitals began to realize what the new order of things is going to mean to them. In some districts the medical men concerned, realizing that the British Medical Association has shown much foresight in this matter, have insisted that the Association's policy shall be followed, but in many other cases schemes have been started without any apparent interest being evinced by those upon whom, after all, the success of any such scheme depends.

If a contributory scheme has no rule to the effect that a patient will not be admitted without a recommendation from his attending practitioner, and if no income limit is fixed for the subscribers to the scheme, do the members of the hospital

staffs concerned realize the situation created? Many persons who in the past have had occasion to seek advice from the members of the hospital staffs in their private capacity, and who have paid for the advice given or the operations performed, will no longer be counted among the clientele of these medical men, but will be able to obtain all the advice and treatment they need by taking advantage of the benefits which they are entitled to as members of the contributory scheme.

To safeguard the position of the medical members of hospital staffs three fundamental principles should be insisted upon:

- 1 That a contributor to a scheme will only be admitted to the hospital upon the recommendation of the attending practitioner.
- 2 That only persons below a definite income limit are entitled to join a contributory scheme for hospital benefit.
- 3 That recognition is made of the services of the medical staff.

The massed or periodical contributions received for a considerable number of years by many of the large voluntary hospitals in large industrial areas are really in the same category as the contributory schemes, for here again the right of entry into the hospitals when need arises is implied, and in some cases explicitly stated. Again, many firms with large numbers of employees contribute to the hospitals in their areas, and although no conditions are attached to their payments it is obviously expected that admission to hospital will be given to any one of their employees who meets with an accident which calls for institutional treatment.

The admission of patients who contribute in some way has changed the character of the voluntary hospitals, and consequently has changed also the arrangements under which the subscribers and the honorary medical staffs agreed to place their funds and services at the disposal of the hospital management.

Hospital in-patients should be divided into three categories—the free or indigent, the tariff, and the private.

Indigent Patients.—As far as the free or indigent class is concerned the services of the honorary medical staffs of the voluntary hospitals will continue to be given gratuitously as heretofore. There should be no misunderstanding on this point, for the medical staffs do not expect and do not intend to ask for any of the hospital funds which are used for the benefit of those who can rightly claim to belong to this class. The free or indigent patient should be defined as one certified by the almoner or other officer of the hospital as unable to contribute in any way towards his maintenance and medical treatment for such persons hospital benefit is provided by the gratuitous contributions placed at the discretion of the hospital management and by the gratuitous services of the honorary medical staff. Persons obviously destitute or those already in receipt of Poor Law relief should, after they have been seen once in the casualty or out-patient department, be referred to the Poor Law relieving officer unless retained by the hospital for treatment. But in the case of patients referred by Poor Law medical officers to hospital for consultation or treatment payment should be required from the Poor Law guardians both for advice and treatment and for maintenance.

Tariff Patients. should be defined as those paying or for whom is paid in part or in whole the tariff cost of maintenance and treatment. This included in this group would be those for whom any payment is made by a public authority, approved society, employer of labour, insurance company or other body, as well as those making payments through a contributory scheme. The tariff cost should cover in full the accommodation, the maintenance, and the medical treatment of the patient while in hospital. The admission of patients under this category should be defined by an income limit which must of necessity vary with local conditions. The income limit suggested I have outlined when discussing contributory schemes.

Private Patients.—All those whose income places them beyond the agreed scale for tariff patients should be admitted to the hospital as private patients when they should be called upon to pay such charges for maintenance as will fully cover every cost to the hospital, the cost of medical treatment being left for arrangement between patient and doctor. If private patients are allowed in the public wards of a voluntary hospital they should be admitted only upon the recommendation of a private practitioner and no preferential treatment should be given them. Where special accommodation in the nature of a nursing home attached to a hospital is available the patient should be allowed to select his own medical attendant.

The amount of work carried on at the out-patient departments of some of our hospitals ought to be curtailed, and only such treatment should be given as cannot consistently with the best interests of the patient be undertaken by a general practitioner of ordinary professional competence and skill. The primary purpose of the out-patient department should be

consultation. If those in charge of the out-patient departments were to refer all cases not suitable for hospital treatment to a practitioner concerned with the case, and to refuse all further treatment which comes within the scope of the practitioner of ordinary competence and skill, there would be less abuse of hospitals. The practice of referring a case to a hospital for advice when the patient is able to pay a fee (modified if necessary) to a consultant seeing the patient at his own home cannot be too strongly condemned. Arrangements should be made for consultations and specialist services for tariff patients whereby these services can be given so far as is possible and consistent with the best interests of the patients by a private practitioner at his own consulting room or at the patient's own home.

Such an arrangement has been instituted in connexion with the administration of ophthalmic benefit as an additional benefit under the National Insurance Act. Cases are referred by approved societies, upon the recommendation of insurance practitioners, to certain ophthalmic surgeons who have agreed to do the work upon certain terms agreed centrally. The ophthalmic surgeon is therefore consulted, not as a member of a hospital staff, but as a consultant in his own private capacity. Some such arrangements should be made in any contributory schemes in order that cases may be referred in the first instance to the individual consultant at his own home, and not, as at present, to the hospital. A proper regulation of the work at the out-patient departments of our hospitals will do much to remove many of the difficulties, financial and otherwise, which face the hospitals.

The demand that patients other than those belonging to the indigent class should pay for their hospital treatment, whether such payment is made by the individual or through some contributory scheme or otherwise, at once raises the question of payment in some form of the members of the medical staff and it is from this aspect that the hospital policy of the Association has been most discussed.

Nearly everyone is now agreed that for the work which a hospital does for the State, the hospital and the medical staff should receive payment. This was recognized in the treatment of discharged and disabled soldiers during the war, and in many hospitals as much as 20 per cent. of their gross receipts under such arrangements was allocated to the medical staffs. Again, it is generally agreed that for cases referred to the hospital for treatment by local authorities, such as the education authority, payment should be made, and that this should include some payment for the services of the medical staff. Indeed, whenever the board of management of a voluntary hospital enters into a financial arrangement with a public authority, an employer of labour, approved society, or insurance company, or under a contributory scheme or otherwise for the reception of patients, such arrangement should be taken to cover the cost of maintenance and medical treatment, and a percentage of all such receipts should be passed into a fund at the disposal of the visiting medical staff of the hospital. A definite financial arrangement having been made by some body or company which has accepted responsibility for the provision of hospital benefit for a group of persons under certain defined conditions, it cannot be expected that the medical staffs of the voluntary hospitals concerned should give their services free and therefore the Association recommends that a percentage of the money received by the hospital under such an arrangement should be allocated to a staff fund at the disposal of the staff. The contract made is for hospital benefit as a whole, and therefore the payment made under any financial arrangement is for treatment as well as for accommodation and maintenance.

If a contributory scheme were run in accordance with the Association's policy and the contributors to the scheme (where occasion demanded it) were treated in the hospital on a tariff basis, the money received by the hospital would be assessable for staff fund purposes. But the schemes springing up all over the country are either organized by the hospital itself or by some group which gives a contribution to the hospital out of the funds collected, in other words, no definite financial arrangement is entered into with the hospital. The same position arises in relation to the contributions for patients made by approved societies, insurance companies and employers of labour. The Association considers that the visiting medical staff should, in these circumstances, also receive recognition for its services either by a percentage passing into a staff fund or

by a fixed honorarium. An honorarium was suggested to meet the objections of those who were definitely opposed to the staff fund proposal in these particular instances. Contributions made to the hospitals by unskilled or periodical payments by employees, such as exist in many of the large mining areas, should, of course, be treated on corresponding lines.

Still another class of case—apart from the purely private patient from whom the hospital receives a contribution—has to be considered here. Individuals, in return for or in anticipation of treatment, are called upon to make a contribution to a hospital, and the Association considers that the visiting medical staffs should receive recognition for their services either in the form of an agreed honorarium or by passing a percentage of all such payments into a special fund, the honorarium or the fund being allocated as the visiting medical staff may determine. Payment is being exacted from patients by the hospital managements in increasing numbers and in increasing amount. A patient is expected to pay as much as he can afford, and his financial position is scrutinized in order that the payment demanded may be justified. As a consequence of this demand the patient believes he is paying for his maintenance and treatment while in hospital, and even although the amount he actually contributes does not cover the full maintenance rate, it is a payment towards the full cost of hospital benefit, which includes treatment as well as accommodation and maintenance. In as far as the patients are treated on a charitable basis, in so far should the medical staffs be prepared to give their services gratuitously, but in as far as the hospital makes a charge in respect of hospital benefit, in so far should the medical staff receive a portion of that charge.

If the medical staff objects to a percentage passing into a staff fund, then the method of an agreed honorarium may be adopted. It is essential that the medical profession should enter its claim and demand a return for services rendered in respect of the classes of cases I have mentioned. The amount of the claim is not at the moment of prime importance, but it is imperative that the principle should be established everywhere without further delay. It may, of course, be said that if payment is insisted upon in some shape for all those outside the free indigent class the present funds of the hospital will be more than enough to provide for the patients of such a class, and a surplus would soon be created for which there would be no outlet. If such a state of affairs ever came to pass (and it is to be hoped it will) the surplus might be used in a variety of ways—for example the extension of existing hospitals or the building of additional hospitals, or the reduction of the tariff rates for the benefit of those who come within this particular category of patient.

Many of the accident cases at our hospitals should not be treated gratuitously, for it must be remembered that there are many accidents for which the patient's medical treatment is covered directly or indirectly by insurance and in these cases the hospital authority should recover from the insurance company, either direct or through the patient, the full cost of maintenance and treatment. Where persons who would ordinarily be regarded as private patients are admitted to hospital solely on account of accident or emergency they should be treated as private patients.

It is surely in the interests of public health that the numbers of practitioners attached to our hospitals should be increased, and that the tenure of office should be modified so as to allow more and younger practitioners to obtain responsible hospital experience. As full opportunity as possible should be given to private practitioners with the necessary qualifications and experience to participate in hospital work. The number of patients wishing to avail themselves of hospital benefit is undoubtedly on the increase, and if satisfactory methods of payment for maintenance and treatment are established there is no reason why this wish should not be granted and the medical staff increased to cope with the work. But it is essential that all who are appointed to the staff in any capacity whatsoever should make their hospital duties their primary consideration and should not permit outside work to interfere with their hospital work. Another important point to be considered is the representation of lay and medical interests on the boards of management of the hospitals. No single interest should be in the majority.

If at any time the State has occasion to contribute to the hospitals, such contributions should be made by way of the Voluntary Hospitals Commission to the local Voluntary Hos-

pitals Committees, set up in accordance with the report of the committee presided over by Viscount Cave. The British Medical Association considers that the scope of these local committees should be extended so as to make them the co-ordinating bodies for all the hospital accommodation (voluntary, municipal, and Poor Law) required within their areas. The three types of hospitals in which provision is made for the treatment and nursing of the sick should be co-ordinated so that the existing anomalies may be amended. The areas covered by the Voluntary Hospitals Committees should be large enough to cover effective hospital districts, and need not be confined to local government areas. The representation of these committees should include representatives of all the hospitals in the area, whether voluntary, municipal, or Poor Law, and, further, the committee should contain representatives from the medical practitioners in the area. Medical representation should be twofold: from the medical staff of the hospital and from the local Advisory Medical Committee, such, for instance, as the local Branch or Division of the British Medical Association. The work of any such Voluntary Hospitals Committee should not interfere with the domestic autonomy of the several hospitals in its area; it should act only in an advisory capacity, advice being given upon the accommodation required in the area as regards both special and general hospitals and municipal and Poor Law hospitals as well, and it should make recommendations for the provision of any additional accommodation needed and the type of such provision. Lastly, the Association considers that the scope of the existing central Voluntary Hospitals Commission should be extended so as to make it a standing consultative hospitals committee for England and Wales which should represent all the local hospitals committees of the several areas and should act as between the Ministry of Health and the local committees in all matters concerned with the hospital policy of the Ministry. Such a permanent Voluntary Hospitals Commission should be charged with the allotment to hospitals not directly supported by the State of any grants the State may decide to make.

It behooves all our Divisions and Branches through the country to give the hospital question their earnest consideration and to set up special hospitals committees representative of all medical interests in their areas, in order that developments in connexion with our hospitals may be watched with a careful eye.

British Medical Association.

CURRENT NOTES

Status of the Insurance Acts Committee.

THE Annual Conference of representatives of Local Medical and Panel Committees on October 22nd, 1925, passed a resolution, with only eleven dissentients out of 179 representatives present, expressing its confidence in the Insurance Acts Committee of the British Medical Association as the one and only medical body authorized to defend the honour and interests of insurance practitioners and to voice their wishes. This resolution also urged its constituent committees to give loyal and undivided support to the Insurance Acts Committee, dissociating themselves from any action taken within the profession which can result in rendering collective bargaining ineffectual. The Insurance Acts Committee has circulated copies of this resolution to all Local Medical and Panel Committees, pointing out that only a small number of those committees have ever taken any such action as is referred to therein, and stating that, before sending representatives to any conferences except those called by the Insurance Acts Committee, and especially before agreeing to any deputation to the Government representing Local Medical and Panel Committees, they should have regard to the above-mentioned opinion of the Annual Conference.

Insurance Practitioners with Limited Lists

Medical officers of hospitals and other institutions are at present allowed to place their names on the local medical list for the purpose of attending the insured members of the staff of the institution. They are not

allowed to undertake the treatment of other insured persons. The question has recently been raised whether such medical officers should be entitled to attend employees of the institution who live outside. The Insurance Acts Committee is of opinion that such medical officers should not be admitted to the list unless their insured patients are confined to the resident employees of the institution. This can be given effect to in Clause 5 of the Model Distribution Scheme.

Subscriptions for 1925

Members of the British Medical Association are reminded that subscriptions fall due on January 1st in each year, and that if each member who receives an application for his or her subscription from the Head Office will send the amount to the Financial Secretary within the first week of the new year the work of the office will be very considerably lightened. Members are also reminded of the claims of charity. The amounts at the disposal of those concerned in the administration of medical benevolence are altogether insufficient to meet the appeals that are received, and the British Medical Association Charities Fund was formed in order to assist. Subscriptions or donations are urgently needed, and every member of the Association is asked to add to his next payment a sum for the credit of the B.M.A. Charities Fund.

SOUTH AFRICAN COMMITTEE

A MEETING of the South African Committee of the British Medical Association was held at Pietermaritzburg on July 6th and July 11th, with Dr D CAMPBELL WATT in the chair, and a copy of the minutes has now been received in London. The following note gives a brief account of the chief items of general interest in the proceedings.

On the subject of Congress Regulations a proposal of the local organizing committee regarding the length of papers at sectional meetings was considered. That committee recommended that papers for opening discussion be limited to forty minutes, and other papers limited to thirty minutes. Sir SPENCER LISTER seconded by Dr H. S. JONES, moved that these times be altered to thirty five minutes and twenty minutes respectively, and after discussion this amendment was carried. It was agreed that a recommendation be made to the Pretoria Branch that notices for the next congress (to be held in Pretoria) be sent out in both official languages.

The resignation of Dr T. D. Greenlees, who has for many years served as a representative of South Africa on the Council of the Association, was accepted with regret, and it was agreed that a letter be sent to him thanking him for his services to South Africa.

The PRESIDENT reported that under the powers conferred upon the South African Committee by the Council of the Association and the resolution of this Committee he had sanctioned the formation of a new Branch with the following area: Humansdorp, Willowmore, Jansenville, Uniondale, Knysna, Port Elizabeth, and Uitenhage, being those districts agreed upon by the two neighbouring Branches. As regards the additional district claimed for the new Branch, a sub-committee was appointed to go into this matter and report. At the adjourned meeting it was agreed that the new Branch should be styled the Midland Branch.

Medical Registration Fee.—A letter was read from the Witwatersrand Branch of the British Medical Association calling the Committee's attention to the proposed alteration contained in the new Medical Bill regarding the amount of the registration fee, and to the fact that the proposed method of financing medical councils left the practitioner's liability unlimited. Dr FRASER moved that it be an instruction from the South African Committee to the Cape Western Province Branch to protest against this method of finance, which left the practitioner with no knowledge of his liability. This was carried.

Payment of Fees to Doctors called to Street Accidents.—Attention was drawn by the Secretary of the Witwatersrand Branch to page 134 of the SUPPLEMENT to the BRITISH MEDICAL JOURNAL of October 11th, 1924, wherein it was stated that the English Home Office had sent a letter to all chief constables asking them to make arrangements for payment of fees to doctors called to street accidents where no such arrangements exist. The Witwatersrand Council desired the South African Committee to consider the matter with a view to making similar arrangements in the Union. It was proposed by Dr GREENBERG, and seconded by Dr CHARLES PORTER, that when the police called in a medical man to attend a street

accident the police authority should be responsible for the payment of a fee. This was carried.

Specialists and Medical Officers' Fees.—The matter of the working of the Railway and Harbour Sick Fund Board in regard to the appointment of medical officers, the payment of fees, and the distribution of patients was brought up by the Cape of Good Hope (Western Province) Branch, there being much dissatisfaction among the medical practitioners in the Cape in connexion therewith. As the matter was of general importance it was thought that it should be dealt with by the South African Committee. After discussion, it was unanimously agreed that each Branch be asked to inquire and report upon the conditions in its own area.

Hospital Commission's Report.—It was agreed that Branches be circularized for their opinion of the Commission's recommendations, and that the matter be left in the hands of the President with power to co-opt, and to take such action as might be necessary.

Congress Resolution.—Among the resolutions received from the Honorary Secretary of this year's South African Medical Congress, and adopted at the business meeting of the Congress, was the following:

That on the retirement of Dr Charles Porter from the office of medical officer of health Johannesburg the South African Medical Congress held at Maritzburg 1925 place on record its appreciation of the great services rendered by Dr Porter to the advancement of public health in Johannesburg and in the Union of South Africa and expresses the hope that he may long be spared to enjoy a well earned leisure and that a copy of this resolution be forwarded to the Town Council Johannesburg.

Association Notices

BANFF, MORAY, AND NAIRN DIVISION

NOTICE is hereby given to all concerned that the Council has changed the name of the Banff, Elgin and Nairn Division to "Banff, Moray and Nairn" Division, the change to take effect as from the date of publication of this notice.

PROPOSED WINDSOR DIVISION

NOTICE is hereby given to all concerned of the following proposal made by the Reading Division:

That there be formed a Windsor Division of the Oxford and Reading Branch, of area as follows:

- (i) The Municipal Boroughs of Maidenhead and Windsor and the Rural Districts of Cookham, Easthampstead and Windsor, which at present form part of the area of the Reading Division of the Oxford and Reading Branch,
- (ii) The Urban Districts of Eton and Slough, and the Rural District of Eton, which at present form part of the area of the Buckinghamshire Division of the South Midland Branch,
- (iii) The Urban Districts of Chertsey and Egham, which at present form part of the area of the Guildford Division of the Surrey Branch.

Written notice of the proposal has been given to the above named existing bodies, and the matter will be determined in due course by the Council. Any member affected by the proposed change, and objecting thereto, is requested to write giving reasons therefor, to the Medical Secretary, British Medical Association House, Tavistock Square, London, W.C.1, not later than January 19th, 1925.

BRANCH AND DIVISION MEETINGS TO BE HELD

EDINBURGH BRANCH SOUTH EASTERN COUNTIES DIVISION.—An ordinary meeting of the South Eastern Counties Division will be held in the Railway Hotel, Newtown St. Boswells on Wednesday, December 23rd, at 3 p.m. Business Arrangements for annual dinner, presentation of badges of office for chairman and secretary of Division by Dr James Morris Menzies (Selkirk), present chairman of the South Eastern Counties Division, address on ultra violet radiation medicine by Dr Charles Cameron, Fortuna Sanatorium.

KENT BRANCH TONBRIDGE WELLS DIVISION.—A meeting of the Tonbridge Wells Division will be held at the General Hospital, Tonbridge Wells, to-day (Friday, December 18th) at 3.30 p.m. Dr A. J. Hall, Professor of Medicine, University of Sheffield will give a British Medical Association Lecture on later effects of epidemic encephalitis (illustrated by lantern slides). Tea will be provided. Further lectures will be given on January 20th 1925 by Dr T. A. Ross on some varieties of psychotherapy and in March by Dr A. White Robertson.

LANCASHIRE AND CHESHIRE BRANCH HYDE DIVISION.—A meeting of the Hyde Division will be held in the Hyde Town Hall on Thursday, January 14th, 1925, at 4 p.m. Agenda: Report of the Executive

Committee as to the scale of minimum commencing salaries for public health medical officers, and proposal that the Division should adopt a resolution in connexion therewith pursuant to the Division Rules

METROPOLITAN COUNTIES BRANCH CITY DIVISION—A meeting of the City Division will be held at the Public Library, Holloway Road, N., on Tuesday, January 5th, 1926, at 9.30 p.m. Lieut. Colonel Spencer Mort will read a paper on interesting surgical cases in relation to general practice (with photographs)

MIDLAND BRANCH CHESTERFIELD DIVISION—A meeting of the Chesterfield Division will be held at the Maternity Hospital, Chesterfield, on Friday, January 8th, 1926, at 8.15 p.m. Mr. A. M. Webber, I.R.C.S., honorary surgeon Nottingham General Hospital, will give an address on pelvic pain in women. Tea and coffee at 8.

SOUTH MIDLAND BRANCH BEDFORDSHIRE DIVISION—A general meeting of the Bedfordshire Division will be held at the Bedford County Hospital on Tuesday, December 29th, at 3 p.m. Agenda: (a) vice-chairman, (b) additional representative on Branch Council communication regarding badge for chairman and secretary, report of Executive Committee as to the scale of minimum commencing salaries for public health medical officers, and proposal for adoption of a resolution in connexion with the same. Dr. Ross will read notes on a case of renal calculus, and on some abdominal cases. Tea will be provided.

SOUTH WALES AND MONMOUTHSHIRE BRANCH SOUTH WEST WALES DIVISION—A meeting of the South West Wales Division will be held at the Carmarthenshire Infirmary on Wednesday, January 13th, 1926, at 3 p.m., when Professor A. J. Clark will give a British Medical Association Lecture on recent advances in endocrinology.

SUFFOLK BRANCH SOUTH SUFFOLK DIVISION—A meeting of the South Suffolk Division will be held at the Crown and Anchor Hotel, Ipswich, to-day (Friday, December 18th), at 3.30 p.m. A lecture on the heart will be given by Dr. W. T. Addey, M.P.C.P.

SURREY BRANCH KINGSTON ON THAMES DIVISION—At the meeting of the Kingston on Thames Division to be held on Tuesday, January 5th, 1926, Mr. J. G. Turner, I.R.C.S., will read a paper on dental sepsis.

SURREY BRANCH REIGATE DIVISION—At the meeting of the Reigate Division to be held at the East Surrey Hospital, Reigate, on Tuesday, January 12th, 1926, at 8.45 p.m., Sir Henry Gauvain will read a paper on conservative treatment in non-pulmonary tuberculosis.

YORKSHIRE BRANCH DEWBURY DIVISION—A meeting of the Dewbury Division will be held in the Man and Saddo Restaurant, Dewbury, on Tuesday, January 12th, 1926, at 8.15 p.m. Dr. W. Fletcher Shaw (Manchester) will read a paper on chronic pelvic pain.

YORKSHIRE BRANCH WAKEFIELD POTTEFACT, AND CASTLEFORD DIVISION—A meeting of the Wakefield, Pottefact, and Castleford Division will be held in the Bull Restaurant, Westgate, Wakefield, on Thursday, January 14th, 1926, at 8.30 p.m. The chairman (Dr. William Stevens) will open a discussion on the role of the general practitioner in preventive medicine. Supper will be served at 7.15 (charge 2s. 6d.).

Meetings of Branches and Divisions.

KENT BRANCH

Meeting to Discuss Hospital Policy

The Kent Branch of the British Medical Association has undertaken the work of forming a local hospitals committee, as outlined in the Association's pamphlet *Policy Affecting Hospitals* (I). To explain fully the policy of the Association a meeting of the hospital staffs of the East Kent hospitals was held at Ashford on November 4th, with Dr. A. W. G. Woodhouse (Rochester) in the chair. The meeting was addressed by Mr. W. McAdam Eccles, M.S., F.P.C.S., who set out the policy of the British Medical Association, and gave instances of the value of such a committee.

The Chairman explained that the idea in forming this committee was to look after the interests of the hospitals in the county. It might be necessary to make alterations with regard to the representation but that could be done later. Arrangements had been made for two meetings, one for East Kent and one for West Kent in order to make it more possible for members of hospital staffs to attend.

Mr. McAdam Eccles, in the course of his address, said that the great war had wrought many changes, and had even altered the policy of voluntary hospitals. The seven years since the armistice had seen (1) patients asked to contribute towards maintenance while in hospital, (2) voluntary staffs accepting a percentage of payments made to the lay authorities of the hospital by State or municipality towards the cost of treatment and maintenance of patients, (3) voluntary hospitals receiving aid from the Treasury. These radical changes and many other minor ones, had led the Representative Body of the Association to formulate a definite hospital policy. This policy had been gradual in its growth and had caused much labour particularly on the part of the present Treasurer. It aimed at being a practical not an academic scheme. Mr. Eccles explained how every part of the medical profession was concerned with a hospital policy and pointed out that the primary consideration in the admission of a patient to

hospital should be the suitability of the case on medical grounds. The good of the patient should be paramount. But some means of investigation into the circumstances of the applicant for relief, by means of an almoner or other agent should be employed in all medical charities. He then enumerated and discussed the three categories of patients for inpatient treatment—free, tariff and private. While there were three classes of patients who made use of hospitals, there were three types of hospitals for them to make use of—voluntary, municipal, and Poor Law. The interrelation and correlation of the three had a considerable bearing upon the promptness and effectiveness of inpatient hospital treatment. The British Medical Association, appreciating the importance of the bearings of hospitals on the common health and on the work of the general practitioner, had formulated provisions in relation thereto by means of its Hospitals Committee and the Representative Body, and these had now become the policy of the Association.

After explaining briefly certain principles in regard to voluntary, municipal, and Poor Law hospitals, Mr. Eccles made some general observations arising out of the Association's hospital policy. It was, he said, exceedingly desirable that the general practitioner should be brought into closer relationship with the services provided by hospitals. There were at least three ways in which this might be brought about: (a) Every case whether for inpatient or outpatient treatment should apply to the hospital on the recommendation of his medical attendant, whether private or insurance. (b) The hospital out-patient department should become more and more a consultative department to which the general practitioner should send his patient with a note, and from which he should receive a short report upon his patient. (c) General practitioners should be invited by members of the medical staff to attend the wards and operation theatres of the hospital in order to see the progress of their patients while under treatment, while it was difficult for busy practitioners to find time for this, they should at least be given the opportunity of so doing. In all contributory schemes whether financially benefiting the hospital directly or indirectly, abuse of the hospital should be obviated by insisting that the hospital service should be only obtainable through the general practitioner. There should be much more representation of the medical element on the governing bodies of hospitals, and on local voluntary hospital committees.

The Chairman thanked Mr. McAdam Eccles for the clear-cut way in which he had presented the case, and stated that he was in favour of a medical committee for each hospital. Dr. Travers stated that with regard to municipal hospitals Maidstone was coming within this scheme, as a new maternity block had been built on to the West Kent General Hospital. A further example of the usefulness of the late voluntary hospitals staff committee was that by its means pressure was brought to bear on Lord Cave's Committee, and an additional medical member (in the person of its chairman, Dr. Tyson) was added to the Kent Hospitals Committee. Dr. Jordan expressed the opinion that emergency patients were the chief cases of abuse. Dr. Molesworth asked what could be done in the case where a local authority sent patients to hospital (for example child welfare departments), it was difficult to get into communication with the general practitioner. Dr. Tyson, looking back on over forty years of practice, expressed the opinion that out-patient departments should be done away with. Dr. McMaster, as representing the municipal part of the work at Dover, stated that admission was on the recommendation of the medical attendant, the treatment of school children was by arrangement with local authorities. Dr. Starling said that a central county medical staffs committee would unify methods. The medical staffs were not so well organized as they might be and with better organization better and more efficient work could be done. He was in entire approval of the pamphlet which had been circulated.

The meeting closed with votes of thanks to the chairman and Mr. McAdam Eccles.

ABERDEEN BRANCH ABERDEEN DIVISION

A meeting of the Aberdeen Division was held at 29, King Street, on December 8th, to discuss a proposed contract, offering a capital rate of 3s. a head, issued by one of the friendly societies for the treatment of its juvenile members. The meeting was unanimous in refusing such a contract, and passed the following resolution:

That no contract for the attendance on any uninsured person dependants or others should be undertaken at a rate lower than that existing under the National Health Insurance Act with the addition of mileage for distances of over two miles in the country districts.

METROPOLITAN COUNTIES BRANCH CAMBERWELL DIVISION

An ordinary meeting of the Camberwell Division took place at Bermondsey and Rotherhithe Hospital at 9 p.m. on December 8th, and was presided over by Dr. W. G. Storr, chairman of the Division. The chief business of the meeting took the form of a clinical demonstration. A number of interesting cases were shown by members of the staff of the hospital, which was followed by an animated discussion.

METROPOLITAN COUNTIES BRANCH CITY DIVISION

The annual dinner of the City Division was held on December 3rd at the Holborn Restaurant. There was a good attendance and the guests of the Division were Professor Gask, Mr. Conyns Beckley, Dr. C. O. Hawthorne, Sir Bruce Bruce Porter, Professor H. Maclean, and Dr. Edwin Smith. After an excellent dinner the toast of "The King" proposed by the Chairman, having been honoured, that of "The British Medical Association" was proposed.

by Sir B. BRUCE PORTER, who embellished his speech with a few good stories, and Mr. CORNELL REELEY, chairman of the Metropolitan Counties Branch replied. The toast of 'The Guests' was proposed by Dr. PHILIP HAMILL and acknowledged jointly by Prof. G. GASK and Dr. LEWIS SMITH, coroner for North-East London. The toast of 'The Chairman—Dr. G. Clark Trotter,' was in the able hands of Dr. WIGGLESWORTH, the retiring chairman, who alluded in glowing terms to the enthusiasm and thoroughness with which Dr. Clark Trotter entered into any business or pleasure connected with the Division or Association, ably backed by his charming wife. During the evening Miss Doris Vane (soprano), Mr. W. V. ROBINSON (baritone) and Mr. FINDLAY DUNN (entertainer) in the piano gave excellent diversion and a most successful evening terminated with 'Auld lang syne.'

A clinical afternoon was held at the Metropolitan Hospital on December 11th. Cases were shown and demonstrated by Dr. NORMAN H. HILL, assistant physician to the Belgrave and Metropolitan Hospital, a most instructive and interesting afternoon being spent. There was a good attendance. The following cases were exhibited:

1 *Pseudo hypertrophic Muscular Paralysis*—Male, aged 13 years, eldest of four, others so far normal, numerous relations on mother's side affected. Symptoms commenced when 8 years of age. Now typical case. All muscles very weak, enormous hypertrophy of calf muscles, lordosis, waddling gait, typical method of rising from floor, climbing up himself. Characteristic difficulty in picking him up by grasping him under the arms.

2 *Congenital Morbus Cordis in a mongol*—Male, aged 6 years. Frequent attacks of cyanosis and dyspnoea. Typical mongolian a pig, cyanosed, slight clubbing of fingers. Heart shows some degree of enlargement to the right, well marked systolic murmur over the pulmonary area.

3 *Congenital Morbus Cordis—Aortic Stenosis*—Male, aged 4 years, no rheumatic symptoms in the past, has had measles, bronchitis and tonsils and adenoids removed with no untoward symptoms. Has no cardiac symptoms. Well developed, but no cyanosis, no clubbing of the fingers, no dyspnoea. Some left sided enlargement of the heart. Well marked thrill systolic in time over aortic area, together with rough systolic murmur conducted upwards.

4 *Aortic Aneurysm*—Male, aged 49. Swelling of right side of neck noticed one year ago. Well nourished man, many tortuous and dilated veins over thorax and abdomen. No oedema of face now. Large area of dullness to percussion behind and on each side of sternum. No cardiac murmurs. Pupils equal and pulse equal and synchronous. No tracheal tug. Radiogram shows large shadow continuous with that of aorta—the aneurysm involving practically the whole of the aortic arch. Latest radiogram shows aneurysm to have increased in size. Wassermann reaction strongly positive.

5 *Aortic Aneurysm*—Male, aged 68. Three months' vomiting all food immediately after taking. Lately vomiting even fluids. Loss of weight. Thin wasted man. No abnormal physical signs. X rays show local bulging of aortic arch, the walls of which are thickened, causing partial obstruction of the oesophagus. Wassermann reaction strongly positive.

6 *Permeious Anaemia with Recovering Peripheral Neuritis*—Female, aged 33 years. August 1925 typical permeious anaemia, blood count with 14 million red blood corpuscles and symptoms of peripheral neuritis, paraesthesia both legs, weakness and wasting, loss of knee jerks, flexor plantar response. Unable to walk. Blood transfusion August 1925 with 400 c.c. of citrated blood. October 1st red cell count was 5 million. Now looks well, is getting stronger and can walk fairly well. Paraesthesia disappeared and knee jerks returned. There was never any evidence of arsenical neuritis, as she had all her symptoms before taking any drugs.

7 *Progressive Muscular Atrophy*—Male, aged 56. Twelve months' weakness left hand. Shows marked wasting of intrinsic muscles of left hand with great loss of power and feeble grip. There is early involvement of the right hand.

NORTH OF ENGLAND BRANCH, HARTLEPOOL DIVISION

A WELL attended meeting of the Hartlepool Division was held on December 3rd when Dr. J. E. ENGLISH was in the chair. Professor R. P. RANKEN LYLE (Newcastle upon Tyne) gave an address on difficult labour. He laid it down as an axiom at the outset that the aim of the doctor should be to save life. Professor Lyle said he condemned such operations as craniotomy, abortion and sterilization. Pre-maternity work was of the greatest value for the prevention of eclampsia, the rectification of abnormal presentations, and the recognition of anomalies of the female pelvis. He went on to emphasize the fact that the treatment of difficult labour was changing rapidly, and contrasted the almost complete safety of Caesarean section, both for mother and child with the appalling high mortality rates of many of the older methods of treating difficult cases. Caesarean section was the best treatment for (1) contracted pelvis, (2) prolapse of the cord, (3) placenta praevia, (4) threatened rupture of the uterus, (5) repeated death of foetus at or near term, (6) abnormal presentations, (7) primary uterine inertia with rigidity of the os, (8) heart disease and other diseases in the mother. Difficult labour as it was known twenty years ago was he said soon going to become extinct by the perfection of pre-maternity work, and because the general practitioner of the future would hand over such cases to institutions for Caesarean section.

Professor Lyle concluded by demonstrating some useful obstetrical hints. The lecture was of the greatest interest and gave rise to an animated discussion.

NORTH LANCASHIRE AND SOUTH WESTMORLAND BRANCH

A MEETING of the North Lancashire and South Westmorland Branch was held at Calgarth, Windermere, on December 5th when Professor J. A. VYON, C.V.G., M.D. physician Bristol Royal Infirmary gave a very interesting lecture entitled 'Insulin treatment of diabetes with particular reference to the complications of diabetes and surgery in diabetes.' This was the first British Medical Association Lecture which the Branch has had the pleasure of hearing, and the very animated discussion after the address showed how highly it was appreciated and how well the complicated subject was handled by the speaker. It is to be regretted that, owing to the whole district being in the grip of a very severe frost, the attendance was not what it would otherwise have been, many more members would certainly have been present if it had been possible. A hearty vote of thanks to Professor Vyon, and to Dr. Hough for presiding, concluded the meeting.

SOUTH WALES AND MONMOUTHSHIRE BRANCH, CARDIFF DIVISION

A MOST interesting address was given by Dr. BRACKENBURY on December 3rd on theory and practice in Association policy.

In the evening a very enjoyable dinner and dance was held at which almost two hundred were present. The toast of 'The Association' was proposed by the Lord Mayor of Cardiff, and was replied to by Dr. BRACKENBURY, that of 'The Visitors' was proposed by the Chairman of the Division Dr. W. D. J. MORRIS and replied to by Sir WILLIAM DIAMOND, chairman of the Cardiff Royal Infirmary, and by Mr. CECIL BROWN, the town clerk of Cardiff.

Dancing went on to 2 a.m. and everyone present seemed to enjoy the function very much.

SOUTHERN BRANCH, PORTSMOUTH DIVISION

A VERY successful meeting of the Portsmouth Division was held at the Queen's Hotel, Southsea, on December 3rd when Dr. A. MEAKINS FRASER was in the chair. The attendance numbered fifty-six of whom forty-six sat down to the customary supper preceding the meeting.

The business part of the meeting dealt with various matters including the discussion of steps to secure that a salary in accordance with the scale of the British Medical Association should be offered for the vacant post of school medical officer in Portsmouth, the rate of remuneration for contract practice, and the question of tendering for public medical appointments. This was followed by a discussion on the diagnosis of functional nervous disease opened by Dr. A. J. WATSON of London in which a number of members took part. The meeting closed with a hearty vote of thanks to Dr. Whiting. During the evening a collection was made to provide Christmas presents for the Portsmouth Queen Victoria Jubilee Nurses.

SUFFOLK BRANCH, NORTH SUFFOLK DIVISION

A CLINICAL meeting of the North Suffolk Division was held at the Lowestoft Hospital on November 24th when Dr. L. B. CASE presided. There was a good attendance.

A number of interesting cases and specimens were shown by Drs. EVANS, HITCHINSON, GARDEN, TITCHERST, BOSWELL, TAPSCOTT, and TISON.

SUFFOLK BRANCH, WEST SUFFOLK DIVISION

A MEETING of the West Suffolk Division was held at the West Suffolk General Hospital, Bury St. Edmunds, on November 24th when Dr. R. W. RIX, chairman of the Division, presided.

Dr. F. R. BARWELL opened a discussion on the use and abuse of pituitrin in labour. He dealt with the different varieties of uterine inertia and the conditions under which pituitrin may be used, explaining that the chief indication was the deficiency of pituitary substances in the blood as indicated by a low blood pressure. The maximum single dose during labour should not exceed 0.5 c.c. and it was preferable to use repeated doses of 0.25 c.c. During the third stage pituitrin should not be employed until after the expulsion of the placenta. The administration should be intramuscular or intravenous, as in this way a much more rapid action was obtained than by subcutaneous injection. Dr. Barwell then described a new method of induction of labour by the use of a No. 20 stomach tube instead of a bougie, the whole of the tube to be introduced through the os. Dr. Barwell stated that he had found this method easy to employ and more satisfactory than the old method. A method of dealing with retained placenta was then described consisting in the slow injection into the umbilical vein of about 10 oz. of fluid by means of a Higginson syringe. Dr. Barwell stated that this method was said to be almost invariably successful. In this connection he stated that in his opinion the natural end of the cord should not be tied as the ligature might cause a positive pressure which might delay separation.

In the subsequent discussion Drs. WILKIN, HAPDOWICK, BRYNNE, RIX, B. E. A. BATT, STUFF and HINNELL took part. Dr. CANNAN gave his experience in connection with the points raised by Dr. Barwell and also described a method for induction of labour which he employed and which consisted in the administration of 6 p.m. of castor oil 2 oz. at 9.10 and 11 p.m. quinine 5 gr. At 9 a.m. the following day pituitrin 0.5 c.c. This to be repeated in one hour, and if necessary, once more at an hour's interval.

On the motion of the CHAIRMAN a vote of thanks was recorded with acclamation to Dr. Barwell.

Dr. H. G. KILMER described three cases with specimens—namely (a) stomach ball consisting of hay weighing 2½ lb., (b) two cases of sarcoma of the small intestine.

Dr. B. E. A. BATT showed two cases: (a) tumour of the occipital bone, (b) enlargement of spleen and liver of doubtful origin.

WILTSHIRE BRANCH TROWBRIDGE DIVISION

A DINNER was held at the Bear Hotel, Devizes, on December 2nd, when twenty six members, two guests, and four non members from the Devizes area were present.

After the loyal toast had been honoured Dr T. WOOD LOCKER in proposing that of the British Medical Association, described some of the advantages of membership, and said that the larger the membership the more could be done to help the public medical services than had been done in the past, though that was very considerable and also the medical officers in the Royal Navy and Army Medical Services. Dr FLEMING in reply, said that he thought the greatest advantage he personally had had from the Association were the many friendships he had made. Dr TREVOR SHOPLAND proposed "The Guests," to which Dr LOCKER COATES replied.

Mr CECIL TERRY FRCS (Bath) subsequently read a most interesting and instructive paper entitled "Some minor points in surgery." This was greatly appreciated by those present. In the short discussion which followed, Drs FLEMING, LAURENCE, COATES, and LOCKER took part.

Dr BOAD proposed a vote of thanks to the honorary secretary and Dr Hamilton for arranging the dinner.

General Medical Council

EXECUTIVE COMMITTEE

A MEETING of the Executive Committee of the General Medical Council was held on November 23rd, Sir DONALD MACALISTER presiding. Several of the matters which came forward for consideration, including the question of reciprocity with Italy, the recognition of Indian universities, and the position in Saskatchewan and New Brunswick with regard to practitioners registered in the United Kingdom, were referred to in sufficient detail in the Presidential Address delivered to the Council on the following day (SUPPLEMENT, November 28th, p. 185).

Reciprocity with Foreign Countries

THE PRIVY COUNCIL had inquired of the Committee as to the practice of medicine in the British Empire by holders of Latvian and of Austrian medical degrees, and had accompanied the inquiry in the case of Austria with the statement that, in view of the overcrowding of the medical profession in Austria, the Supreme Sanitary Council had resolved to consider ways and means of facilitating the emigration of Austrian doctors to foreign countries. The President had directed memorandums to be prepared (which were approved by the Committee) stating that no reciprocity existed in the case either of Latvia or of Austria, so that in order to become a legally qualified practitioner in this country the holder of a Latvian or an Austrian medical degree would have to obtain a recognized British qualification. Persons holding reputable degrees obtained abroad were frequently admitted to examination for a qualification in this country, either without further curriculum or with a short course of study to supplement any subjects which might be deficient. With regard to Austria the President stated that it was understood that at present no foreigner could practise medicine in Austria unless he became an Austrian citizen, and thus, of course, precluded reciprocity. As to the possibility of Austrian practitioners obtaining lucrative employment outside their own country, no information could be given regarding the British Dominions overseas, but so far as Great Britain was concerned the number of registrations during the last three years had been much greater than usual, and some time would probably elapse before the newly qualified practitioners in this country were absorbed in private practice or the public service. It was therefore likely that foreign doctors would have some difficulty in establishing themselves.

Registration of "Drugless Practitioners" in Ontario

TWO measures before the Ontario Parliament were transmitted to the Council from the Dominion Office. One of these was a bill to amend the Ontario Medical Act 1923. A new section in the amending bill lays down certain penalties (fines of not less than 25 dollars nor more than 100 dollars) for unregistered persons who use any title calculated to lead people to infer that they are registered. A second bill provides for the registration of "drugless practitioners." The bill proposes to set up a board of regents to be composed of five persons appointed by the Lieutenant Governor in Council, to register the persons admitted under this statute to prescribe their "allegations" and to provide for their discipline and control. The bill further provides that any person not registered as a

drugless practitioner who practises or holds himself out as practising within the meaning of the statute, or uses affixes or prefixes signifying that he is qualified to practise, is liable to a penalty not exceeding 100 dollars for a first offence and for a subsequent offence within two years of the first conviction to imprisonment for not more than three months. It is provided that nothing in the statute shall affect the position of the practising any profession under other general or special Acts, nurses acting under the direction of a legally qualified medical man, those who furnish first aid or temporary assistance in emergency, or "persons treating human ailments by prayer or spiritual means as an enjoyment or exercise of religious freedom."

Medical Practice in Iraq

THE Colonial Office transmitted to the Council the law of medical practice in Iraq, made at Baghdad in March last, and signed by King Faisal. The law lays down the conditions for the practice of medicine, and defines various categories of professional misconduct—namely, the employment of any unauthorized person as dresser, dental mechanic, vaccinator, midwife, or nurse, advertising and canvassing, or the sanctioning of the same, failure to comply with regulations issued by the director of public health as to notification and other matters, anything detrimental to the honour and interests of the profession, and all contraventions of the practice of medicine coming within the provisions of the Baghdad penal code. The practice of medicine or any of its branches in Iraq, for payment or otherwise, is forbidden except to authorized persons in accordance with this law. Consular certificates as to character and the validity of the diploma are necessary in the case of practitioners not of Iraqi nationality, and such practitioners are required to pay a registration fee of Rs 500 (£50) instead of the Rs 50 required of native doctors or dentists, but any doctor or dentist of either Iraqi or foreign nationality engaged in practice in Iraq on the date of the coming into force of the law is deemed to be registered. The director of public health is authorized to specify from time to time areas in which foreign doctors or dentists other than those already registered may not practise, and any doctor or dentist who contravenes such a regulation is liable to penalty. In Iraq a doctor is not allowed to style himself a specialist in any branch of medicine without permission of the director of public health. The law also contains provisions for the removal of names from the Register, and for penalties (up to fines of Rs 1,000 (£100) or six months imprisonment) against those who, being unregistered, practise or attempt to practise or use styles or titles implying authorization.

Medical Service in Bechuanaland

A communication from the principal medical officer of Bechuanaland was considered relating to the difficulty of providing medical service at out stations in that territory where small groups of European and native populations where qualified medical officers are not available. The officer asked if the Council would devise a form of licence for unqualified European dispensers, and empower himself, with other medical officers, to grant such licences to suitable men. A reply was approved to the effect that if the Government submitted a scheme whereby a competent medical board could license approved persons of the dispenser class to constitute a sort of "subordinate" medical service of an emergency character similar to that which obtained in India, giving good reasons for the formal departure from the legal prohibition of such unqualified practice, the Committee would consider it with every desire to meet the difficulties of the situation in the Bechuanaland Protectorate. A similar reply was recently sent to the Tanganyika authorities, who were in much the same position.

Miscellaneous Business

THE Committee considered the draft charter of incorporation of the Royal Medical Psychological Association of Great Britain, and raised no objection to the granting of the charter. The Committee also considered the question of the separate qualifications granted by the Conjoint Examining Board in London entitling their holders to original registration, and passed a resolution that when a joint qualification examination in medicine, surgery, and midwifery had been held by the two Royal Colleges either College might transmit a list of candidates for its diploma who had passed such examination, and any applicant presenting to the Registrar the diploma of either College, or a certificate showing him to have received such diploma, and whose name was on the list, should be accepted as eligible for registration.

Our report of the winter session of the General Medical Council was completed in the last issue of the SUPPLEMENT.

THE DENTAL BOARD

At the November session of the Dental Board the General Medical Council was asked to approve expenditure by the Board for 1926 of £18,000 for educational grants. The University of Sheffield was informed that the Board, subject to certain conditions, was willing to make a grant of £1,500 for equipment in the dental school. It was reported that 287 students so far had been assisted by individual grants or loans from the Board.

Dental Examinations—The report of the assessor at the ninth series of prescribed examinations held in London in July last was to the effect that many of the candidates presenting themselves found difficulty in attaining the required standard in the more theoretical parts of the examination. The examiners also were of opinion that the candidates were not of the same standard as those who attended the earlier series, further, they appeared to have required their information from textbooks which, in the absence of a teacher, they had not understood, 52 per cent of the candidates satisfied the examiners, and 48 per cent were referred.

Dental Research—The Board received reports on various researches which it is assisting. The Department of Scientific and Industrial Research reported on dental alloys and amalgams, and the Medical Research Council submitted interim reports by several workers on the causes of dental disease. There were also reports from individual investigators on the relation between dental sepsis and blood sugar tolerance, the nutrition of dentine during adult life, and other subjects.

Dental Health Propaganda—The Dental Health Propaganda Committee reported to the Board on various forms of publicity, several of which are already being used, including films, lectures, and travelling exhibits. It has also been arranged to carry out, under the committee's supervision, propaganda in the columns of the press.

National Insurance

THE EXETER INSURANCE INQUIRY

IN THE SUPPLEMENT of October 24th (p. 139) we published a report of the inquiry, held in public at Exeter on October 7th, to investigate a representation which had been made to the Minister of Health by the Exeter Insurance Committee "that the continuance of Dr. Bernard Kelly, upon the medical list is prejudicial to the efficiency of the medical service of insured persons." The Inquiry Committee consisted of Mr. E. H. Findal Atkinson, barrister at law (chairman), Dr. E. Collingwood Andrews, and Dr. A. Forbes.

We have now received from the Ministry of Health a copy of the report of the Inquiry Committee, together with a copy of the formal document embodying the Minister's decision on this case.

The Minister of Health, having read and considered the committee's report, states that he has decided not to remove Dr. Kelly's name from the medical list of the Exeter Insurance Committee. The Minister has further considered the question of costs of the inquiry, and directs that the sum of fifty guineas be paid by the Exeter Insurance Committee towards the costs of Dr. Kelly.

In view of the importance of the case we print below (substantially in full) the Inquiry Committee's report.

THE COMMITTEE'S REPORT

The Inquiry Committee was constituted to investigate a representation made to the Minister of Health by the Exeter Insurance Committee (the complainants) that the continuance upon the complainants' medical list of Dr. Kelly (the respondent) would be prejudicial to the efficiency of the medical service of the insured. The representations were based upon the following facts and grounds:

Facts Alleged

On March 26th, Sidney S. Stevens, a brass works packer, aged 45, an insured person, after removing his tins at night suddenly strained himself when lifting his child and precipitated an old rupture in left groin, which caused him to vomit blood, and was in great pain during the whole night. This continuing, his wife went to the patients' panel doctor at 9 o'clock next morning and acquainted him of what had happened and of her husband's serious condition when without seeing the patient he wrote a prescription for bismuth. In the afternoon, the patient being worse a second message was taken to the surgery, where the dispenser on hearing the symptoms wrote down "Strangulated hernia: urgent." The doctor on returning, read this and visited the patient in bed to whom he expressed much anger at being called and left the house within two minutes. The same evening at his surgery he wrote a second prescription for a fuller bismuth mixture and gave the wife a certificate of

"gastro enteritis," and at the same time blamed her for sending a message as to hernia (which word she had not used) and he told her it was not strangulated hernia, and volunteered to make another visit in the evening, which he did and then apologized for the annoyance shown previously, and said it was his dispenser who had made the mistake. The patient's wife and a neighbour both saw and felt a lump in his left groin. The patient daily got worse and vomited motion on the 28th and afterwards, but beyond the above prescriptions no further medical treatment or remedial measures were provided by the doctor, although he visited him on the following days, during which time the wife told him she was not satisfied, but he assured her there was no need for her being anxious as it was nothing serious. Becoming more alarmed she asked on the 31st that a second doctor should be called in. The respondent brought in a surgeon who on seeing the patient's condition ordered his immediate removal to the hospital for an operation which was performed by himself and the house-surgeon the same afternoon, but the patient died the following evening April 1st. The certificate of death given by the house surgeon stated as the cause of death "(1) Strangulated inguinal hernia (2) intestinal obstruction." There was no post mortem examination.

Grounds for the Representation

(a) The respondent knew the patient had a previous rupture and had worn a truss for ten years, and admitted in his evidence that he "had hernia at the back of his mind." The medical record card returned to the Committee afterwards bears entry of first visit "27th March pain in abdomen hernia inguinal." (b) The respondent evidently connected this illness with the old rupture, as on March 29th he told patient that if they had operated on him when he sent him to the hospital ten years ago it would have saved all this bother. (c) Respondent failed to realize the seriousness of patient's condition, although particulars of the accident accounting for it had been given to him, and there was an absence of accurate methods of diagnosis and treatment. Respondent neglected to ask for or to make any inquiry as to the nature of patient's vomit. (d) Respondent's angry manner to patient and his wife was not consonant with the expected best medical treatment nor conducive to patient's relief within the services required by the Regulations. (e) The operation after a delay of five days was too late to save the patient's life. The operator states that by delay the whole of the bowels had become paralysed by septic poisoning through the obstruction and in his opinion it that had been relieved a day or two earlier there would undoubtedly have been a chance of recovery. (f) The respondent, either in error or undue haste gave a certificate of "gastro enteritis" and treated the patient accordingly on the first day only, 27th but no mention of such fact appears on the medical record card, pointing to a lack of consistency in his diagnosis, no subsequent symptoms and the certified cause of death proved. (g) The respondent's first entry on the medical record card—vide (a)—presumably indicated his then opinion of the symptoms and should have been instantly followed up by appropriate treatment—which was not done. (h) Only by the wife's request was further advice obtained for which she has paid two guineas for medical services that should have been rendered by the respondent himself as a general practitioner under his terms of service and as within the range of skill and experience he was expected to possess. (i) The complaint being of a serious nature raising as it does inferential reflections upon the respondent's professional conduct as a panel practitioner, and also affecting the complaint by her being suddenly left a widow with five children, the Committee are of opinion a fuller inquiry should be made in this case, as well as in the common interest of all insured persons.

The respondent did not submit a formal answer to the aforesaid representation. The inquiry was held by us at Exeter on October 7th.

A Technical Objection Overruled

Before Mr. Mathews opened the complainants' case Mr. Goddard K.C. [representing Dr. Kelly] submitted a technical objection relative to the scope of our duties at the inquiry. He brought to our notice the fact that an inquiry had been held as to this case by the local Medical Service Subcommittee although (a) properly he did not enter it in the report of that subcommittee or refer to its findings in view of the facts that the report was not to be submitted to us by the complainants and that we had not seen or desired to see the same. He referred us to Regulations 28, 29, and 30, and laid stress on the provision contained in Regulation 29 (4) whereby the Insurance Committee shall accept as conclusive any finding of fact of the subcommittee. He contended that this provision was binding on the Insurance Committee in relation to any action taken or to be taken by them under Regulation 30 and more particularly under paragraph 2 (d) of that Regulation, which contemplates the making of a representation to the Minister in the form of that brought before us. He therefore submitted notwithstanding the general terms of Regulation 42 that the scope of the inquiry before us was limited in the sense that we had no power to entertain *de novo* questions of fact already adjudicated upon by the subcommittee and to hear oral evidence thereon, and the complainants were entitled only to submit to us the conclusive findings of fact of the subcommittee and to invite us to report thereon with any inferences which we might think right to submit to the Minister with a view to assisting him in his executive decision.

We ruled against this submission mainly on the ground that Part VI of the Regulations contemplates an inquiry being held by the Inquiry Committee independently of the fact that an

Naval and Military Appointments.

ROYAL ARMY MEDICAL CORPS

Captain R. W. D. Hewson to be temporary Captain, and temporarily relinquishes the rank of Captain.
Captain E. C. Lang, D.S.O., to be Major July 26th 1924 with precedence next below R. A. Flood M.C. (substituted for notification in the London Gazette of August 8th 1924).
Arthur L. Moorby to be temporary Lieutenant.

INDIAN MEDICAL SERVICE

Lieut. Colonel J. W. D. Megaw has been appointed to be Honorary Surgeon to the Viceroy and Governor General vice Colonel R. P. Wilson, C.I.E., whose tenure has expired.
Major A. G. Coulhe has retired from the service.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Major F. W. D. Young, T.D., to be Lieutenant Colonel and to command the 164th (West Lancs.) Field Ambulance.
Lieutenant J. H. Hies to be Captain.
Lieutenant F. R. Sandford M.C. (from supernumerary for service with University of London Contingent O.T.C.), to be Lieutenant as from May 14th 1924.
Douglas C. Vaughan to be Lieutenant.

COLONIAL MEDICAL SERVICE

Dr. T. S. Cochrane appointed Medical Officer Kenya. Dr. F. A. Small, T.H. Nolan and A. J. Imsden appointed Deputy Medical Officers Masaka, Mbari and Kitgum, Uganda, respectively.

VACANCIES

BIRMINGHAM CITY JOINT BOARD OF RESEARCH FOR MENTAL DISEASE—Laboratory Attendant Salary £250 per annum.
BLACKBURN AND EAST LANCASHIRE ROYAL INFIRMARY—Third House Surgeon (male) Salary £150 per annum.
BOURNEMOUTH COUNTY BOROUGH—Assistant Medical Officer of Health and Assistant School Medical Officer Salary £630 per annum with £30 per annum for travelling expenses.
BRADFORD CITY—Assistant Dentist Salary £450 per annum, plus bonus, at present £32 16s per annum.
Bristol General Hospital—Honorary Assistant Surgeon to the Ear, Nose, and Throat Department.
CONSUMPTION SANATORIUM OF SCOTLAND Bridge of Weir—Resident Medical Assistant (male) Salary £200 £250 per annum.
DEPBY UNION INSTITUTION—Resident Medical Officer (unmarried) Salary £450 per annum, with two annual increments of £25.
DURHAM COUNTY COUNCIL—Medical Superintendent at Holywood Hall Sanatorium Salary £850 per annum.
EAST LONDON HOSPITAL FOR CHILDREN Shadwell E.1—(1) House Surgeon (2) Morning Casualty Officer (Males) Salary at the rate of £150 and £120 per annum respectively.
ELIZABETH GARNETT ANDERSON HOSPITAL 144, Euston Road N.W.1—(1) Assistant Radiologist (female) honorarium at the rate of £100 per annum (2) Anaesthetist for the Throat and Ear Department honorarium £5 5s per annum.
HOSPITAL FOR SICK CHILDREN Great Ormond Street, W.C.1—(1) Resident Medical Superintendent salary £300 per annum (2) House Surgeon (male) salary £50 for six months.
HUDDESFIELD ROYAL INFIRMARY—Junior House Surgeon Salary £150 per annum.
IPSWICH EAST SUFFOLK AND IPSWICH HOSPITAL—(1) House Physician (2) House Surgeons Salary at the rate of £400 per annum.
KINGSLY VICTORIA HOSPITAL—Resident Medical Officer Salary at the rate of £180 per annum.
LONDON TEMPERANCE HOSPITAL, Hampstead Road, N.W.1—Casualty Officer (male) Salary £120 per annum.
MANCHESTER CITY—Junior Medical Assistant at the Monsall Hospital for Infectious Diseases (male unmarried) Salary £350 per annum.
MANCHESTER St Mary's Hospitals—Two House Surgeons for the Whitworth Street West Hospital (Maternity) and three for the Whitworth Park Hospital (gynaecological and children) Salary at the rate of £50 per annum each.
NORWICH NORFOLK AND NORWICH HOSPITAL—Resident Anaesthetist Salary £150 per annum.
PENYDOL COUNTY BOROUGH—Resident Medical Officer of the Didworthy Sanatorium Salary £600 per annum.
PORTRUTH EDUCATION COMMITTEE—School Medical Officer (male) Salary £450 per annum rising to £550.
READING ROYAL BERKSHIRE HOSPITAL—Honorary Anaesthetist.
ROYAL FREE HOSPITAL Gray's Inn Road, W.C.1—District Obstetric Assistant Salary £100.
ST MARK'S HOSPITAL FOR CANCER FISTULA ETC, City Road E.C.1—Anaesthetist Salary £25 per annum.
ST MARK'S HOSPITAL Paddington W.2—Assistant Medical Officer in charge of 1 day Department.
SUNDERBY GENERAL INFIRMARY—House Surgeon (male unmarried) Salary £150 per annum.
SINGAPORE MUNICIPALITY—Assistant Health Officer Salary \$7200 for first year \$7680 for second year and \$8160 for third year.
WEST HILL COUNTY BOROUGH—Second Assistant Medical Officer at the Whitton Fever Hospital Salary £200 and bonus approximately £106 per annum at present.
WATFORD HOSPITAL Hammersmith Road W.6—Honorary Obstetric Registrar.
WATFORD HOSPITAL Broad Sanctuary S.W.—Obstetric Tutor and Registrar Honorarium £50 per annum.

MEDICAL REPTFFER UNDER THE WORKMEN'S COMPENSATION ACT FOR FALKIRK DISTRICT—Applications to the Private Secretary Scottish Office, Whitehall, S.W.1, by January 5th.

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column advertisements must be received not later than the first post on Tuesday morning.

APPOINTMENTS

GPAS E. E. D. M.B. B.S. Lond. Certifying Factory Surgeon for the Taddington District co. Middlesex.

CURRENT NOTES

Medical Charities

On the instruction of the Representative Body of the Association a British Medical Association Charities Committee has been formed, the chief function of which is to direct the attention of members, through the machinery of the Association, to the financial and educational positions which arise as a result of misfortune falling on members of the profession, and to appeal for contributions to meet those positions, as explained briefly in a leading article in this week's JOURNAL. The institution of this committee arose from a survey of the resources available for the relief of distress amongst medical men or their families who have fallen on bad times and for the provision of educational facilities for children left without parental support. Existing benevolent organizations have undoubtedly done, and continue to do, good work, but they are greatly hampered by lack of funds. An appeal is therefore made to members of the profession to assist their less fortunate brethren by contributing as liberally as they are able to the British Medical Association Charities Fund in order that the committee administering that fund may be in a position to help existing benevolent organizations—namely, "The Sir Charles Hastings Fund" of the British Medical Association, the Royal Medical Benevolent Fund, the Royal Medical Foundation of Epsom College, and the Royal Medical Benevolent Fund Society of Ireland. Provision is made in the form of application which members will receive on January 1st for the annual subscription to the Association for 1926, whereby contributions to the British Medical Association Charities Committee may be forwarded along with the subscription to the Association. In making use of this, it is suggested that members should place their contributions at the disposal of the committee, though they may earmark them for any particular fund if they so prefer.

The Medical Secretary's Visit to South Africa

We had hoped to be able to publish in the present issue a short report of Dr Alfred Cox's doings in South Africa, but, as we have to go to press earlier owing to the Christmas holiday, this must be postponed until next week. In the SUPPLEMENT for January 2nd members may expect to find some account of the wonderful reception Dr Cox has had from our colleagues in South Africa. A very extensive programme has been arranged out for him and the South African Committee evidently intends to let him see as much of the medical profession in South Africa as is possible in the time at his disposal. Dr Cox is receiving much hospitality, and not from the medical profession alone.

Garage Accommodation at Headquarters

Garage facilities are now available for members in the garage at the rear of the North Wing of the Association's new House in Tavistock Square. Members may garage their cars during the day free of charge, and during the night at a charge of 2s a night. There are also two lock-up garages available, the charges for which are 5s a night, 25s a week or £40 a year, these may be let for a period of not longer than one year on a three months' notice, or for shorter periods. All applications for garage accommodation should be made to the Financial Secretary and Business Manager. The garage is accessible only during office hours, except by arrangement with the caretaker. It must be clearly understood that the Association can take no responsibility for cars garaged on the premises.

Subscriptions for 1926.

Members of the British Medical Association are reminded that subscriptions fall due on January 1st in each year, and that if each member who receives an application for his or her subscription from the Head Office will send the amount to the Financial Secretary within the first week of the New Year the work of the office will be very considerably lightened. Members are also reminded of the claims of charity, to which reference is made elsewhere. The amounts at the disposal of those who administer medical benevolence are altogether insufficient to meet the appeals that are received, and the British Medical Association Charities Fund was formed in order to assist. Subscriptions or donations are urgently needed, and every member of the Association is asked to add to his next payment a sum for the credit of the B.M.A. Charities Fund.

IRISH MEDICAL COMMITTEE

At a meeting of the Irish Medical Committee held on December 8th 1925 in the Royal College of Surgeons Dublin the following members were present: Senator W. O'Sullivan (in the chair), Drs J. M. Dwyer, Denis Dowd, J. T. Elliot, Conor Maguire, J. Mills, E. J. King, R. W. Murphy, J. O'Meara, H. R. B. R. Roche Kelly, R. J. Lowlette, J. P. Shanley, D. Walsh, H. F. Warnock, and Dr F. Hennessy. Medical Secretary Senator W. O'Sullivan was elected (for the 11th time) vice chairman of the Irish Medical Committee.

Among the correspondence read was a letter from the National Health Insurance Commission to approved societies stating that it had been brought to their notice that in certain cases insured persons seeking compensation or damages under the Employers' Liability Act 1880 or the Workmen's Compensation Act 1906 have utilized in support of their claims medical certificates issued to them on Form M.C. 1 by medical certifiers under the National Health Insurance Acts. The Insurance Commission informed the approved societies that an insured person is not entitled to use such certificates for any purpose other than national health insurance purposes, and that such medical certificates should not be returned to insured persons, but should be retained by the society.

Inquiry into Health Insurance and Medical Services

Dr R J Rowlette, representative of the Irish Medical Committee on the Committee of Inquiry, gave an outline of the most important matters dealt with in the report, especially as they affected the medical profession, he also stated that the Committee of Inquiry would resume its sittings in the early part of the coming year as soon as the financial expert had furnished his report with regard to the financial position of the approved societies in the Free State. A warm vote of thanks was passed to Dr Rowlette for his services on the Committee of Inquiry and it was resolved that a copy of the interim report be sent to secretaries of the Local Medical Committees for the information of medical men in the different areas.

Registration of Birth, Deaths, and Marriages

At the last meeting of the Irish Medical Committee a resolution with the inadequacy of the fees for the deaths, and marriages was passed and forwarded to the Ministry of Local Government and Public Health. As no steps had, however, been taken to increase these fees it was resolved that the advisability of registrars resigning then offices be submitted to a meeting of delegates if the Ministry decline to pay dispensary doctors who act as registrars the remuneration paid for similar work in Great Britain to non medical registrars.

Medical Treatment of Postmen

In regard to medical attendance on postmen, the Committee decided to send a communication to the Minister for Posts and Telegraphs protesting against the arrangement whereby a doctor who is medical attendant to the Civic Guards is paid a lesser capitation fee for attending the postmen in his area than if he acted in the latter capacity alone.

County Medical Officer of Health in the Free State

The Executive Committee of the Irish Medical Committee was instructed to confer with the Minister for Local Government and Public Health with regard to the remuneration and conditions of service of county medical officers of health.

Medical Registration

Dr Hennessey gave an account of the present position of medical registration in the Irish Free State. He stated that the Government seemed willing to allow the existing arrangements for medical registration to continue so long as they did not interfere with the establishment of a Medical Council and Register for the Free State. He added that he believed it was the intention of the Government to extend for six or nine months the Medical Act of 1925. The case of students who had already commenced medical studies was made the subject of a special representation to the Government.

Salaries of County Mayo Medical Officers

The Committee decided to inform the Minister for Local Government and Public Health that it was much disappointed at his failure to fix an adequate scale of salaries for the county Mayo medical officers and again requesting him to take into consideration the case of these doctors, who, while living in the largest and most populous districts in Ireland, are paid the most inadequately in the service.

Salaries of Medical Inspectors

With regard to the salaries of medical inspectors the following resolution was adopted:

That the Irish Medical Committee resents the degradation of the Irish medical profession by the recent appointment of medical inspectors at salaries less than were paid fifty years ago and the reduction of the subsistence allowance to less than that fixed for the more highly paid officers.

Copies of this resolution were ordered to be forwarded to the Departments of Finance and Local Government and Public Health.

The Committee also dealt with the questions of medical certification for sickness benefits, lunacy fees, certificates for emigrants, and medical evidence before the Departmental Committee on Workmen's Compensation.

Association Notices**BRANCH AND DIVISION MEETINGS TO BE HELD**

BIRMINGHAM BRANCH, NUNEATON AND TAMWORTH DIVISION—A meeting of the Nuneaton and Tamworth Division will be held at the Nuneaton General Hospital on Wednesday January 20th, 1926.
